3. *Efficiency.*—In any class of electromotor this is bound to depend largely on the amount of material put into it. Comparison is, therefore, admissible between motors of different types and of the same weight. In this connection my present experience does not enable me to give any definite figures, but I should say that the repulsion motor for a given power will be heavier than the corresponding polyphase motor, and lighter than the single-phase motor with its starting apparatus. Considering the enormous waste of energy in starting the latter, the repulsion motor will be far more economical for non-continuous running. Unfortunately, detailed results of actual output per kilowatt during continuous running are not yet forthcoming from any source.

4. *Starting Advantages.*—Under the best circumstances the repulsion motor may be started under full load with a current only slightly exceeding the full running current. This great advantage is obtained without any expensive and cumbersome starting arrangement, and it is this which must be put forward as the great advantage of this type of motor. Of course at starting the motor is really a special case of the split-phase type of motor, and the only reason why it is so much better than other motors depending on this principle, is that the phase splitting is performed by the motor itself, and depends on no additional apparatus. Further, by careful design the phase difference produced at starting must be so very much greater here than in any starting apparatus for single-phase motors, except such as depend on the introduction of a very large condenser.

This paper must, of course, be considered as preliminary, in that no curves of results are given, but these I hope to have ready to publish shortly.

(To be continued.)

PERSONAL.

Mr. Alfred S. Blackman, M.I.C.E., who has for four years been electrical engineer to the borough of Poplar, has been appointed by the Electricity Committee of the Bradford Corporation to the position of electrical engineer, formerly held by Mr. Chattock, at a salary of £600 per annum. Mr. Blackman is a member of the Institution of Electrical Engineers, is 33 years of age, and has been electrical engineer at Poplar for four years, previous to which he had experience in a similar position at Aberdeen, and was assistant engineer at the works of the Hove Electric Lighting Company, West Brighton. He goes to Bradford with excellent testimonials. The appointment will come up for formal approval of the City Council this week.

Mr. W. H. Merteus, Brighton, has been appointed assistant electrical engineer and clerk of works for the new electrical supply installation at Londonderry.

Mr. Richard Pape, borough electrical engineer at Morecambe, has resigned, he having received the appointment of municipal electrical engineer at Port Elizabeth, South Africa. The selection of a successor is to be made to-day. We understand that the candidates selected are Messrs. W. H. Hall, Yeaman, and J. Hargreaves.

Tariff Controversy.—The present time is particularly opportune for the publication of any volume dealing with the question of fiscal policy. Our readers will be glad to know that Messrs. P. S. King and Son, Westminster, have just published "The Tariff Problem," by W. J. Ashley, the well-known writer and lecturer on economics.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

621. Resonance occurs when the natural period of discharge of a circuit is equal to the generator frequency, and is complete when the self-induction and capacity of the line exactly neutralise each other. Explain this clearly.—T. G.

622. Explain how to find the efficiency of an alternating-current motor of 6 h.p., the speed being 1,500 revolutions per minute.—W. F. F.

ANSWERS.

Question No. 613.—I have two motors, 2½ h.p., 85 volts, and my voltage on the mains is 110. Please tell me the best economical method of using above motors.

Best Answer to No. 613 (*awarded* 10*s.*).—The question does not state whether the motors are shunt or series

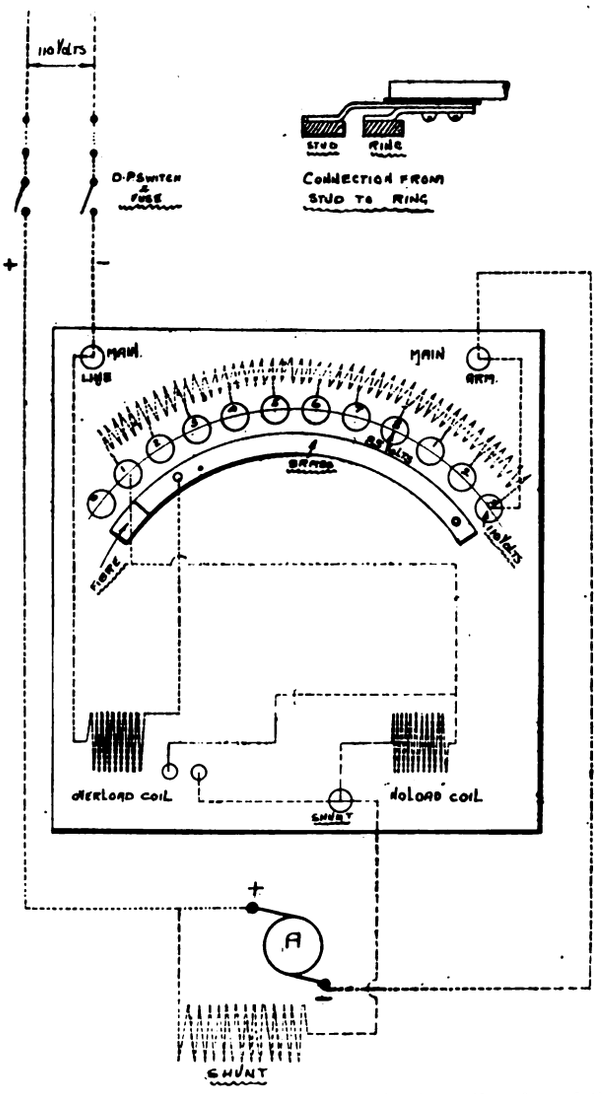

Diagram of Connections for Motor-Starting Switch. Connections shown dotted

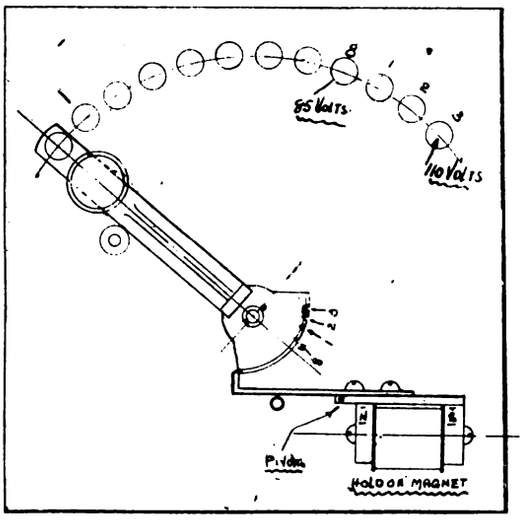
wound, so I presume they are shunt. I do not think there is really an economical method of using the motors in question without any alteration to the winding of same,

Digitized by Google

which, I presume, must not be done, because the extra volts or watts (110-85) is practically all waste if the motor is to run on 85-volt mains and no higher, but if an increase of speed is required (which is often the case) then the extra power may be used to advantage—*i.e.*, the resistance being cut out and the E.M.F. at the brushes increased. If the machines are liberally designed the extra volts ought to make very little difference in the working (especially if of the open type) for two or three hours at the least, when the temperature will rise if on full load, but if on three-quarter or half load the rise will be most noted in the field coils, which are designed to carry a certain current at 85 volts, then when 110 volts are applied the C^2R loss will be increased, according to Ohm's law, but I do not think sufficiently to be harmful to the machine. If this was found to be unsafe, a permanent resistance would have to be inserted in series with the shunt winding, either contained in the starter, or, preferably, in the form of extra shunt winding, the cost of which would be very small. It will be noted from the diagram that the armature starting resistance is in series with the shunt winding, which might help matters, and if the no-load release magnet (which is in series with the shunt winding) were wound with resistance wire this might also help.



Starter Front, showing Arrangement of "Hold-on" Magnet.

Summing up, I think the most satisfactory method would be to make an experiment with the machines and obtain exact data accordingly, which would be useful to the makers of the starting switch, and then to have a starter specially made and connected as shown in diagram. It would contain, say, 11 contacts in all, eight for the 85 volts and three from 85 to 110 volts, a lower current density being allowed in the coils connected to the last three contacts than in the starting coils, because they would perhaps be used continuously. When the starting resistance is all cut out, the lever will stop on that contact (No. 8) and on each of the succeeding ones (1, 2, and 3) but on no one between 0 and 8, as per arrangement shown in sketch herewith. The starter will be of the automatic type, having no-load and overload release, the latter being wound for maximum 110-volt current and adjustable as usual.—P. P. D.

Answer to No. 613 (*awarded* 7*s.* 6*d.*).—The question as raised might refer to either continuous or alternating current motors. Taking the case of a continuous-current motor first, if the motors in question are series wound, by running them straight off the 110-volt mains a greater speed will be attained, and so a greater output available with any given current than when running on 85 volts. The increase in speed will be directly as the increase of voltage. If, however, the motors are shunt wound it will be quite safe to put 110 volts on the armature, but the resistance of the shunt field circuit will have to be increased in the proportion of 110 : 85—*i.e.*, by approximately 30 per cent.—in order avoid overheating. If the poles are not already saturated, the necessary additional resistance might well be obtained by winding additional turns on over the present spools, and connecting these turns into the shunt circuit. If, however, the poles are nearly saturated, it would be simpler to make up a resistance to put in series with the shunt field winding of the motors, one for each. In this latter case a definite amount of energy which is not being utilised will be dissipated in the resistance, but this would be so in any case if, as is supposed, the poles were already saturated. This dissipated energy would be about 23 per cent. of the total amount expended in the field circuit. In the former case the speed increase will depend on the change of flux; in the latter case, where the flux is unaltered, the speed will increase directly as the voltage. In each case the available horse-power will be nearly three. If the motors are compound wound, the shunt field winding only will need alteration and will be treated like the field of a shunt motor. If they are induction motors, it would not be advisable to run them at 110 volts on a circuit of the frequency for which they were designed at 85 volts. They would run satisfactorily on a circuit of 110 volts and a frequency 30 per cent. higher than that for which they were designed. In the former case the starting current would be much higher, and the magnetising current would also be much higher depending on the type of machine. If the saturation of the core is not high, the motors might run satisfactorily at 110 volts and rated frequency, but it is doubtful.—J. M. R.

Answer to No. 613 (*awarded* 7*s.* 6*d.*).—If the machines are not running at an excessive speed already, they can probably be put directly on to the higher voltage without harm, provided that a small amount of resistance is inserted permanently in series with the shunt winding to prevent the latter overheating. If this resistance is arranged to keep the shunt current the same on 110 volts as it is at present on 85 volts, the speed of the motors will increase exactly in proportion to the voltage—*i.e.*, some 30 per cent. The current taken to develop 2¼ b.h.p. will fall some 30 per cent, so that at the old full-load current the motor will really be capable of developing 2¾ b h.p. to 3 b.h.p. on 110 volts, with practically the same temperature rise and at least as good an efficiency as before at 2¼ b.h p. If the increase of speed is inadmissible, it will be necessary to completely rewind the armatures of the motors, putting on about 30 per cent. more turns of a wire 30 per cent. less in sectional area than the present wire, and at the same time inserting the resistance in the shunt winding as above. The speed and output would then remain unchanged, and the current taken from the mains to develop 2¼ b.h.p. would be reduced in the ratio of 85 : 110.—Q.

Answer to No. 613 (*awarded* 5*s.*).—From the wording of the question "J. W." has probably not tried the effect of running his 85-volt motors direct on the 110-volt mains, as it is quite likely that a satisfactory result would be obtained by so doing. The only objections are that the speed would be increased about 15 to 20 per cent., and that the field coils would get rather hot. The first of these two difficulties can probably be overcome by fitting pulleys of rather smaller diameters to the motors, and the second by placing small resistance coils in series with the field windings to reduce the field currents. There would be a small loss of power in these resistances, amounting to ·4 kilowatt-hour per day, assuming the two motors to be both running for eight hours a day, and this would amount to a total yearly loss of about 23s. if the motors are running every day. It is quite possible that the field coils are very cool on 85 volts, in which case the heating might not be excessive on 110 volts, and consequently no resistances would be required.

If the method cannot be carried out owing to the speed being definitely fixed, it is possible to use a main circuit resistance in series with the motor armatures to absorb 25 volts out of the 110 volts on the supply circuit, and so to allow 85 volts across the motor armatures. In this case the loss of power would be very great, being 10 kilowatt-hours per day of eight hours, which amounts to a yearly loss of about £28 on the two motors. Instead of allowing this power to be wasted in the resistance, it could be used for driving a small fan motor, wound for the special low voltage, which would cost about £4 complete, and would

Digitized by Google

probably be a useful article for ventilating any office or building close by. The armature and field coils of the motors could be rewound for 110 volts at a total cost of about 45s., and then no resistances of any kind would be required; but it does not appear to be advisable to do this unless the speed is definitely fixed, as in the writer's estimation the method first mentioned is the cheapest and most economical.—P.

Question No. 614.—In motor starters, graded in G.P. and having wires with a rating proportional to dia.$^{\frac{3}{2}}$, how should the constant K (or the diameter of the wire) vary from the first to the last contact for the same temperature of wire, and for the greatest economy in resistance material, allowing the same space of time on each contact (say three seconds). Consider a 5-h.p. starter with 16 contacts, and a similar one with 24 contacts.

Best Answer to No. 614 (*awarded* 10*s.*).—Suppose the 5-h.p. motor to be on a 110-volt circuit and taking 40 amperes at full load, also that it is shunt wound, having an armature resistance of ·2 ohm. Generally, for our purpose, the shunt winding may be neglected. The formula giving amount of resistance is

$$A \times r^n = R,$$

where A = resistance of armature;
r = ratio (in this case $\frac{3}{2}$);
n = number of parts into which resistance is divided;
R = whole amount of starting resistance.

We then have for a starter with 16 contacts—that is, the whole resistance divided into 16 − 1 = 15 parts $R = ·2 \times (\frac{3}{2})^{15}$.

$$\therefore R = 8·75 \text{ ohms}$$

Commencing with the armature, we then have the series—

$$·2;\ ·2 \times (1·5);\ ·2 \times (1.5)^2;$$
$$·2 \times (1·5)^3 \ . \ . \ . \ ·2 \times (1.5)^{15}.$$

With such conditions and turning lever of starter to first contact (allowing for brush resistance), the current will have an approximate value of

$$\frac{110}{9} = 12·2 \text{ amperes.}$$

This current may not start the motor, as it is less than one-third of the full load current, and, consequently, the torque will be less in proportion to the current flowing in the armature. On turning lever to the second contact current will be

$$\frac{110}{·2 \times (1·5)^{14}} = 18·3 \text{ amperes (approximate),}$$

and so on until sufficient torque is obtained.

For a starter with 24 contacts—that is, with the resistance in 23 divisions—we have

$$·2 \times (\tfrac{3}{2})^{23} = 63·39 \text{ ohms.}$$

With such an arrangement, under the conditions supposed, it is almost certain that the armature would not move until the lever had passed over several contacts. A general rule is to allow the resistance wires to carry from one-sixteenth to one-eighth their fusing currents. It is impossible to give definite figures. Even with the best starting switches damage may be done by starting up too quickly, or by leaving current on the resistance for too long a time.—M. M.

TRADE NOTICES AND NOVELTIES.

Steam Accessories.

We are indebted to Messrs. Holden and Brooke, Limited, Sirius Works, West Gorton, Manchester, for a quantity of their recently-issued trade literature, which comprises a large number of illustrated lists of uniform size and excellence, each forming a part of the firm's Catalogue C, first edition. Among the specialities dealt with in these lists may be mentioned injectors for boiler feeding by means of live steam; exhaust steam injectors for boiler feeding, heating, raising and circulating water, heating buildings, etc.; lifters, ejectors, or jet pumps for lifting or forcing to a height, conveying long distances on the level, mixing or extracting liquids, semi-liquids, or gases; feed-water heaters for use with exhaust or with high-pressure steam; ejector heaters for heating, boiling, and circulating liquids by the direct application of live or exhaust steam; valves and fittings, feed regulators, water gauges, relief valves, exhaust heads, and steam traps, etc.

V.I.R. Flexible, etc.

From Messrs. Johnson and Phillips's Electric Cable Works, Old Charlton, Kent, we have received a copy of their price-list of new standard V.I.R. flexible, etc. The specification of this flexible is as follows: "Each conductor composed of high-conductivity tinned copper wires, ·0076in. diameter (No. 36 S.W.G.), insulated with one coat of pure Para rubber and two coats of vulcanised indiarubber. Insulation resistance 600 megohms per mile at 60deg. F. after 24 hours' immersion in water, and one minute's electrification. Test voltage, 1,000 volts alternating for 15 minutes." The list also deals with electrolier and fittings wire, 2,500 megohms grade, and extra high-grade pure rubber flexibles.

Mono- and Poly- Phase Motors.

Pamphlet No. 1,101 issued by the Union Electric Company, Limited, 151, Queen Victoria-street, London, E.C., deals with "Union" mono- and poly- phase motors ranging in output from 1-12 b.h.p. to 30 b.h.p., and suitable for every-day industrial purposes. The machines are carried out both with and without slip-rings, and the rotors are constructed to carry a considerable overload without falling out of step.

Motor-Driven Hack Saw.

An illustrated price-list recently issued by Messrs. Edward G. Herbert, Limited, Cornbrook Park Works, Manchester, deals with a motor-driven hack saw of their well-known quick-cutting eccentric type. It is claimed that these machines cut much quicker than the ordinary hack saw, due to the eccentric motion. The cutting speed is further increased by running the machine at double the ordinary speed and using a rotary pump to supply the blade with water. The machine illustrated in the list before us is capable of cutting bars and girders up to 12in. by 8in., and the motor, which is fixed in an inverted position under the bed, is of the fully-enclosed constant-speed type, wound for 600 revolutions per minute, and gives ½ h.p. at that speed. It is driven direct from the motor by chain gearing having a ratio of 6 to 1. As all the necessary switches are attached to it, the machine is entirely self-contained and portable. This machine is not only suitable for engineering works where electric driving is in force, but also for iron merchants and others who have no shafting, and structural engineers should find it a useful tool to have working on the job.

Howard Conduit.

Some useful information relating to the asphalt solid system of the Howard Conduit Company, Limited, Trafford Park, Manchester, is contained in a booklet recently issued by this firm. Numerous illustrations and engineers' opinions of the system are included.

Miscellaneous Apparatus.

A few of the many specialities manufactured by Messrs. Offord, Wilson, and Barfield, 98, Woodcock-street, Birmingham, are illustrated and described in this firm's new price-list. Mention may be made of the following: automatic time switches, automatic switches, photographic arc lamps, resistances, meters (ampere and volt), motor starters, field regulators, theatre and optical arc lamps, stage accessories, cast-iron plugs and sockets, switch service fuses, and main switches.

Brush Holders, etc.

Price-list G, issued by Messrs. D. Santoni and Co., Limited, 28, Ely-place, Holborn-circus, London, E.C., deals with brush holders, brushes, carbons, and a safety suspension lock for arc lamps.

Electrical Sheet Iron, etc.

Armature discs of various types, laminated pole-tips and pole-shoes, stator and rotor stampings, transformer stampings, and Swedish iron bars—rounds, squares, and flats—are illustrated on a collection of sheets issued in pamphlet form by Messrs. Turner Bros., 134, Upper Thames-street, London, E.C. For the most part the illustrations take the form of line drawings, the dimensions when given being clearly marked in.

Insulating Material.

One great trouble in the design of electrical apparatus lies in the fact that practically all our insulating materials are subject to faults either in their electrical or mechanical properties. In consequence of this, a large number of firms have experimented on various compositions in order to get as near perfection as possible, and to obtain an insulating material which shall possess good mechanical properties without sacrificing its insulating character. Amongst these manufacturers we would call attention to Psychiloid, Limited, which company has its works in Bridge-street and Love-street, Sheffield. The material produced by this company is termed Psychiloid, and it has been subjected to severe mechanical and electrical tests by independent authorities. As an example of this, we are informed that a

Digitized by Google

square inch of Psychiloid sheet ¼in. thick will stand a pressure of 25 tons without crushing. The material is insoluble in all the ordinary solvents, and is quite unaffected by boiling water. In the same way it resists animal, vegetable, and mineral oils. Messrs. Ferranti subjected some samples of this material to electrical stress, and found that a grey sample 3-16in. thick successfully withstood 20,000 volts alternating between opposite fuses. The surface leakage was also exceedingly small. The firm are specialising in the manufacture of formers and bobbins for dynamo field coils and in the various other accessories, such as commutator rings, switch handles, etc., for which the combination of mechanical strength and high electrical resistance in the insulating material are so much required.

LEGAL INTELLIGENCE.

GEORGE F. MILNES AND CO.

Mr. Justice Bucknill, at the Vacation Court on Wednesday, had before him a petition presented by John Lysaght, Limited, for the winding up of George F. Milnes and Co., Limited.

Mr. Hamilton, K.C., for the petitioners, said it was a creditor's petition, asking for a compulsory order for winding-up, or, in the alternative, for a supervision order and the appointment of Mr. Mackenzie Sharp, a chartered accountant, in place of the present voluntary liquidator. The company was established for the purpose of manufacturing electric tramcars, and the plaintiff company was the holder for value of bills of exchange amounting to £246, which had been dishonoured. In addition, there were claims for goods supplied for £85.

Mr. Bramwell Davis, K.C., for the company, said the assets were in the hands of the voluntary liquidator, and there was, therefore, no urgency.

Mr. Hamilton said there was going to be a sale, and that proposal constituted urgency.

Mr. Davis said they were not going to sell without the sanction of the Court, and he would undertake, if such sanction were asked for, to give due notice to the petitioner.

On this undertaking his **Lordship** directed the petition to stand over to the first petition day in next sittings.

BRITISH ELECTRIC STREET TRAMWAYS.

Mr. Justice Bucknill on Wednesday had before him the matter of Bond *v.* the British Electric Street Tramways, Limited, and another before him on a motion for an injunction to restrain the company dealing with its assets.

Mr. Bramwell Davis, K.C., for the plaintiff, said his lordship would not be troubled with the motion on that day, owing to the continuance of the undertaking. However, the urgency of the matter was that one of the companies concerned in the action would be actually dissolved next month.

His Lordship directed the motion to stand over for a week, further affidavits to be filed by Wednesday.

ANGLO-AMERICAN ALUMINIUM COMPANY.

Before Mr. Justice Bucknill in the Vacation Court on Wednesday the case of Hamilton *v* the Anglo-American Aluminium Company, Limited, was again heard on a motion for the discharge of Mr. C. P. Nelson, who was appointed receiver in this debenture holders' action by Mr. Justice Walton a fortnight ago.

His Lordship said the suggestion was that Mr. Nelson's appointment was a snatched appointment. He regretted that this was so. After reading all the papers in evidence, his Lordship came to the conclusion that there was no good reason adduced for the removal of Mr. Nelson. He was not satisfied that the present position of the company was brought about by Mr. Nelson's management.

Accordingly the motion was dismissed.

PUBLIC UNDERTAKINGS SYNDICATE.

A petition for a compulsory winding-up order against the Public Undertakings Syndicate, Limited, was heard by his Honour Judge Parry at the Manchester County Court last week.

Mr. Mansfield, representing the petitioning creditors, Messrs. Aubrey Ward, Thomas, and John Wilding Donaldson, consulting engineers, Victoria-street, Manchester, said the syndicate was registered in March, 1901, with a nominal capital of £10,000, for the carrying out of public works and conveniences in the United Kingdom, such as electric tramways, piers, harbours, and docks. The petitioners were engaged by the syndicate as electrical engineers in connection with the promotion of a Bill in Parliament for the incorporation of the West Cumberland Electric Tramways Company. The Royal assent was given in August, 1901. The petitioners were unable to obtain payment of their charges, amounting to £2,360. 17s. 2d., and commenced an action to recover them, but the syndicate agreed to the matter going before the official referee for the amount due to be fixed. Nearly a month was occupied by those proceedings, which resulted in a direction that judgment for £2,049 should be signed, only about £30 being struck out of the claim. A few days prior to the signing of the judgment, the syndicate gave notice of an extraordinary meeting to consider a proposal to go into voluntary liquidation. This was eventually agreed to by the shareholders. It was represented that there no trade creditors, and that the assets of the syndicate were 3s. 1d. in one bank, 4s. 8d. in another, and £20 unpaid capital.

In opposing the motion, **Mr. McConkey** said the syndicate's only hope of getting more money lay in the floating of the statutory company, for which parliamentary powers had been secured, and their point was that the petitioner's claim was really against that company.

His Honour said he did not think a case had been established by Mr. Mansfield. The petition would be dismissed with costs as from Aug. 4.

THEFT OF ELECTRICITY.

At South Shields Petty Sessions a labourer named John Pratt was charged with having stolen electricity, the property of the Northern Countities Electricity Supply Company, Hebburn.

Mr. A. Robson, who appeared for the company, explained that the charge was rather a novel one. The defendant's house was wired by the company, the installation including a penny-in-the-slot or prepayment meter. The electricity had been stolen by the current being diverted, making a separate circuit so that it did not pass through the meter. By this means the consumer was enabled to have the use of the light without having the quantity registered on the meter.

Walter Bates, mains foreman for the electricity company, said that on Aug. 5 he visited the defendant's house and examined the meter. He found that it registered 16 hours and there was 3d. in the till. On Aug. 26 he again examined the meter. It registered five hours and there was 1d. in the till. Witness became suspicious and on putting off the switch he found that the light in the house still burned. He thereupon made an examination and discovered that a piece of wire had been inserted diverting the current so that it did not pass through the meter, the object being to defraud the company.

Defendant pleaded guilty and was fined 40s. and costs.

THE SPEED OF ELECTRIC TRAMCARS.

Mr. Moffat Ford, managing director of the Motorcar Company, Limited, has applied to Mr. Lane at the West London Police Court for directions in the matter of the summonses he had issued against several drivers of the London United Tramway Company for exceeding their legal speed limit. Mr. Ford reminded the magistrate that the case had been before the Court on two previous occasions and had been adjourned, the first time upon a point of law, which had subsequently been waived, and the second time upon the magistrate's own suggestion that an independent referee should be appointed to conduct an official test of speed before all parties concerned, the defence being that it was impossible for the defendants' tramcars to exceed a speed of 13 miles an hour. Mr. Ford stated that although a month had elapsed since the last adjournment, and although a referee had been agreed upon between the parties, yet he could not obtain an appointment for the test from the defendants, who did not seem at all anxious to hurry the matter forward. The magistrate remarked that Mr. Rose, before whom the previous hearings had been, would return very shortly to the Court, and he had no doubt that before that time the defendants would come to some arrangement with Mr. Ford for the official test to take place in ample time for the case to be continued immediately Mr. Rose recommenced his sittings at the Court.

COMPANIES' MEETINGS AND REPORTS.

CENTRAL LONDON RAILWAY.

An extraordinary meeting of proprietors of this railway was held on Friday at the Company's offices in High Holborn, under the presidency of Sir Henry Oakley.

The meeting was called to consider resolutions providing for the conversion and consolidation into ordinary stock of the Company of the 15,000 shares of £10 each created and issued under their Act of 1901, and for authorising the directors to raise the additional £150,000 of capital authorised by the Company's Act of 1902 by the creation and issue of ordinary stock instead of shares, as mentioned in the resolution passed at the extraordinary meeting held on Feb. 4 last.

The **Chairman** said their ordinary capital was £2,850,000, in shares, and they had powers under two separate Acts of 1901 and 1902 to raise £150,000 share capital by each of those Acts. In the ordinary course these Bills were submitted to the shareholders, and the Board were authorised to create the capital and to dispose of it from time to time, according to the requirements of the Company, on the best terms they could obtain. This authority was given at two meetings—in February, 1902, and in February of this year. At their meeting in February he explained that the capital was in debt to the amount of £103,000, and that in the course of this half-year it would be necessary for the Company to raise some of it in order to carry on their business and to pay their dividend. The capital was now all created in shares. The directors had sold £150,000, but as the whole of the ordinary share capital was now stock, and no longer shares, it was necessary that this £150,000 should be placed in the same category. The resolutions to be submitted were as follows: "That pursuant to the powers conferred upon the Company by the Companies' Clauses Consolidation Act, 1845, the 15,000 shares of £10 each created and issued under the Company's Act of 1901, all fully paid up, be converted or consolidated into ordinary stock, to be divided amongst the shareholders according to their respective interests therein. That the directors be and they are hereby authorised to raise £150,000 additional capital authorised by the Company's Act of 1902 by the creation and issue of ordinary stock instead of by the creation and issue of new shares, as provided

Digitized by Google

in the resolution passed at the extraordinary meeting held on Feb. 4, 1903."

The resolutions were unanimously adopted.

CHLORIDE ELECTRICAL STORAGE.

The annual general meeting of the shareholders in this Company was held at the offices, Clifton Junction, near Manchester, on 16th inst., Mr. Bannister presiding.

The **Chairman**, in moving the adoption of the report (*vide* last issue), considered that the balance-sheet was clear evidence of the prosperity of the Company, and stated that the Company had not alone increased their business during the year, but had also increased their profits and their favour among the public. The balance-sheet presented a very healthy appearance.

The **Vice-Chairman** (Dr. Hopkinson), in seconding the motion, took occasion to refer to the interest which the Electric Storage Battery Company of Philadelphia had, during the year under consideration, acquired in the Company. He had little doubt it would be greatly to their advantage in the future. It was an example of American co-operation with England which could not but produce the greatest advantage.

Mr. Herbert Lloyd, a director and president of the Electric Storage Battery Company of Philadelphia, pointed out that the American Company was managed by Englishmen. The Electric Storage Battery Company in America did business last year to the extent of about £800,000, and made a profit of nearly £250,000, and he expected the turnover of the present year would come to approximately £1,000,000. He hoped to see this Company, by the adoption of their methods, largely increase their turnover, especially in the line of central-station work.

The motion was carried unanimously.

Sir Bache Cunard having been appointed a director, a dividend at the rate of 6 per cent., less income tax, on the preference shares, and of 8 per cent., free of income tax, on the ordinary shares was declared, and the meeting separated.

YORKSHIRE ELECTRIC POWER.

The first ordinary general meeting of this Company was held at the Hotel Metropole, Leeds, Mr. Arthur G. Lupton presiding.

It was announced that the contractors are in possession of the land for the first power station at Thornhill, and work on the buildings was being rapidly pushed on. Tenders had been accepted for a 6,000-h.p. generating plant, together with the necessary equipment for transmission and distribution. The generators are to be of the latest type of Curtis steam-turbines, and are to be built at the British Thomson-Houston works at Rugby. The Company are now in a position to negotiate for the supply of power within a radius of 10 miles of the first station, and power will be available in about 10 months' time.

Mr. W. B. Woodhouse, engineer in charge of the generating stations at Newcastle-on-Tyne Electric Supply Company, has been appointed resident engineer, and Mr. J. J. H. Stansfield secretary, both of whom will take up their duties early in October. The offices of the Company are at Central Bank-chambers, Infirmary-street, Leeds.

The following gentlemen were elected directors: Messrs. Arthur G. Lupton, Robert Armitage, Arthur Currer Briggs, J. O. Callender, E. A. Carolan, H. A. Earle, A. C. Embleton, W. P. J. Fawcus, and Robert Hudson, and Sir Richard Mottram.

ELECTRICITY SUPPLY COMPANY FOR SPAIN.

The report of the directors for 1902 states that the rent of 1,100,000 pesetas receivable under the lease of the Company's undertaking in Madrid to the Compania General Madrilena de Electricidad has been regularly paid. The revenue has produced £31,936, to which has to be added interest on deposits and transfer fees, making a total of £32,493. After deducting debenture interest, interest on loans, and all charges, amounting to £17,093, and after putting aside £1,852 for redemption of debentures there remains a surplus of £13,548, which, with the amount brought forward from last year, leaves a balance of £22,311. After providing for the 5 per cent. dividend on the preference shares for the year 1901, amounting to £8,665, paid on Feb. 27 last, the directors propose to write off £13,145, thus entirely extinguishing the suspense account, and to carry forward £500. In view of the arrangement referrred to below, the directors do not recommend any dividend on the preference shares for this year, it being thought advisable to accumulate a reserve against any unforeseen contingency, such as a further drop in the exchange. The shareholders may be congratulated on the greatly improved position of the Company, which has enabled the directors to wipe out in two years, instead of in five, as originally contemplated, the whole of the deficiency of £19,045 on capital account, as ascertained at the time of leasing the Company's undertaking. In addition to this, the sum of £1,852 has been set aside for the redemption of debentures. The first mortgage debentures for £75,000, and the £41,300 "B" debentures, fell due for repayment on July 1, 1903. The state of the money market during the early part of the year rendered it inadvisable to negotiate with the holders of these two series of bonds for their conversion into 5 per cent. consolidated debentures. The directors, therefore, decided that it would be better to arrange for the extension of the first and "B" mortgage debentures for a further period of eight years, during which time the whole amount would be paid off by annual drawings. A bonus of 3 per cent. was offered to the holders agreeing to renew their bonds, and an arrangement was made with a responsible guarantor to take up and extend the holdings of those who refused. The scheme has been successfully carried through, and signed agreements have been executed in respect of the whole of the first and "B" mortgage debentures. As the Company will be able practically to meet out of its income the whole of the charge for the interest and redemption of its debenture debt, the Company is in a very much stronger position than it has ever enjoyed to date. It is evident that as soon as the two series of debentures have been paid off the position of the shareholders will be immensely improved, as the sum available for dividend each year will be largely increased.

DICK-KERR.

The report of the directors for the year ended June 30 last states that profits amount to £110,449. Out of this had to be paid debenture and loan interest and trustees' fees, and there has been reserved the sum required to provide for the premium payable on the redemption of the present debenture stock. These items absorb £8,472, leaving a balance of £101,977, to which must be added the profits brought forward from last year—namely, £30,868—making a total of £132,845. It is proposed to carry £16,735 to reserve fund as required by clause 24 of the trust deed securing the debentures, and to place further sum to this reserve, £23,265; to pay a dividend of 10 per cent. and bonus of 5 per cent. on the ordinary shares, and to carry forward £35,545. The Company has completed during the year under review many important contracts at home and abroad, and are still busily engaged in the execution of further large contracts. Since the last report was issued the acquisition of the English Electric Manufacturing Company, Limited's, works in Preston has been completed, and these are fully employed in the production of machinery. Out of the dividends declared by the English Electric Manufacturing Company, Limited, on March 31, 1903, the sum of £30,000 has been carried direct to the credit of the reserve fund set aside under the provisions of the trust deed securing the debentures.

MERSEY RAILWAY.

The report of the directors for the half-year ended June 30 last states that receipts from all sources have been £32,278, as compared with £31,781 for the corresponding period of 1902. Working expenses, exclusive of the exceptional charges for pumping, ventilation, and lifts, have been £27,375, equal to 84·41 per cent., as against £23,066, equal to 72·58 per cent, for the corresponding six months. These exceptional charges for pumping, ventilation, and hydraulic lifts for the past six months amounted to £4,686, equal to 14·52 per cent., as compared with £6,389, or at the rate of 20·10 per cent., in 1902. The number of passengers conveyed has been 3,201,644, as against 3,104,294 for the corresponding period of 1902, exclusive of season-ticket holders. The net revenue account shows a debit balance of £3,728. This, added to the previous debit of £4,924, makes a total of £8,652. The working of the railway by steam locomotives ceased on May 4, 1903, and since that date it has been worked by electric traction. There has not yet been sufficient experience to enable a reliable estimate to be formed with regard to the probable receipts and expenditure of the new method of working, but the difficulties of ventilation have been overcome, and the suitability and capacity of electric traction for dealing with the traffic have been fully demonstrated.

NEW COMPANIES REGISTERED.

M. I. P. Electrical Syndicate, Limited.—Capital, £10,000. Object: to adopt an agreement with Sir Anthony Crompton-Thornhill, Bart., for the acquisition of the benefit of certain existing inventions relating to the production of electricity, etc.

Penarth Tramway Syndicate, Limited.—Capital, £3,000. Object: to obtain a provisional order or Act of Parliament for the construction of tramways or light railways between Cardiff and Penarth, etc. Registered office: 124, Bute-street, Bardiff.

Manufacturing Electric Company, Limited.—Capital, £6,000. Object: to carry on the business of manufacturers of and dealers in wires, cables, and lines of all kinds, electricians, electrical, mechanical engineers, etc. Registered office: 34 and 35, High Holborn, W.C.

Kolar Mines Power Station, Limited.—Capital, £30,000. Objects: to erect, establish, instal, and equip, near the Kolar goldfield, India, or elsewhere, a central electric power station or stations, and to carry on the business of an electric power supply company. The number of directors is to be five, one being appointed by each of the following companies—viz.: the Mysore Gold Mining Company, Limited, the Champion Reef Gold Mining Company of India, Limited, the Ooregum Gold Mining Company of India, Limited, the Nundydroog Company, Limited, and the Balaghât Gold Mining Company, Limited.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Manchester.—The Corporation require tenders for a 32-ton electric lift. Tenders by Oct. 5.

Macao.—The Colonial Office at Lisbon invite tenders for the electric lighting of Macao. Tenders by Oct. 21.

Lisbon.—The Public Works Department require tenders for the public electric lighting of Macao. Tenders by Oct. 21.

Paris.—The Posts and Telegraph Department, 103 Rue de Grenelle, require tenders for two lots of electric wire. Tenders by Oct. 1.

Digitized by Google

Bucharest.—The Government Railways require tenders for the installation of electric lighting and plant for their workshops. Tenders by Oct. 10.

Pietermaritzburg.—Tenders are invited by the Natal Government Railways Electrical Department for additional plant for the power station at Pietermaritzburg.

Dover.—Tenders are invited for an electrically swung bridge at the harbour. Tenders close in about 10 days. Particulars may be obtained from the Harbour Board.

Paris.—The Post and Telegraph Department, 103, rue de Grenelle, require tenders for 600,000 ko. copper wire and 80,000 copper junction boxes, lot of telegraph material, by Sept. 28.

Swansea.—The Corporation invite tenders for the supply, delivery, fixing, and connecting of ducts, troughs, cables, wires, street boxes, etc. Tenders by Oct. 31. See advertisement.

Transvaal Colony.—The Chairman of the Tender Board, Pretoria, requires tenders for installing and working the electric lighting of Potchefstrom for about five years. Tenders by Oct. 30.

Dublin.—The Port and Docks Board invite tenders for the supply of a 100-ton electric crane. Specification can be obtained at the office of the engineer to the Board, Mr. John P. Griffith, M.I.C.E., Eastwall, Dublin. Tenders by Oct. 5.

Blackpool.—The Corporation invite tenders for the supply of arc lamp carbons for the ensuing year. Specification, etc., may be obtained on application to Mr. Charles Furness, borough electrical and tramway engineer, Electricity Works, Blackpool.

Manchester.—The Paving, Sewering, and Highways Committee invite tenders for laying underground telephone pipes, with other appurtenant works. Specification, etc., may be obtained at the City Surveyor's Office, Town Hall. Tenders to the Chairman by Oct. 8.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

East Barnet.—The Urban District Council will receive proposals for carrying out the provisions of their electric lighting order within the Council's district. Further particulars upon application to Mr. Henry York, the Council's surveyor, Council Offices, Station-road, New Barnet. See advertisement.

Rochdale.—The Guardians invite tenders for certain new underground cables and switchboard alterations and additions required at the workhouse, Dearnley. Specifications, etc., may be obtained from Messrs. Shepherd and Watney, Greek-street-chambers, Leeds. Tenders by 26th inst.

Russia.—The Russian Minister of the Interior has sanctioned a plan for the reconstruction of three lines of municipal tramways—namely, those in Newsky, Sadovaïa, and Wassiliostrow districts. Each car is to provide for two classes of travellers, and will accommodate 52 persons.

New Barnet.—The East Barnet Valley Urban District Council invite proposals for carrying out the provisions of their electric lighting order within the Council's district. Further particulars can be obtained from Mr. Henry York, surveyor, Council Offices, Station-road, New Barnet.

Utrecht.—The Town Council will receive tenders for supply and erection of a central electric establishment for lighting, power supply, and working tramways. Contract, conditions, etc., to be obtained at the "Gemeente Secretaire" of Utrecht, on payment of 5fl. (8s. 4d.). Tenders by Oct. 1.

Brighton.—The Town Council invite tenders for the (1) supply of steel girder tramrails, fishplates, etc.; (2) tramcars; (3) points and crossings and other fittings. Specifications, etc., may be obtained from Mr. Francis J. Tillstone, town clerk, Town Hall, Brighton Tenders by 10.30 a.m. on Oct. 5.

London, W.—The Commissioners of H.M. Works and Public Buildings invite tenders for alterations and additions to Ealing telephone exchange. Drawings, etc., may be seen on application to Mr. J. Wager. Tenders to the Secretary, H.M. Office of Works, etc., Storey's-gate, London, S.W., before 12 noon on 29th inst.

Great Western Railway.—The Directors invite tenders for about 90 tons of steel bridge girders and other steel and iron work of British manufacture. Specifications, etc., may be obtained at the office of the Engineer between the hours of 10 a.m. and 4 p.m. Tenders by Oct. 6 to Mr. G. K. Mills, Paddington Station, London.

Manchester.—The Electricity Committee invite tenders for the supply and delivery as and when required of 1,200 electricity meters. Specifications, etc, may be obtained from Mr. F. E. Hughes, secretary, Electricity Department, Town Hall. Tenders to the Chairman of the Electricity Committee, Town Hall, by Oct. 1.

Johannesburg.—The Municipality require tenders for gas generating plant or for steam generating plant and for gas motors or steam motors, with electric generators and accessories. Particulars may be obtained from the Town Clerk, Johannesburg, or from Messrs. Mordey and Dawbarn, 82, Victoria-street. Tenders by Oct. 19.

Launceston (Tasmania).—The Mayor and Aldermen invite tenders for the supply of 500 or more electric meters. Particulars may be obtained on application to Mr. William Corin, city electrical engineer, Launceston, Tasmania, or to Messrs. John Terry and Co., 7, Great Winchester-street, London, E.C. Tenders by Sept. 28.

Bootle.—The Corporation invite tenders for the extension of the boiler-house at the electric light station, Pine-grove. Plans, etc., may be seen at the office of Mr. B. J. Wolfenden, A.M.I.C.E., borough engineer, on and after the 18th inst. Tenders to the Chairman of the Electric Power and Lighting Committee by the 30th inst.

Cienfuegos (Cuba).—The Municipal Authorities require tenders for the installation and working of electric lighting. They will pay an annual subsidy of 24,000 piastres for 150 arc lamps of 1,500 c.p. each and 350 incandescent lamps of 50 to 100 c.p. each for street lighting, and 16 to 25 lamps in public buildings. Tenders by 1 p.m. on Sept. 28.

Ashton-under-Lyne.—The Market and Lighting Committee invite tenders for the supply of arc lamp carbons and globes during ensuing year. Specification, etc., may be obtained at the office of Mr. Neville Appelbee, Electricity Works. Tenders to the Chairman of the Market and Lighting Committee at the Town Hall, Ashton-under-Lyne, by 29th inst.

London, N.—The Shoreditch Borough Council invite tenders for pulling down and rebuilding 3, Hoxton-square, N., to be used as stores for the electricity department. Specification, etc., may be inspected and bills of quantities obtained at the office of Mr. J. Rush Dixon, A.M.I.C.E. Tenders to the Town Clerk's Office, Town Hall, Old-street, E.C., by Oct. 6.

Swansea.—The Corporation invite tenders for (1) laying of permanent way, including rail bonding; (2) rails and fishplates; (3) steel tiebars, bolts, and nuts; (4) points, crossings, cast-steel curved rails, and special work; (A) overhead electrical equipment; (B) ducts, troughs, cables, wires, section and other boxes, etc. Tenders by Oct. 31. See advertisement.

Halifax.—The Tramways and Electricity Committee invite tenders for the supply and fixing of heating apparatus required at the several offices and workshops at the Skircoat depôt. Specifications, etc., may be seen and forms of tender obtained on application to Mr. James Lord, C.E., borough engineer, Town Hall, Halifax. Tenders to Mr. Keighley Walton, town clerk, by 30th inst.

Dundee.—The Town Council invite tenders for the relaying of distribution mains in the central area of the town. Specification, etc., may be had on application to Mr. H. Richardson, A.M.I.E.E., city electrical and tramways engineer, Dudhope-crescent-road, Dundee. Tenders to Mr. W. H. Blyth Martin, clerk to the Council, City Chambers, Dundee, not later than Sept. 30.

London, S.E.—The London County Council invite tenders for the supply, delivery, and erection in the electricity generating station to be established by the Council at Greenwich of four 5,000-h.p. vertical-horizontal steam-engines, each suitable for driving a three-phase generator. Particulars, etc., may be obtained at the County Hall, Spring-gardens, S.W. Tenders by 10 a.m. on Oct. 6.

London, W.C.—The Directors of the Savoy Hotel, London, invite tenders for the purchase of two Lancashire and two Cornish boilers, working pressure 150lb.; at present in use in connection with the electric lighting and heating of the Savoy Hotel. Further particulars can be obtained at the offices of the engineers, Kincaid, Waller, Manville, and Dawson, 29, Great George-street, Westminster.

Bradford.—The Corporation invite tenders for the construction of about 13 miles of light railways and tramways in connection with the Angram storage reservoir works. Plans may be seen and specifications, etc., obtained at the office of Mr. James Watson, M.I.C.E., waterworks engineer, Town Hall, Bradford. Tenders to Mr. Frederick Stevens, town clerk, Town Hall, Bradford, by 10 a.m. on Oct. 1.

Salford.—The Tramways Committee invite tenders for the supply and delivery of planing, turning, boring, drilling, grinding, milling, screwing, punching, and shearing, and wood-working machinery, power hammer, shafting motors, etc., at their central car depôt, Frederick-road, Pendleton. Specifications, etc., can be obtained from the General Manager, 32, Blackfriars-street, Salford. Tenders by Oct. 19.

Whitehaven.—Tenders are required for the joiners' work, slating, plastering, plumbing glazing, painting, electric lighting and bells for six houses at Wellington-row, Whitehaven. Plans and specifications can be seen on application to Messrs. A. and T. H. Anderson, builders, New-road, Whitehaven, or at the office of Mr. J. S. Moffat, M.S.A., 53, Church-street, Whitehaven, where tenders are to be delivered by 29th inst.

Oldham.—The Electricity Committee invite tenders for arc and incandescent lighting and power circuits in Greenhill station, comprised in specification No. 9. Copies of the specification, etc., can be obtained from the Resident Engineer. Specifications can be seen at the offices of Messrs. Kennedy and Jenkin, 17, Victoria-street, Westminster, S.W. Tenders to be sent to the resident engineer, Mr. S. Wilmott Newington, by Oct. 6.

Birkenhead.—The Education Committee invite tenders for the wiring of the Laird School of Art in Park-road for electric light, and for extensions to the electric light wiring of the Holt School of Science and Art. Plans can be seen and specifications, etc., obtained on application to the borough electrical engineer, Mr. William Bates, A.M.I.C.E., Electrical Engineer's Office, Craven-street. Tenders to reach Mr. Robert T. Jones, secretary, Education Department, Town Hall, by 9 a.m. on Oct. 9.

London, E.C.—Tenders will be received until noon on Sept. 28 (a for the supply of Swedish, Norwegian, or Finland red fir telegraph poles, to be delivered in London, at Northumberland Dock (River Tyne), West Hartlepool, Hull, or Grimsby, at Leven, Fifeshire, and at Swansea, Cardiff, or Newport; and (b) for creosoting the poles with 10lb. or 12lb. of creosote to the cubic foot, as may be directed. The poles to be felled during the winter of 1903-4, and to be delivered during the following summer at the port at which the creosoting is to be performed. Butt sections, 2in. thick, stamped with the shipper's mark, from not less than three poles, to show the quality of timber offered, must precede or accompany the tender of any person who has not already supplied the Postmaster-General with poles. Forms of tender may be obtained from Mr. S. C. Hoolley, controller of stores, Stores Department, 17-19, Bedford-street, London, W.C.

RESULTS OF TENDERS.

Hammersmith.—The following tenders have been accepted: 38 arc lamps and accessories, Oliver and Co., £360. 3s.; W. Brown and Sons, £70 for painting at electricity station.

Portugal.—A contract has been entered into by the Municipality of Faro with Ferdinand Thudichum, of Aljustrel, for the public and private lighting of the town of Faro by electricity.

Preston.—The Corporation have accepted the tender of T. B. Garnett, Preston, at £11,272. 19s. 4d., for erection of a power station and car-sheds, Holmrook-road and Sussex-street East.

Nottingham.—The contract for the storage battery for the city asylum has been placed by the Corporation with the Electrical Power Storage Company, Limited, of 4, Great Winchester-street, London, E.C.

Edinburgh.—The Town Council have accepted the following tenders for the extension of M'Donald-road electric station: Builder's work, Colin M'Andrew, £16,829; engineer's work, Redpath, Brown, and Co., £6,591.

Liverpool.—The City Council have accepted the tender of the Wheeler Condenser and Engineering Company, Queen Victoria-street, E.C., at £11,975, for supply of condensing plant for the first section of the electric station in Lister-drive.

Bury.—The Electricity Committee have accepted the tender of Callender's Cable and Construction Company, Limited, for the supply and completion of the works embraced in electricity contract 11—tramway and lighting cables, feeders, etc.

London, W.—The St. James's and Pall Mall Electric Lighting Company, Limited, have placed the contract for the renewal of their storage battery with the Electrical Power Storage Company, Limited, of 4, Great Winchester-street, London, E.C.

Durban.—The Borough Council have accepted the tender of the Western Electric Company for exchange equipment for £7,640, and of the British Insulated and Helsby Cables, Limited, for underground cables for £5,241 for the proposed municipal telephones.

Fulham.—The following tenders are recommended for acceptance: Mr. Thomas Pearce for constructing a transformer chamber in Townmead-road, £455; British Electric Transformer Company, Limited, for the supply of four transformers (contract No. 26), for the sum of £292; Messrs. Windsor and Co. for the construction of sub-stations (contract A), for the sum of £520.

London.—The Bermondsey Borough Council have accepted A. E. White and Co.'s tenders for erection of buildings in connection with extensions to the dust destructor house, electric light station, boiler-house, etc., at the Council's works, as follows: Main estimate, £5,646; separate estimate for work to be completed in five weeks, £1,156; special estimate in connection with engineering section, and forming part of engineering contract, £1,561.

King's Heath.—The Urban District Council have received the following tenders for the construction of about three miles of electric tramway permanent way:

E. Taylor, Blackpool	£18,290	18	5
G. Law and Co., Kidderminster (disqualified)	15,946	4	8
R. W. Fitzmaurice and Co., Birmingham	29,262	2	3
Curnall, Lewis, and Martin, Birmingham	19,195	3	6
G. Freeman and Sons, Oldham	18,200	9	3
A. Faulkes, Loughborough	17,622	14	6
R. C. Brebner and Co., Edinburgh	20,229	5	5
R. W. Blackwell and Co., London (accepted)	16,892	11	7
J. White, jun., Birmingham	24,746	16	0
Macartney, McElroy, and Co., London	24,145	2	0
J. G. White and Co., London	17,594	11	5
Acme Wood Flooring Company, Limited, London	18,953	16	9
G. Trentham, Birmingham	22,108	11	9
W. Griffiths and Co., Limited, London	18,245	17	3
J. Branton, Hull	20,474	18	4

Hackney.—The following tenders were submitted at last night's meeting:

Electricity supply mains.

Western Electric Company*	£2,105	7	6
Henley's Telegraph Works	2,614	19	10
Callender Cable Company	2,890	8	1
St. Helens Cable Company	2,893	6	8
British Insulated and Helsby Cables, Limited	2,803	14	3
Siemens Bros. and Co.	2,124	2	4
Glover and Co.	2,940	12	1

Arc lamps and pillars.

Oliver and Co.	1,119	19	11
Oliver and Co.	1,111	10	11
Crompton and Co., Limited*	1,160	13	0
Crompton and Co., Limited	1,167	0	0
Johnson and Phillips	1,182	13	0
Johnson and Phillips	1,244	12	0
W. T. Allen and Co.	1,232	7	0
Gilbert Arc Lamp Company, Limited	1,243	1	6
Brockie-Pell Arc Lamp Company, Limited	1,285	14	6
General Electric Company, Limited	1,374	12	3
New Century Arc Light Company, Limited	1,510	0	6

For 500 electrolytic meters—Reason Manufacturing Company, 36s. 6d. and 60s. per meter, according to size.* For 500 motor meters—Ferranti Limited, 36s. and 117s. per meter, according to size.* Engine foundations—In consequence of the decease of Mr. B. E. Nightingale, whose tender had already been accepted by the Council for carrying out the construction of the engine foundations, it has been necessary to prepare the contract in the names of his successors, Messrs. A. C., W. H., A. E., F. A., and P. G. Nightingale.

* Recommended for acceptance.

Walsall.—The Corporation have placed the contract for the storage battery, Butts-road sub-station, with the Electrical Power Storage Company, Limited, of 4, Great Winchester-street, London, E.C.

Walsall.—The tender of Messrs. Crompton and Co., Limited, for supplying and erecting a duplicate booster, similar to that supplied to the Hospital-street sub-station, for £362, and the tender of the Electric Power Storage Company, Limited, for supplying and erecting a battery for the Butts-road sub-station, similar to the one supplied to the Hospital-street sub-station, for £1,062, have been accepted.

BUSINESS NOTES.

TRACTION.

Chatham.—The light railway company propose to double the line of tramways on Chatham Hill.

Brighouse.—The construction of the tramlines from Hove Edge to Brighouse has been commenced.

Perth.—A special meeting of the Town Council is to be called to consider the question of tramway extensions.

Cardiff.—The Tramways Committee are considering a suggestion for an extension of the Cathays tramway route.

Newcastle.—A further extension of tramways was opened for passenger traffic on Thursday—namely, the route to Benwell.

Eastbourne.—The Council have agreed to the erection of a shed for motor omnibuses and the charging of batteries of electric vehicles.

Penarth.—A syndicate has been formed with the object of promoting a scheme for a line of tramways between this place and Cardiff.

Bloemfontein (S.A.).—The Town Council have resolved to instruct their London consulting engineer to prepare a scheme of electric tramways for the town.

Anglo-Argentine Tramways.—A dividend on the preference shares of 2s. 6d. per share, being at the rate of 5 per cent. per annum, is announced, payable Oct 5.

Leamington.—The tramway reconstruction in the town is about to be entered upon by the British Electric Traction Company, who have submitted plans to the Town Council.

Exeter.—The City Council have decided to apply to the Board of Trade to nominate a referee to determine the value of the tramways in connection with their purchase by the Corporation.

Wishaw.—At the monthly meeting of the Town Council it was unanimously agreed to request the tramway company to cease running their cars on Sundays during the hours of church service.

Dovercourt.—The English Industrials Company propose to carry out a scheme for supplying the borough with electric light. The scheme also embraces a service of motor omnibuses and trams between Harwich and Dovercourt.

Leicester.—The first through line of the new electric tramways—from the London-road borough boundary to Belgrave—is nearing completion, and will shortly be opened for traffic. Progress is also being made with the other routes.

Paisley.—The negotiations for the purchase of the tramways by Mr. William Murphy have now been completed. It is understood that the price to be paid is about £15,000. The new electric system to be inaugurated will extend to Renfrew and Johnstone.

Swansea.—Plans and specifications for the construction of the light railways and the tramways authorised by the order and Act of 1902 have been approved by the Town Council, and will be laid before the Board of Trade. Tenders for the execution of the work are to be invited.

Scarborough.—The Corporation have generally approved the plans submitted by the tramways company, on the understanding that the details with regard to the position of the poles and the carrying out of alterations to the streets and similar matters are not included in such approval.

Ossett.—The General Purposes Committee of the Town Council have taken the necessary steps in connection with the proposed application for a provisional order authorising the Corporation to construct tramways within the borough. Mr. J. H. Rhodes, of Leeds, has been appointed engineer to the scheme.

Aberdeen.—At this week's meeting of the Town Council a letter was read from the secretary of the Aberdeen Suburban Tramways Company asking the approval of the Council of the scheme for the construction of the Donside section of the suburban tramways. The letter was remitted to the Tramways Committee.

Lisbon.—The *Diario do Governo* of Sept. 11 contains a notice to the effect that a project which has been presented by the Lisbon Railway Company (Companhia Carris de Ferro de Lisboa) for the construction of a new electric railway line in the city of Lisbon, is open for inspection in the office of the Inspector-General of Telegraphs and Electrical Works, Lisbon.

Soothill.—The Soothill Upper District Council and the Dewsbury Corporation have now arrived at an agreement in regard to the tramways question, and, subject to the veto of the Board of Trade, there is a probability of the network of tramways which intersect Dewsbury and district being completed as the result of the combined action of the local authorities of Dewsbury and Ossett and the two Soothills.

Hanley.—The delay in constructing the new tramways or light railways, for which the Potteries Electric Traction Company have obtained sanction, was commented upon at the last meeting of the Town Council, and a member expressed the opinion that when the company's time limit had expired the Council should themselves take

Digitized by Google

the matter in hand and do the work. The power could be supplied from their own generating station.

Llandudno.—Owing to lapse of time the concession held by a syndicate for a light railway between Llandudno and Colwyn Bay has become, or will soon become, void, and the Urban District Council have decided to appoint a committee to consider the question of light railways in the district. There is a proposal for a light railway between Llandudno and Liverpool, but no definite scheme has yet been placed before the Council, who, however, are favourable to such a scheme.

East Ham.—The Urban District Council have received a letter from the West Ham Town Council agreeing to a conference with a view to running powers being mutually granted in the working of the authorities' electric tramway systems. It is hoped that the proposed arrangement will be extended to Ilford, so as to provide for a through service of electric trams from Romford parish boundary to the boundary of the London County Council's area at Bow Bridge, and in the intersecting thoroughfares.

Blackpool.—Total receipts from the electric tramways—reckoning the New-road section from June 18 last year to Sept. 17 this year, and the other routes from April 1—are announced as follows: £30,649. 9s. 4d., at 1s. 6¼d. per mile, showing a decrease of £139. 17s. 4d. On the three routes there was an increase in the number of passengers of 279,969—the figures being 3,963,393 as against 4,243,362—while the mileage showed a decrease of 26,824—the figures being 430,905 in 1902 and 404,081 miles this year.

The Dry-Seat Problem.—A rainproof cover for tramcars, invented by Mr. J. A. de Macedo, the Portuguese consul in Leeds, is to be tested on the circular route in that city. The appliance covers the whole of the top of an ordinary electric car, and the inventor claims that it can be put up or taken down in a couple of minutes. The trolley pole is fixed on the roof, and by the removal of the trolley standard two more seats are secured. Altogether the cover provides for six more seats than the ordinary car.

Leeds.—A deputation representing the governing bodies of Rawdon, Yeadon, and Guiseley has waited upon the Corporation Tramways Committee with the suggestion that the Horsforth line, which has already secured parliamentary sanction and only needs the finishing touch of the tracklayer, should be extended through their respective areas by the broad turnpike road which runs from Leeds to Guiseley and on to Ilkley and Skipton. No immediate decision was arrived at, the matter being referred to a special sub-committee.

Woking.—It is stated that in all probability the Woking tramways scheme projected by the West Surrey Light Railway Company will have to be abandoned. The Woking Urban District Council required all the roads along which the proposed tramways would pass to be widened to the extent provided for under the Tramways Act of 1870. The company having carefully considered this, felt that, owing to the enormous expense which would be involved, they could not meet the requirement, and it is understood the scheme will be abandoned.

Bromley (Kent).—At the last meeting of the Urban District Council a letter was read from Edmundson's Electricity Corporation, Limited, asking the Council whether they would be prepared to consider a scheme for tramways in Bromley. They thought there was a demand for trams, which could not be postponed much longer. They were very largely interested in the Bromley Electricity Supply Company, and would like to promote a system in connection with that company. It was decided to acknowledge the receipt of the letter.

Burton.—Dissatisfaction has been expressed by both motormen and conductors employed on the Corporation tramways at the dismissal of a driver, for no other reason, as they allege, than that he was acting as secretary to a trade union, and was organising the men. A largely-attended meeting of tramway employés has been held, when resolutions were passed to the effect that the Burton branch of the Tramway Men's Union become affiliated to the Burton Trades' Council, and also that the question of the employé's reinstatement be made through that body.

Wolverhampton.—The decision of the Tramways Committee to purchase the 11 miles of tramway track laid on the Lorain surface-contact system for £22,000 under certain conditions, was confirmed by the Town Council at a special meeting on Monday. It was also decided that the remaining routes under the Council's control should be equipped with the same system in order, as it is said, "to keep the B.E.T. Company out of the town." The result, however, is not in accordance with the views of all the members of the committee, and five resignations have been made from the committee as a protest.

South Shields.—At a meeting of the Tramways Committee held to consider what steps should first be taken in relation to the proposed new system of tramways in the borough, it was decided to take into consideration the whole question of routes to be laid down "irrespective of the present routes in accordance with the plans and specifications in the Act." The committee have instructed the borough engineer to get out the necessary plans, etc., and to present his report to a future meeting of the committee, when it will be decided what system to adopt. After that it is the intention of the committee to seek for tenders for the laying down of the new system.

Additional Traffic Returns.—Anglo-Argentine, £1,928 increase; Barcelona Ensanche y Gracia, £185 increase; Barcelona, £98 decrease; Brisbane, £59 decrease (month of August, £11,736, increase £294); British Columbia Electric (month of March), gross earnings £10,352, net income £2,658; Buenos Ayres and Belgrano Electric, £252 increase (month of August, £13,431, increase £533); Calcutta, £383 increase; Cape Town (month of August), receipts £15,349, expenditure £8,696; Isle of Thanet Electric, £215 decrease; Mexico Electric (month of August), receipts £48,600; expenses, £27,900; Perth Electric, £134 increase; Port Elizabeth (month of August), receipts £3,875, expenditure £2,305.

Southend.—Owners and occupiers in Leigh-road have petitioned the Tramways Committee, suggesting that in any renewals or reconstruction of the tracks along Leigh-road wood blocks or other suitable material might be used. The engineer has been instructed to submit designs of new cars, and the chairman and engineer will visit Gravesend and Margate to view the cars in those towns. The borough surveyor has submitted plans showing a proposed extension of the car-shed, the provision of a workshop at the western end, the provision over part of the roof of a water-tank as a site for the proposed additional cooling tower, etc., at an estimated cost of £2,250, which plans the committee have adopted.

Lancaster.—While one of the Corporation electric tramcars was being driven down Bowerham-lane, the steepest hill in the town, about 11 o'clock at night, the trolley jumped, and the driver losing control the car went down the steep incline at a high rate. At a place called the Pointer there is a curve where the metals intersect, and the car, jumping the points, rushed on to the footpath, cutting up a number of thick flagstones for a distance of about 20 yards before it came to a standstill. Fortunately there were no passengers in the car, and the last tram going towards the park had just passed before the mishap occurred. Neither the driver nor the conductor was much injured. The former states that the hand brake refused to act.

Leith.—At the last meeting of the committee of the whole Town Council it was resolved to recommend the Council that, in the event of Leith tramways being acquired by the Corporation, their policy should be to have the entire system electrified, and not to allow the Edinburgh cable system to be extended to Leith. With a view to formulating a proposal with regard to through traffic to the lessees of the Edinburgh system, the provost was requested, along with the consulting engineer, to enquire into the system in operation in London and elsewhere by which the electric cars are fitted with an adjustable gripper, which can be used to carry them over the cable system. The town clerk was instructed to proceed in due course with the necessary provisional order for extensions of the Leith system.

Bradford Fatality.—In the case of a man aged 60 who was knocked down by an electric car in Bradford and killed, a coroner's jury have returned a verdict of accidental death, adding the rider that if the lifeguard had been in proper working order the deceased's life might have been saved. The Coroner said doubtless Mr. Bird (the representative of the Corporation) would report the opinion of the jury to the proper quarter, who would see if something could not be done to make lifeguards more effective. Mr. Bird said the guard was recommended by the Board of Trade, and it would require very strong evidence that the guard was ineffective before corporations or companies who used it could be held to be negligent. He would place the opinion of the jury and the remarks of the coroner before the Tramways Committee.

Streatham.—The London County Council have a scheme for extending the tramways from the present terminus at Streatham on to the county boundary at Norbury so as to link up with the Croydon Corporation electric tramways, which run out to Purley. The scheme, as it deserves, has the support of the Streatham inhabitants, as the joining up of the two systems, requiring the construction of under two miles of line, would provide a through journey by electric car from Purley to London—or *vice versa*—a distance of some 13 or 14 miles. Unfortunately, the Wandsworth Borough Council up to now have declined to bear any portion of the cost of the necessary street widenings, but at their last meeting the recommendations of the committee to continue this policy did not meet with approval, and were referred back. In their reconsideration of the question we hope the committee will show more public spirit, and not try to kill a scheme with which the local inhabitants have every sympathy.

Loughborough Generating Station.—A party of members of the Civil and Mechanical Engineers' Society paid a visit on Saturday to the generating station of the London County Council at Camberwell. The station occupies a site near Loughborough Junction and supplies current for working the electric tramways in South London. There are two engines, each of 2,500 h.p., one supplying the cars and the other used as a stand-by, and each capable of generating 1,500 kw. The visitors were met on their arrival by Mr. Rider, electrical engineer to the Council, and by assistants representing Mr. Alfred Baker, the Council's tramway manager, and Dr. Kennedy, the consulting engineer. The generating station is only a temporary one, built to meet the immediate requirements of the Council in operating the first portions of their tramway system by electricity. It supplies the three sub-stations at Brixton-road, Clapham Park-road, and the Elephant and Castle, which feed the Tooting lines. As soon as the permanent generating station at Greenwich is ready, the supply will be by means of high-tension three-phase alternating currents transformed at sub-stations for the working line.

Portsmouth.—Mr. W. R. Spaven, the general manager of the Corporation tramways, has furnished the committee with his first annual report on the working of the system up to March 31 last. In it he states that during the year the permanent way has been maintained in an efficient condition. The overhead line, which has been kept in a thorough manner, is examined once a month, and any weakness detected in the insulation is immediately remedied. Mr. Spaven states that during the last 12 months there has been no failure in the supply of current. The slight interruptions in traffic have been solely due to the line taps having given out. He had been informed by the resident engineer that any appreciable addition to the maximum number of cars on the line will necessitate an increase of plant at the power station. The Board of Trade units generated during the past year were 3·6 times the number generated during the previous year. The rolling-stock has been thoroughly attended to. In addition to carrying out all ordinary running repairs, a considerable amount of work was done towards converting four of the old horse cars into motorcars. The equipment of the cars is in very

Digitized by Google

good condition. The receipts, in spite of suffering so greatly from the effects of the inclement weather that was experienced last summer, might, on the whole, be taken as satisfactory, although the traffic was seriously impeded by the reconstruction of Fratton Bridge. The total number of passengers carried during the year was 16,355,692, or almost double that of the corresponding 12 months before. The receipts showed an increase of over £33,000. The profits for the year were £13,046. 18s. 7d. There are 14½ miles of tramlines, and on these 80 cars run daily.

North-Eastern Railway.—The new departure of the North-Eastern Railway Company in adopting electric traction for passenger traffic on the north side of the Tyne, says a local contemporary, is being watched with keen interest by all the railway companies of the kingdom. It is the first effort on a large scale to grapple with the problem of tramway competition. In addition to the Tyneside lines, the North-Eastern Railway is equipping the Quayside branch line for the electrical operation of the goods traffic. The railway company has, for the present at any rate, decided to purchase its current from the Newcastle-on-Tyne Electric Supply Company, Limited, who have a power station at Wallsend, rather than construct a generating station of own use. An additional power station is being constructed at Carville, farther down the river, and it is at this station that most of the current will be generated. Five sub-stations are being erected at Pandon Dene, Cullercoats, Wallsend Benton, and Kenton. As regards the rolling-stock, the construction of which is being undertaken by the North-Eastern Railway at the works in York, it will comprise simply motor and trailer coaches of the open corridor type, heated and lighted by electricity. The cars will be on two four-wheeled trucks. A train will consist of two motor coaches, with a trailer coach between. The motorcars will each be equipped with two General Electric motors, each rated at 150 h.p. There will accommodation in such trains for 48 first-class and 138 third-class passengers, but this may, if necessary, be increased by the addition of another unit train. An average speed of 22 miles per hour will be maintained, including stops, which will make the run from Newcastle to Tynemouth about 23 minutes, but express trains running through without a stop will do the journey in 15 minutes.

Electric Tramways in America.—A recent United States census bulletin contains figures showing the status of street electric tramways and railways in America, some of which are here presented by way of comparison, as well as for their own great intrinsic value. The bulletin was prepared by Messrs. T. Commerford Martin and E. Dana Durand, special experts, and is issued by Mr. W. M. Steuart, the chief statistician for manufactures. The statistics contained therein cover all street and electric tramways in the United States that were in operation during any part of the year ending June 30, 1902. During this period there were in existence 817 operating electric railway companies and 170 leased companies, making a total of 987 companies. These companies owned or controlled 22,576·99 miles of single track. The par value of the capital stock and funded debt outstanding, as reported, amounted to 2,308 282,099dol. The average net capital liabilities per mile of single track owned for the companies for the companies reporting both factors were 96,287dol. The total income and expenses of the operating companies amounted to 250,504,627dol. and 219,907,650dol. respectively. The companies gave employment on the average during the year to 133,641 wage earners, and paid 80,770,449dol. in wages. There were 7,128 salaried officials and clerks employed, to whom 7,439,716dol. was paid in salaries. The roads carried 5,871,957,830 passengers of all kinds. From the items as reported, it appears that the single-track mileage increased from 8,123 miles in 1890 to 22,577 miles in 1902, or 178 per cent, and the number of fare passengers carried from 2,023,000,000 to 4,810,000,000, or 138 per cent. The term "street and electric railways," as used in the bulletin, includes all electric railways irrespective of their length or location, and all street railways irrespective of their motive power. The total for 1902 includes 12 miles of track duplicated in reports of different companies, and in the figures for electric roads for that year are included six miles operated by compressed air. Of the electric roads, 21,280 miles were single overhead trolley, 23 miles double overhead trolley, 266 miles conduit trolley, 343 miles third rail, and 2½ miles storage battery. The length of single track—22 589 miles—reported for 1902 consists of 16,652 miles of first main track, 5,030 miles of second main track, and 907 miles of sidings and turnouts. Of the total single-track mileage, 21,914 miles, or 97 per cent, were operated by electric power, and 416 miles, or 1 9 per cent., by other mechanical traction, while only 259 miles, or 1·1 per cent., were operated by animal power, as compared with 69 7 operated in the last way in 1890. There were 66,784 cars of all classes reported. The largest number (3,612) reported for a single company is given for the Boston Elevated Railway Company, of Boston, Mass., which includes cars operated on both surface and elevated tracks. There were 60,290 passenger cars and 6,494 cars used for express work or other purposes. Of the passenger cars, 32,656 were closed and 24,250 were open. There were 159 water-wheels, with horse-power of 49,153, used as the primary power in the generation of electric current. The average horse-power per water-wheel was 309. The direct-current electric generators numbered 2,861, with a total horse-power of 972,314, the number having a capacity of 1,000 h.p. and over being 209, with an output of 330,456 h.p. There were 441 alternators, with 231,924 h.p., those over 1,000 h.p. numbering 58, with a capacity of 133,571 h.p. In the main stations storage batteries having an aggregate horse-power of 19,744 were reported, while the storage batteries in sub-stations had a total of 33,249 h.p. Of the 5,871,957,830 passengers carried, 4,809,554,438, or 81·91 per cent., were fare passengers and 1,062,403,392, or 18 09 per cent., were transfer passengers. The transfer passengers included those using free transfers, also in a few cases those using transfers for which an additional payment was required. There were 4,455 transfer points reported. The average number of fare passengers per mile of single track operated in the United States was 208,600. In preparing this average, only the companies from which complete statistics were received are considered. Of the total car mileage—1,099,256,774—the passenger cars travelled 98·7 per cent., and the freight, mail, express, and other cars 1·3 per cent. The fare passengers per car mile for all companies averaged 4·43.

LIGHTING AND GENERAL.

Horsham.—The Council have obtained sanction to borrow £9,500 for electric light extensions.

Eastleigh and Bishopstoke.—The Urban District Council have decided to take steps to obtain an electric lighting provisional order.

Babcock and Wilcox.—The directors have declared an interim dividend on the ordinary shares at the rate of 14 per cent. per annum.

Chester.—A distributing main is to be extended for supplying energy for public and private lighting at Handbridge at an estimated cost of £57.

Cape Colony.—It is proposed to raise a loan of £814,000 for the construction of certain public works and for telegraph and telephone requirements.

Montrose.—At the next Town Council meeting it will be proposed that an early opportunity be taken to introduce electric light into the town buildings.

Felixstowe.—An enquiry has been held into the application of the Urban District Council for a loan of £17,160 in connection with a scheme for electric lighting.

Boston.—An electrical engineer is to be appointed to prepare, construct, and work out a scheme for the electric lighting of the town on the lines of the present order.

Direct Spanish Telegraph Co.—An interim dividend at the rate of 4 per cent., tax free, on the ordinary shares for the half-year ended June 30 is payable on Oct. 1.

Eastern Extension, Australasia, and China Telegraph Company.—The directors have declared an interim dividend for the quarter ended June 30 last of 2s. 6d. per share.

Calcutta Electric Supply Co.—The directors have declared an interim dividend for the half-year ended June 31 last at the rate of 6 per cent. per annum, payable on Nov. 15 next.

Eastern Telegraph Co.—The directors announce the payment on Oct. 15 of an interim dividend of 1¼ per cent. on the ordinary stock, tax free, in respect of profits for the quarter ended June 30.

Manwell.—The cost of the Council obtaining a provisional order to supply their own electric light would be about £150. The matter has been referred to the Works Committee of the District Council.

Ossett.—At the last Town Council meeting it transpired, in connection with an offer of a syndicate to purchase the Corporation's electric lighting order, that the Council intend to put the order into force.

Hornsey.—The preliminary scheme for the supply of electricity which has been carried out has cost £90,000. The works have only been open about six months, and already the supply is paying working expenses.

Dalkeith.—A plan from Messrs. Crompton and Co. showing the streets in which it is proposed to lay down the electric mains, along with a schedule of streets in which mains are proposed to be laid, has been adopted.

Edinburgh.—Application is to be made to the Secretary for Scotland for consent to the borrowing of a further sum of £70,000 for the execution of capital works under the electric lighting provisional order of 1891.

Rawmarsh.—The Urban District Council are inviting objections to the proposed transfer of the undertaking granted by the Rawmarsh Electric Lighting Order, 1898, to the Mexborough and Swinton Tramways Company.

Southwark.—The Borough Council are fixing ¼-ampere Nernst lamps on to the electric light standards in Newington, and the Electric Light Committee will maintain the lamps at £5. 10s. per standard per annum.

Belfast.—The proposed extension of the electric main along the Old Lodge-road is in the hands of Mr. V. A. H. M'Cowen, electrical engineer. A report is also to be furnished regarding the various types of penny-in-the slot meters.

Dollar.—The agreement between the Town Council and Messrs. Crompton and Co. as to the supply of electric lighting of the streets of the burgh has been signed by the Council. It is expected that current will be ready about Christmas.

Saffron Walden.—The Town Council will consider at the next meeting whether they will apply for a provisional order to enable them to supply electrical energy for both public and private purposes in the borough.

Londonderry.—The Private Lighting and Power Committee will be able to supply current about February or March next. Messrs. Coates intend to open a branch in connection with house wiring and motor hiring, etc., almost immediately.

Removal.—Messrs. E. Goossens, Pope, and Co., electric lamp manufacturers, have removed to 18, Newington, Liverpool, owing, we are informed, to increasing business due to recent further improvements which have been made in their types of manufacture.

Lima (Peru).—A project for the acquisition of refuse destructors is before the municipality. They are anxious to secure these furnaces, but for want of funds the purchase is being postponed. Callao, Arequipa, Cuzco, Piura, Trujillo, in fact, almost all Peruvian towns, are worse off than Lima as regards sanitary arrangements of every kind.

Glasgow.—The electricity department of the Corporation have resolved to reduce the annual charge per light from £14 to £13 per

Digitized by Google

annum, with a further reduction to £12 if the minimum number of additional lights is provided. A considerable increase can now be made in the number of arc lamps without any increase in the annual lighting bill for street electric lighting.

St. Albans.—The principal terms under which the Corporation propose to hand over their electric lighting order to the North Metropolitan Electric Supply Corporation were agreed to at last week's meeting of the Urban Committee. Mr. E. Macgregor Duncan, consulting engineer, and a representative of the Electric Corporation were present. The order was obtained in 1900.

New Book.—Vol. I. of Mr. W. Perren Maycock's "Electric Lighting and Power Distribution" has passed through a couple of new editions since the date of its publication in 1896. The second and concluding volume is now about to be issued by the publishers, Messrs. Whittaker and Co., of Paternoster-square. The new volume, we understand, comprises 684 pages and 400 illustrations.

Blackburn.—A deputation of the Guardians last week inspected the heating arrangements and electric lighting installation at Fulwood Workhouse, Preston, as they contemplate the introduction of electric lighting in the place of gas lighting at Blackburn Workhouse. We understand that, owing to the adoption of electricity at the Preston house, there is efficient lighting and heating and a saving of £300 a year as compared with the cost under the old system.

Aberdeen.—The Corporation have fixed the price to be charged for electricity for the year 1903-4 as follows—viz: (1) For lighting—for the first hour daily of the maximum demand, 6d. per Board of Trade unit; thereafter 2½d. per Board of Trade unit. (2) For motive power—for the first hour daily of the maximum demand, 3d. per Board of Trade unit; thereafter 1d. per Board of Trade unit. Minimum charge per half-year—for lighting, £1; for motive power, 10s.

Clydebank.—At the last meeting of the Town Council, an objection was made to the minutes of the meetings of the Magistrates' Committee on the question of the *plébiscite* to the ratepayers on the subject of whether or not the burgh should carry out its own electric light provisional order. A motion that the *plébiscite* was not satisfactory, the Council should proceed with the electric lighting order, combined with a refuse destructor, however only received two votes.

Belgium.—The Post Office notifies that on Oct. 1 the existing telephone services between London and Brussels will be extended to other Belgian towns, and communication will at the same time be opened between Birmingham, Brighton, Bristol, Cambridge, Cardiff, Derby, Ipswich, Leicester, Lowestoft, Newport (Mon.), Norwich, Nottingham, Sheffield, Southampton, Yarmouth, and Brussels and certain of the other Belgian towns. The charge will be 8s. for a conversation of three minutes.

Lecture—In connection with the Stafford Municipal Technical School a popular lecture was given in the borough hall last week by Mr. G. W. Hefford, B.Sc., the science master, assisted by Mr. J. Butters, B.Sc., the title of the lecture being "Electric Sparks." There was a good attendance. Mr. Hefford prefaced his lecture by remarking that its primary object was to provide a rallying point for old students and a starting point for new students at the municipal technical school.

Partnership.—Mr. Hal Williams, 60, Queen Victoria-street, London, E.C., has taken Mr. Walter Bridges into partnership, and the firm will be known as Hal Williams and Bridges. Mr. Bridges, who was for some years with Messrs. James Simpson and Co., engineers and contractors, London and Newark, has until recently been chief engineer to Messrs. Belshaw and Co., engineers and contractors, Westminster, S.W., and has had a unique experience in all classes of electrical and mechanical engineering.

Chippenham.—The engineer consulted by the Urban District Council as to an electric lighting scheme for the borough estimates that one can be installed for a capital cost of £10,000 or (alternately, to meet possible requirements) for £11,000 or £11,500. Revenue is so estimated that the three expenditures would result, after providing for working expenses and repayment of capital and interest, in annual profits of respectively £285, £555, and £1,140. It has been decided that steps be taken to obtain a provisional order to establish electrical works.

Stirling.—The electric light undertaking is making steady progress, the number of units generated this year being 194,076, as compared with 127,062 last year, while the quantity sold shows an equally gratifying increase. The revenue from the sale of current was £2,961 this year, as against £2,030 last year. Last year £1,552 went for interest and sinking fund, while this year, with the additional capital spent, this item had increased to £1,981. The debit balance on the year's working was £367, as compared with £784 last year and £905 in 1901.

Devizes.—Mr. Wingfield Bowles, Westminster, has reported on the proposed application for a provisional order for the purposes of electric lighting and supply, and as the result of his recommendations, it has been decided: (*a*) that the site of the generating station be at the wharf; (*b*) that the greater portion of the town be scheduled as the compulsory area, provision being made for extensions as may be required; (*c*) that the generating power shall be steam. Mr. Bowles is preparing the requisite plans and estimates. The Council will work the order themselves.

Peru.—A consular report on Peru states that in the near future there will be openings for the trade in electrical appliances of all kinds. There are already a number of installations for supplying electric light to towns and private houses. So far all orders for the plants have been placed with American, German, and Italian firms. No tenders were invited. It would therefore, the consul considers, be advisable for British manufacturers of electrical appliances to have active and reliable agents on the spot, so that no time may be lost as soon as an opening is heard of.

George F. Milnes and Co., Limited.—We have received a statement of the approximate liabilities and assets of the above company as at July 31, 1903, on which date a receiver and manager was appointed by the Court at the instance of the debenture holders. The liquidator, Mr. Max Meyer, is at present engaged upon negotiations for the sale of the business as a going concern. It will greatly depend upon the result of these negotiations what dividend there will be for the creditors. The liabilities are set down as £155,963. 13s. 10d., and the total assets, excluding goodwill and patents, as £185,315. 6s. 9d.

Whitehaven.—Last week at Carlisle Consistory Court, the Rev. C. B. S. Gillings, vicar of St. Nicholas, Whitehaven, and the churchwardens thereof, obtained a faculty to authorise them to instal electric light in the church instead of gas, and to use the present gas pendants for the purpose of carrying the electric lamps, and to sell the gas-meter and such parts of the gas fittings as are not required, on the distinct understanding that there would be no interference with the fabric, and also that the proceeds of the sale of the gas pendants, etc., should be applied to the fund for making the alteration and not to any extraneous purpose.

Brighton.—The municipal telephone system is to be inaugurated next week. The system will begin with 1,200 subscribers. A charge of £5. 10s. per year will be made for unlimited service. There will also be a limited service, costing £3. 10s. per year, and 1d. for each call made. Subscribers will not be able to communicate with the National Telephone Company's subscribers in the Brighton area, but will be able to communicate with the company's subscribers in any other town. The extension of the Brighton telephones into Hove is already under way. The conduits are being laid by Messrs. W. T. Henley's Telegraph Works Company, Limited.

Keighley.—The Electricity Sub-Committee recommend that the town clerk be instructed to endeavour to have included in the proposed provisional order to amend certain sanitary provisions of the Keighley Corporation Act, 1898, clauses empowering the Corporation to acquire, sell, or let on hire motors, arc lamps, and other appliances for extending the supply of electric energy. The electricity sold during August totalled to 9,799 units, as compared with 7,773 units for August last year, an increase of 2,026 units. For the two months ending Aug. 31 the increase over the corresponding period of 1902 in the sale of electricity was equal to 26·1 per cent.

Wandsworth.—The General Purposes Committee have been informed by the City of London and Brush Provincial Electric Lighting Company that the average price of the current sold by them during 1902 was practically 4½d. a unit, and they were prepared to quote guaranteed rates for 4½d. per unit for lighting purposes according to the character of the consumer's demands. The charge for current for power and heating purposes would be reduced to a flat rate of 2½d. a unit from Sept. 30, with a scale of discount ranging from 5 to 30 per cent. The matter has been referred back for further consideration on the chance of getting more favourable terms from the company.

Kingswinford.—Mr. J. H. McLean, who represented the Midland Electric Corporation, attended last week before the Rural District Council with regard to the electric lighting of the district. He said the company were pressing on with the work as quickly as possible, and had greater strength on. In two months the company had done close on 12 miles of streets, which was a record. The Council had refused to have any part of the district lighted without the whole of it was done. They could have the light at Wall Heath the next day if the Council would agree. He hoped that the work would be finished by Oct. 1, but he would promise that it should be all complete by Oct. 7.

Blackpool.—The last report of Mr. Furness, the borough electrical engineer, states that the returns for the month of August this year, as compared with the corresponding month last year, showed an increase in the works output of 25,766 units, made up as follows: Lighting—1903 116,854, increase over last year 7.045; traction—Corporation 106,314 (9.078), St. Annes trams 9,643 (9,643)—total, 232,811 (25,766). The wages for this month, as compared with August of last year, showed a decrease of £17, the figures being £419 as against £436. The cooling tower is now completed and ready for service, while the new steam winch and coal elevator are working and giving every satisfaction.

Stock Exchange Settlements.—The Stock Exchange Committee have appointed Sept. 29 a special settling day in Metropolitan Electric Tramways, Limited, further issue of 185,984 5 per cent. cumulative preference shares of £1 each, fully paid, Nos. 814,017 to 1,000,000, and ordered the undermentioned securities to be quoted in the official list: Eastern Extension, Australasia, and China Telegraph Company's further issue of £282,400 4 per cent. mortgage debenture stock; Eastern Telegraph Company's further issue of £302,169 4 per cent. mortgage debenture stock; Metropolitan Electric Tramways, Limited, further issue of 185,984 5 per cent. cumulative preference shares of £1 each fully paid, Nos. 814,017 to 1,000,000. Application has been made to the committee to appoint a special settling day in and to grant a quotation to the Oriental Telephone and Electric Company's 50,000 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1 to 50,000. The committee has also been asked to appoint a special settling day in the Bournemouth and Poole Electricity Supply Company's provisional certificates (fully and partly paid) for a further issue of 4,500 ordinary shares of £10 each, Nos. 22,501 to 27,000.

Walsall.—The last report states that the total number of consumers supplied on Aug. 31 last was 281. During the past month the total units generated at the station was 52,297. The total output from the main generators was 55,937 units. The total units from the transformers was 44,368 (estimated). The total units registered on the meters was 42,494. The machinery was run for 612 hours. The wages paid amounted to £120. The electrical engineer has reduced his estimate for the loan of £24,550 by £650, in consequence of the

Digitized by Google

Council having been able to lease buildings for transformer stations, and the sanction of the Local Government Board has now been received to the borrowing of the balance of the loan, amounting to £7,868.

Fulham.—The borough electrical engineer has reported on the lighting of the small hall, suggesting that to obtain satisfactory lighting with minimum expense, the best plan would be to alter four of the existing brackets, so as to have, instead of three electric lamps, four incandescent lamps and two Nernst lamps, the brackets to be reversed and relacquered before fixing. He also suggests that, for the purpose of lighting the stage, two five-light electroliers should be dropped from the ceiling at the opposite corners of the platform. If these two pendants be fixed, the two brackets at present over the platform could be dispensed with, and one single bracket could be altered for gaslighting only, in order to meet the requirements of the London County Council. The cost of carrying out this work would be £56. 4s. 4d.

Northfleet.—The Electric Lighting Committee of the Rural District Council recently discussed draft proposals submitted by the Sir Hiram Maxim Electrical and Engineering Company, Limited, for carrying out the terms of the Council's electric lighting provisional order, which, amongst others, included a provision that the Council should obtain a loan for the capital expenditure required for the construction of electricity works, and the provision of plant, machinery, and mains, such works and plant, etc., being constructed and provided by the company in accordance with plans and specification to be prepared by, and to be under the supervision of, the company's consulting electrical engineer (Mr. F. J. Warden-Stevens, of Westminster). The committee came to the conclusion that the only form of agreement which they might be willing to enter into would be a contract for the execution and maintenance of the works authorised by the provisional order, the company, of course, providing all capital and supplying electricity within the Council's area.

Battersea.—The Lighting Committee on Wednesday recommended the adoption of a scheme for the provision of plant for raising coal from barges at Grove Wharf and conveying it across to the central electric generating station at an estimated cost of £3,500, and the acceptance of an offer from the Rhodes Electrical Company, Limited, to supply to consumers within the borough motors on the "hire," "hire purchase," and "direct purchase" systems. The following particulars relative to applications for the supply of electrical energy to premises within the borough, including the Council buildings, were reported: Lighting—Consumers, number of applications quarter ended Sept. 15, 431 (38); actual, 404 (32); electrical energy, equivalent in 8-c.p. lamps, applied for, 34,977 (3,477); actually supplied, 29,797 (1,553). Motive power*—Equivalent in horse power, applied for, 381¼ (43¾); actually supplied, 323⅜ (9½). The figures in parentheses mark the increase over quarter ended June 16. * 20 amperes for charging accumulators applied for, 15 amperes connected; also 69 amperes for heating and cooking applied for and 48 amperes connected.

Carnarvon.—An enquiry has been held into the Council's application for sanction to borrow £17,000 for electric lighting. An agreement has been arrived at with the National Wiring Company for free wiring, the company undertaking, when required, to put at their own expense installation complete with plain fittings and lamps ready for connection to the mains on the following terms: (1) The consumer to sign an agreement in which he agrees to pay a rental of 4½d. per lamp per quarter for incandescent lamps of any standard candle-power up to 25 candles per incandescent lamp; above that candle-power 4¾d. per lamp per quarter, the agreement to be signed by the landlord of the premises when required. (2) The consumers to have the option at any time of purchasing their installation for 16s. 6d. per lamp, less 2½ per cent. per annum for depreciation. (3) The Corporation to have the option of purchasing the installation when the agreement is determined at 16s. 6d. per lamp, less 2½ per cent. per annum for depreciation; failing purchase, the Corporation to pay the company 4¼d. per lamp per quarter until purchase, but as each installation has been completed for 25 years the guarantee in respect of such installation to cease, the installation becoming the property of the Corporation without any further payment.

Stamford.—The great demand for electricity for lighting, heating, and power purposes has made it necessary to instal additional plant at the electricity works to meet the coming winter's load. These extensions, which are now being installed, consist of a duplicate Babcock and Wilcox boiler with a heating surface of 2,437 square feet. This will practically double the present capacity of the boiler-house. The new boiler is fitted with superheater having a capacity of 362 square feet, and electrically-driven Meldrum's mechanical stokers are to be fitted. The new steam set consists of a triple-expansion high-speed engine, coupled direct to a multipolar dynamo. The engine is an enclosed Belliss and Morcom one of 350 h.p. There is a shunt-wound dynamo of an output of 420 amperes at a pressure of 530 volts by Parker, of Wolverhampton. A larger storage battery is also being installed; the capacity of this battery is 600 ampere-hours at a discharge rate of 90 amperes. Cables have been laid connecting various streets with the object of thickening up the network and equalising the pressure of supply. The expectations of the company were that 6,000 lamps would be connected by Christmas next. The private lighting connections now are equivalent to 13,000 lamps. The above extensions, as was all the previous construction work, are being carried out under the supervision of the resident engineer, Mr. W. E. Milns, and in most cases by his own staff.

St. Marylebone.—At the last meeting the Town Clerk said, in reply to a question regarding the Council's position with regard to the electric light question, that the Board of Trade had not had the formal application for a license before them, which would have to follow advertisements and proper notices. They had met representatives from the company, the County Council and the Borough Council, that they might arrive at some mode of settlement, and they were very much surprised that the London County Council could not see its way to the settlement proposed. Having failed at the present in getting all four authorities to agree to a course they were still considering the question of granting the license, but had written to the parliamentary agents to state that the solicitors to the Board of Trade advised that the license should not be granted. The Local Government Board were awaiting the decision of the Board of Trade before themselves deciding on the appeal which had been made to them against the decision of the London County Council not to sanction the necessary loan. The Borough Council had already decided the procedure. Failing one department, they would go to the other, and failing that, they would go on with the Bill in November, after giving the necessary notice which the Council had authorised to be given. The Board of Trade's solicitors had reported that it was inexpedient, with regard to the facts, that the license should be given, and they convened a meeting of the officials of the four authorities, who could not come to a decision, and the matter was referred to the various authorities on that occasion.

Bermondsey.—Messrs. Kincaid, Waller, Manville, and Dawson, in a scheme for the extension of electric lighting which was submitted to the Council before the recess, anticipated that a sub-station could be provided at Bull Head Dock It has now been found impossible to carry out that design, and to provide a sub-station on other land would prove expensive. They have, therefore, submitted a further report stating that, if the expenditure was not too great, it would be better to continue the low-tension continuous-current system. In the case of Bermondsey, however, the expenditure on the low-tension mains, if this system in its complete simplicity was used to supply consumers at the farthest possible distance from the generating station, would be more considerable than if some system of automatically increasing the pressure along the feeders supplying the outside districts was utilised, maintaining the same method of supply to consumers within a reasonable distance of the generating station as that at present in use. The Electric Lighting Committee recommended at the last meeting that the latter course be adopted. The plant proposed to be installed includes an extension of the destructor-house by adding two new cells and a marine-type water-tube boiler. It would hardly be possible to get the whole of the new plant proposed installed in time for the coming winter owing to the period necessary for the erection of the new buildings; consequently the committee divided the estimate into two portions—one showing the cost of the work to be carried out before the winter, and the other the work which must be finished during next year. The first estimate involved an expenditure of £25,254, and the second £23,908 The committee recommended that the extensions be carried out. The recommendation was adopted, and Messrs. Kincaid, Waller, Manville, and Dawson were retained as consulting engineers.

London Gazette.—The petition for the winding-up of the Cheshire Electric Tramways Trust, Limited, by the High Court of Justice, heard on Sept. 9, 1903, will be reheard on Sept. 30, 1903, before the Court sitting at the Royal Courts of Justice, Strand, London, when the Court will be asked by the petitioner to make an order for the compulsory winding-up of the company, or in the alternative for an order continuing the voluntary winding-up of the company under the supervision of the Court. The Electric and Ordnance Accessories Company, Limited, of Stellite Works, Cheston-road, Aston, near Birmingham, fuse manufacturers, will apply to the justices of the county of Warwick, acting for the division of Aston, at the police court, Aston-juxta-Birmingham, on Oct. 28, 1903, at 11 a.m., for their assent to the establishment of a new factory for explosives upon premises situate in Cheston-road, Aston, near Birmingham. A dividend is intended to be declared in the estate of James George Cole, electrical engineer, 34, Summerhill-road, South Tottenham. Creditors who have not already sent in their claims are requested, on or before Oct. 10, 1903, to send in their names and addresses and the particulars of their debts and claims to Harry Egerton Knight, of Weavers' Hall, 22, Basinghall-street, London, chartered accountant. A general meeting of the members of the Anderson Electrical Traction Syndicate, Limited, will be held at the registered office of the company, 1, Cheapside, Bradford, on Monday, Oct. 26, 1903, at 3 p.m., for the purpose of having laid before such meeting an account of the liquidator, showing the manner in which the winding-up has been conducted and the property of the company disposed of, and of hearing any explanations that may be given by the liquidator. A general meeting of the members of the North-Eastern Telephone Company, Limited, will be held at the office of the liquidator, 12, West-street, Gateshead, on Thursday, Oct. 22, 1903, at 3 p.m., for the purpose of having an account laid before them, showing the manner in which the winding up has been conducted and the property of the company disposed of, and of hearing any explanation that may be given by the liquidator, and also of determining by extraordinary resolution the manner in which the books, etc., of the company and of the liquidator shall be disposed of.

Ladysmith.—The formal opening of the electric light plant took place on Aug. 29, when Mrs. Joseph Farquhar turned on the current to the street lights. It was through the work and enthusiasm of Mr. Joseph Farquhar, when mayor of the borough, that the idea of electric light was first taken up. Private lighting was commenced on the following Saturday. The power station is situated on the Market-square, and contains four generators, which are worked by two engines. There are three boilers of the locomotive type, each of 30 h.p., to which special fire-boxes have been fitted to suit the consumption of Natal coal. The boilers are Robey's, and the engines from Messrs. Willans and Robinson, of Rugby. The contract for the electrical work was given to Messrs. Hubert Davies and Spain, the price being £8,326, and the operations were carried out under the direction of Messrs. Reeves and Manning. Mr. L. Roberts, A.I.E.E., of Durban, was the consulting engineer, and it was from his specifications and

Digitized by Google

plans that the scheme was first started upon, though it has since been increased, and extensions to the value of £2,000, made from specifications by the borough electrical engineer, Mr. J. Stanley White, of Manchester, who will also take charge of the whole of the workings when they are completed. Mr. A. Ritchie, of Durban, was the architect for the power station, and Mr. A. Fraser, of Ladysmith, was the builder. The four generators are each of 25 kw. capacity, and they are of the multipolar type, and are supplied by the Electrical Construction Company, of Wolverhampton. The current will be distributed on the three-wire overhead system. Each pole will contain five wires, but two will be switch wires for the street-lighting. The two outside wires will be power wires, and will each carry a direct current of 220 volts. Already the anticipated demand has so considerably increased that in Murchison-street it has been thought advisable to fix a cable of $^{19}/_{16}$ wire in place of the No. 6 cable as at first intended. The work of establishing house connections goes on rapidly, and no less than 50 are already connected. A hundred 32-c.p. incandescent lamps will be distributed over the town, one on each alternate pole, except in dangerous parts, where the lights will be on every pole. Four arc lamps are expected to arrive in three weeks' time. These are intended for the more central parts of the town. A further 75 incandescent lamps have been ordered for placing on the poles in the extensions of the original scheme. The power, under present arrangements, will be supplied throughout the night from dusk until daylight. The charge to private consumers will be 1s. per unit. The charge for connection is £1. 10s. This covers all cost of material, provided the premises stand sufficiently near the boundary line to enable one span of wire to be used from the mains. Where more than one span is necessary the customer will be charged to the extent of the cost of such extra work. Meters will be supplied at rentals varying from 1s. to 1s. 6d. per month, according to size.

Hammersmith.—The agenda for this week's meeting of the Borough Council contains a recommendation that the Council do join the Association of Metropolitan Borough Councils, and appoint representatives thereon. The alterations recommended by the Home Office factory inspector for the protection of the generating station and sub-stations will be carried out. The committee in their report say "that all the requirements for the protection of the high-tension 'bus bars on the high-tension distribution boards will be fully satisfied if the original scheme is completed and the space between the two boards filled in so as to make one continuous board. This will provide eight more feeder panels, and as all the present panels are in use, there are no spares for extensions, and it will be necessary to carry out this arrangement before any more high-tension feeders can be put to work. Messrs. Ferranti Limited (the makers of the original boards) have offered to carry out the work, including instruments, for £360. 4s., which is less per panel than the price charged for the original boards. With reference to the better protection of the main switchboard, the committee consider that the time has now come for the unsatisfactory temporary hand railing to be removed and a protection rail of good design substituted. Messrs. J. and A. Law have offered to supply the necessary material ready for erection for £49. 15s., or to be erected complete for £65. The extension of the rectifier platform has been completed. The Council have entered into an agreement for supplying steam from the generating station to the Imperial Tobacco Company's factory. As the demand for electricity has very greatly increased, the committee consider it advisable to have all the boilers in thorough readiness for meeting the load this winter, and as No. 1 boiler is of very little use in its present condition, the engineer has submitted the following report upon the subject of installing Howden's forced-draught apparatus to enable us to use this boiler with advantage: 'For some time now we have not been able to use the Lancashire boiler to any advantage on account of the very low draught obtainable at that end of the flue, as the chimney is loaded up to its full capacity. This is due to the large amount of air required by the boilers nearer the chimney, leaving very little for the boiler at the far end. This state of affairs will grow worse as the load increases, and I am afraid that we shall some day shut down for want of steam. I have given very careful consideration as to the best means of making this boiler permanently useful, and at the same time more economical. We have tried several forms of steam-jet apparatus, all of which have given trouble without any real advantage in return. The only thing which remains is to adopt some form of mechanical draught in which the required air is supplied by means of a fan driven by a steam-engine. The use of mechanical draught has been employed very largely in the mercantile marine, and the details having been thoroughly worked out so as to make it a reliable and economical system, there is no need for us to do any experimenting in this direction ourselves. There are, however, very few land installations where this system can be seen in operation, but there is no doubt that a proper system will show greatly increased economy, and will pay for the cost of installing by the amount of coal saved. I have carefully looked into the working of the Howden hot-air forced-draught system, which has been installed in over 13,000 furnaces, supplying steam-engines of nearly 5,000,000 h.p. The plant I inspected was at work driving the one boiler fixed to supply steam to the whole of Messrs. Howden's works. It consists of a fan driven by a small steam-engine, forcing the air into the furnace through heaters placed in the side flues of the boiler, so that the air absorbs the heat, which would otherwise be wasted, and reaches the furnace at an increased temperature of over 100deg. The firing is done by hand, and a system of hot-air jets over the furnace and in front of the fire-hole door prevents the admission of cold air, which reduces the efficiency of the furnace and makes smoke. The operation is extremely simple, giving the fireman absolute control of the combustion, which can be instantly adjusted to suit the varying loads. The chimney was not discharging any smoke, in spite of the fact that small Scotch coal was being hand-fired. The whole of the apparatus is of a most substantial manufacture and of simple design, so that there is nothing to get out of order or require skilful attention. The cost of the installation for our boiler seems high, but it can afterwards be extended to the other boilers at a correspondingly less price. The apparatus includes: (*a*) one double-inlet fan, driven by a single-cylinder double-action enclosed type engine; (*b*) two air-heaters for side flues of boiler, complete with air-tubes, piping from fan to heater and from heaters to front of boiler; (*c*) air reservoirs round furnace front, and front of furnace complete with door valve air distribution boxes and all mountings; (*d*) furnace bars, bearers, and bridges. The whole apparatus fitted to the boiler complete and ready for work costs £355. As the results of several tests made for comparison with oil fuel, our boilers gave an evaporation of 85lb. of water per pound of coal, whereas in the Admiralty test of the Howden system an evaporation of 12 3 was obtained as the result of a 13 hours' test from Liverpool to Queenstown on the Cunard liner "Saxionia." This is an increase of nearly 50 per cent. on the results obtained here. I do not anticipate being able to obtain such results, but there is no reason why we should not increase the evaporation by 2lb. or 3lb. of water per pound of coal. The boiler will consume some 900 tons of coal during the winter months, and an increased evaporation of 2½lb. of water per pound of coal will be equivalent to a saving of 250 tons of coal, costing us £1 per ton at the furnace, or £250 saving, so that the whole cost will be recouped at the end of 12 months. This is borne out by the actual results obtained at the last installation equipped by this firm. In our case the actual saving which will be effected is a secondary consideration in comparison with the necessity of having stand-by plant for the winter months, and in view of the results already obtained, I should advise the fitting up of No. 1 boiler with this system without delay. The conversion will require at least six weeks for completion, and as by that time the load will be nearing its maximum there is no time for making experiments.'" The committee recommend that the apparatus reported upon by the engineer be ordered and fitted to No. 1 boiler, at an approximate cost of £355. Application has been made to the Conservators of the River Thames for their sanction to the laying in the river bed of the suction pipes required in connection with the extension of the condensing scheme, which was decided upon in March last, and permission has been obtained on condition that the work be carried out and maintained to the satisfaction of the Conservators under the inspection of their engineer, and that the same will be allowed to remain during pleasure on the terms and conditions set forth in and endorsed upon the Conservators' license. In connection with certain electrical machinery about to be installed by Messrs. J. and H. Gwynne and Messrs. Joseph Baker and Son, and which will require to be driven by continuous current instead of single-phase alternating current as supplied by the committee, it will be necessary for a motor-generator to be installed at each of their premises, the estimated cost thereof being £350 each, for the use of which both firms are prepared to pay a rental, as if these transformers are installed a large amount of current will be consumed, which will greatly increase the output, and the committee recommend (*a*) that two transformers be purchased at an estimated cost of £350 each, and that it be referred to them to prepare specifications and obtain tenders; (*b*) that the annual rental to be charged for the use of the transformers be at the rate of 5 per cent. of the cost thereof.

PROVISIONAL PATENTS, 1903.

SEPT. 14.

19715. Improvements in electrolytic meters. Sydney Holmwood Holden, 18, Southampton-buildings, Chancery-lane, London.

19748. New or improved means for protecting the terminals of electric apparatus, and ensuring good electrical contact. William Peto, 43, Southampton-buildings, Chancery-lane, London. (Complete specification.)

19780. Improvements in or connected with electric lamps. Godfrey Bamberg, 173, Fleet-street, London.

SEPT. 15.

19801. An electrochemically-deposited jacket for explosion engines and the like. Willoughby Lake Baylay and William Ashbee Tritton, Thorndean, Anson-road, Tufnell Park, London.

19836. Improvements in insulated joints for railroad rail sections. Sydney Elliott Page, 28, New Bridge-street, London. (The Weber Railway Joint Manufacturing Company, United States.) (Complete specification.)

19877. Improvements in electromagnetic relay apparatus. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Aktien-Gesellschaft, Germany.) (Complete specification.)

19882. Improvements in electric fuses and the like. George Benson Bâby, 111, Hatton-garden, London.

19886. Improvements in electromotive force regulators. Benjamin Garver Lamme, Westinghouse-building, Norfolk-street, Strand, London. (Date applied for under Patents Act, 1901, Oct. 2, 1902, being date of application in United States.) (Complete specification.)

19887. Improvements in controlling apparatus for electric motors. Benjamin Garver Lamme, Westinghouse-building, Norfolk-street, Strand, London. (Date applied for under Patents Act, 1901, Sept. 29, 1902, being date of application in United States. (Complete specification.)

19894. Improvements in incandescent electric lamps. William Cowper Robison, 19, Holborn-viaduct, London.

NOTES.

Junior Institution of Engineers.—Mr. J. Fletcher Moulton, K.C., M.P., F.R.S., has been elected president of this institution in succession to Colonel Edward Raban, C.B., R.E.

Electric Speed Trials.—The speed of 114 miles an hour attained on the Berlin-Zossen military railway at the beginning of last week is reported by Reuter to have been increased to 118 miles on Saturday. The trials, which are to be continued, are stated to have passed off without a hitch.

Rumoured French Combine.—Rumours which have been current as to a probable combination of the various large electrical manufacturing companies in France are officially denied by the French Thomson-Houston Company, who were supposed to be at the head of the scheme. The report is considered by the company to emanate from certain speculators who are interested in pushing up the price of the company's shares, and has no truth in fact.

The Faraday Society.—Arrangements for an interchange of publications between the members of the American Electrochemical Society and the Faraday Society have recently been made, so that, in addition to their own *Proceedings*, members of the Faraday Society will in future receive the *Transactions* of the American society free of charge. The exchange will take effect with vol. iv. of the American *Transactions*, containing the papers read before the recent meeting of the American society held at Niagara Falls.

West African Telegraphs.—Information brought to this country by the steamer "Akabo," of the Elder-Dempster line, states that the telegraph line between Lagos and Forcados is approaching completion. This line, which is being constructed overland from Lagos, will then put the whole of both colonies in West Africa in telegraphic and cable communication with each other and with the outside world. It is intended to extend the land line to the Old Calabar seat of the Southern Nigerian Government.

Literary Notice.—A new edition of "The Dynamo," in Whittaker and Co.'s specialist series, is in the press, and will be published shortly. Since the last edition the authors, Messrs. Hawkins and Wallis, have entirely revised this work, rewritten the greater part, and added a great deal of fresh matter in connection with the more recent types of multiphase continuous-current machines with slotted armatures, and alternators, single and polyphase. The book will be illustrated with diagrams and drawings of recent designs.

Atlantic Wireless Telegraphy.—The Cunard liner, "Lucania," is reported to have been in continual communication with land by wireless telegraphy during the whole voyage to New York last week. She also exchanged numerous messages with passing liners equipped with Marconi instruments. The following rates are quoted for communication by wireless telegraphy on the Atlantic: From ship to Marconi station, 6d. per word; from ship to passing steamer and thence to station, 6d. per word. The minimum charge by way of Crookhaven stations in the United Kingdom is 6s. 6d.

Liability of Telephone Companies.—The liability of telephone companies for defects in wires and instruments causing "misconnections" is to be called into question in an American lawsuit, in which damages are claimed from a telephone company because the instrument failed to work when used to call up the local fire station. This is believed to be the first case of the kind on record, and the decision of the Courts will be of general interest. The claim is made that damage was done by the fire, which, had the telephone been properly connected and in working order, would have been prevented.

London Traffic Enquiry.—The Royal Commission appointed to enquire into traffic conditions in London generally have, as recently mentioned in these columns, transferred their labours to American soil. The party arrived in New York last Saturday on the White Star liner "Arabic." It consists of Sir David Barbour (the chairman of the Commission), Lord Ribblesdale, Sir John Dickson Poynder, Sir Francis Hopwood, Sir Geo. Bartley, Mr. George S. Gibb, and Mr. Lynden Macassey (secretary). The Commission will at first confine their attentions to New York, but before returning to London they are expected to visit a number of other cities in the States.

Treatment of Cancer by Electric Osmose.—Dr. Clarence A. J. Wright contributes to the *Lancet* a long article in which he states that he has been successful in the treatment of cancer and other forms of malignant disease by electric osmose. Of 23 cases which he has treated by this method only five have proved really successful, but he claims that 22 per cent. of successes is sufficiently encouraging to recommend this method to the attention of the medical profession for a more extended time. Personally Dr. Wright believes that a "radioactive salt of strontium introduced into the tissues by cataphoresis by high frequency" will prove the desired panacea of all forms of malignant disease.

Technical Instruction in London.—The pioneer polytechnic in Regent-street commenced its twenty-second class session on Monday evening last. Some idea of the extent of the educational work carried on in this polytechnic may be gathered from the fact that last session 14,400 students attended classes and nearly £15,000 was paid in fees. A special feature of the work is the comprehensive courses of instruction at nominal fees arranged to meet the requirements of various trades and professions. For instance, excellent courses may be taken by students in electricity and magnetism in the evening, including laboratory work; also in telegraphy and telephony. A three years' training is provided for, and separate instruction is given to elementary and advanced students. Equally advantageous courses at nominal fees may be had in other branches of the engineering profession. Altogether the Polytechnic may well anticipate another successful session.

International Electrical Congress. — It is announced that an international electrical congress will be held in St. Louis during the week, Sept. 12-17, 1904, in connection with the World's Fair. The congress will be divided into three branches—a chamber of delegates appointed by various Governments, the main body of the congress divided into sections, and conventions of the various electrical organisations in the United States held simultaneously with the congress. In scope it is said the proposed congress will be far more comprehensive and influential than any previous electrical congress, and its transactions are expected to form a most valuable publication showing the development of all departments in the electrical field. It will be remembered that our Institution of Electrical Engineers is paying a visit to America in the autumn of next year, and part of the programme is to spend a few days at St. Louis. It is hoped, therefore, that a number of English electrical engineers will be able to take part in the above congress, and at the same time have

Digitized by Google

the advantage of visiting the World's Fair when scientists and engineers from all over the world are gathered together within its immediate precincts.

Electricity in Weaving.—It seems that favourable results have been obtained by the introduction of electric power in the home weaving industry at Aurath, a Rhenish town, where formerly cottage hand weaving was extensively, though not very profitably, carried on. Contrary to what might be expected, it is said that since electric power has been introduced the weavers are far better off. Consul-General Schwabach in his report on the trade of Germany states that the weavers are employed by dealers, some of whom have also provided the new electric looms. These are paid for by means of small deductions from each delivery of goods until the cost is covered, when they become the absolute property of the weavers. The average price of a loom is £40, and the electric power per loom amounts to about £3 per annum. In addition to a much larger productive capacity, the use of electric power requires less exertion on the part of the operator and is a decided gain all round.

Municipal Testing Houses.—Testing houses have not yet become common adjuncts of municipal enterprise, although there are some few existing in provincial towns at the present time. Bradford may be quoted as an example of this. In that city the Corporation have for some eleven years conducted a municipal testing house, which yields in fees an average yearly revenue of something like £7,000. In this institution 150 persons are employed, and the mechanical equipment includes not only such as is necessary to test the strength of wool and fabrics, but also hydraulic apparatus for determining the resisting power of building materials and electric power for tests, involving the use of continuous and alternating currents under different conditions on specially delicate instruments and appliances. Manchester, which is in the van of municipal enterprise, is now proposing to establish such an institution, and there are signs of other municipal bodies following in the same line before long.

Books Received.—"Engineering Preliminaries for an Interurban Electric Railway" (McGraw Publishing Company, New York), by Ernest Gonzenbach. This work embodies the plans and recommendations made in a report on a proposed railway in the Western States, and serves as a good example of many roads now on paper, and which may soon assume tangible form. The book may prove instructive as showing the way in which certain conditions met with in the case referred to were successfully met, although it by no means covers the whole ground in the art of electric railway construction at the present day. "The Practical Testing of Dynamos and Motors" (The Scientific Publishing Company), by Charles F. Smith; 5s. The author proclaims this work to be an elementary introduction to the study of continuous-current dynamo machinery, and it is thus of special value to students who are beginning the study of electrical machinery. To a large extent the 230 odd pages comprising the volume are devoted to descriptions of experiments, and the use of mathematics has been avoided as far as possible, results and inferences being discussed in connection with curves obtained in the experiments. The book contains over 80 illustrations.

Advancement of Apprentices.—Our attention is called to a scheme for the advancement of apprentices in engineering shops which Messrs. Richardson, Westgarth, and Co. inform us they have adopted at their Hartlepool engine works. The idea is to award the apprentices marks in accordance with their industrial propensities and general conduct, and to reward them by a monetary consideration if they attain the required standard. The maximum number of marks it is possible for an apprentice to attain is 120—*i.e.*, 20 for each approved examination in science or in practical mathematics, 40 for regular timekeeping, and 40 for good conduct, perseverance, and progress in the workshops. An apprentice obtaining a total of 60 marks will have the sum of 6d. added to his weekly rate of pay for the ensuing year, and for marks in excess of 60 his rate will be proportionately increased. Full marks will entitle the apprentice to an increase of 1s. per week, but in any case there should not be much difficulty in an apprentice at least securing half that increase it he be only moderately industrious. Another inducement which the above firm is offering its apprentices to persevere is promotion in the workshops, which will be largely regulated by the number of marks obtained.

Calcutta Tramways.—Electric tram drivers in this country may be thankful sometimes that they do not live in India. The Calcutta electric tramways have only been running a few months, but in that time they have had more than their share of accidents. As they are more or less a novelty in India this may not seem surprising, and the blame cannot be lightly thrown on the management, which has street difficulties to face in Calcutta which would not be generally met with in European towns. *Indian Engineering* in its last issue informs us that a collision took place at 11 o'clock at night on July 15 between an electric car and a private carriage full of women and children. It does not seem to have resulted in any fatalities, but the driver of the electric car was hauled before the magistrates on a charge, presumably, of excessive speed. From our contemporary's report, it is not clear whether the charge was justified by evidence or not, but in any event the magistrate found the accused guilty, and dealt out the maximum punishment—namely, six months' rigorous imprisonment! Such a sentence, we presume, would only be justified in a case of gross and culpable negligence, but to us in this country it may well appear to be excessive, when it is considered that the accident occurred late at night and under circumstances which might conceivably have been out of the control of the individual concerned.

Iron and Steel Institute.—It has been decided to hold the next autumn meeting of the above institution in New York. The invitation came from the American members of the institute, and was formally tendered and accepted at the conclusion of the general meeting at Barrow-in-Furness. The dates arranged for the meeting are Oct. 24, 25, and 26, 1904, but after the business proceedings, which will occupy these three days, there will be an excursion to Philadelphia, Washington, Pittsburgh, Cleveland, Niagara Falls, and Buffalo, returning to New York on Nov. 10. During the trip night travelling will be avoided, and every endeavour will be made to obviate fatigue. The two Sundays will be spent at Washington and at Niagara Falls. The approximate cost of the stay in the United States is estimated at £25. For the convenience of members desirous of visiting the St. Louis Exhibition, arrangements will be made for a limited number to leave Pittsburgh for St. Louis and Chicago, reaching New York on the evening of Nov. 10. This trip will necessitate three nights being spent in sleeping cars, and the approximate cost will be £35. In order to carry on negotiations with the principal steamship companies so as to obtain for members the advantages of reduced rates, it is asked that members who propose attending the meeting will communicate with the secretary, Mr. Bennett H. Brough. at their earliest convenience.

Testing Steel Axles.—In a recent number of *La Energia Eléctrica* A. Sandarán describes a new method

Digitized by Google

of testing the molecular state of locomotive axles and other iron and steel pieces, this method being based on the magnetic properties of iron and steel, and intended to reveal any injury these pieces possibly have undergone in operation. From the principles of magnetism it is inferred that, when testing an iron or steel piece before commencing work, the graphical representation of a magnetising cycle will afford an illustration of the magnetical properties of the piece concerned. Now the axles of locomotive and railway carriages, as well as other machine pieces, are exposed in operation to such vibrations and shocks as to become brittle, when the fracture will show a crystalline structure. At the same time the magnetic residual phenomena are diminished, the iron piece assuming the normal average state as corresponding with the magnetic force acting on it much more rapidly, its hysteresis thus being diminished, and the ascending and descending branches of the induction curve differing from one another to no material degree. Between the magnetising curves of an axle or another iron piece, as recorded at different periods of operation, there may thus be noted important differences, a magnetic investigation of the piece in question allowing of conclusions being made as to its present safety, and of stating whether any abnormal alteration, such as an internal fracture, has occurred.

Electricity in Agriculture.—Electricity as an aid to agriculture is being watched with keen interest at the present time. To the uninitiated the following notes as to the large amount of work it can be made to do in the agricultural field will prove instructive. It may not be generally known that three German companies—the Union, the Schuckert, and the Helios—own model farms on which most of the work is done by electricity. It is used both for lighting and power. The Helios Company's farm, Quednan, covers some 450 acres near Konisberg, and is in charge of Prof. Backhaus. There is a power-house equipped with a 50-h.p engine driving a four-pole dynamo and yielding a current of 90 amperes at a pressure of 500 volts. For lighting purposes a small two-pole dynamo has been installed, giving current at 30 amperes and 220 volts, or at 18 amperes and a pressure of 320 volts when used for charging a Pollak storage battery of 130 volts. Incidentally, electricity is also employed for cooking and heating purposes at the farm-house. The agricultural machinery is driven by three electric motors, one of 1½ h.p. being used for cutting vegetables. The other two are portable, and do odd work, such as driving mills and thrashing machines, crushing flax seed, pumping water, turning a circular saw, and so on. A feature of the agricultural implements is an electrically-driven plough. The same company own the Simmern farm, where in the power-house the Helios dynamos are driven by turbines of the Beché type. The experiments which are being tried in this case are aimed at dispensing with manual labour as much as possible, and two small portable motors are employed. One of 10 h.p. does the heavier work of the farm, and one of ¾ h.p. drives either a centrifugal cream separator or else a winnower in the wheat bin. In other ways on the other farms electricity is taken full advantage of, and its application is being tried to a number of farm implements which have hitherto been worked by hand.

Ventilation of Tube Railways.—Before Section G at the meeting of the British Association at Southport, Mr. J. W. Thomas made a highly interesting communication, in which he dealt with the all-important subject of the ventilation of tube railways. After considering the physical conditions essential to good ventilation in tube railways, the calculation is made that the forces brought into play by the moving trains and the natural heat of the tubes will be ample if properly directed. The author thus explained his meaning: In tube railways, if B is the centre of three stations, the down train moving from A to B will draw air from the A station into the tube and expel it in the B station, and the up train moving from C to B will draw air from the C station into the tube and expel it in the B station. Three stations are thus directly involved, and a triple-station arrangement will best fulfil the physical conditions. Owing to the elasticity of air, the outlets for expelling the vitiated atmosphere must not be situated far from the points of greatest compression, and should begin in the centre of each station underground and end in the open air above the station at the surface. For the same reason the intakes for fresh air should be close to the points where the sudden expansion of the air begins. These points are at the ends of the tubes which the moving trains enter. Doors can be fixed at the ends of the two tubes which the trains enter in each station, and closed behind the last trains at night, so that the fresh air brought into the end of the tube immediately beyond the doors will drive out the foul air into the next station by natural ventilating pressure. His conclusion is that the providing of fresh-air inlets inside the ends of the tubes which the trains enter, with an outlet shaft in the centre of each station, will enable the moving trains to draw in and expel enough air to keep the atmosphere in good condition even in hot summer weather. In addition to this, however, there are two auxiliary aids to ventilation which enable the station masters to make certain that the state of the atmosphere in the tubes are satisfactory: first, having inlets and outlets as above, the timing of the departure of the up and down trains as they move towards the same station will enable enormous volumes of air to be driven to the surface, and a corresponding volume will be drawn in; second, by closing the doors after some of the trains as they leave the stations fresh air must be drawn into the tubes.

Electrical Propulsion for General Transport.—Among the most interesting papers read before Section G of the British Association meeting at Southport was one by Mr. James N. Shoolbred, in which he considered the possibilities of electrical propulsion as the general means of transport. The tendency of the last few years has been, in England and elsewhere, to introduce electric tractive power—on tramways, on railways, on road carriages, on canals, in automobiles, and in other ways. But these various groups have each been acting independently of the others—isolated, and in some cases actuated thereto by motives of jealousy, or of hostility, due to the dread of conflicting commercial interests. Besides the above proposed applications for electrical traction, there have sprung up in various directions what may be termed "universal providers of electricity," under the head of electrical power schemes, etc., to acquire a right—nay, even a practical monopoly—over very large areas to provide a supply of electricity for, within certain limits, all purposes, whether for locomotion or for stationary purposes. It is only reasonable to suppose, says the author, that if, instead of a number of conflicting interests, the various parties could be made to combine and fuse together the several portions of their common work, so as to avoid a repetition, and antagonistic, in some cases, of some portions thereof, there might then arise mutual benefit as well as economy, not merely to the operators themselves, but also to the community at large. One difficulty lies in the conflicting interests and in the jealousy amongst the various classes of operators. But another danger, to the public more especially, lies in the monopoly which virtually might thereby be afforded to the operators. An attempt has been recently made by

Digitized by Google

the Liverpool Corporation, the Mersey Docks and Harbour Board, and the South Lancashire Electric Tramways to give expression to this tendency for co-operation among the various workers; and there are indications in Yorkshire and elsewhere of similar tendencies coming into operation. Although the result so far of the attempt above referred to has been rather to accentuate than otherwise the difficulties which beset a united undertaking of such a character, yet the benefits which would ultimately accrue to the public (say, in cheapening the cost of transportation by a more comprehensive and united action among the workers) fully warrants their being discussed. In the paper particulars are proposed as would tend to such a joint action and to the benefits arising therefrom.

North-Eastern Railway Electrification.—It is fully expected that in about 12 months' time the present steam lines of the North-Eastern Railway in the neighbourhood of Newcastle and Tynemouth will begin to operate by electric traction. As our readers are aware, the conversion of the 37 miles of line involved in the scheme from steam to electric traction is being carried out, so far as the electrical equipment is concerned, by the British Thomson-Houston Company, who have made such good progress with the work that an important trial was enabled to be made with the new system on Sunday on a section of the line between Carville and Percy Main. The selection of that day for the first run of the electric system was a happy coincidence, for it was on Sept. 27, 1825, that the first passenger steam line in England was opened between Stockport and Darlington. We are informed that the trial, though of a purely informal character, was a very successful one, and that the officials of the railway were highly pleased with the results. The experimental train was made up of two motorcars with a trailer car between, and on one run a speed of 45 miles an hour was obtained, the train attaining a speed of 30 miles 30 seconds after starting from rest. We believe that, under normal conditions, the average speed will be about 30 miles an hour. It will be remembered that the system adopted is the multiple-unit, and British Thomson-Houston motors and apparatus will be used exclusively in the equipment of the line. The cars are of the open corridor type, and are mounted on two four-wheeled bogie trucks supplied by the Brush Electrical Engineering Company. Perhaps the most important result of Sunday's trial was on the point of acceleration. The motors clearly demonstrated their ability to attain a speed of 30 miles an hour in 30 seconds, which is the acceleration obtained on the Central London Railway. The motors, of which each motorcar is equipped with two, are each of 125 h.p., and are supplied with current from the rail conductor at 550 volts. When the line is in full operation there will be 30 trains in use, a train being made up of two motorcars and a trailer, with a carrying capacity of 200 passengers. The coaches will be both lighted and heated by electricity. The idea is to give a fast and frequent service in the districts around Newcastle and Tynemouth, in the hope of reviving traffic lost since the advent of the electric tramways. Within the next fortnight it is expected to make some further trials, by which time the electrical equipment will probably have been carried as far as Walker Gate on the Wallsend route.

Determining Latent Heat of Evaporation.—In the current number of the *Proceedings* of the Royal Society of Edinburgh there is printed a lengthy paper by Mr. A. Cameron Smith, B.Sc., in which he describes a direct electrical method of determining latent heat of evaporation at the boiling point. In this method the liquid of which the latent heat is to be determined is contained in a glass vessel which is suspended by a fine wire from the hook of a balance, and the amount of electrical energy is measured which is required for the evaporation of an observed mass. The electrical energy is supplied by a large current passing through a small resistance in the liquid itself. In order to reduce heat losses as much as possible, the vessel carrying the liquid and the resistance is completely surrounded by a double-walled shield, which is filled by the saturated vapour of the liquid itself. The estimation of the electrical energy supplied necessitates the measurement of the current, C (amperes), the resistance, R (ohms), of the heating coil, and the time in seconds, T, during which the current flows. It is expressed by $C^2 R T$ joules, and if M be the mass evaporated in grammes, the latent heat expressed in joules per gramme becomes $C^2 R T/M$. Enumerating the advantages of this method, the author states that in nearly all methods the total heat is measured and the latent heat deduced from an assumption of the mean specific heat In this method the latent heat is determined directly. Again, the latent heat is obtained by an electrical measurement, which may be made more accurately than is possible when the results depend on the reading of an ordinary mercury thermometer. As a result of several very trustworthy determinations with in the last decade, the value of J in electrical units for various calories is known to at least 1 in 2,000. The experiments made by the author have so far had the end in view of testing the reliability of the method, and for this purpose water has always been used, in order to enable a comparison to be made with Regnault's result. Taking this as 536·3 (calories at 15deg.), and Joule's equivalent J = 4·187 (calorie at 15deg.), this gives the latent heat in joules per gramme = 536·3 × 4·187 = 2,245·5. Compared with this, the numbers 2,249, 2,264, 2,266 have been obtained in the order given. These numbers seem to indicate a value somewhat higher than Regnault's, but they were obtained with forms of apparatus which subsequent experience showed to be unsatisfactory in several respects. It is hoped that with the present form more concordant results may be obtained. Experiments for this purpose are being continued.

Jungner-Edison Accumulator.—On account of the more or less mysterious particulars as to a new accumulator, designed, in Edison's opinion, to bring about a total revolution in the province of electric traction by accumulators, M. U. Schoop in a recent number of the *Elektrotechnische Zeitschrift* records the results of a comparative investigation of the familiar lead accumulator and Edison's alkali accumulator, this investigation being the more interesting as the Edison's accumulator has so far not been put on the market. The Swedish chemist, Dr. Jungner, as is known, has simultaneously with, and even most likely before, Edison been granted letters patent for a similar galvanic combination, based on the fact that nickel oxide fixed in a suitable way on a support constitutes an available depolariser. Whereas for purposes of transportation the present lead accumulator presents many drawbacks, the first of which is its heavy weight, local lead accumulators in connection with which both the weight and the space do not play but a secondary *rôle*, have arrived at so high a degree of perfection that no other type of storage battery is required for this case. The parallel between the lead and alkali accumulator, though not being complete, goes to show that nickel sheets or steel sheets plated with nickel in alkali solution when exposed to the effect of currents will not be altered in the least even after weeks, corrosive effects, as in the case of the lead peroxide plate, being never observed. The author, however, thinks it possible that the active masses as present in perforated cells in the

Digitized by Google

form of compressed powders, devoid, it appears, of the adhesive properties of lead salts, should drop from their supports in course of time. A diminution in capacity, the author thinks, would be avoided by heating the electrodes. The alkali cell would finally be inserted into an automatic charging and discharging device, allowing of 200 to 300 discharges and charges being made during one month. Particulars as to these experiments will be published later on. As regards the life of lead accumulators, even in the best types as is known, the positive lead support is gradually destroyed by oxidation, the negative mass diminishing progressively in capacity. The demand for a satisfactory durability is, therefore, absolutely in disagreement with the demand for a small weight. On the other hand, it is inferred from the tables recording the experiments of the author that the alkali storage battery, beside some evident advantages, presents for the moment as many and as important drawbacks. The author, however, thinks this type of accumulator to be as capable of further development as the lead accumulator was in its earlier stages, so that all these drawbacks might in course of time become eliminated. From results of tests made on the Edison battery in this country which we have knowledge of, it is evident that this battery is doing good work, and that it is much more hardy in constitution than lead cells. Unfortunately the results cannot be made public at the present time.

Technical Education in America.—Early in the present year Dr. R. Mullineux Walmsley, the principal of the Northampton Institute, Clerkenwell, made an educational tour in America for the purpose of investigating the present conditions of higher engineering education there and its relations to the various industries for which the students are being trained. In view of the transitional condition of technological and all forms of higher secondary education in England at the present time, Dr. Walmsley's report, which has been issued this week by the governing body of the Northampton Institute, is of very considerable interest. During the tour, which occupied close on three months, the principal visited over 100 colleges, institutions, schools, and industrial works, and he has produced a report replete with the fullest information of what is being done in America in the interests of technical education. The document is so full of interesting matter that the short abstract we are able to give of it by no means does justice to the subject. There is, however, one point on which Dr. Walmsley's remarks particularly appeal to us, and that is with regard to the attitude of employers regarding the general value of the work carried out by the schools and institutions. Put briefly, it may be said that the large majority of manufacturers and employers regard the work done in the colleges as being of material and vital importance and absolutely indispensable to the development and progress of the engineering industry. What they want in America is "an adequate supply of trained and disciplined brains," and they are prepared to go to any length within reason to ensure the continuity of such a supply. Another direction in which the action of employers and manufacturers has materially helped the schools in their work is in the donation of engineering appliances upon a working scale, and the provision of facilities for the students to make real engineering tests outside the walls of the colleges. To sum up with regard to higher engineering education, the parents of would-be engineers, recognising the importance of a thorough training and its influence on the subsequent careers of their sons, are willing to incur the expense of continuing their training up to 22 or 23 years of age. The schools are numerous, well equipped, and fairly well staffed, and their curricula, on the whole, are well adapted to the requirements of the profession; and the employers and manufacturers are convinced of the importance of the training given in the schools, and for the present are willing and able to find places for and to give a fair chance to every graduate turned out, and also to render assistance in many ways. Dr. Walmsley's remarks on horological education may be taken as coming from a man who has a special knowledge of the subject. From what he has seen in America, he thinks it may be concluded that schools in horology which exist in the States have absolutely no appreciable effect upon the manufacturing industry. Dr. Walmsley promises a more technical report later on, and we shall watch for it with interest.

Tesla Split-Phase Motor.—An important and far-reaching decision has been given by the American Courts in some legal proceedings in which the validity of the Tesla split-phase patents was the question in dispute. The importance of these patents is great, as some of the most successful alternating-current meters and motors of small size are tributary to them. The defendants' device, against which the suit was directed, was the Sangamo electric meter, and the American Courts have decided that this is an infringement of Tesla's patents. We have been favoured with an official copy of the decision of Judge Archbold, who tried the case in the United States Circuit Court, from which we are able to gather that the principal defence was a publication by Ferraris in March of 1888 on the rotary field and of the means for obtaining polyphase from single-phase currents. The Tesla patents were not applied for until some nine months later, but the Courts held that the testimony in the case showed conclusively that Tesla had early in May, 1888, a complete grasp of the split-phase idea; and not only was the invention beyond question carried back by it to that period, but the patent not being able to be worked out in a day, ground was thus laid for an earlier date, if there were fair evidence to warrant it. The judge decided that there was such evidence showing that Tesla disclosed the principles of his invention to his patent agent at a date prior to April 22. The date claimed by Tesla of his discovery was September, 1887. On the question of infringement, the judge considered that the construction of the defendants' meter was in effect a motor in which the armature was operated upon by two independent interconnecting circuits produced by passing through them a divided and dephased alternating current derived from a single source, this apparently realising the patents in question. The short finding of the Courts, therefore, is that the Tesla patents for split-phase motors are valid and have been infringed. The most interesting part of Judge Archbold's judgment is that in which he discusses the contention raised by the defendants that a meter is not a motor, and that on this ground of itself there could be no infringement. The learned judge said that, "while the Tesla patents contemplate the production of power, they are silent as to the amount of it; and as a meter armature rotates against the action of a permanent magnet and turns a spindle which operates the registering devices, the production of some power is necessarily involved. It is somewhat aside from the question, but still it is a circumstance that Gutmann himself, in accordance with whose patents the meters in question are constructed, recognises and claims therein that this device may be used for power purposes also. No doubt the strict object of a meter of this class is to measure and record the element which passes through or actuates it—gas, water, the electric current, or whatever it may be; but where, as here, it is in mechanical construction, nothing more than an adapted motor with meter attachments, it cannot escape infringement on the plea."

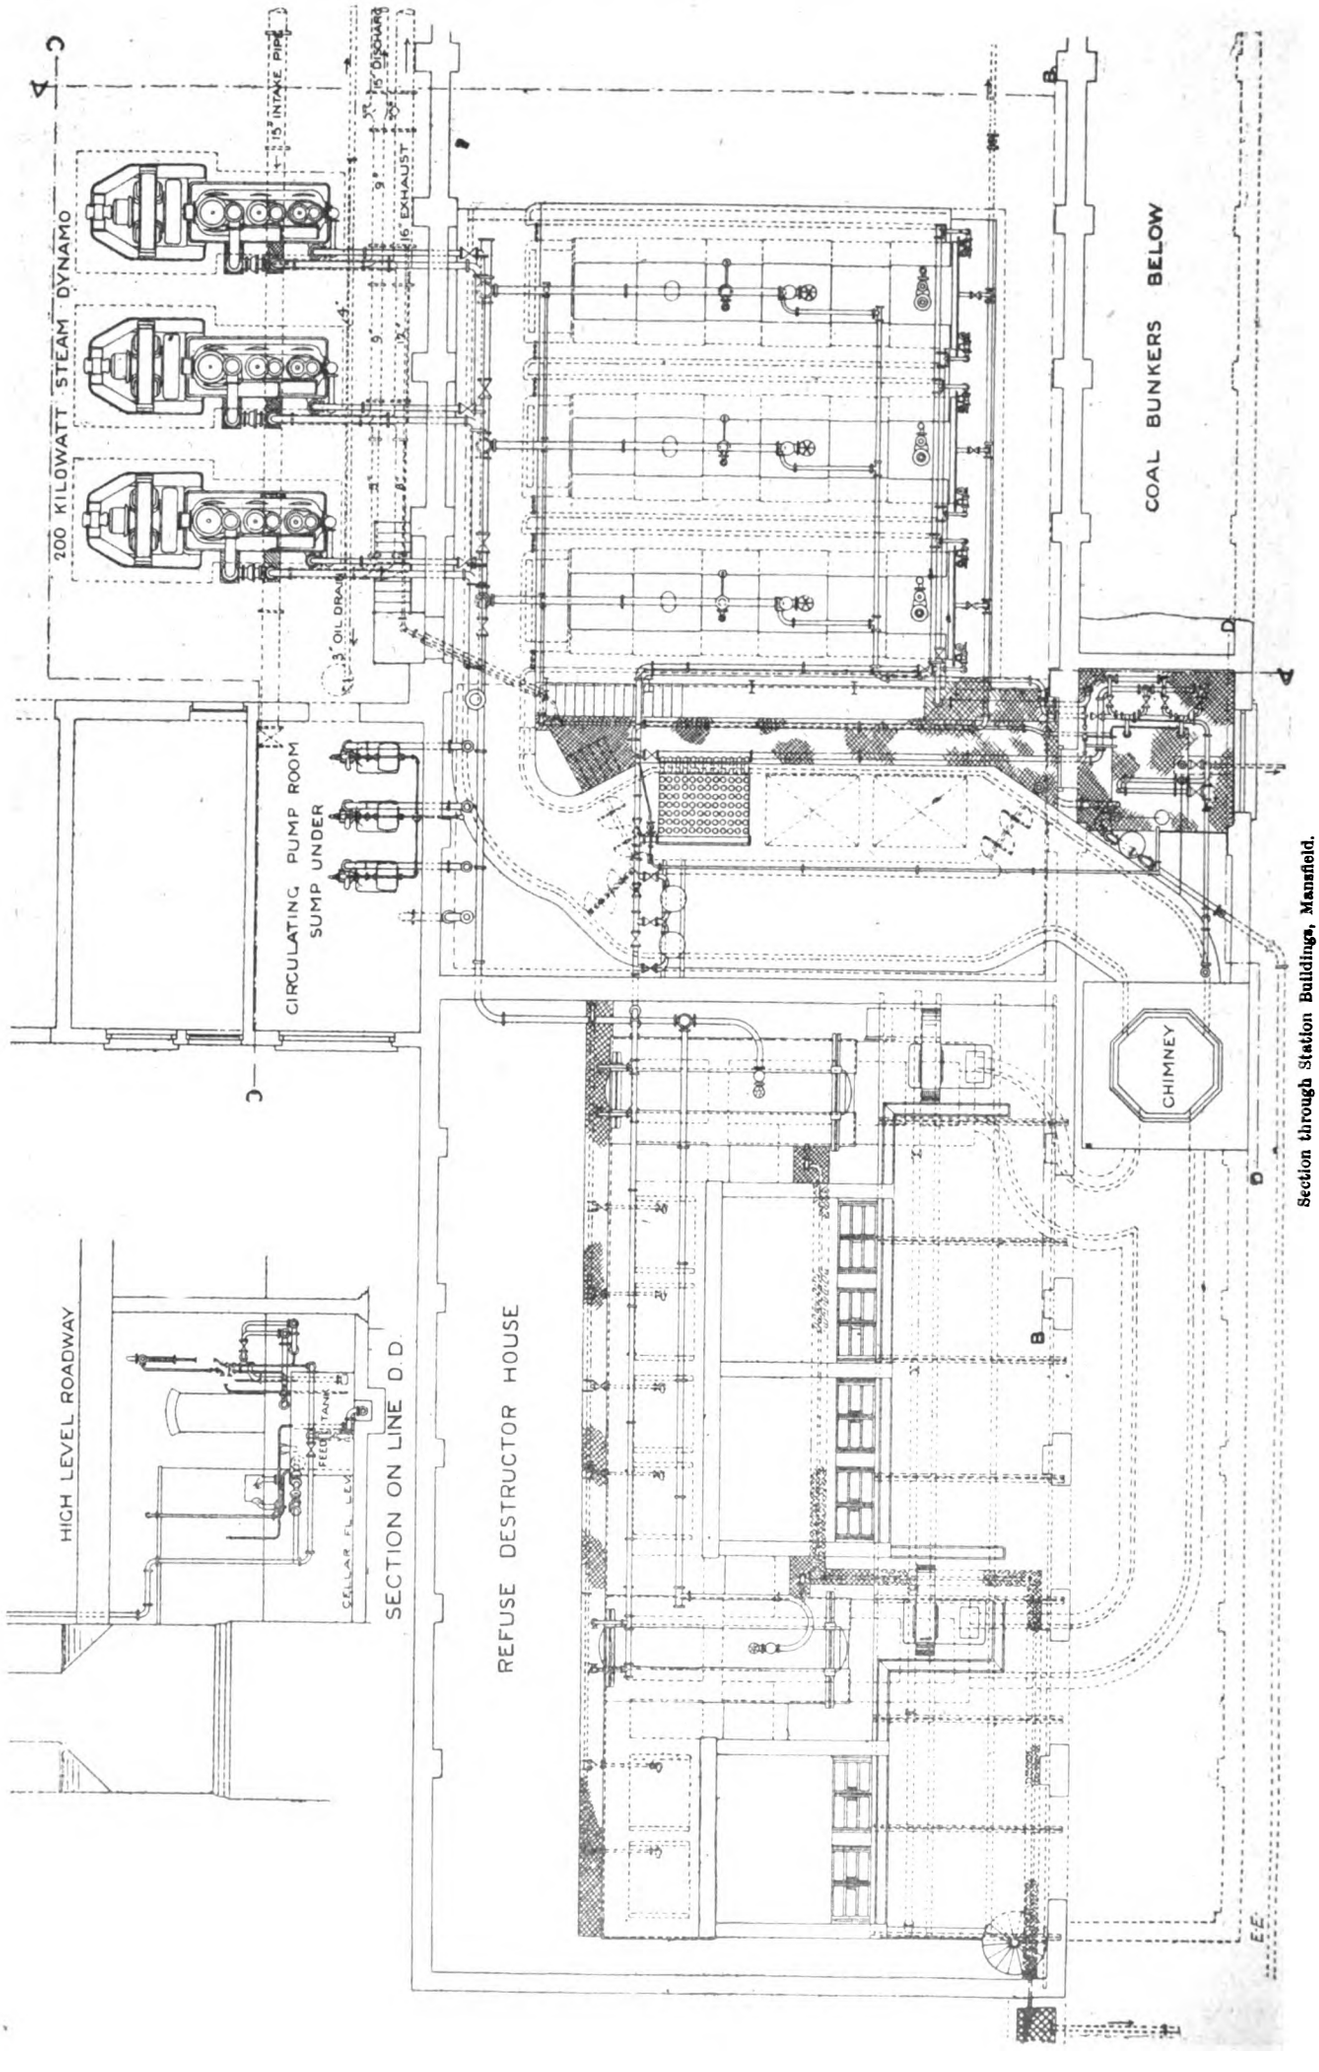
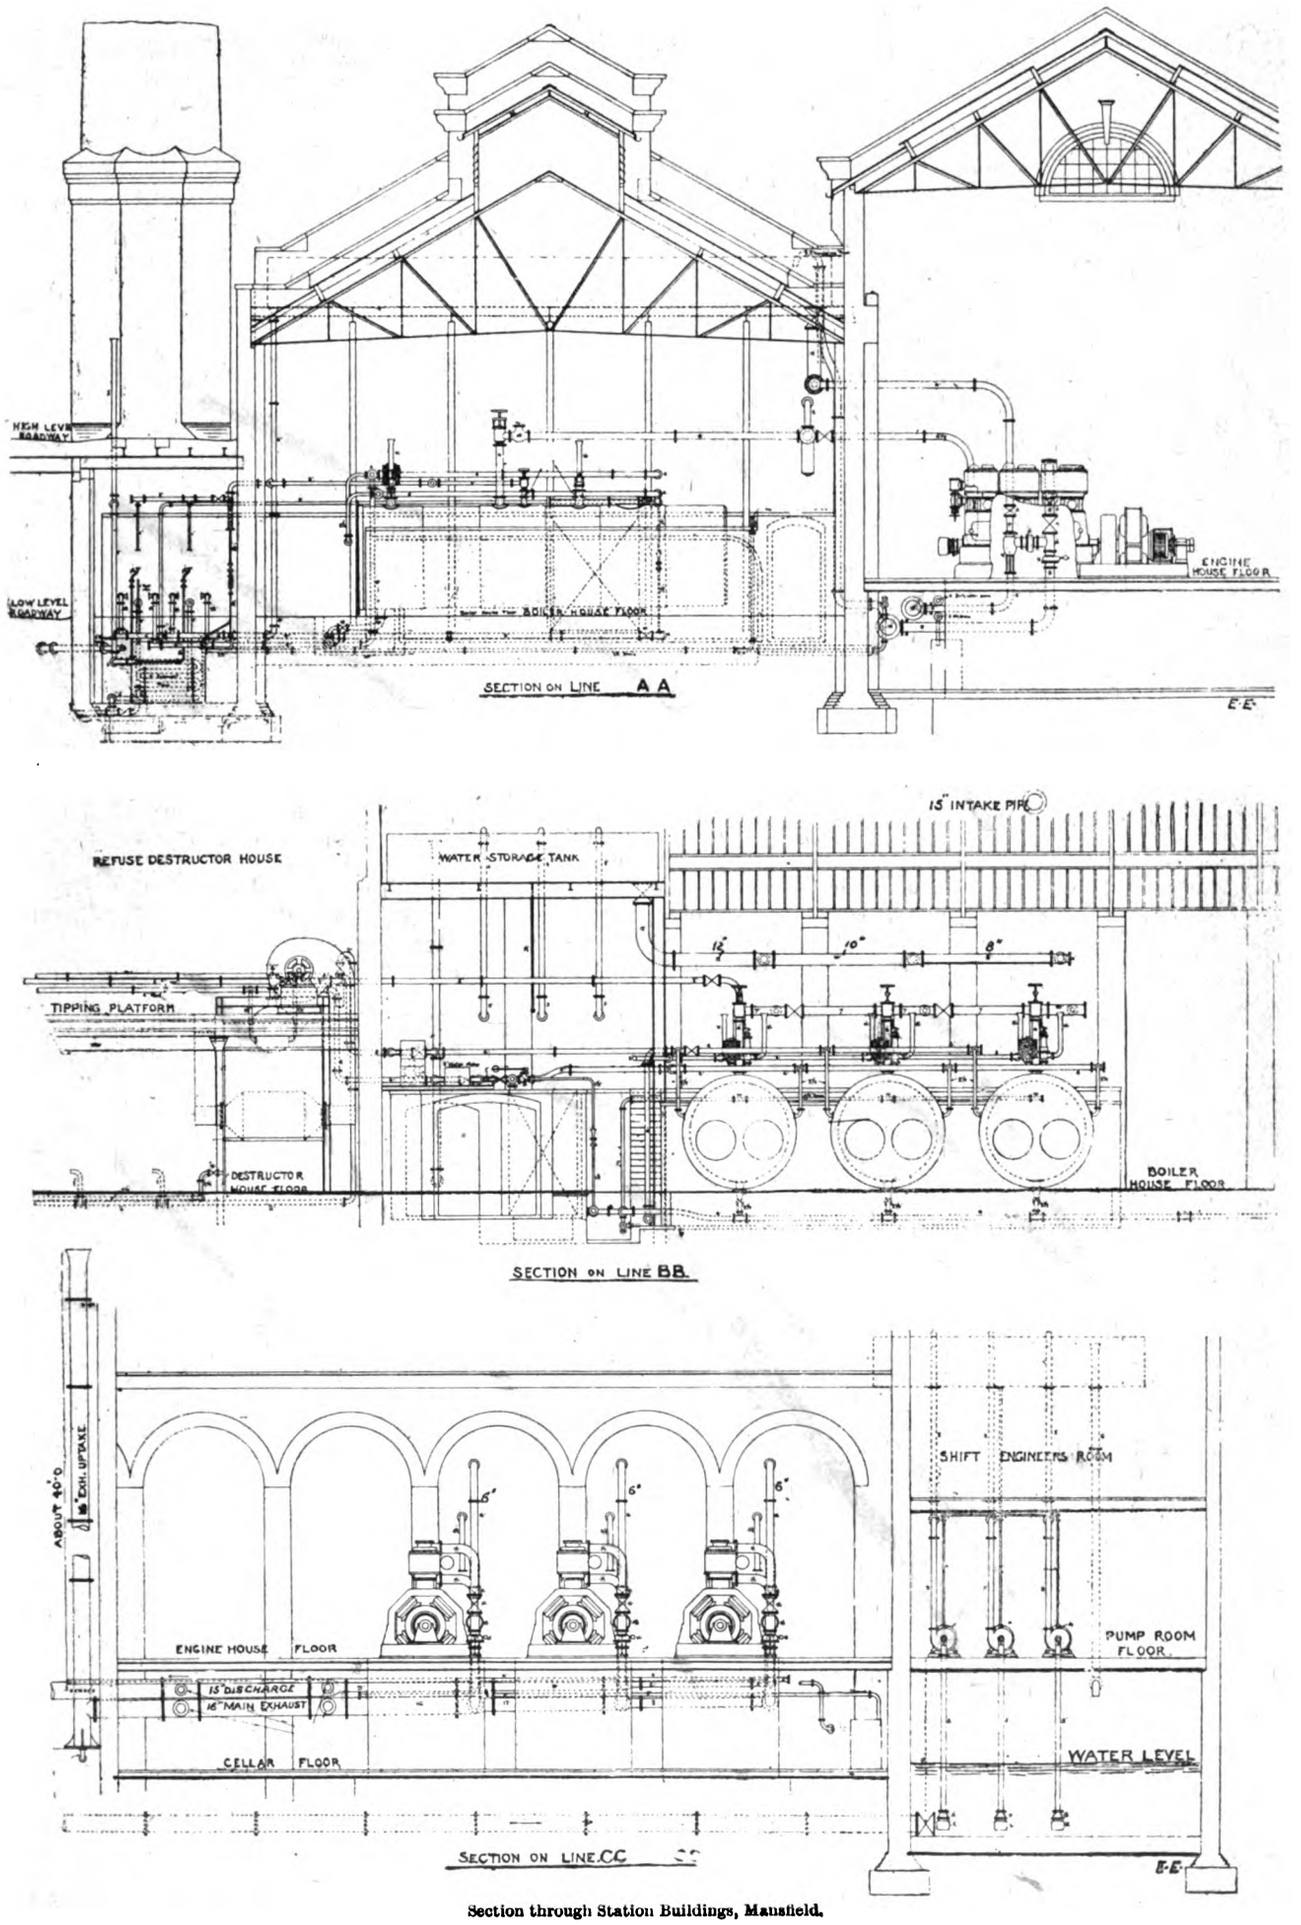
MANSFIELD ELECTRICITY WORKS.



Section through Station Buildings, Mansfield.

Digitized by Google

The thriving market town of Mansfield, which is situated on the fringe of Sherwood Forest, and within a few miles of the famous "Dukeries," is now in possession of thoroughly equipped electricity and refuse-destructor works. The town has a population of about 25,000, with a rateable value of over £70,000, and is growing rapidly.



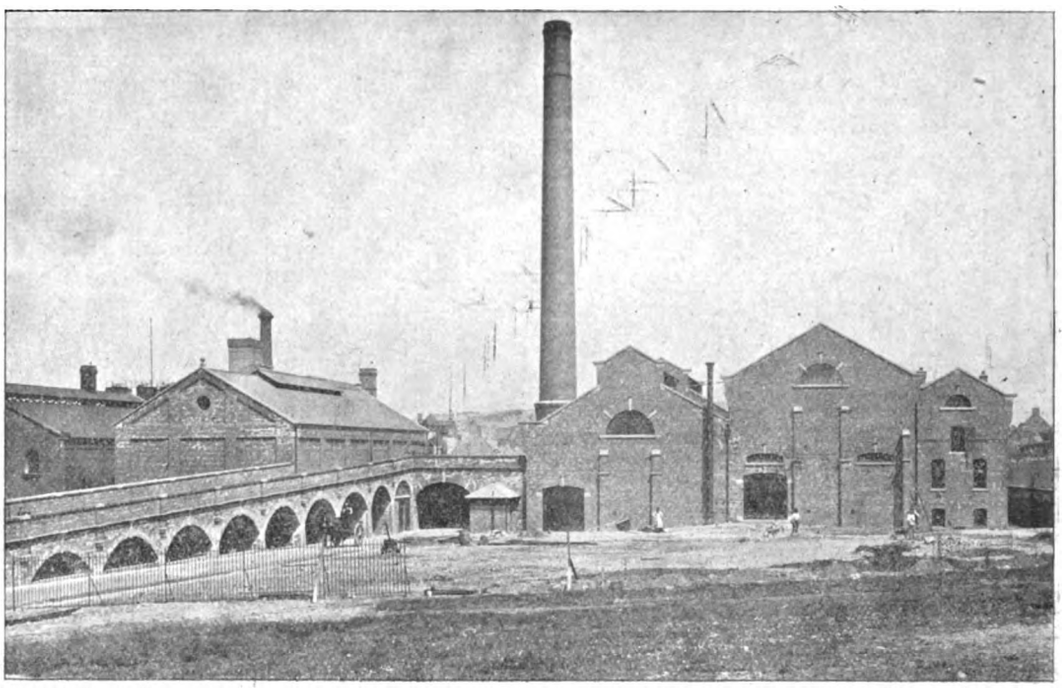
Section through Station Buildings, Mansfield.

The electricity works have been erected on a portion of Burdan's Estate, at an approximate cost of £50,000. At

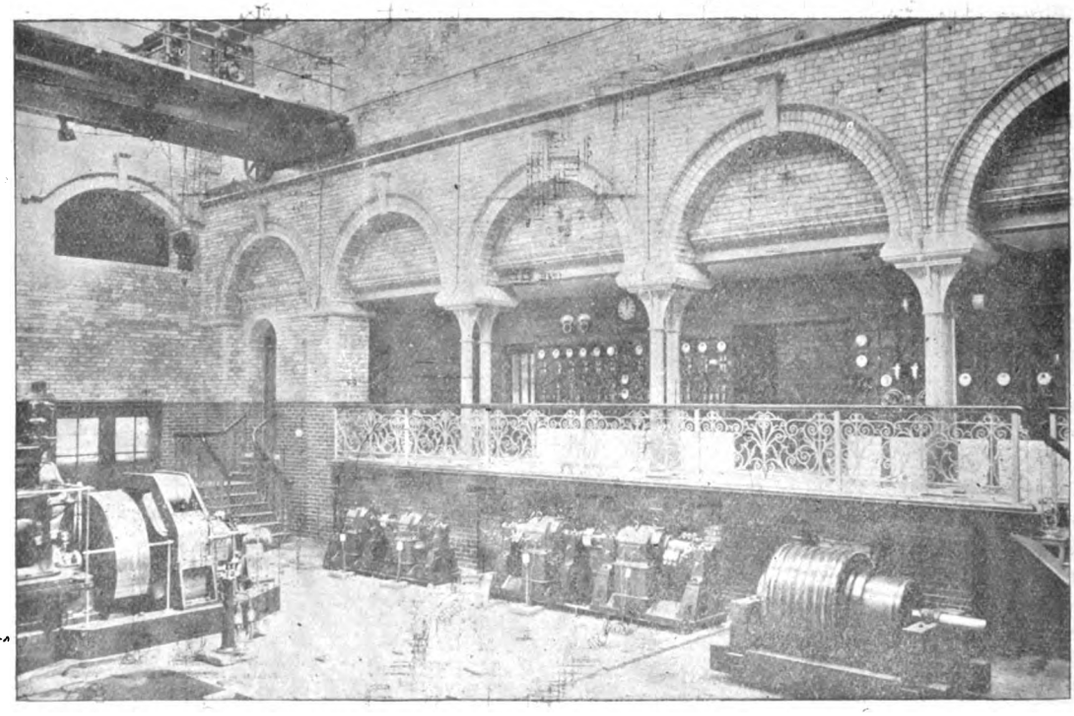
Digitized by Google

present the Corporation are providing a supply principally for lighting purposes, but the works have been designed to permit of further extensions in view of a contemplated project of electric tramways. Mr. Robert Hammond, M.I.C.E, has acted as consulting engineer, and Mr. R. Frank Vallance, the borough surveyor, was the architect. The buildings, which are constructed of brick with stone dressings, comprise engine-house, coal boiler-house, destructor house, and offices. The engine-room is 64ft. by 40ft. and 45ft high. The internal walls are of buff brick, with a green glazed dado above a brown glazed plinth. The coal boiler-house is 72ft. by 47ft. and 42ft. high, and the destructor house is 75ft. 6in. by 48ft. and 45ft. in height. The chimney stack is 150ft. high, and is of the special design of the Alphons Custodis Chimney Construction Company. Coal and refuse are brought to the works up an inclined roadway carried on arches.

The boiler-house contains three Lancashire boilers by Jno. Musgrave and Sons, Limited, of Bolton. Each boiler is 30ft. long by 8ft. in diameter, capable of evaporating 8,000lb of steam per hour. They are made of steel throughout, and are constructed for a working pressure of 160lb. per square inch. Each boiler is mounted with a complete set of Baldwin's patent "Safety" mountings, including an "Anti-Friction" high steam and low-water safety valve, in which the friction is reduced to a minimum by the lever coming in contact with the roller bearings; a "Self-Assisting" dead-weight safety valve and spring safety valve, combined on one base, the valves having bores of 2in. and 3in. respectively, and being designed so that the escaping steam assists the valve to blow off more steam without a corresponding increase in boiler pressure; a "Simplex" stop-valve, fitted with patent expansion seating and new grip handwheel, and coupled to an automatic isolation valve, which, in the event of accident or reduction of boiler pressure from any other cause, will automatically isolate the boiler; and a "Betall Accessible" check feed-valve, made of bronze, and arranged to be



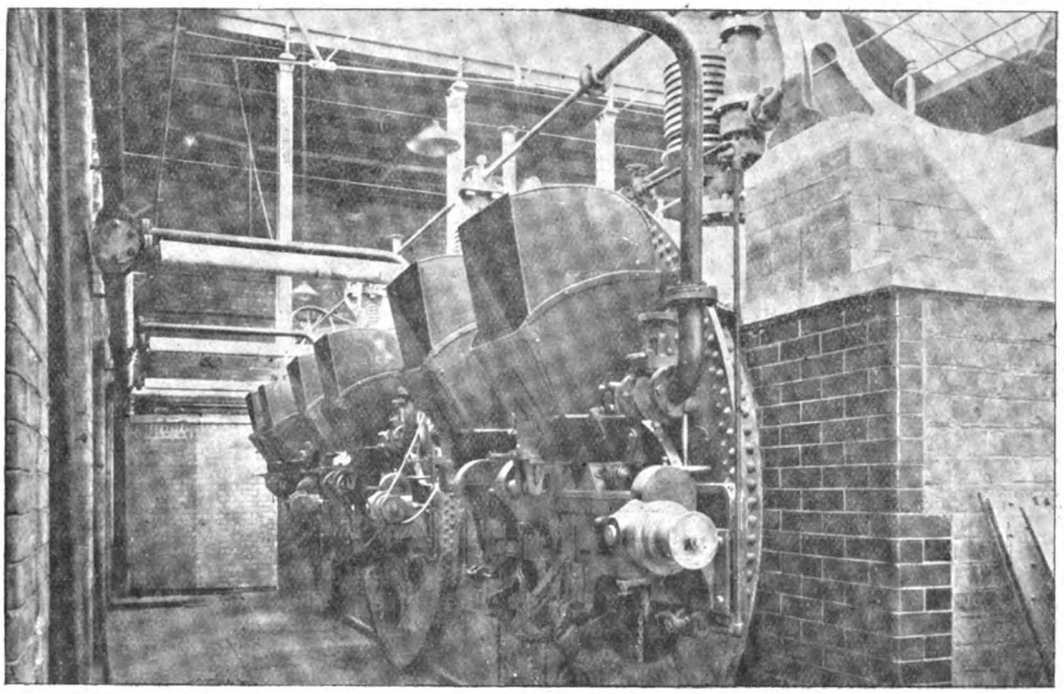
View of Works, Mansfield.



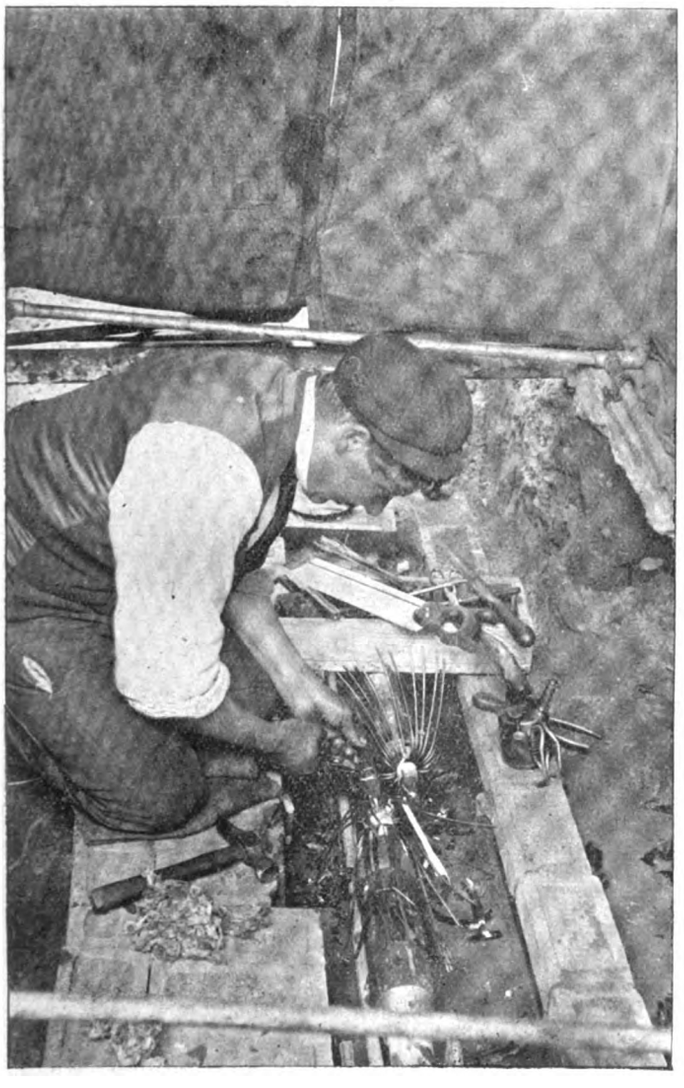
Engine Room, Mansfield.

Digitized by Google

operated from the firing floor. This valve is accessible to the engineer when boiler is under steam, and the valve and seating is also removable and renewable when the boiler is working. The "Nomis" automatic water-gauges, which were also supplied by Messrs. James Baldwin and Co., Devonshire Brassworks, Keighley, are fitted with protectors The boilers are also fitted with Proctor's mechanical stokers. The dampers in the side flues are worked from the front end of the boilers, the balance weight being arranged to work in guides, which are graduated to show the opening in inches and feet. The products of combustion are taken through the economisers or a by-pass flue as required. Water is fed into the boilers by two compound double-acting ram pumps made by Messrs. J. and P. Hall, of Peterborough, with an injector as stand-by; and the feed water can be passed directly into the boilers or alternatively through a Green's economiser containing 96 tubes. A Westinghouse 5-kw. shunt-wound motor drives the shafting for the mechanical stokers and the scrapers for the economiser. The main steam and feed pipes are of lap-welded steel, and the whole of the pipe-work and tanks was entrusted to Messrs. Crompton and Co, Limited, of London.



Boiler Fronts with Stokers, Mansfield.



Making a Joint, Mansfield.

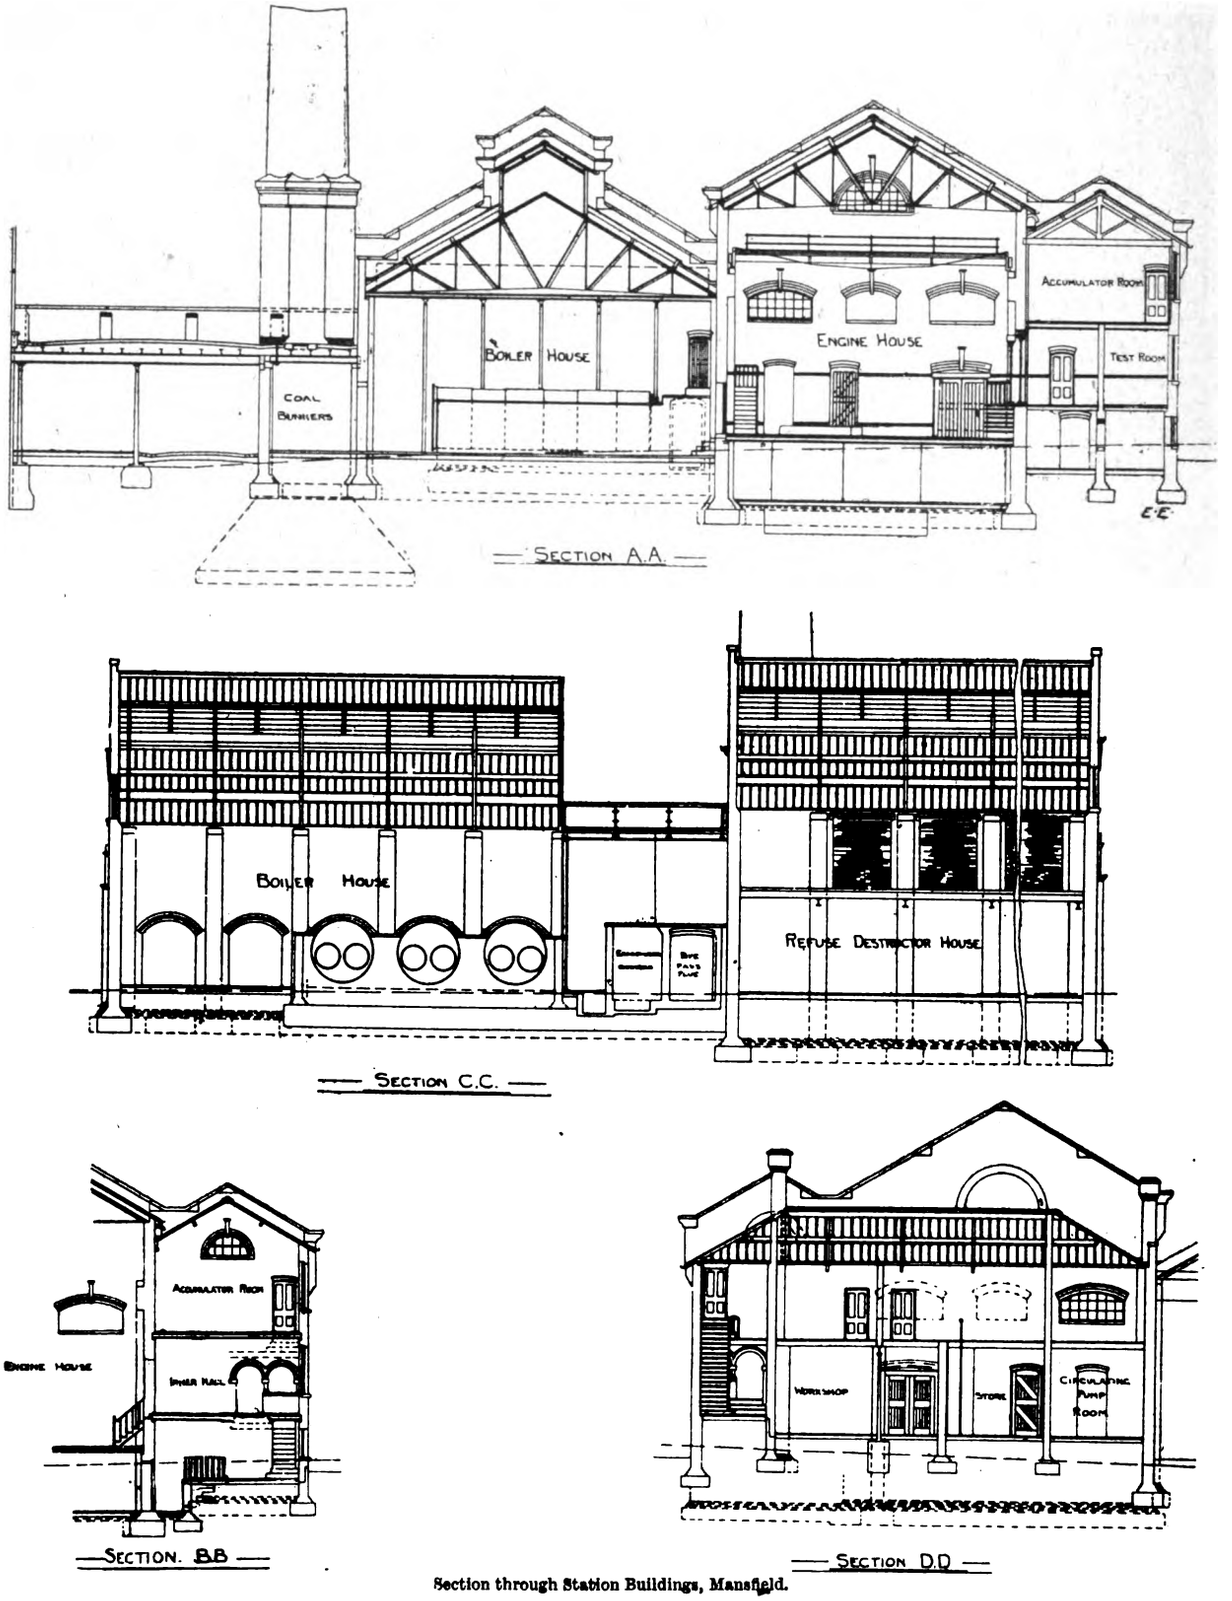
With regard to the engine-house plant, foundations are provided for three similar sets of generating plant, of which two are at present at work. These are triple-expansion engines with three cylinders, working on cranks set 120deg. apart. The normal speed is 360 revolutions per minute, and they are designed to develop 400 i.h.p. with 150lb. steam pressure. Coupled to the engines are multipolar compound dynamos, by Thomas Parker, Limited, Wolverhampton, designed for an output of 200 kw. to 300 kw., according to the conditions of loading. The flywheels are specially heavy, to provide for the fluctuations in the load experienced when supplying power to tramways. Link switches for equalising, compounding, or plain shunt running, with a regulator for altering the compounding, are mounted by the side of each machine. The engines are double-acting, and fitted with special forced lubrication arrangements for long continuous runs. The oil after being forced through the bearings is collected in the crank pit, from which it is pumped through a filter and used over and over again An overhead travelling crane spans the engine-room. It was made by Messrs. Carrick and Ritchie, of Edinburgh, and will lift a weight of 10 tons. A booster is placed in the engine-room, and provides the necessary additional pressure for charging the battery. It consists of two single horseshoe machines, coupled together and mounted on the same bed-plate. One machine runs as a motor, and obtains current from the 'bus bars at 480 to 500 volts. It drives the other machine, which is a generator, and is designed to give a current of 160 amperes at any pressure from 20 to 160 volts when running at a speed of about 800 revolutions. A balancer is also provided for equalising the pressure on each side of

Digitized by Google

the three-wire system. It is arranged similarly to the booster, and is capable of dealing with out-of-balance loads up to 130 amperes. Water for condensing is obtained from the River Maun through a 15in. pipe, which runs from the dam through a special strainer into a tank below the level of the engine-room floor, whence it is pumped by three centrifugal electrically-driven pumps into a large tank over one end of the boiler-house, from which it gravitates through the condensers and is returned again to the stream. Each pump is calculated to deal with 20,000 gallons of water per hour, and the condensers are designed to maintain a vacuum of 24in. under normal conditions of atmosphere with the full load of the engines. They are of the ejector type, and supplied by Messrs. Ledward and Co., sub-contractors to Messrs. Johnson and Phillips, who are responsible for the condensing arrangement generally.

There are two separate switchboards in the engine-room. These were supplied and erected by Messrs. Bertram Thomas, Manchester, and are made up of enamelled slate panels framed in iron, and resting on white glazed brick plinths. One, the dynamo board, deals with the machines and battery, and the other, the feeder board, with the distributing arrangement. The dynamo board has six panels—one for the booster, two for the battery, and three for the dynamos. The feeder board has seven panels—four for feeders, two for works circuit and balancer, and one for the neutral wire. The various panels are fitted with full equipment of measuring and controlling instruments and apparatus. The pressure regulating resistances are mounted separately in front of the dynamo board, and controlled by wheel handles mounted on substantial pillars. The battery contains cells capable of maintaining a discharge of 100 amperes continually for 10 hours.

At present 13¾ miles of cables have been laid, including



Section through Station Buildings, Mansfield.

Digitized by Google

four miles of public lamp cables, supplying 30 arc lamps for street-lighting. The Western Electric Company were the contractors for these cables, which have been laid on the solid system. About 180 tons of refuse is collected per week of six working days, and the object of the Corporation has been to thoroughly cremate without causing a nuisance, and in such a manner as to utilise the heat in raising steam for the electricity works. The destructor, by Messrs. Heenan and Froude, Manchester, has three cells with twin furnaces, with a burning capacity of 30 tons per 24 hours. Two water-tube boilers, each having 1,200ft. of heating surface, are combined with the cells. The buildings, with the exception of the chimney, were erected by Mr. John Greenwood, of Mansfield.

It may be added, in conclusion, that these works were formally opened on June 17 last, the ceremony being marked by appropriate civic dignity.

Mr. Ernest F. J. Holcombe Hewlett was born in Manchester in February, 1866; early education, Broomhouse School, Eccles; grammar school scholarship, 1878; technical education, Manchester technical classes; bronze medal, City Guilds Institute, 1882. He was apprenticed to the Edison Company, Manchester, in 1885, and remained six years, rising to the position of assistant manager. The principal works with which he was connected while with this company were the original Edison central station in Manchester and the Manchester Exhibition lighting, 1887. He left in April, 1891, to take charge of the electrical department of Messrs. Baerlein and Co., Lisbon, for whom he carried out several large plants for cotton mills,

E. HOLCOMBE HEWLETT, BOROUGH ELECTRICAL ENGINEER, MANSFIELD.

etc. In October, 1892, Mr. Hewlett joined the staff of Messrs. Siemens Bros., with whom he remained until July, 1893, when he was appointed clerk of works for construction of the electric lighting plant and mains for the Corporation of Hove. In January, 1895, he accepted the post of electrical engineer to the Rockhampton Gas Company, Queensland, where he carried out numerous improvements in station and plant and a number of contracts in various parts of the colony. In 1897 the Mount Morgan Goldmining Company appointed him consulting engineer, and in this capacity he designed and carried out a complete power, lighting, and tramways scheme for the large works of the company. This station was probably the first in the Empire to utilise the idea of automatic boosting in connection with a battery and variable load, the booster for the work being the first of its kind made by Messrs. Crompton and Co. Early in 1900 Mr. Hewlett decided to devote himself to consulting practice, and in this capacity reported to the Rockhampton municipality on tramways and Mount Morgan on lighting. In the latter part of that year family reasons compelled a return from the tropics to more temperate climes. Returning to England in February, 1901, he joined Mr. Robert Hammond, and in March assisted him at Hackney, and after other work went to Mansfield as resident engineer in May, 1902, and was taken over by the Council as borough electrical engineer on completion of the works. Mr. Hewlett has written several scientific and technical papers, among them being "A Problem in Coal-Pit Lighting," "The Rockhampton Electrical Undertaking," and "The Use of Electricity in Mines." He is a member of the Institutes of Electrical Engineers of England and America, and an ex-member of council of the Australian Institute of Mining Engineers.

Inter-Gang Match.—Last week there was a football match on Mr. E. Sutton's field, by Freshfield Station, between the workmen of Messrs. Dick, Kerr, and Co., Southport gang against Formby gang, the game ending Formby gang seven goals, Birkdale gang three goals.

THE BEXLEY ELECTRIC TRAMWAYS AND ELECTRIC LIGHTING.

Yesterday morning there were inaugurated the electric tramways of the Urban District Council of Bexley, and also the electric lighting system for the district. The area covered by the two systems is about 10 square miles, and there are at present about 15,000 inhabitants within it. The area touches on the one side the metropolitan borough of Woolwich, and on the other connects up to Erith. In fact, it is to Bexley that Woolwich looks to find building sites for its overcrowded inhabitants in the near future. When the Council, therefore, considered the carrying out of the electric lighting provisional order, they were advised by their consulting engineers, Messrs. Mordey and Dawbarn, that they would do well to make the tramway scheme the main portion of the undertaking and to work in the electric lighting as a subsidiary undertaking for the time being. The tramways which are now completed extend from High-street, Plumstead, to the Erith boundary. At the Plumstead end they connect up to the lines of the Woolwich and South-East London Tramway Company, but the gauge is not the same. The reason for this is that the lines of the above tramway company are to be converted for electrical working by the London County Council, who will alter the gauge to their standard. When this has been done it will be possible to arrange for through running right from London to the Erith boundary of Bexley.

Owing to the extremely scattered character of the residential portions of the area, the problem of adequately serving the whole district was by no means an easy one, having in view the comparatively small population and relatively small revenue which might reasonably be anticipated. The scheme which the consulting engineers have adopted is that of using direct current for the tramway work both for distribution and transmission, and the single-phase alternate-current system for the lighting. They have placed the works at Bexley, which is 1½ miles from the nearest point on the tramway, and rather more from the Bexleyheath lighting area. There are some high-class houses to be supplied in Old Bexley near the works, but in the future it seems likely that the bulk of the lighting will also be situated at very considerable distances from the works. This is so because it is at Bexleyheath that building work is mostly being carried on. We are informed that the consulting engineers placed the works at Bexley in order to be near the railway, and to have the advantage of condensing water, which is now obtained from the River Cray. Fig. 1 is an outside view of the works, which shows the substantial character of the buildings which have been erected. They have a handsome appearance, but money has not been wasted on ornamentation. They were erected by Mr. Arthur Faulks, of Loughborough.

The generating plant (Fig. 2) comprises at present only two engines, each capable of developing 150 kw. Each engine is, however, coupled to two machines, one being an alternator of 150 kw. capacity and the other a direct-current dynamo of the same capacity, both having been manufactured by Messrs. Dick, Kerr, and Co. By this arrangement only one engine is required to be run until such time as the combined tramway and lighting loads exceed 150 kw. The effect of this on the economy of the undertaking will be readily appreciated by all station engineers. The consumption of fuel is further reduced by the adoption of a high degree of superheat. The engines, which are of the enclosed vertical compound type, running at 375 revolutions per minute, were constructed by Messrs. Browett, Lindley, and Co., at Patricroft, and are fitted with Schmidt's patent reheater, by which the steam in passing to the high-pressure cylinder gives up a portion of its heat to the steam entering the low-pressure cylinder, thereby reducing the temperature of the steam as it enters the high-pressure cylinder to about 550deg. F., or a little below 200deg. superheat, whilst the steam itself has been superheated to 300deg. The governors are of a sensitive type acting on the high-pressure cut-off. They are fitted with arrangements for controlling the speed whilst running within a

Digitized by Google

range of about 5 per cent. to facilitate paralleling the alternators.

In order to obtain the best possible load factor, a battery of 240 cells of the Hart Accumulator Company has been

50 amperes at 500 volts for eight hours, or 200 amperes for one hour.

Another piece of auxiliary machinery in the generating station proper consists of a rotary converter, the function

tramway. Thus, whilst the current given to the tramways will fluctuate from zero to an amount considerably exceeding the normal full load of one engine, the engine itself will be subjected to a steady load a little in excess of the mean of these fluctuations. The accumulators are capable of giving

board (Fig. 3), supplied by Messrs. Johnson and Phillips, consists of a row of panels 29ft. long. Those which relate to the alternating-current work are of white marble, whilst, for the purpose of making a permanent distinction, the tramway panels are of polished black slate. The instru-

Digitized by Google

ments are of the usual character, but on the alternating-current side the switch arrangements are such that any circuit can be instantly thrown over to either of two omnibus bars. Each feeder has been fitted with a meter.

The boiler-room (Fig. 4) contains three Lancashire boilers by Messrs. John Fraser and Son, of Millwall, with space for a fourth, and two Schmidt superheaters, supplied by Messrs. Easton and Co., of Erith, each arranged for a pair of boilers. The boilers are fitted with Benniss automatic stokers driven by a direct-current motor off the tramway omnibus bars, the hoppers of the stokers being automatically kept full by the inclined bunkers above them. The bunkers are arranged on a platform reached by an inclined roadway, which permits of the coal being shot directly into them from carts. The boiler-room contains the condensing plant, which comprises a Cole, Marchent, and Morley compound steam air-pump of the Edwards type. The condenser is of the simple jet type. A fuel economiser, constructed by Messrs. Arthur Lowcock, Limited, of Shrewsbury, has also been erected, in addition to a large feed-water tank. A Brunn-Lowener water softener has been supplied by Messrs. Lassen and Hjort. The heat required for this apparatus is supplied by turning into it the exhaust steam from the Weir feed pumps, of which one is a stand-by.

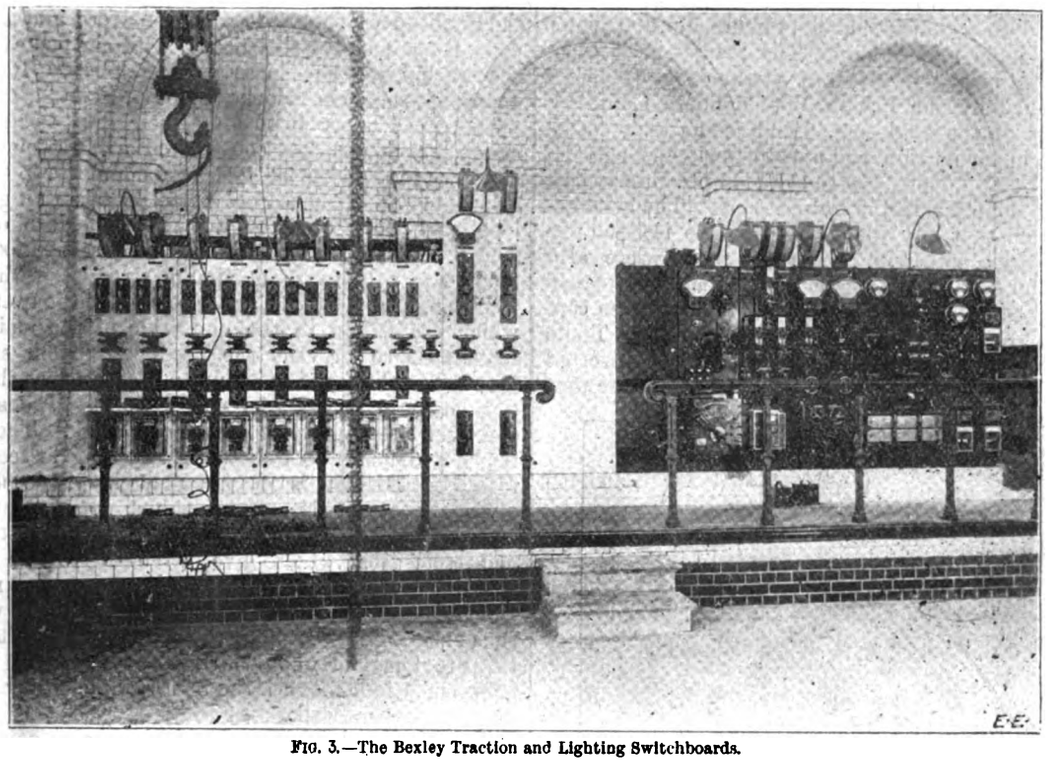

FIG. 3.—The Bexley Traction and Lighting Switchboards.

A fitters' shop is provided, easily accessible either from the engine-room or from the boiler-room. A suitable store room is also provided and excellent lavatory arrangements which include a bathroom. An engineer's office and the accumulator-room complete the building arrangements. The accumulator-room has been arranged to be entirely

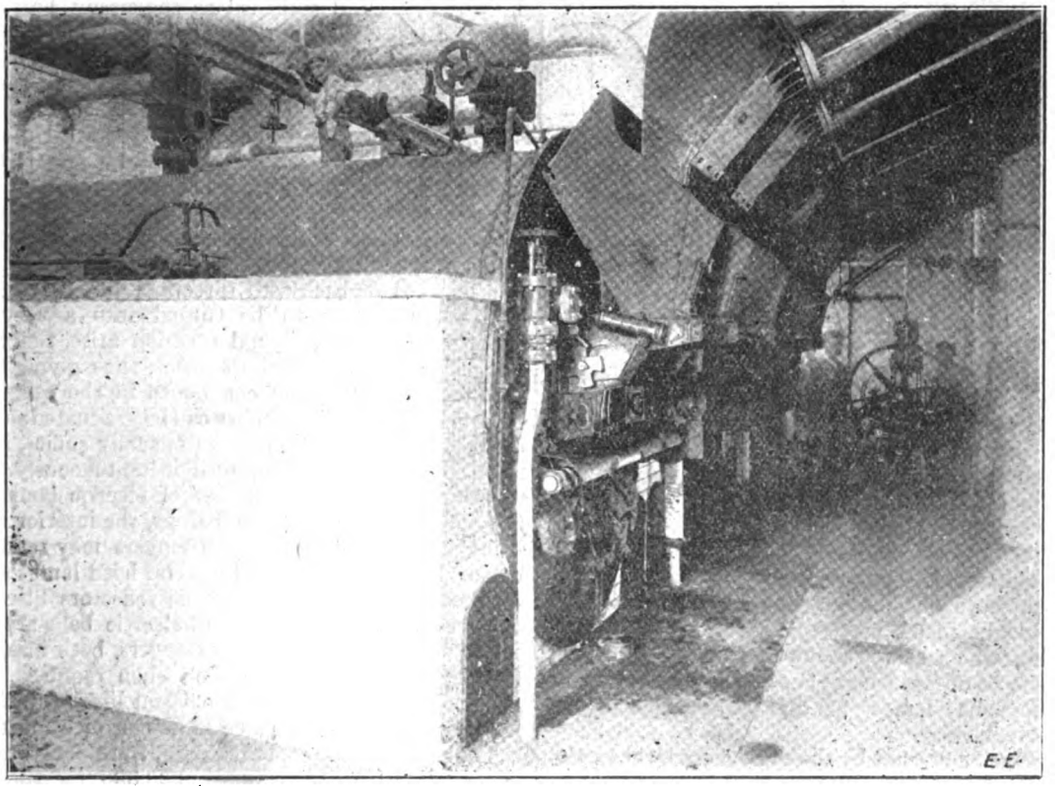

FIG. 4.—The Boiler House, showing the Fraser Boilers and Benniss Mechanical Stokers.

Digitized by Google

shut off from the engine-room, and is only accessible from outside.

The whole of the cables have been supplied by the Anchor Cable Company, of Leigh, Lancs. The high-pressure cables, which are worked at 2,000 volts, are of the concentric type, insulated with paper and lead sheathed. They are laid in stoneware troughs filled in with bitumen. The low-pressure distributing cables are triple-concentric paper-insulated and worked at a pressure of 200 volts on each side of the middle wire. The transformers have in all cases been placed in cast-iron kiosks (Fig. 5) above ground, supplied by the British Westinghouse Company to the design of the engineers. Each contains a transformer in the upper portion and a set of switchgear in the base reached by two doors, one to the high-pressure switch and fuses and the other to the low-pressure. The arrangements are such that any distributor can be isolated by merely opening a switch. The transformers were also supplied by the British Westinghouse Company.

At each transformer an earth connection has been connected on to the middle wire, and the Board of Trade have required that a recording ammeter shall be inserted in each of these connections to earth. We presume that

FIG. 5.—View of the Bexleyheath Electric Tramway, with Lighting Transformer Kiosk in the foreground.

the earth connection has been made in order to bring the distributing system under the low-tension regulations of the Board of Trade. It remains to be seen how this earthing at a large number of points on the low-tension network will work in practice, and we shall not be surprised to hear that a portion of the returned current from the tramways is carried at times through the zero wire of the electric lighting system.

The tramway cables are insulated with vulcanised bitumen laid in wooden trough run in with bitumen. The length of high-pressure lighting feeders is about 10 miles, and the low-pressure distributors will, in the course of a few weeks, amount to 8½ miles, exclusive of the street-lighting cables, which serve about 260 lamps, of which about 110 are to be 60-c.p. Nernst lamps, and the remainder 32-c.p. incandescent lamps. These will light about 14½ miles of streets.

The car-sheds were erected by the same contractor as the generating station and are similar in general character. There are six tracks, providing for 18 cars. There is a paint shop, a blacksmiths' shop, and a carpenters' shop, as well as a messroom, an office, and a storeroom. The whole of the tracks are supported on brick piers in such a way as to leave the whole floor clear below the cars in order to facilitate inspection, cleaning, and repairs.

The tramway rails weigh 90lb. per yard and are of Belgian make, the contractors being Messrs. Alex. Penney and Co. The contractors for the permanent way were Messrs. G. J. White and Co.; the length of the route being about 5¼ miles of single track with passing places. The overhead equipment was carried out by Messrs. Dick, Kerr, and Co., who also supplied the cars.

The rolling-stock for the tramways consists of 12 cars of the double-deck, reversed-stairway pattern, and are mounted upon Brush Company's trucks. The car bodies have been constructed at the works of the Electric Railway and Tramway Carriage Works, Limited, Preston, for the contractors, the latter furnishing their own electrical equipments, which are also constructed at Preston. The cars have seats inside for 22 passengers and for 30 passengers on the roof, making a total of 52 in all, having an overall length of 26ft. 6in. and a maximum width of 6ft. 9in. The floor frames are built of well-seasoned oak of such sections as will ensure maximum strength with minimum weight. The platforms are supported on four steel angles, which are bolted to the underside of the main flooring; truss rods to prevent the car bodies from sagging are inserted in the framing in such a manner that they may be tightened up as necessity may require. The side frames and roof framing are of best English ash. The roofs are triple, and consist as follows: The ceiling as seen from the inside of the car is of three-ply maple veneer, which gives a very handsome appearance to the interior, and also serves to conceal the main framing, consisting of ash and steel ribs, which give strength to the structure. Above the framing is fitted a light wooden roof, upon which is laid a heavy canvas saturated with white lead, thus ensuring the roofs shall be entirely watertight. The third roof is laid upon thickness strips above the canvas before-mentioned, and is the flooring upon which the upper-deck passengers walk.

The electrical equipments of these cars consist of two motors mounted one on each axle, together with the necessary controllers and usual accessories, such as trolley circuit breakers, resistances, etc. The course of the current from the trolley wire to the rail is as follows: The trolley wheel fixed to the upper end of the pole collects the current from the wire, the current being led down the pole and standard to the circuit breakers by an insulated cable. From the circuit breaker it passes to the controller which is in operation, and thence to the resistances and motors in such a manner that the speed of the car can be regulated as desired. Each of the motors weighs approximately one ton, and several samples were picked out by the consulting engineers and tested at the makers' works to ensure that they came up to the guaranteed efficiency called for under contract. Each motor can develop 25 h.p. continuously for one hour if called upon. The controllers, besides operating the cars in a forward or backward direction, are so designed as to enable the motors to be turned into a very powerful electric brake, and, should occasion arise, the car can be stopped within a very short space, thus giving the motorman entire control and confidence in the carrying out of his work. The braking effect can be graduated so that while a moderate application only will usually suffice, if necessary the full effect may be applied instantaneously. The cars are illuminated by a number of electric lamps mounted in handsome polished brass fittings, the interior of the cars being so illuminated that passengers may read with the utmost facility at night. Powerful head lamps are fixed in separate fittings having parabolic reflectors fitted in front of the cars. Several circuits of electric bells are also fitted so that the conductor and passengers, both inside and out, can signal to the driver to stop when required. The cars are also equipped with very efficient lifeguards designed to pick anyone up who may be in danger of being run over.

The authorised capital expenditure for the combined scheme is £103,813—namely, £88,320 for the tramways and £15,493 for the lighting. The actual cost of the work now practically completed is well within these estimates. The capital charge for lighting is kept low owing to the electric lighting being treated as an accessory to the traction scheme. Thus under this heading only the cost of the electric lighting mains, the transformers, and the

Digitized by Google

alternate-current plant in the station is included. The equivalent of about 2,000 8-c.p. lamps are now connected to the mains or applied for.

INDEPENDENT TELEPHONY IN GREAT BRITAIN.

BY GARDNER AND HOLME.

Since the passing of the Telegraph Act in 1899, giving Corporations powers to establish telephone exchanges, there has been considerable discussion on the capital cost, maintenance, and general construction of such systems, but until the exchanges had been established no actual figures were forthcoming. There are now from 20 to 30 exchanges established by Corporations, and it is proposed to give a series of articles on the construction, capital cost, and management of such exchanges. For the convenience of reference the subject will be treated under 12 headings.

(1) *Capital Cost.*—In any commercial undertaking there are three main considerations—viz., capital outlay, income, and expenditure. The capital cost of a telephone undertaking will be thoroughly gone into with the view of establishing a standard unit of construction on which to base estimates.

(2) *Maintenance.*—The cost of upkeeping a system when once established. Depreciation of a system.

(3) *Tariffs.*—Taking the capital cost and maintenance of a system, standard rates of subscription will be deduced.

(4) *Management and Switching Systems.*—The management and control of a system and the various methods of switching.

(5) *Underground Construction.*—The very latest method of carrying out this under direct supervision of the Corporation.

(6) *Overhead Work.*—Running of wire and making off. Erecting large poles, a point so far never touched on in any telephone book.

(7) *Junctions and Trunks.*—Methods of assembling material. Wayleaves.

(8) *Exchange Constructions.*—Modern test-room equipment. Fitting of switchboards.

(9) *Power Plant Construction.*—This latest development in telephone work will be thoroughly described. Management of accumulators.

(10) *Instrument Construction.*—Fitting of instruments and small boards.

(11) *Testing.* — Rapid testing apparatus for faults. Wheatstone bridge.

(12) *Private Installations.*

Capital Cost of a Telephone Exchange System.

To estimate the cost of a telephone exchange system, various local circumstances must be taken into consideration, as some towns are more concentrated than others, and the length of junction lines connecting the various exchanges together vary considerably. Then, again, the amount of spare plant to be laid down ready for extensions is an important item.

The Portsmouth Corporation has laid 90 per cent. spare duct accommodation when constructing their telephone system. There are three main items in the construction of a telephone system—viz., switchboards, instruments, and cables. The first two items can be extended as the demand for lines arises, but in the cables it is necessary to carry more wires than are for the time being required, as it is impossible to distribute the numbers of wires in any district to the number of orders received owing to telephone cables being made in standard sizes. Thus, if in one district there was a demand for 28 telephones, it would be necessary to carry 36 pairs of wires in the distributing cable. It must be borne in mind that each subscriber has a separate pair of wires from his office direct into the exchange. The question then arises how much spare duct accommodation should be laid down ready for drawing in new cables should it be found in the course of time that the demand exceeds the supply. If no spare duct accommodation was laid, and the cable wires all taken up, it would be necessary to take up the streets and lay another duct for perhaps a comparatively few new orders. But, on the other hand, the laying of a spare duct is a tax on present subscribers for the benefit of future ones, and so the question is a very important one.

It is found in actual practice that a main cable leaving the exchange, and filling a duct to its full capacity, costs the same as a three-way duct running the same distance. Taking a 312 pair cable as an example, running from the exchange for a distance of one mile and distributing down to zero, the cost would be about £2 per pair, and a three-way duct would cost the same, the total cost being £4 per subscriber. If, now, the demand for telephones was great—and with low rates independent exchanges have found their original subscribers doubled, and even trebled, in a very short time—and these ducts were filled up, and still a few orders remained, it would be necessary to lay another three-way duct and another 312 pair cable. In the first case, then, there would be one cable and a three-way duct at a total cost of £4 per subscriber. After opening the street a second time and laying one more cable and another three-way duct, there would be four cables and two three-way ducts at the following cost: four cables at £2 per pair, £8; two three-way ducts at £2, £4—total, £12. Three of these cables would be working, and consequently three times more subscribers, than when there was only one cable and a three-way duct, and so the cost per subscriber would be £12 ÷ 3 = £4, as in the first case, so that by laying 200 per cent. spare duct accommodation, the cost can be kept evenly distributed over a large expansion. This 200 per cent. does not, of course, represent money value in any way, but duct accommodation for wires, the cost of laying this 200 per cent. duct accommodation amounting only to some 9 per cent. on the capital outlay. Of course, a telephone engineer could reduce this on going into the local circumstances of a town and planning out the various routes, but this will be taken as a standard unit.

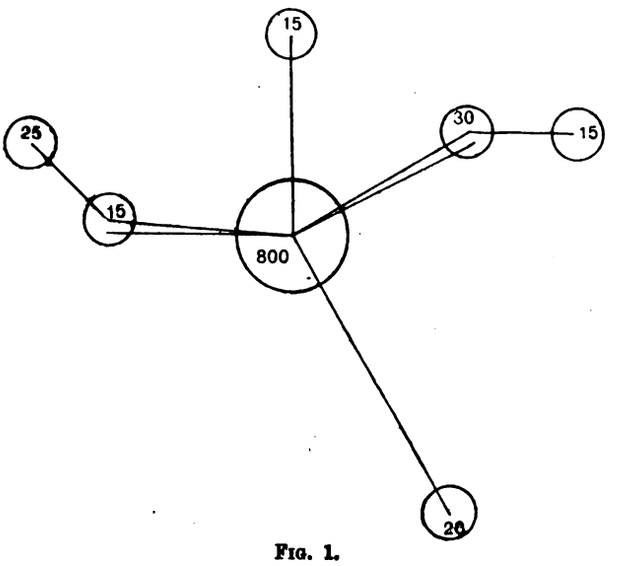

Fig. 1.

Having now arrived at standard units for the three principal sections of construction, it is possible to give a general idea as to the cost of constructing a system. We will take a telephone area of 100 square miles, with one central exchange of 800 subscribers and six village exchanges with 120 subscribers, connected to the central on junction pole routes of 20 miles, with 60 miles of metallic circuit (see Fig. 1). This works out:

920 direct lines, with 25 per cent. spare cable wires at £20 ...	£18,400
20 miles of junction route with 20 miles of metallic circuit...	1,000
40 additional miles of metallic circuit.....	480
200 per cent. spare duct capacity	800
	£20,680

This works out at gross £22. 10s. per direct line. In actual practice this has worked out at £21 at Portsmouth and at Glasgow at £29. The extra cost at Glasgow is accounted for by the laying of a larger proportion of spare ducts, and distributing the wires completely underground similar to gas and water, which, of course, greatly diminishes maintenance charges, as the wires are free

Digitized by Google

from disturbance. This can only be done in large cities, the cost being prohibitive in a town of not more than 300,000 inhabitants.

The foregoing figures cover the cost of the very best material and workmanship, as Corporations have found that the first cost is the least. This question will be further discussed when we come to consider the maintenance of a system. The estimate does not include inside extension lines, as these in no way affect the standard unit; any number can be fitted to a system without using a single cable wire. An exactly similar competition to the one in England is now proceeding in America, where independent companies are springing up in every city in competition to the Bell Company, or monopolists, but in America no license is necessary to establish an exchange, independent companies have no Local Government Board enquiry, consequently the progress of independent exchanges is more marked. The independents also discover the same fact as the British Corporations—namely, that an efficient telephone line can be constructed for £20 to £25, the Jasper County Telephone Company having fixed over 1,000 phones with a capital stock of 100,000dol. The growth of independent telephones in America may be gauged from the one fact that in Chicago alone an independent company is laying down a system of 100,000 telephones, or about 50 per cent. of the telephones of Great Britain and Ireland in one city alone.

In the various discussions on the telephone question the main objection has been that a system cannot be established under £35 per line. We have, however, seen that up-to-date systems *have* been established in England and America at £20 to £25 per line. The cost of the National Telephone Company's lines, dividing the capital by the number of direct lines, works out at something like £35, but as that company have amalgamated with and purchased several rival concerns at more than cost price it is not a fair figure to work upon. It has also been stated that a telephone system is unique among commercial undertakings in so far as the capital account cannot be closed, and that the more lines added the more expensive they become on an average. This, however, is a very mistaken view, as most town councillors are aware that an electric light system and a growing tramway system cannot close their capital account, and that if they have a large increase in their traffic they must necessarily borrow more money—*i.e.*, add to their capital account.

With regard to the increased average cost of lines as an exchange extends, this is also an erroneous view, and founded on the one fact that a large multiple switchboard is more costly per line than a small multiple board. This can best be followed by Fig. 2. In order to enable an operator to have access to every subscriber's line, the whole of the subscriber's jacks on which the lines terminate are repeated about every 6ft. on the switchboard, and this is known as the multiple field. The local or answering field is divided up, so many lines to each operator; while the one operator answers in her local field (generally about 100 lines) she has access to all other subscribers' lines in the multiple field, and can consequently connect subscriber No. 1 with, say, No. 1,000 without leaving her position at the board. Taking the exchange of 800 lines controlled by eight operators, it will be seen that there are 2,400 multiple jacks and 800 local jacks. If, now, it is necessary to extend the system by 400 lines, owing to increased demand, it will be necessary to fit to the switchboard 400 local jacks, and one new section with 1,200 multiple jacks, and also 400 multiple jacks to each of the three existing sections, so that the operators at those sections may have access to the 400 new subscribers' lines, making a total of 4,000 new multiple jacks.

To summarise: in the first case there are 800 local jacks and 2,400 multiple jacks, or one local and three multiple jacks per line; in the second case there are 1,200 local jacks and 4,800 multiple jacks, or one local and four multiple jacks per line. It will thus be seen that in extending the system by 50 per cent. has added to the cost per line as far as the switchboard is concerned one multiple jack, or about 2s.! Against this must be set the saving in outside construction owing to the concentration of the lines, and it will thus be seen that an increase in business lowers the cost per line.

Having now arrived at the capital cost of a system, it will be necessary to carefully consider the cost of maintaining it in order to arrive at the tariffs to charge subscribers so that the exchange may be successful from a commercial point of view.

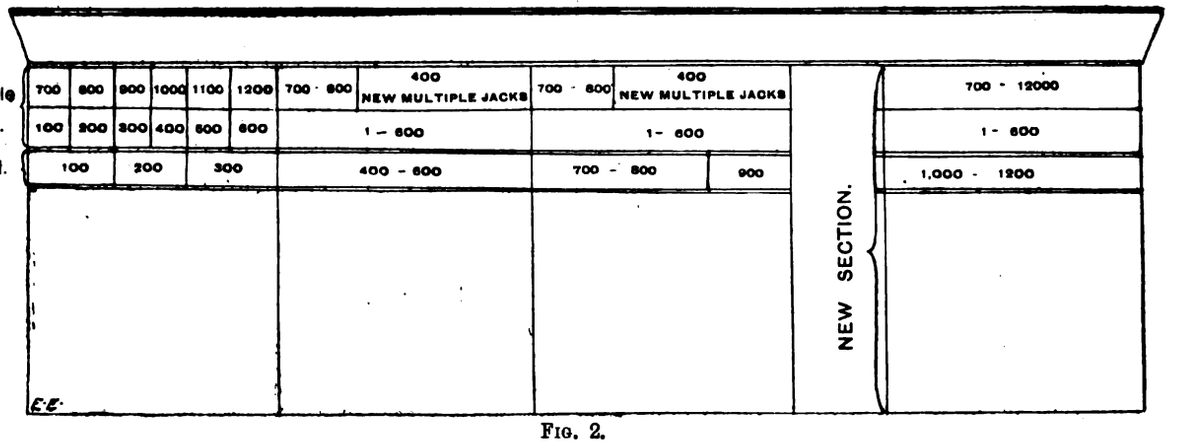

FIG. 2.

(To be continued.)

BRITISH TRADE AND THE COLONIES.

A scheme for expanding British trade in foreign and Colonial markets, and for further consolidating the relations particularly between Colonial buyers and manufacturers in the Mother Country, has been initiated by Mr. B. H. Morgan, recently trade commissioner to South Africa, and is receiving the support and assistance of the Board of Trade, the Foreign Office, and other Government departments. The proposal is that lectures shall be prepared by well-known engineers and experts in England, and forwarded by previous arrangements for reading before technical and trade societies, and other educational and trading bodies in British Colonies and leading centres of trade in foreign countries. The main object which the authors will bear in mind in the preparation of their papers will be to point out what progress has been made in Great Britain up to the present in the manufacture of all classes of machinery and goods, emphasising novel points of utility, design, and so forth. Recognising that the engineering industry is perhaps the most important in this country at the present time, the organiser of the scheme is giving it his first consideration, and has arranged for the preparation of the following lectures: "British Progress in Electrical Work," Sir William H Preece; "British Progress in Dynamo and Motor Construction," Mr. J. Swinburne; "British Progress in Mechanical Road Traction," Colonel R. E. Crompton; "British Progress in Steam Generation," Prof. W. Ripper; "British Progress in Steam-Boiler Construction," Mr. F. J. Rowan; "British Progress in Machine Tool Manufacture," Mr. John Ashford

Digitized by Google

"British Progress in Municipal Engineering," Mr. W. H. Maxwell; "British Progress in Steam-Engine Construction," Mr. J. H. Dales; "British Progress in Gasworks Plant and Machinery," Mr. C. E. Brackenbury; "British Workshops and their Equipment," Mr. B. H. Morgan; "Pneumatic Tools and Appliances," Mr. C. E. Amos; "The Selection of Boilers," Mr. C. E. Stromeyer.

It will be seen from the above list that the scope of the subjects to be dealt with is extremely large, and the assumption is that the lectures must in consequence be more general in character than otherwise. However, with the Government and other influential assistance promised, it is hoped that the scheme will prove successful in its main endeavour to keep foreign and Colonial buyers in touch with the latest British manufacturing practice and bring about a still wider appreciation of British productions in the foreign and Colonial markets.

TRADE NOTICES AND NOVELTIES.

De Dion-Bouton Electrical Combinations.

The De Dion-Bouton motor is universally known in connection with automobiles, but its claim to equal adaptability for use as a stationary engine has not been pushed until quite

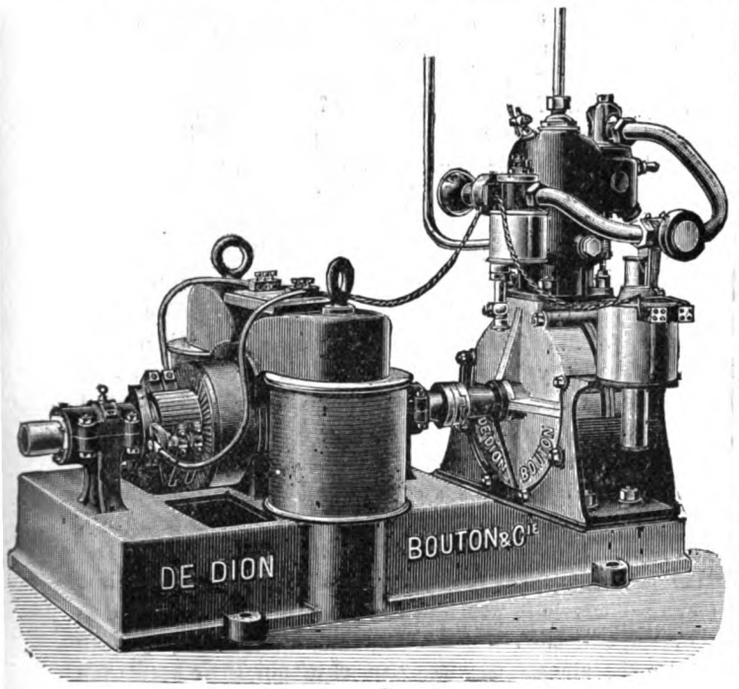

FIG. 1.

recently. Yet its advantages, particularly where compactness, lightness, simplicity, and economy are considerations, cannot be disputed. The principle of this motor is that of the Otto or four-cycle gas-engine, but it differs from the ordinary type of gas-engine in that it produces its own explosive mixture as required. Petrol is the usual fuel employed, the quantity consumed by the motor being less than one pint per horse-power hour. From the petrol tank the spirit flows to the carburettor, and from there the vapour produced passes automatically to the explosion chamber of the motor. The compact appearance of a De Dion-Bouton motor-dynamo combination is seen in Fig. 1 herewith. The motor is started by means of a handle placed at the end of the dynamo shaft, and attains an average speed of 1,500 revolutions per minute. With regard to the dynamo, there is no need for a rheostat, the fields being compound wound for constant E.M.F. with varying loads. An electric regulator is fixed to the motor, which governs the latter according to the power required. This regulator (see Fig. 2) consists of a solenoid, S, acting on a conical plunger core, N, which is guided by a tube. In order to complete the magnetic field of this solenoid, and to diminish the consumption of electrical energy in the regulator, the magnetic circuit of the solenoid is enclosed by a shell formed of two plates, F, F″, joined on the outside by the tube T. This arrangement presents the further advantage of guarding the apparatus from the influence of any magnetic fields which may be in the vicinity. The upper end of the core of the solenoid is attached by a chain, C, to the pulley, P, mounted on the plug, B, fixed in the pipe from the carburettor, and of which the opening, O, is in the passage of the explosive mixture coming from the carburettor. Therefore it is apparent that the rotary movement communicated to the pulley, P, will have the effect, according to the direction of the rotation, of increasing or reducing the opening through which the explosive mixture passes. A flat spiral spring, R, mounted on the other end of the axis of the plug, is fixed at one end to a cover, D, the position of which, in relation to the plug, can

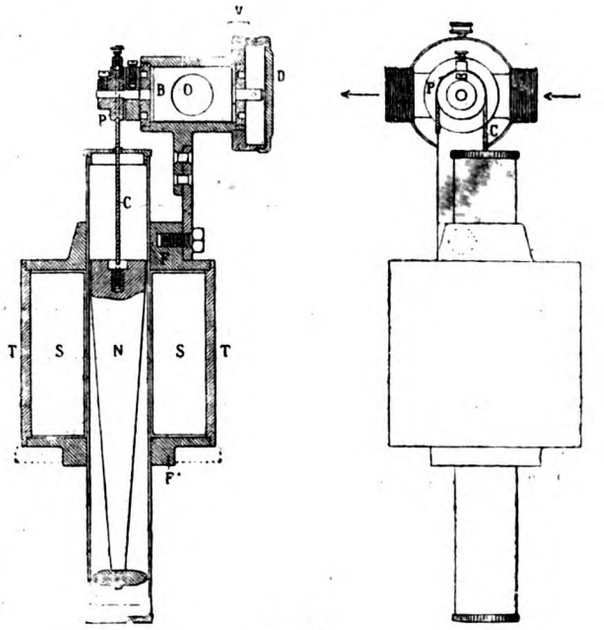

FIG. 2.

be varied by means of the screw, V, so that the tension of the spring can be varied; hence, also, the sensitiveness of the apparatus. The solenoid is of very fine wire, and possesses great resistance—about 2,000 ohms for a dynamo of 100 volts. The regulator is connected to the terminals of the dynamo, as shown in Fig. 3. On being started the dynamo excites itself, and the E.M.F. rises to its normal value. If the load is light, the motor tends to race; but as soon as the normal pressure is exceeded, the core of the regulator is attracted, acts on the pulley, and partly closes the opening through which the explosive mixture enters, thus reducing the power of the motor, and consequently the speed, until the E.M.F. of the dynamo has regained its normal value. When the current is utilised, the speed of the motor, under the action of the load, tends to diminish, the pressure becomes less, and the core of the solenoid ascends, thus permitting the inlet to open under the action of the spring. The regulation is effected in less than five seconds when passing suddenly from full load to running free or *vice versâ*. In short, the sensitiveness of the regulator is so great that the variations in tension do not exceed three volts. The amount of energy consumed in its working is about five watts. The regularity in working thus obtained renders the combination suitable for direct electric lighting, arc or incandescent. They are also admirably adapted for charging accumulators, especially for recharging the accumulators of electrical vehicles, and may be advantageously applied for searchlights. It may be added that these electrical combinations are supplied for outputs ranging from 1¾ h.p. to 8 h.p., the corresponding weights ranging from 450lb. to 775lb. Their installation may be effected in three ways: (1) on a fixed solid base; (2) on a

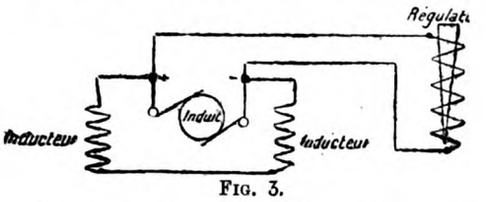

FIG. 3.

spring bed, which absorbs the vibrations; (3) on a small truck, in cases where a portable installation is required. Three sizes are stocked by De Dion-Bouton, Limited, 10, Great Marlborough-street, Regent-street, London, W., who also supply pump and belt pulley motor combinations of equally handy types.

"Stearn Lamps."

The Zurich Incandescence Lamp Company, 47, Victoria-street, Westminster, S.W., have recently issued a new catalogue of their "Stearn" English-made electric lamps. Included among the large variety of lamps listed are the firm's patent changeable voltage lamps, twisted flame lamps, small bulb lamps, tube lamps, and tramway lamps.

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Bound Volumes of "THE ELECTRICAL ENGINEER," *containing half-years copies, bound in Dark-Blue Cloth, Gold Lettered, price 8s. 6d. New Volume, January to July, 1903, now ready.*

THE OTHER SIDE.

A letter in the *Times* of Tuesday last, signed "Croyden and Co.," is deserving of attention. It relates to the Marylebone embroglio concerning electric lighting. It suggests a method of procedure not quite in accord with the honourable traditions of English business. We have commented upon the case once or twice before, and should not again have touched it but for this preposterous letter. The tale is simple. Municipal authorities can (1) have their own electric lighting from the commencement; (2) let a private adventurer take up the lighting and do the best he can; or (3) at the outset let the private adventurer take the risk and show the possibilities of the business, then buy him out. The Marylebone people were of the cautious kind. They let outsiders take the early risks and prove the value of the lighting, and then said: "These adventurers are making too much money out of our necessities. We will oust them from our borders and take up the business ourselves. It is a good thing, and these monopolists must be put down." So Marylebone proceeded to get rid of the so-called intruders; but agreement was not easy, and the question was put to arbitration. The arbitrator gave his award, and that award was exceptional, because Marylebone proposed to take the strongest and best link out of the chain of the company's work. Then there was weeping and wailing at Marylebone. Why? Simply because the arbitrator gave the company a higher price than Marylebone wanted to pay. The suggestion of Messrs. Croyden and Co.—whoever they may be—is "compromise." Why compromise? The time for compromise was before the award; not after. If the award had been greatly in favour of Marylebone, and the company interested had suggested compromise, would the municipality have listened to it. They asked for justice, and when that is awarded, why kick? Surely it must have occurred to some of the august body that pure and unadulterated justice would not be exactly what they wanted and would land them in a close corner. It has—and in our estimation serves them right. We have no sympathy with a municipality that wishes to take advantage of a pioneer company. The latter risks everything, the former risks nothing. The Marylebone Council may say it was wrongly advised, but technical advice is not much needed in such a matter as they had to decide. The members knew or could easily have known the amount of money spent within their borders—the amount spent for immediate return and that invested for future developments. They could have gauged that return and the future prospects as well as anybody else, and their own commonsense ought to have told them that it is seldom you get a good thing at half price. However, they persisted in their endeavour to get rid of the company, with the result that the award caused absolute terror. The suggestions have been "repudiate," "compromise." Repudiation is not under discussion, but the suggesters of compromise say the time is inopportune for the borrowing of money. The man who starts bargaining should think of the getting the money before he starts, not after the bargain is settled. Suppose money had been cheap, not dear, would there have been the talk of compromise then? But the most delightful part of the suggestion is that the company should wait for payment till, say, 1931. Meanwhile, it should carry on the business really for the benefit of the municipality, so that, as the writers of the letter naïvely put it, "there would be handed over to us in 1931 a business many times larger than the present business for only £200,000 more than we shall have to pay in a few months if the company enforce their rights." We may well ask, "Suppose the concern does not increase according to the

Digitized by Google

expectations of Messrs. Croyden and Co. by the year 1931? What is there to prevent further attempts at repudiation or compromise?" Business men, as a rule, do not attempt to make bargains which shall for performance depend upon the state of the money market. Does it not strike Messrs. Croyden and Co. that the receiving company will have something to say in the matter of deferred payment? If money is dear, it is of greater value to them now than if they waited for cheapness. As for suggesting they should become lessees on the following terms, it would be rather a suicidal policy for the company. This is the plan suggested:

"It would be well if they were formally to become lessees of the Borough Council at a fixed annual rent, say £5,000, which the Council might invest every year to form a fund towards repayment of the depreciated value of the extra capital."

"Now, how would such a scheme work out? We have been told that the company have already spent in the borough about £600,000. If even as much as that had to be spent again during the next twenty-eight years, the sum repayable by the Borough Council at the end of that time, less, say, 2 per cent. per annum for depreciation, would be about £400,000, towards which the £5,000 suggested as a rent would, if invested at 3½ per cent., amount in that time to over £200,000, leaving only about £200,000 to be found for the capital in addition to the present debt of £1,300,000. In other words, there would be handed over to us in 1931 a business many times larger than the present business for only £200,000 more than we shall have to pay in a few months if the company enforce their rights. What a relief this would be to the ratepayers."

What is the company to rent? Its own concern, compulsorily bought, but not paid for, to forego some of its annual profit in order to defer a present payment for nearly thirty years. Yes, Marylebone has been ill-advised throughout the whole of this business; but if good advice is obtained, even now the final result may be better than it looks. The advice tendered by Messrs. Croyden and Co. is bad—very bad, without a single redeeming feature.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

OIL-BREAK SWITCHES.

SIR,—Messrs. Ferranti's letter in your issue of the 25th inst. corrects a statement made by me in a paper read before the British Association, and they have been good enough to send me a photograph of the Bankside switches of 1895, which is most interesting.

With regard to the question of priority, I cannot do better than to refer Messrs. Ferranti to an article by Mr. Eborall in the current number of *Engineering*, where, in a footnote on page 410, he states, "So far back as 1891 Mr. G. W. Partridge got out a design for such (*oil break*) switches, which were made and put in service in 1892." To Mr. Partridge be the credit.—Yours, etc.,

Wallsend, Sept. 26. W. B. WOODHOUSE.

INTERMEDIATE SWITCHES AND WIRING.

SIR,—With further reference to the above subject and my letter of the 17th inst., it has just occurred to me that an excellent opportunity now presents itself, while intermediate wiring is receiving general attention, to *deprecate* the two-way and intermediate circuit connections sometimes thonghtlessly advocated in some technical books and journals as being more economical in wire than the ordinary two-way and intermediate wiring circuits, as you have lately illustrated.

An economy in the cost of wire is certainly made in the simple two-way wiring, or if the lamps to be controlled can be arranged near together in the immediate wiring circuit, as both circuit arrangements necessitate the lamps being *between* the two common contacts of the two-way switches. Such being the case, there would be no saving when lamps used, say, in staircase lighting require to be controlled from the various floors.

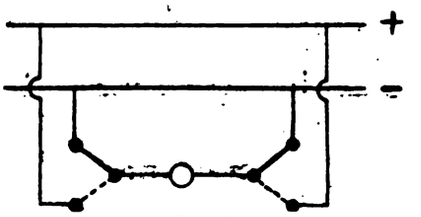

FIG. 1.

In adopting such circuit arrangements it is obvious, however, that serious trouble can occur, while unprotected terminals of opposite polarity are on the same base, particularly with such a universal adoption of metal covers for switches as present practice calls for.

In the type of two-way lever switch with a bearing plate forming a common terminal for both ways, and a contact arm attached to same, making contact alternately with the

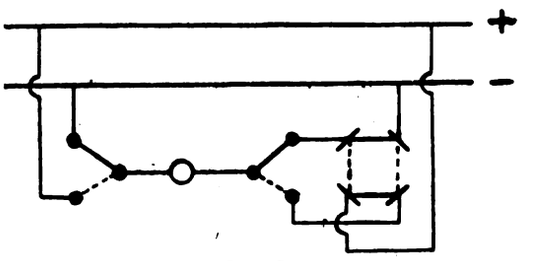

FIG. 2.

two ways, a further danger may develop, particularly if the distance between the two ways is inadequate, if the switch is called upon to carry more current than it was designed for, or if any lagging occurred in the action of the oscillating contact arm, as an arc might be drawn across, following the contact arm, and short-circuit the line.

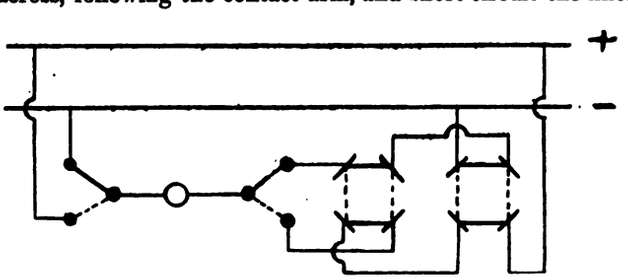

FIG. 3.

The first three diagrams in "F. T. C.'s" answer in your issue of Sept. 11, p. 400, show diagrammatically the oscillating lever type of switch I am referring to best, the intermediate switch of his Fig. 3 being no exception if wired up on the plan which invites trouble. Diagram 1

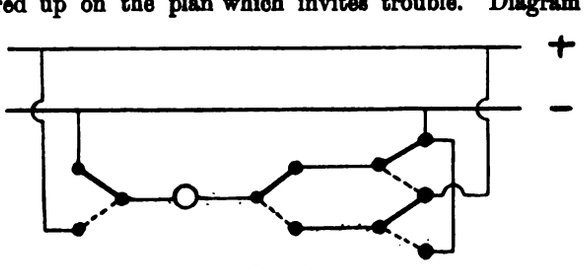

FIG. 4.

shows the plan *to be avoided* for two-way wiring; Diagram 2 shows that for controlling lamps from three points, also to be avoided; Diagram 3 shows that for controlling lamps from four points, also to be avoided; Diagram 4 shows the

Digitized by Google

lever type of intermediate switch, as shown diagrammatically by your correspondent "F. T. C.," also to be avoided.

In the ordinary arrangement for two-way and intermediate wiring—luckily the methods usually advocated—all switches are on one pole and consequently safe.

A little care in adopting the right methods will make all the difference between satisfaction and failure.

Cases of failure have occurred where manufacturers have been blamed, when on investigation the cause of such failure rests with the contractor having adopted the faulty method.

My object in drawing attention to this matter is to prevent others falling into similar error, with resultant loss of prestige with their clients and general disinclination to adopt these convenient wiring methods.—Yours, etc.,

Sept. 29, 1903. A. P. LUNDBERG.

ALUMINIUM.

SIR,—Will you kindly allow me space to correct an important error in the note upon "Aluminium Conductors" appearing in your last issue. You state that:

"The wires experimented with by Mr. Kershaw have a very considerable percentage of other metals—about 5 per cent., whereas those exposed by Prof. Wilson in London were much more pure."

If you will refer to the tables printed with my paper, you will find that this statement is absolutely erroneous. The worst wire (No. 1) contained 3·06 per cent. of iron and silicon, while the best wire (No. 4) contained only ·54 per cent of these two impurities.

As regards the correctness of my conclusions regarding the resistance offered by commercial aluminium to atmospheric exposure, I may refer you to the September issue of the *Engineering Magazine* (p. 876), where you will find independent proof that even in America engineers are beginning to recognise that aluminium requires protection in certain atmospheres.—Yours, etc.,

JOHN B. C. KERSHAW.

The West Lancashire Laboratory, Waterloo, Liverpool, Sept. 26, 1903.

ELECTROSTATIC MULTIPLIERS.

SIR,—On p. 440 of your issue for Sept. 18 there is a reprint of a British Association paper by Prof. Marchant and Mr. W. G. Worrall on "The Use of Capacities as Multipliers in connection with Electrostatic Voltmeters on Alternating-Current Circuits." I think it may be of interest to the authors to know that the method they describe was in regular use in the testing room at the British Thomson-Houston Company's factory in London some four years ago. Also, in the high-potential tests made on the main feeders of the Central London Railway, a condenser-multiplier was used with the Kelvin electrostatic voltmeter for measuring the applied pressure. This multiplier consisted of two sheets of micanite, built up alternately with three sheets of thin iron, the constant being about 2 : 1.—Yours, etc. R. H. CLINKER.

257, Clifton-road, Rugby, Sept. 29, 1903.

SYNCHRONISING DEVICES.

BY F. H. DAVIES.

A review of the various methods used for finding out the exact moment of synchronism when paralleling two alternators makes plain the fact that the necessity of good synchronising has at last become fully recognised, and also that a great deal of ingenuity has been expended in evolving new and more satisfactory methods. In the old days of belt driving synchronism was often performed in a very haphazard manner. It was found that the machine would generally pull itself in quickly and easily by slipping under the belt, and as long as the plant was not damaged no one troubled about the effect on the lights. With the advent of the high-speed engine and direct coupling, primitive methods through their inadequacy began to fall into disfavour, and the alternating-current motor, and particularly the rotary converter, with its sensitiveness to any disturbance in the circuit, have finally made good synchronising indispensable.

The earliest method, which is practically the simplest, had many disadvantages. Perhaps the use of the past tense here is incorrect, as this system is still to a limited extent in use in small installations in this country, and to a greater extent in America. Its best days are, however, certainly over, and we may be excused in looking on it as a thing of the past. A diagram representation is shown in Fig. 1. Alternator A_1

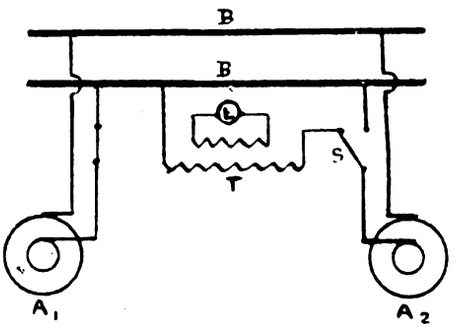

Fig. 1

is connected to the 'bus bars, B B, and is running the load. A_2 is being synchronised, and the main switch is closed on the synchronising contact only. T is a small synchronising transformer, the secondary of which is closed on the lamp, L. When the machines are dead out of phase they are practically in series with the transformer, and consequently the lamp lights brilliantly. A_2 is now speeded up and the volts regulated, and the lamp begins to flicker. The nearer A_2 gets to synchronism, the longer become the periods of light and darkness, and when these periods extend over about three seconds each, the main switch is closed during the dark interval, as then the machines are in phase—that is, the E.M.F.'s oppose one another, and consequently no current passes through the primary of the transformer. A very bad point in this method is that it is impossible to tell by the lamp when the current in it is really at zero. As is well known, a lamp may be run at quite a high percentage of its proper voltage and still look black, especially in daylight; the consequence of this is necessarily bad synchronising, excepting when the right moment has been hit by a fluke. Another point which applies to all synchronisers using lamps is that the light of a lamp when just switched on lags considerably behind the current, owing to the filament having to heat up; it is consequently necessary to allow for this, and to an extent that only experience can dictate.

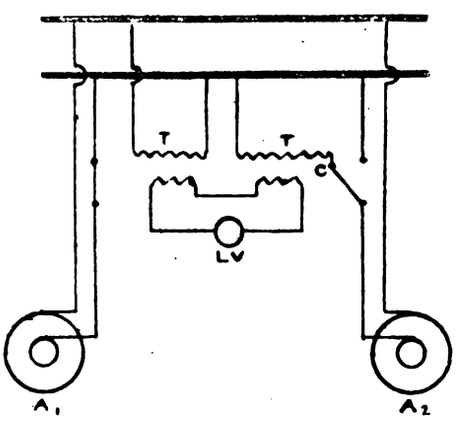

Fig. 2.

The above arrangement introduces the human element to a too great degree, and therefore the chance of trouble through carelessness or ignorance; it gives but the baldest assistance to the operator, and with such aid, to obtain even fair results, it is necessary for him to have had considerable experience with the identical apparatus, machines, and the man at the engine stop-valve. A great improvement on this system is the one shown in Fig. 2. Two transformers, T T, are arranged with their secondaries in series, and closed on the lamp or voltmeter, L V. The primary of one is fed

Digitized by Google

from the 'bus bars, and therefore from the running machine, A_1. The primary of the other is connected to the incoming machine, A_2, through the contact, C, upon which the main switch rests temporarily. It stands to reason that when the machines are out of phase, the currents in the primaries are in opposite directions; therefore the E.M.F.'s in the secondaries also oppose, and the result is no current through L V. On the other hand, when in phase the currents help one another, and L V either lights up or shows full voltage, as the case may be. The machines being in synchronism, the main switch is now closed. This system is improved by the substitution of one transformer, with two primary windings and one secondary for the two shown on the diagram. The action in this case is very similar, with the exception that the opposing forces when the machines are out of phase are magnetic instead of electric. The two primaries being wound in the same way, naturally produce no resultant magnetic flux through the secondary when the currents in them are in opposition, and *vice versâ* when in the same direction.

Synchronisers of this type are greatly in use at the present day, and are fairly satisfactory when operated by experienced men. The hot-wire voltmeter has replaced the lamp, as it affords a better indication and has a smaller lag; they are, however, frequently used in combination for several reasons. The lamp when placed in close proximity to the voltmeter—say directly underneath it, as is the case in the Ferranti synchroniser—to a certain extent assists the eye in judging the correct moment to close the switch. It is also sometimes used for getting the machine roughly into phase, the lamp being switched out and the voltmeter on when the oscillations have become very slow; the reason for this being that rapid oscillations of the voltmeter needle and frequent banging against the stops quickly deteriorates the instrument. The lamp as a guide for the engine-driver is better than a voltmeter, as it can be seen from a distance in any direction. The type of lamp preferable for this purpose is a low candle-power high-voltage, as the filament is fine, and the light consequently has a smaller lag behind the E.M.F., owing to quick heating up. The voltmeter should be of the hot-wire type, with specially light parts in order to reduce the inertia and lag to a minimum; it should, however, be as strongly built as is consistent with lightness, as the strain of frequent oscillations is great. Synchronisers of this kind, while very satisfactory, leave a great deal to the experience of the operator. For instance, they give no indication as to whether the incoming machine is fast or slow, and unless the synchronising voltmeter is watched most carefully from the start, it may be necessary to specially speed the machine up or down to ascertain how things stand. Necessarily this means a waste of time that in emergency, or with a quick rising load, cannot be afforded. In order to simplify matters generally, and to provide a means of exactly determining the state of affairs, Messrs. Everett and Edgcumbe evolved their present well-known type of synchroniser, which is certainly a great step in the right direction, as it provides a clear indication of the exact moment of synchronism, and shows whether the incoming machine is fast or slow and by how much. It consists to all intents and purposes of a small two-phase motor, the rotor and stator of which are each provided with a two-phase winding; the stator is connected to the 'bus bars, and the rotor to the incoming machine. When the machines are in synchronism the two magnetic fields rotate at the same speed; there is consequently no tendency of the rotor to move, and in this case the needle of the instrument, which is fixed to the rotor, remains steady at the position indicating synchronism. If, however, the frequencies are different, there is naturally a difference between the speed of rotation of the two fields, and consequently the rotor rotates in one direction or the other, according to whether the speed of the incoming machine is high or low. One revolution of the rotor—and therefore the needle—is equal to a difference of two complete cycles per second. A lamp is provided on top of the instrument, and indicates by flickering in the usual manner. In order to do away with shouting and signalling from the switchboard to the engine, the instrument is provided on the dial with an arrangement of red and green lights which can be seen from some distance, and which automatically show, in addition to the needle, whether the incoming machine is fast or slow. This effect is produced by a movable shutter, which works in connection with the needle and obscures either the red or the green light as the case may be.

As stated above, the action of this synchroniser is dependant on the rotation of two magnetic fields, for which, of course, a two-phase current at least must be employed. To simplify the connections when used on a two-phase circuit, and to adapt the instrument to use on a single or three-phase circuit, the two-phase currents are produced from one-phase by the insertion of a choking coil in one of the circuits of both the rotor and stator, and a non-inductive resistance in the other, the function of this latter being to equalise the currents in the two coils. For polyphase working, therefore, the instrument is simply inserted in one phase, and so only two transformers are required—one for the 'bus bars, and one for the incoming machine. It would, of course, be possible in the above case to take all the phases into the instrument, and so produce the rotating field without the aid of resistances, but this would mean an increase in the number of transformers and complications in the connections. It is claimed for this instrument—and apparently very justly—that it almost entirely eliminates the human factor, and therefore risk from inexperience or nervousness.

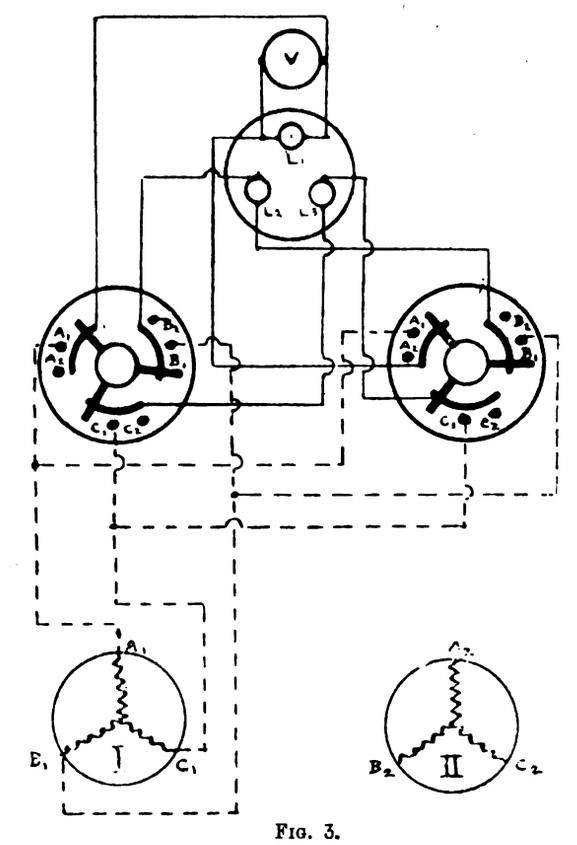

FIG. 3.

A very interesting and ingenious device for synchronising three-phase alternators has been brought out by Messrs. Siemens and Halske. It cannot be said to be as satisfactory as the Everett and Edgcumbe instrument, but it is greatly in use and very pretty in its action. The diagram of connections for two machines is as shown in Fig. 3, the synchronising transformers being left out for simplicity. I. and II. are two three-phase alternators, the terminals of which are connected to their respective contacts on the two three pole switches; it will be noted that these contacts are in parallel. The three main contacts of these switches are connected (as shown) to the three lamps, L_1, L_2, L_3; L_1 is shunted by a voltmeter for greater accuracy. Supposing alternator I. is running the load, and alternator II. is to be put in parallel. The voltages of the two machines are first made equal, the left-hand switch which, as shown, is in the "off" position, is put on to the contacts A_1, B_1, C_1, and therefore connected to alternator I. The right-hand switch is put on contacts A_2, B_2, C_2, and so connected to alternator II. The lamps will now begin to blink, not all at once, but in a certain order—from left to right if the incoming machine is slow, and *vice versâ* if fast. When the rate of the extinctions shows that the machines are running at practically the same speed, and at the moment that the lamp L_1 is dark or the

voltmeter, V, shows zero, the switch is closed. The voltmeter is provided to increase the sensitiveness of the apparatus for the afore-mentioned reasons. This arrangement, owing to the number of transformers required, is costly, and its indications are rather confusing when compared with the revolving pointer of the Everett-Edgcumbe instrument.

Sundry other devices of a more or less ingenious nature have been proposed for determining the moment of synchronism. One, the static instrument of Prof. Ayrton, is beautifully simple, and might, if properly exploited, turn out of practical value. The connections are as shown in Fig. 4. The apparatus consists of only two parts—R, an extremely high resistance connected to the outer of the incoming machine, A_2, and to the inner 'bus bar; E, a gold-leaf electroscope connected to the inner of A_2 and the outer 'bus bar. The switch is closed when the leaves are together, and the method of working is obvious from the diagram. As this device does not necessitate transformers it is very cheap, and on the face of it seems trustworthy. It is, however, difficult to speak of the practical utility of such ideas unless

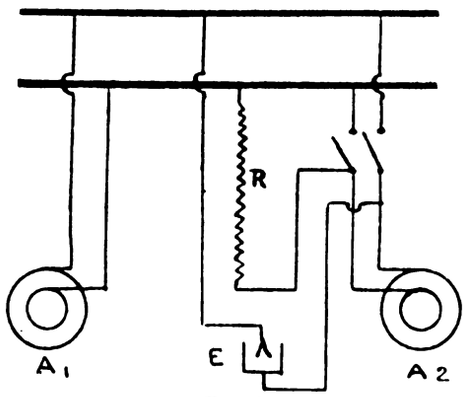

FIG. 4.

they have been tried under working conditions, which is not the case with the above.

PERSONAL.

The Bristol Electrical Committee propose to increase the salary of the deputy electrical engineer (Mr. H. Herbert Couzens) from £300 to £350.

We regret to learn of a serious accident which occurred to Mr. William C. Hart, an electrical engineer of the Plymouth Corporation. Whilst he was placing a new overhead wire in position in Westwell-street he was knocked down from a ladder tower and received injuries to his limbs and concussion of the brain.

Mr. T. Vickers, C.E., who for over two years has had the management of the special track construction works of Messrs. Askham Bros. and Wilson, Sheffield, has resigned and joined the tramway department of Hadfield's Steelfoundry Company, Sheffield. Mr. Vickers is well known among municipal engineers, having held for some time several public posts previous to joining Messrs. Askham.

We understand that Mr. Stephen Sellon has resigned his position as chief engineer to the British Electric Traction Company, and will practice as consulting engineer at 36, Victoria-street, Westminster.

Mr. J. Fletcher Moulton, K.C., M.P., F.R.S., has been elected president of the Junior Institution of Engineers in succession to Colonel Edward Raban, C.B., R.E.

Mr. Ivon Braby, M.I.E.E, having accepted an appointment on the staff of Messrs. Frederick Braby and Co., Limited, has resigned his position as joint managing director of Braby and Tomlinson, Limited.

Mr. William Cramp, A.M.I.E.E., late lecturer on electrical design at the Central Technical College, has joined the Crypto Works Company, Limited, 29, Clerkenwell-road, E.C., as electrical expert. His first duties will be to supervise the manufacture and development of repulsion motors of his own design for monophase working, and up-to-date continuous-current enclosed motors.

The Postmaster-General has appointed Mr. C. H. Bundy to be assistant secretary to the Post Office on the retirement of Mr. G. W. Smyth, C.B.

Mr. Percy W. Naylor has been appointed clerk at the Gravesend electricity works.

Mr. J. Dugdale, who has for some years been traffic superintendent of the Sheffield Corporation tramways, left the city on Wednesday to take up the position of general manager of the Oxford tramways. The tramway employés presented him with a tea and coffee service on tray. Two gatherings were arranged in order to meet the convenience of men on both morning and afternoon duty. Umbrellas, suitably inscribed, were presented to Mr. and Mrs. Dugdale by the tramways police staff.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

623. What is to be said for and against putting wiremen on piece-work: (1) on skeleton houses in Simplex conduit; (2) in houses already finished in casing or Simplex?—F. B C.

624. I wish to construct a transformer, the primary voltage of which is 2 000, and the secondary 25 volts, frequency 60. It is imperative that the secondary circuit consists of *one* turn only. Can this be done? Give particulars of design.—J. G.

ANSWERS.

Question No. 615.—Information is required as to the best method of automatic signalling for electric tramways. The system must be equally applicable for use by day or night. Preference would be given to a method by which the current supply to the car it is desired to stop is cut off entirely, so that the car can no longer proceed, and is not merely detained by signals which might or might not be regarded by the driver.

Best Answer to No. 615 (*awarded* 10*s.*).—It is difficult, if not impossible, to definitely fix upon any particular system of automatic signalling as being the most suitable to meet all the requirements of electric tramway working. Of course, in this country there has been as yet no need for any complete system of block signalling owing to the restrictions laid in all the tramway areas upon the speed at which cars may run. At such speeds, of course, running "on sight" has been in all cases the rule. It seems to the writer that at present, in this country at any rate, signalling is only necessary on our street tramways where single track with turn-outs is worked. Various systems of signalling are in vogue for this kind of work, practically all depending upon the trolley wheel of a car entering a section of single track making contact between the trolley wire and a metal bar about 2ft. long placed alongside the overhead at such a distance that the trolley wheel can touch it, thus closing the circuit of a solenoid at the next turn-out ahead. This solenoid works a plunger which sets a semaphore at "danger" for any car approaching this turn-out in the opposite direction, this semaphore being reset to "clear" by a similar method when the car reaches the turn-out ahead, and is thus clear of the section of single track. If block signallling be required, the car can be arranged to operate the signals behind it as well as those in advance (these latter being only necessary in single-track working), thus protecting itself from a following car. Of course, red and green lights are provided for night working, the lamps being switched on simultaneously with the semaphores—red, of course, indicating "danger" and green "clear." On certain of the American interurban roads this system has worked very successfully; it can be easily applied to any overhead trolley tramway where narrow streets and sharp turnings necessitate the use of single track. An arrangement somewhat on the lines of the above is working satisfactorily on a South Coast town tramway system.

Probably the best method of automatic signalling where it can be applied is that termed the "track-circuit" system, with either the "electro pneumatic" or an "all-electric" arrangement for working the signals. The disadvantage of this system is that it involves the loss of the running rails as a means of conducting the return current from the motors in the case of an electric railway, though a well-known American elevated railway retains one rail per track for this purpose. For the purpose of "track-circuit" signalling the running rails are insulated in sections against

Digitized by Google

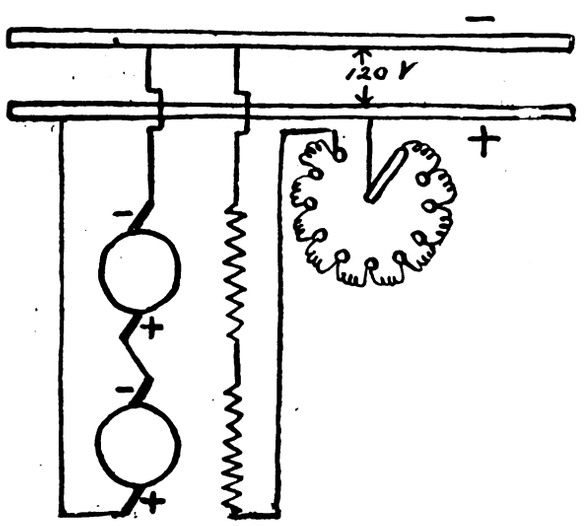
low-voltage current (from 10 to 100 volts). This method is only applicable to railways (either steam or electric) that possess their own right of way and having rails laid on wooden sleepers so that rail insulation is possible. When a train or car enters on a section, its wheels make circuit from rail to rail through the axles. In this circuit is an electromagnet which works a compressed-air motor, consisting of a cylinder and piston, which sets the signal at the entrance to the section occupied at "danger." This is reset at "clear" when the train leaves the section at the other end. In connection with this system it is a simple matter to provide an automatic device at each signal which will pull up a train should the driver fail to obey a signal set at "danger." This is done by interlocking with the signal a trigger which is fixed just outside one of the running rails. This trigger projects upwards when the signal is at "danger," and should a train advance under those circumstances the trigger strikes an aircock on the train air-pipe, opening it, and putting on the brakes. The overload circuit breakers then open and cut the current off from the motors. This is probably the only method successfully adopted as a safety stop, and, of course, cannot well be applied to an ordinary street tramway, nor could the "track-circuit" system of signalling be adopted on such a road for obvious reasons. Thus a trolley contact system is the only one apparently available for a street tramway.

When the electro-pneumatic system is adopted, compressed air for working the signals is supplied by electric air compressors feeding into a main pipe placed along the line, but a leading railway company in this country is experimentally storing liquefied carbonic acid gas at a pressure of about 800lb. per square inch in two portable cylinders at each signal along the road, one cylinder to be recharged while the other is in use; each cylinder is to suffice for about 8,000 operations of the signal.

Of course, the ideal system for safety is the one in which, when anything goes wrong with either the signalling circuit or the pneumatic signal motor, the signals affected will immediately set themselves at "danger," so that the worst thing that can happen in the event of a failure is only a stoppage of trains.—D. J.

Question No. 616.—I have four dynamos, shunt-wound two-brush type, each giving an output of 65 volts 300 amperes. What minimum alterations in windings are necessary to give 120 volts. Would compounding the fields be satisfactory? Give sketches, calculating formula, etc.

Answer to No. 616 (*awarded* 10*s.*).—As it is possible to obtained the required 120 volts without altering the present winding, we will consider this before calculating radical alterations. If the dynamos are connected up two in series as per sketch, the resulting voltage will be 130 at



the 'bus bars; this can easily be reduced to 120, either by running the machines a little shower or by inserting resistance in the shunt circuit. The ordinary connections of the shunt windings are altered, the shunts being in series as well as the armatures. To arrange for each dynamo to give 120 volts, it will be necessary to take several tests and measurements. As the question assumes the dynamos to be similar, presumably the same alterations will be required for each; it will, however, be as well to check the figures for each machine as far as possible. By placing an ampere-meter in the shunt circuit, and by noting number of turns when unwinding bobbins, the number of ampere-turns under present conditions will be obtained. Take readings of speed and volts on open circuit and at various loads. The E.M.F. of a dynamo depends on the number of lines of force cut by the armature winding per second; these lines of force are created by the ampere-turns of the magnet winding. We have

$$E = \frac{N\,n\,w}{10^8}$$

where E = E.M.F. generated by armature;
N = total number of lines passing through armature;
n = revolutions per second;
w = total number of conductors on armature
10^8 = a constant, to change absolute into practical units.

To get N we must wind the magnets with a number of turns of wire through which a current is passed. The current flowing multiplied by number of turns gives the ampere-turns of the winding.

$$N = \frac{1{\cdot}25 \times \text{A.T.} \times \text{area of magnets} \times \mu}{\text{length of magnetic circuit}}$$

where A.T. = ampere-turns;
μ = permeability of the magnets at the given density.

By noting number of turns on the armature, its speed and voltage, and allowing for drop in volts due to the shunt current which passes through the armature, the open-circuit readings will give the number of lines passing through armature. The number of lines through the armature will will be less than that through the magnets, owing to leakage. The leakage factor varies for different dynamos from about 1·2 to 1·4. It is then a matter of simple proportion, supposing speed and strength of field are kept the same, to find how many turns are required on the armature to give 120 instead of 65 volts. A fair average density of lines is about 80,000 per square inch for mild steel, and half that quantity for cast iron. Having determined the number of ampere-turns from these data for the new voltage, the next thing is to find the size of wire. To find the most suitable size, we have to consider how much we can afford to lose by resistance. For instance, suppose we only have one layer for the shunt winding, the loss

$$\frac{E^2}{R} = \frac{120^2}{\text{resistance of shunt}}$$

would be prohibitive. A formula giving approximate rise of the winding in degrees Fahrenheit is

$$\frac{\text{Watts used in winding} \times 100}{\text{Area of surface in square inches}}$$

This must be considered when calculating the area of the wire from

$$a = \frac{l \times p}{r};$$

where a = area of wire;
l = length of mean turn;
p = resistance in ohms of unit cube;
r = resistance of mean turn;
$= \frac{\text{volts at terminals}}{\text{ampere-turns}}$.

The same commutators might be used, as although the volts will be more per section, the energy causing sparking will be about the same. Although general practice would be from 60 to 80 sections for 120 volts, the present commutators, unless the number of sections are below, say, 30 or 40, should be used, as new ones would mean a considerable addition to the expense. It may be found better to have fewer turns on the armatures and run quicker, or have stronger fields or *vice versâ* than the first calculations would indicate. The brushes would have less to do, owing to the reduction in the current. Compound winding is

Digitized by Google

used to balance armature reactions and the drop due to resistance, thus keeping the voltage constant at varying loads. The amount of series winding to be added is found by running the machine at different loads and noting drop in volts as load is increased. The series winding must provide a sufficient number of magnetic lines to make up for this loss.—M. M.

Answer to No. 616 (*awarded* 7*s.* 6*d.*).—It will be necessary to rewind both the armature and the field completely. The new armature winding should consist of twice as many turns as the present one, and of a wire of about half the sectional area. The existing commutator can be used in again, as there is very little fear of sparking, due to doubling the number of turns per section, at so low a voltage as 120. The new field winding may be either shunt or compound. If shunt, the number of turns per pole must be doubled and the section of the wire halved as compared with the present shunt. If a compound winding is preferred, a preliminary test should be made with the unaltered machine. A reading of the shunt amperes required to give 60 volts on open circuit should be taken, and also of those required for about 61 or 62 volts with 300 amperes in the armature, the additional volt or two being necessary to allow for the drop which will occur over the series winding. Calling the first shunt current C_1, and the second C_2, the number of ampere-turns per pole to be given by the new shunt winding will be $C_1 T$ (where T is the number of turns on each of the existing coils) and the total ampere-turns per pole (shunt + series winding) required at full load will be $C_2 \times T$. The difference between these two values is the number of ampere-turns per pole to be given by the series winding.

The correct sectional area of the shunt wire can be found by the formula

$$\text{Area of wire in square inch} = \frac{\cdot 0000077 \times L \times C_1 \times T}{V},$$

where L is the mean length of one turn of the winding in inches; and

V is the number of volts across one coil (*i.e.*, 60 volts of the machine has two coils in series or 30 volts if it is a four-polar machine with four coils in series).

The nearest standard size of wire to this should be employed. The total depth of wire (shunt and series winding) put on each coil should be about the same as that of the existing shunt. The series winding should work at a current density of about 1,000 amperes per square inch, and the number of turns required is, of course, directly obtained by dividing the number of series ampere-turns, found as above, by the total current (150 to 160 amperes in this case). As a check on the correct total amount of wire to put into each coil, the total watts (shunt and series) calculated with the new winding should be equal to the watts with the existing shunt winding, in order to ensure the same temperature rise.—Q.

Answer to No. 616 (*awarded* 7*s.* 6*d.*).—With the amount of data given it would be difficult to pass an opinion as to whether the desired result will be accomplished with the same machines. In all classes of machine design, if the output of a machine is to be increased, other factors relating to the output must be increased in *proportion*. Hence it will be impossible to obtain 300 amperes at 120 volts from the machines when run at the same speed as for generating 65 volts, no matter what alterations be made to the fields. (This is, of course, based on the assumption that the magnetic circuit of the machines in the first case is worked at a density corresponding to the current practice.) Probably the best and most satisfactory way of obtaining the 120 volts would be to couple two of the machines in series and excite the shunt fields in series from the 'bus bars, a field rheostat being inserted to adjust the voltage to 120.

The brief example given below will clearly show why it is impossible to use the same frame and armature for 120 volts. It will be convenient to give here the general formula for E M.F.:

$$E = \frac{4\,T.N.M}{10^8},$$

where E is the E.M.F. generated in the armature (in volts);
T the number of turns in series between the brushes;
N the number of magnetic cycles per second; and
M the magnetic flux linked with each of the T turns.

To ensure for all cases a correct interpretation of this formula, it will be desirable to consider some of the terms more in detail:

T = turns in series between brushes
= total *turns* on armature divided by number of paths through armature from negative to positive brushes;
N = number of magnetic cycles per second
$$= \frac{\text{revolutions per minute} \times \text{number of } \textit{pairs} \text{ of poles}}{60}.$$

It should also be noted that for a ring armature M = half flux from one pole-piece into armature, and for a drum armature M = total flux from one pole-piece into armature.

For the case under consideration we will assume that, for practical reasons, it is inadvisable to increase the speed of the machines; and hence, in the above formula, T and N will be constant, and if E is to be increased M the flux must also be increased.* The question states that the machines are of the "two-brush type." Presumably it is meant that there are two brush spindles. In this case the design would probably be of the two-pole variety. For the purpose of this example, we will assume that the machines run at 800 revolutions per minute when generating 65 volts, and that this speed cannot be increased. We will also assume that T equals 60. Applying the above formula we find that to generate 65 volts M = 2 megalines, and for 120 volts M = 3·75 megalines. The density in the armature core in the first case (for 65 volts terminal pressure) may be taken as 70 kilo-lines per square inch (at which density the M.M.F. required is 15·5 ampere-turns per inch length of magnetic path). The section of iron required in the armature will thus be 28·6 square inches. Now, in the second case this section has to carry 3·75 megalines, and the density becomes 130 kilo-lines per square inch. At this density about 800 ampere-turns are required per inch magnetic path, the iron being well saturated. A step further will serve to convince that the desired result cannot be obtained with the present machines. We will assume the leakage coefficient in the first case to be 1·3 and in the second case to be 1·6. Hence, flux to be generated in pole core equals 2·6 megalines in the first case and six megalines in the second. If the pole cores be of wrought iron and worked at a density of 60 kilo-lines per square inch, in the first case, the section required is 43·5 square inches and the density in the second case becomes 140 kilo-lines per square inch. It is evident, without carrying this example further, that it will be impossible to make up the required ampere-turns by any spool winding, and compound winding is entirely out of the question. The use of a compound winding on a machine is to supply the extra ampere-turns required at *full* load, to make up for the "C R drop" in the armature and the increased density in the magnetic circuit.

The mechanical design of the machines at once imposes a limit to an increase in speed, which would also be inadvisable from an electrical standpoint, on account of sparking troubles, resulting from the high frequency of commutation. If new machines are to be constructed (which is the only satisfactory solution to the problem), the writer would recommend that they should be of the multipolar type—a four-pole design being preferable. By adopting this type, the reactance voltage of the coils undergoing commutation may be made so low that the machines might easily stand 25 per cent. overload without sparking. The armature should be of the slotted type, with a multiple-circuit winding. There should be one turn per commutator segment, and the conductor should have a section of about 0·042 square inch, four conductors being placed in one slot. The number of poles should be a multiple of the number of slots. In the present case the number of slots should be divisible by 4. The average "pitch" of the winding should

* The rate of increase of M with regard to E will depend on the initial stage of magnetisation and quality of material constituting the magnetic circuit. At high densities leakage will modify very considerably the results.

TABLE A.

I. Part of machine.	II. Material.	III. Density in kilo-lines per square inch. From	To	IV. Ampere-turns per inch of magnetic path. From	To	V. Length of magnetic path, inches.	VI. Ampere-turns required.
Armature	Sheet iron or steel	70	75	15	16 5	$\frac{d_1 - d_2}{4 \times \text{number of poles}}$*	$\frac{d_1 - d_2}{10} \times$ Column IV.
Teeth	Ditto	110	120	25	150	Length of tooth	Column V. × Column IV.
Air-gap	Air	35	45	—	—	Radial depth of gap	·313 D L.†
Magnet core	Cast steel or wrought iron	60	80	19	32	Length of pole	Length of pole × Column IV.
Yoke	Cast steel	60	75	19	25	$\frac{d_3 - d_4}{4 \times \text{number of poles}}$‡	$\frac{d_3 - d_4}{10} \times$ Column IV.
	Cast iron	35	55	70	190	Ditto	Ditto

* d_1 = diameter of core at bottom of slots; d_2 = internal diameter of core. The rule can be put into another form; thus $\frac{\text{average circumference of core discs}}{2 \times \text{number of poles}}$.

† This formula gives the ampere-turns required for the air-gap direct. D = density in kilo-lines per square inch, and L = radial depth of gap in inches.

‡ d_3 = external diameter and d_4 internal diameter of yoke (assuming the circular form); or the rule may be put $\frac{\text{average circumference of yoke}}{2 \times \text{number of poles}}$.

$\frac{c}{4}$, where c is the number of face conductors. If there be 160 conductors on the armature, the average pitch will be 40 and the front pitch should be 21 and the back pitch −19. The number of turns in series between the brushes will be $\frac{c}{8}$, since there are four paths through the armature. The armature core should be worked at a density of 70 to 75 kilo-lines per square inch, and the teeth should be proportioned that the tooth density is of the order of 110 to 120 kilo-lines per square inch. The density in the air-gap should be from 35 to 45 kilo-lines per square inch, an average value, of course, being taken which will correspond to the saturation of the teeth. The accompanying Table A may be of use in designing. The leakage factor will be from 1·15 to 1·2 for a four-pole design, and an average value should be taken. The total ampere-turns needed *per pole* will be found by totalling the various quantities in Column VI. The current for the shunt excitation would be from 3 to 5 per cent. of the total current generated. In making calculations for the spools, overall dimensions will have to be assumed from which the mean length of one turn may be estimated. The following formula, which the writer has found to be of great service in spool calculations, may then be applied:

$$W = \frac{31 \times \left(\frac{\text{ampere-feet}}{1{,}000}\right)^2}{\text{watts}}$$

in which W = weight of copper in the spool in pounds;
ampere-feet = ampere-turns × mean length of one turn (in feet);
watts = watts consumed in the spool at 20deg. C.

An example will best illustrate the application of this formula. Suppose that the total of Column VI. comes to 4,000—*i.e.*, 4,000 ampere-turns per spool are required. Assume that the mean length of one turn is 2ft. Then

$$\left(\frac{\text{ampere-feet}}{1{,}000}\right)^2 = \left(\frac{4{,}000 \times 2}{1{,}000}\right)^2 = 64.$$

Assume that the spool has a radiating surface of 200 square inches, and after due considerations, as to ventilation, it is decided to permit 0·6 watt per square inch of radiating surface.

Therefore, watts = 200 × ·6 = 120 per spool.

Hence, $$W = \frac{31 \times 64}{120} = 16\tfrac{1}{2}\text{lb.}$$

The length of wire may be estimated from the dimensions, and the weight per thousand feet can readily be calculated. A reference to a wire-gauge table gives the size of the wire, and this must be checked for the required number of ampere-turns. For the methods followed in the calculation of the reactance voltage, such works as those of Messrs. Parshall and Hobart should be consulted. (See "Electric Generators," p. 175, and "Traction and Transmission," vol. iv., p. 143.).—A. DOVER.

Answer to No. 616 (*awarded* 7*s.* 6*d.*).—The voltage obtained from any dynamo depends on the number of conductors on the armature, and on the speed of rotation and on the strength of field (from the fundamental principle discovered by Volta that a difference of potential of one volt was obtained at the ends of a wire when that wire cut 10^8 C.G.S. lines of force in one second), consequently to obtain 120 volts out of the 65-volt dynamos referred to in the above question, either the speed will have to be almost doubled, or else the armature core rewound with twice as many conductors as there are on at present. The field could not be strengthened to obtain the necessary increase in volts owing to the heating of the field coils and the saturation of the iron. As no mention in the question is made as to the present speed of the dynamos, we shall have to assume some speed. Supposing that the speed is about 400 revolutions per minute on full load, then possibly this speed could be increased to about 750 revolutions per minute if the machines are belt driven by altering the size of the pulleys. This would be the best plan if it is possible, but if it is not, the armatures will have to be dismantled and rewound with double the number of conductors of about half the present sectional area of copper, as the current for the same kilowatt output will be practically halved at 120 volts. This alteration to the conductors will necessitate doubling the number of turns per section, as is shown diagrammatically in Fig. 1, the

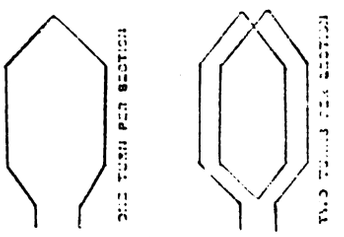

FIG. 1.

same commutators being used again. As the field windings will have to be rewound to suit the higher voltage, it is possible to compound wind them, and it will be advisable to do so if the dynamos are for lighting purposes and not for battery charging, as is explained later on. To find out the amount of series and shunt windings required, saturation curves should be made on the present 65-volt dynamos as follows: Run the dynamos up to the normal speed, and then, by means of an adjustable rheostat in series with the shunt winding, alter the strength of the field, and note the corresponding changes in the volts at the dynamo terminals. By taking two tests—(1) at full load, (2) at no load—curves can be plotted as shown in Fig. 2. From these curves it is seen that to obtain a

Digitized by Google

terminal voltage of 60 volts, 4,000 ampere-turns are required at no load and 5,000 ampere-turns at full load, showing that the shunt winding must be wound for 4,000 ampere-turns and the series winding for 1,000 ampere-

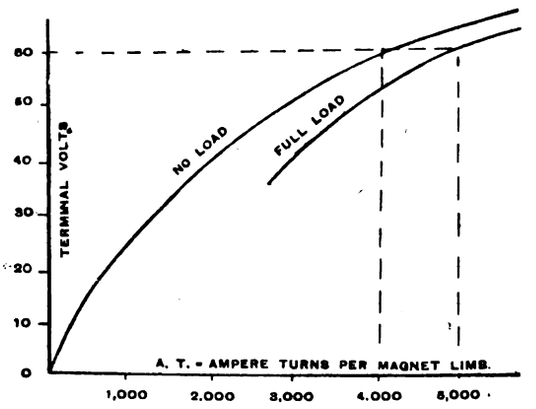

FIG. 2.

turns—of course, the actual number of ampere-turns are assumed and are only used for the sake of clearness—and if the armature is rewound with double the number of conductors, with the same ampere-turns the terminal voltage will be 120 volts instead of 60 volts.

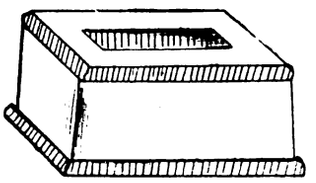

FIG. 3.

The following formulæ can be used for calculating the number of turns of shunt and series winding, etc. Assuming that the ordinary type of wooden flanged former is used as is shown in Fig. 3, the area of shunt wire

$$\frac{\cdot00028 \times \text{mean length of one turn} \times \text{ampere-turns per limb}}{36 \times \text{volts across one limb}}$$

$$\text{Number of turns in one layer} = \frac{\text{length of winding}}{\text{covered diameter of wire}} = x$$

$$\text{Number of layers} = \frac{\text{depth of winding}}{\text{covered diameter of wire}} = y$$

$$\text{Total number of turns on each former} = x \times y = z$$

$$\text{Resistance (in ohms) of each former (hot)} = \frac{\cdot000028 \times z \times \text{mean length of one turn} \times \text{number of formers}}{36 \times \text{area of wire}}$$

Weight of wire on each former = $\cdot32 \times z \times$ mean length of one turn × number of formers × area of wire = lbs.

The sectional area of the series winding should be such that the current density does not exceed 1,000 amperes per square inch when the full-load current is passing through it.

The total radiating surface = length of winding × peripheral length round the outside of the coil × the number of formers.

The total heating on the shunt winding and series winding combined should not exceed ·6 watt per square inch of radiating surface.

The advantage of compounding these dynamos lies in the fact that, when the shunt winding has reached its maximum temperature after a few hours' run, the terminal voltage will be almost constant at all loads without any adjustment of a shunt regulating resistance. But if the dynamos are to be used for battery charging, the shunt winding must be made strong enough to give the full charging voltage alone without the series winding, as this latter would have to be cut out during the charging. A compound-wound dynamo cannot be used for battery charging, because the battery will drive the dynamo as a motor, a strong current passing round the series winding if the battery voltage happens to rise above the dynamo voltage.—P.

BRIGHTON ELECTRICITY ACCOUNTS.

Below we give an abstract of the statement of the above accounts for year ended March 31 last, on which date the capital expenditure totalled £466,746.

Dr. Revenue Account.	£	s.	d.
Coal or other fuel	20,432	12	1
Oil, engine-room stores, etc.	1,899	3	10
Wages at generating station	6,265	14	4

APPOINTMENTS VACANT.

Resident Electrical Engineer, Leek Urban District Council, £150 per annum. See advertisement.

Assistant to attend to electrical plant, Honley District Council.

Assistant for private plant in London, £2 per week. See advertisement.

Engineer to superintend mainlaying. See advertisement.

Superintendent of Electric Lighting, etc. The Crown Agents for the Colonies will receive applications for the appointments of (1) superintendent of electric lighting, and (2) assistant electrical engineer, under the Public Works Department of the colony of Lagos. Salaries £400 and £300 per annum respectively, appointments for two years' service in the colony. Four months' leave on full pay in this country at the end of each 12 months' continuous service if returning to the colony, and two months if not returning to the colony. Half salary

Digitized by Google

on the first voyage out, but on subsequent voyages full salary will be paid. Applications by letter, stating age and experience, and accompanied by copies of not more than three recent testimonials, will be received by the Crown Agents for the Colonies, Downing-street, London, S.W., up to Oct. 7. The following reference should be quoted on the top left-hand corner of letter of application, M.1,751.

Mechanical Engineer to superintend machinery, Commissioners of the Port of Calcutta, Rs.1,000 per month, Oct. 15. See advertisement.

Improver, as switchboard attendant, Coventry. Applications by Oct. 8, to Manager, Electricity Works.

Junior Assistant Engineer, Aldershot. Applications by Oct. 10 to F. Garside, Electricity Works.

Clerk of Works, Heston and Isleworth, to superintend building of electric light station. Application by Oct. 8 to Mr. H. J. Baker, Town Hall, Hounslow.

LEGAL INTELLIGENCE.

ELECTRIC TRAMWAYS TRUST.

In the Vacation Court on Wednesday, before Mr. Justice Bucknill, the petition of Mr. W. Bratby for the winding up of the Electric Tramways Trust, Limited, was mentioned.

Counsel for the petitioner said that originally this was a petition for a compulsory winding-up order presented to Mr. Justice Walton on 9th ult. His Lordship made an order continuing the voluntary winding-up under the supervision of the Court. He also directed the appointment of an additional liquidator to act with the existing liquidator. The petition, however, did not ask for a supervision order, and in accordance with the practice of the Court it was necessary to amend the petition, to ask for a supervision order, and to readvertise it. That had been done, and the petition now came on as amended. The company appearing and consenting, his Lordship made the order asked for, directing that the costs be paid out of the assets of the company.

COMPANIES' MEETINGS AND REPORTS.

DICK, KERR, AND CO.

The ordinary general meeting of the shareholders in this Company was held at the Cannon-street Hotel on Tuesday, at noon, Mr. Claud T. Cayley presiding.

The **Chairman**, in moving the adoption of the report (which appeared in our last issue) commented first on several items in the balance-sheet. He said the liabilities of the Company had been increased, owing to the absorption of the English Electric Manufacturing Company, Limited, works at Preston. The works had been taken over as a going concern, and as from March 31 last had been entirely under the management of this Company. Having drawn attention to the fact that since the last balance-sheet the directors had increased the reserve fund by £70,000, making the total reserves £161,559. 11s. 2d., he showed that, adding to this the carry-forward from this year of £35,544. 18s. 7d., they had a total of £197,104. 9s. 9d. On the assets side the capital expenditure had increased, due to the purchase of the works at Preston. Incidentally, he drew attention to a paragraph in the auditors' report, which stated that the plant and machinery had been amply depreciated. Contracts due for work, stock of materials, etc., were in excess of last year; but up to June 30 they held certificates from the various corporations and companies amounting to considerably over £300,000, and these certificates were as good as cash, and since then most of this money had been received. Proceeding to discuss the question of the absorption by this Company of the English Electric Manufacturing Company, he stated that these works were capable of turning out the largest direct-current and three-phase generators yet designed, together with all sizes of traction and stationary motors, controllers, etc. It had been found necessary to make a large addition to the present buildings to cope with their present contracts, and they expected that the new buildings would be ready for occupation in about a month from now. He thought it might be stated that since the brief period they entered the electric traction field they had completed and had in course of construction permanent way, overhead lines and cables, rolling-stock, and electrical equipment, generating plant, including steam-engines, boilers, and generators, and general engineering, amounting, in round figures, to something like £7,500,000. In addition to the home contracts which they were carrying out, they were at the present time engaged in the construction and equipment of tramways in Mandalay, Singapore, Hong Kong, and Tokio, and they had also supplied machinery for and equipped important undertakings in South Africa, and had in hand important contracts in South America, Australia, and Canada. The home business included large contracts for machinery, permanent way, rolling-stock, and equipments for London and various cities and towns in the provinces. Their works at Kilmarnock were fully employed in their own special manufactures, and were likely to be for some time to come. They were principally engaged in the manufacture of narrow-gauge rolling-stock, points, and crossings for portable railways, turntables, and special work for tramways. After a sympathetic reference to the late Prof. Sydney H. Short, who was the technical director of the English Electric Manufacturing Company, the chairman passed on to say that the business of the Company had grown so much of late years that their offices at 110, Cannon-street had been found far too small. They had been fortunate, however, in securing offices in a new building in Abchurch-yard, a few yards from the present offices, which would meet all their requirements for some time to come. Their address, therefore, from Oct. 1 would be Abchurch-yard, Cannon-street, instead of 110, Cannon-street. The shareholders probably had seen a paragraph in some of the papers to the effect that this Company was at the head of a combine which proposed consolidating several other concerns of a similar nature. He desired emphatically to state that there was not a word of truth in the statement referred to, and he trusted that the same publicity would be given by the Press to this denial as had been accorded to the statement in question.

Mr. R. H. Prestwich seconded the resolution, which was carried unanimously, without comment.

Mr. Claude T. Cayley having been re-elected a director, the election of Messrs. Richardson, Prestwich, and Lingard, who had been directors of the English Electric Manufacturing Company, to seats at the Board of this Company was confirmed.

The proceedings closed with a vote of thanks to the chairman, directors, and staff.

MERSEY RAILWAY.

The half-yearly ordinary general meeting of the proprietors of this Company was held at Worcester House, Walbrook, E.C., on Tuesday, Mr. J. Falconer presiding.

The **Chairman**, in moving the adoption of the report (*vide* last issue), referred to the electrification of the railway, which was completed on May 4 last. He said that under their old system—steam—the greatest of all difficulties was that of ventilation. The condition of the tunnel now, as regarded atmosphere, was absolutely perfect and quite healthy. The temperature was equable, the air always fresh, and the old steam-driven fans which had to be kept going continuously had been replaced by lighter electrical fans, which only required to be used occasionally, and which could sweep the whole tunnel in a very short time. Previously, the lighting of the stations was a source of considerable difficulty on account of the state of the atmosphere, but now they were brightly lighted so that anyone could read with comfort. The tunnel itself had also been equipped with electric light on both sides from end to end, so that anyone passing through it could see clearly where they were going. With regard to the train service, at the present time they undoubtedly provided the most speedy means of communication between the points served, and the comfort of the line generally could not, he thought, be surpassed. As regards the safety of the service—a matter which was paramount in connection with such a line—he believed it to be the safest means of transit in or about Liverpool or Birkenhead. It was too early yet to tabulate the figures or even to form a reliable estimate of what they would be under the new conditions. The accounts before them only represented two months' working from the commencement of the new undertaking; but, so far as the receipts were concerned, it was gratifying to find that the tide had turned. For years they had had a steady ebb of their receipts; but since the change there had been a steady flow. He did not, however, wish to mislead the shareholders by suggesting that they had reached anything like the result hoped for—a result to be of any value to the ordinary shareholders. As regards the working expenses, it was impossible from a few months' operations to arrive at any results which could be taken as an indication of what might be expected later on. Experience had satisfied the Board that electrical traction was undoubtedly the right method of working the railway, and they had every reason to believe that they would be rewarded by the results. Referring to the question of a connection between the Company's undertaking at the low-level station and the Cheshire Lines on the Liverpool side, he said that the Great Central Railway, which had had for about 18 years the power to construct such a connection, had in the course of this year applied to Parliament for a renewal of their powers. With this in view, the Board had obtained sanction to have inserted in the Bill special provision that, in the event of the line being constructed to connect the lines of the Cheshire Railways, it should be so constructed as to enable it to be worked by electricity—an important provision for the Mersey Company should the Great Central Company resolve to carry out their powers.

The report was unanimously adopted.

ELECTRIC RAILWAY AND TRAMWAY CARRIAGE WORKS.

The annual general meeting of the shareholders in this Company was held at Preston on Thursday last week, Mr. George Richardson presiding.

The **Chairman**, in moving the adoption of the report, said they had had a very fair year, and orders had been received from almost all parts of the world, including Buenos Ayres, Hong Kong, and Rhodesia, while at home orders were in hand from East Ham, Burnley, Colchester, Swindon, Leicester, Bolton, Birmingham, and Northampton, and other places. The works had been kept in a very efficient state. So far as the revenue account was concerned, the profits for the year amounted to £19,426. 18s. 7d. after paying debenture interest and charging £5,096. 3s 9d. to depreciation, the net profit thus being £16,594. 14s. 11d. The directors proposed to carry £2,000 to the general reserve fund, and to recommend a dividend of 8 per cent., less income tax, for the year, absorbing £12,000, and to carry forward £5,426. 18s. 7d. to the next year's account. This would make their reserve fund for depreciation on buildings, fixed plant, and machinery, £10,500, and the additional general reserve fund to £6,000. Since their works were opened on March 23, 1899, orders had been executed to the extent of £665,000. Referring to statements that negotiations had been entered into regarding the consolidation of the British electrical industry, and that Messrs. Dick, Kerr, and Co., who were

Digitized by Google

intimately acquainted with the Electric Works, Limited, were at the head of the movement, the chairman said he had heard of no such negotiation. The Company was in no way connected with Messrs. Dick, Kerr, and Co. He denied everything leading people to think that the Company was entering into any combination. There was not a particle of truth in the statements published.

Alderman Copland seconded the motion, and it was adopted unanimously.

A vote of thanks to the directors, manager, and staff for their services during the year closed the proceedings.

DIRECT WEST INDIA CABLE.

The report of the directors for the year ended June 30 last states that the net result of the year's working is a profit of £1,430, as compared with £4,789 for the previous year. This reduction in the Company's income is chiefly due to the interference with traffic beyond Jamaica as the result of the recent decision in favour of the Cuba Submarine Telegraph Company in their suit with the West India and Panama Telegraph Company. An interim dividend of 3 per cent. has already be paid, and it is now proposed to make a further equal payment. The amount to the credit of revenue account is £30,612. Offers for the sale of debentures to the trustees were invited in December and June last, and £8,497 was paid for £8,500 of debentures, which amount has been written off capital expenditure.

CAPE TOWN CONSOLIDATED TRAMWAYS AND LAND.

The report of the directors for the period ended Dec. 31 last states that the final section of the Camps Bay Tramway Company, Limited (namely, the Kloof line) extending from the terminus of the Cape Town Tramway Company's system in Burnside-road down to Camps Bay, was opened on Nov. 10, 1902, thus completing the tramway system as originally designed. The total length of track now in operation is about 9½ miles, and while the directors look forward to a permanent increase in the traffic and receipts as the development in both the Oranjezicht Estates and the Cape Marine Suburbs proceeds, they have thought it advisable, during such period of development, to grant to the Cape Electric Tramways, Limited, a lease of this Company's tramways for three years from Jan. 1, 1903, on mutually advantageous terms. The profit and loss account shows a credit balance of £873.

NEW COMPANIES REGISTERED.

Hodge and Co., Limited.—Capital, £25,000. Objects: to adopt an agreement with A. E. Hodge and G. W. Elliott for the acquisition of the business of gas engineers and contractors, and chandelier, gas, and electric light fitting manufacturers, now carried on by them at 100, Hatton-garden, E.C.

Electro-Post Railway Company, Limited.—Capital, £100. Objects: to construct, repair, maintain, and operate installations, cables, wires, and other works of every kind for the generation, supply, distribution, and employment of electricity for motive power, lighting, heating, or other purposes

Tonyrefail and Gilfach Goch Electric Light Company, Limited.—Capital, £3,000. Objects: to carry on at Tonyrefail, Gilfach Goch, and elsewhere in Glamorgan, the business of an electric light company, electricians, mechanical and general engineers, suppliers of electricity for light, heat, motive power, or otherwise, etc. Registered office: 138, High-street, Tonyrefail.

Whitehead Electric Supply Company, Limited.—Capital of £10,000. Objects: to carry on the business of an electric light company at Whitehead, co. Antrim, and for adopting and carrying into effect an agreement between the National Electric Wiring Company, John McLaughlin, Alfred E. Wilson, Otto Weisener, and Alfred Hugh McKibbin. Registered office: 8, Garfield-street, Belfast.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Luton.—The Guardians invite tenders for lighting the new tramp wards by electricity.

Manchester.—The Corporation require tenders for a 32-ton electric lift. Tenders by Oct. 5.

Macao.—The Colonial Office at Lisbon invite tenders for the electric lighting of Macao. Tenders by Oct. 21.

Lisbon.—The Public Works Department require tenders for the public electric lighting of Macao. Tenders by Oct. 21.

Paris.—The Post and Telegraph Department, 103, Rue de Grenelle, require switchboards for telegraph and telephone offices by 15th inst.

Bucharest.—The Government Railways require tenders for the installation of electric lighting and plant for their workshops. Tenders by Oct. 10.

Pietermaritzburg.—Tenders are invited by the Natal Government Railways Electrical Department for additional plant for the power station at Pietermaritzburg.

Dover.—Tenders are invited for an electrically swung bridge at the harbour. Tenders close in about 10 days. Particulars may be obtained from the Harbour Board.

Swansea.—The Corporation invite tenders for the supply, delivery, fixing, and connecting of ducts, troughs, cables, wires, street boxes, etc. Tenders by Oct. 31. See advertisement.

Leeds.—The City Council invite tenders for one or two complete sets of steam or electrically driven surface condensing plant. Tenders to Mr. W. J. Jeeves, town clerk, by 9 a.m. on Oct. 7.

Transvaal Colony.—The Chairman of the Tender Board, Pretoria, requires tenders for installing and working the electric lighting of Potchefstrom for about five years. Tenders by Oct. 30.

France.—The Prefect of the Isère requires tenders for laying and working two tramway lines, about 49 miles. Tenders by 15th inst Particulars may be obtained from the Prefecture of the Department.

London, N.E.—The Bethnal Green Borough Council invite tenders for clearing the site of proposed electricity works. Specification may be obtained from the Borough Surveyor. Tenders by 4 p.m. on 13th inst.

London.—The Directors of the Metropolitan Railway Company invite tenders for the erection of a repairing shed and shops for electric rolling-stock at Neasden. Specifications, etc., after 5th inst. Tenders by 19th inst.

Dublin.—The Port and Docks Board invite tenders for the supply of a 100-ton electric crane. Specification can be obtained at the office of the engineer to the Board, Mr. John P. Griffith, M.I.C.E., Eastwall, Dublin. Tenders by Oct. 5.

Blackpool.—The Corporation invite tenders for the supply of arc lamp carbons for the ensuing year. Specification, etc., may be obtained on application to Mr. Charles Furness, borough electrical and tramway engineer, Electricity Works, Blackpool.

Liverpool.—The Tramways Committee invite tenders for the supply of ticket punches from Jan. 1, 1904. Specification, etc., may be obtained from the General Manager, Corporation Tramways, 6, Sir Thomas-street. Tenders by 10 a.m. on 14th inst.

Gravesend.—The Town Council invite tenders for a generating set, pump and air compressor, etc., in connection with their electricity works. Particulars may be obtained of Mr. C. F. McInnes, A.M.I.E.E., Electricity Works. Tenders by 10 a.m. on 5th inst.

Manchester.—The Paving, Sewering, and Highways Committee invite tenders for laying underground telephone pipes, with other appurtenant works. Specification, etc., may be obtained at the City Surveyor's Office, Town Hall. Tenders to the Chairman by Oct. 8.

Grimsby.—The Corporation invite tenders for the electric lighting of the new buildings forming the extension of the police department. Specifications, etc., may be obtained from Mr. W. A. Vignoles, M.I.E.E., Electrical Works, Doughty-road. Tenders by noon on 2nd inst.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

Canterbury.—The Urban Sanitary Authority invite tenders for the supply of 2,220 yards of ·4 square inch t c/c cable. Specification may be obtained from the Engineer, Electricity Works, Canterbury. Tenders by 10th inst. to the Town Clerk, Burgate-street. See advertisement.

Russia.—The Russian Minister of the Interior has sanctioned a plan for the reconstruction of three lines of municipal tramways—namely, those in Newsky, Sadovaïa, and Wassiliostrow districts. Each car is to provide for two classes of travellers, and will accommodate 52 persons.

Salford.—The Tramways Committee invite tenders for the installation of electric light at their central car depôt in Frederick-road, Pendleton. Specifications and plans may be obtained from the General Manager, Tramway Offices, 32, Blackfriars-street. Tenders by 5 p.m. on 19th inst.

East Barnet.—The Urban District Council will receive proposals for carrying out the provisions of their electric lighting order within the Council's district. Further particulars upon application to Mr. Henry York, the Council's surveyor, Council Offices, Station-road, New Barnet. See advertisement.

Brighton.—The Town Council invite tenders for the (1) supply of steel girder tramrails, fishplates, etc.; (2) tramcars; (3) points and crossings and other fittings. Specifications, etc., may be obtained from Mr. Francis J. Tillstone, town clerk, Town Hall, Brighton Tenders by 10.30 a.m. on Oct. 5.

Barrow-in-Furness.—The Education Committee invite tenders for the electrical lighting of the chemical laboratory in the higher-grade school. Specification, etc., may be obtained on application to Mr. W. Hutchinson, secretary to the Education Committee, Town Hall. Tenders by 12 noon on 5th inst.

Great Western Railway.—The Directors invite tenders for about 90 tons of steel bridge girders and other steel and iron work of British manufacture. Specifications, etc., may be obtained at the office of the Engineer between the hours of 10 a.m. and 4 p.m. Tenders by Oct. 6 to Mr. G. K. Mills, Paddington Station, London.

London.—The Directors of the Metropolitan Railway Company invite tenders for the supply of electric lighting sundries and iron signal and telegraph wire and telegraph battery jars and zincs, G.P. wire, etc., during 12 months ending Oct. 31, 1904. Forms of application on and after 5th inst. Tenders by 10th inst.

Johannesburg.—The Municipality require tenders for gas generating plant or for steam generating plant and for gas motors or steam motors, with electric generators and accessories. Particulars may be obtained from the Town Clerk, Johannesburg, or from Messrs. Mordey and Dawbarn, 82, Victoria-street. Tenders by Oct. 19.

Manchester.—The Tramways Committee invite tenders for the supply of a car-wheel grinding machine, radial-arm drilling machine,

Digitized by Google

planing machine, gap lathe, and other machine tools. Specifications, etc., may be obtained from Mr. J. M. M'Elroy, general manager, Tramways Department, 55, Piccadilly, Manchester. Tenders by 10 a.m. on Oct. 6.

London, N.—The Shoreditch Borough Council invite tenders for pulling down and rebuilding 3, Hoxton-square, N., to be used as stores for the electricity department. Specification, etc., may be inspected and bills of quantities obtained at the office of Mr. J. Rush Dixon, A.M.I.C.E. Tenders to the Town Clerk's Office, Town Hall, Old-street, E.C., by Oct 6.

Swansea.—The Corporation invite tenders for (1) laying of permanent way, including rail bonding; (2) rails and fishplates; (3) steel tiebars, bolts, and nuts; (4) points, crossings, cast-steel curved rails, and special work; (A) overhead electrical equipment; (B) ducts, troughs, cables, wires, section and other boxes, etc. Tenders by Oct. 31. See advertisement in last issue.

King's Norton and Northfield.—The Urban District Council invite tenders for the overhead construction of about three miles of electric tramway. Specifications, etc., can be obtained from the Council's engineer and surveyor, Mr. A. W. Cross, 23, Valentine-road, King's Heath; or Mr. J. H. Gadsby, 20, Victoria-street, Westminster, S.W. Tenders by 12 noon on 10th inst.

London, S.E.—The London County Council invite tenders for the supply, delivery, and erection in the electricity generating station to be established by the Council at Greenwich of four 5,000-h.p. vertical-horizontal steam-engines, each suitable for driving a three-phase generator. Particulars, etc., may be obtained at the County Hall, Spring-gardens, S.W. Tenders by 10 a.m. on Oct. 6.

London, W.C.—The Directors of the Savoy Hotel, London, invite tenders for the purchase of two Lancashire and two Cornish boilers, working pressure 150lb.; at present in use in connection with the electric lighting and heating of the Savoy Hotel. Further particulars can be obtained at the offices of the engineers, Kincaid, Waller, Manville, and Dawson, 29, Great George-street, Westminster.

Salford.—The Tramways Committee invite tenders for the supply and delivery of planing, turning, boring, drilling, grinding, milling, screwing, punching, and shearing, and wood-working machinery, power hammer, shafting motors, etc., at their central car depôt, Frederick-road, Pendleton. Specifications, etc., can be obtained from the General Manager, 32, Blackfriars-street, Salford. Tenders by Oct. 19.

Oldham.—The Electricity Committee invite tenders for arc and incandescent lighting and power circuits in Greenhill station, comprised in specification No. 9. Copies of the specification, etc., can be obtained from the Resident Engineer. Specifications can be seen at the offices of Messrs. Kennedy and Jenkin, 17, Victoria-street, Westminster, S.W. Tenders to be sent to the resident engineer, Mr. S. Wilmott Newington, by Oct. 6.

Birkenhead.—The Education Committee invite tenders for the wiring of the Laird School of Art in Park-road for electric light, and for extensions to the electric light wiring of the Holt School of Science and Art. Plans can be seen and specifications, etc., obtained on application to the borough electrical engineer, Mr. William Bates, A.M.I.C.E., Electrical Engineer's Office, Craven-street. Tenders to reach Mr. Robert T. Jones, secretary, Education Department, Town Hall, by 9 a.m. on Oct. 9

Harrismith (South Africa).—The Town Council invite tenders for the following electrical machinery and accessories f.o.b. and alternatively erected in Harrismith, Orange River Colony, South Africa: two water-tube boilers and one 25-kw and two 80-kw. steam alternators, with ejector condensers, switchboards, pipework, and other accessories. Specifications, etc., may be seen and obtained at the offices of Messrs. Mordey and Dawbarn, 82, Victoria-street, Westminster, S.W. Tenders to Messrs. Webster, Steel, and Co., 5, East-India-avenue, Leadenhall-street, London, E.C., by noon on 19th inst.

Great Western Railway.—The Directors invite tenders for the supply of telegraph instruments, telegraph apparatus, copper wire, G.P wire, etc., telegraph ironwork and tools, telegraph drysalteries, electric light carbons, incandescent electric lamps, iron rivets, bolts and nuts, etc., fishplates, and bolts and nuts for permanent way, and telegraph poles and yellow pines, etc., from Dec. 1 next to Nov. 30, 1904. Samples, etc., may be seen from 6th to 15th inst., at the office of the Stores Superintendent, Swindon. Specifications, etc., may be obtained at the office of the Stores Superintendent. Tenders by 19th inst. to Mr. G. K. Mills, secretary, Paddington Station, London. See advertisement.

RESULTS OF TENDERS.

Tynemouth.—The contract for the storage battery has been placed by the Corporation with the Electrical Power Storage Company, Limited.

Metropolitan Electric Supply Company.—The company have placed an order with Messrs. Dick, Kerr, and Co., Limited, for eight 500-kw. motor-generators.

Bexhill.—The tender of Messrs. Babcock and Wilcox, at £528. 7s., for pipework in connection with the new boiler for the electric light works has been accepted.

West Bromwich.—The tender of the British Insulated and Helsby Cables, Limited, in connection with the street-lighting scheme is recommended for acceptance.

Preston.—The Town Council have accepted the tender of Messrs. Thos. Croft and Sons, Limited, for the erection of a chimney stack at the electrical power station for £911.

Aberdeen.—The tender of Mr. James Leith, jun., amounting to £825, has been accepted for the making of the extension of the tramway line from Whinhill-road to Holburn-street.

Sunderland.—The order for the storage battery for Ryhope Asylum has been placed with the Electrical Power Storage Company.

Brighton.—The Electrical Power Storage Company, Limited, of 4, Great Winchester-street, London, E.C., have received the order from the Corporation for the extension of their storage battery.

Aberdeen.—The tender of the Clyde Structural Iron Company, Clydeside Ironworks, Glasgow, has been accepted for the ironwork in connection with the new car-sheds and workshops at Dee Village.

Bath.—The Town Council have accepted the tender of Messrs. J. G. Statter and Co., at £1,544, for extension of switchgear, subject to the provision of circuit breakers of the British Thomson-Houston make.

Manchester.—Edgar Allen and Co., Limited, have received another contract from the Corporation for the supply of their cast-steel points and crossings fitted with hardened cast-steel renewable centres for the tramways.

Aston Manor.—The Council have accepted the tender of Messrs. Johnson and Phillips, Old Charlton, for motors of the following b.h.p:—enclosed: 50, 75, 100, 150, 200, 250, 300; semi-enclosed, 150, 200, 250, 300; open, 250.

Carlisle.—Messrs. Hemingway and Pitt, of Richmond and Victoria-street, S.W., have secured the order for the electric lighting of the County and Station Hotel. Upwards of 500 lights are being installed, complete with all fittings. This same firm are also carrying out the lighting of the additional buildings at Richmond Union Infirmary, and the lighting of Weir Bank, Teddington, for Mr. W. H. Phillips.

St. Pancras.—The Borough Council at their last meeting, against the recommendation of their Electricity Committee, accepted a tender of the Western Electric Company at £6,683 for 56,100 yards of electric cables, although it was £700 more than a tender received from a German firm. It was urged that the money would be spent largely in wages for British workmen, and that the conditions which handicapped the British as against the foreign manufacturer should not be allowed to operate to the former's disadvantage.

Whitechapel Union.—The following tenders for the installation of the electric light in a section of the infirmary have been referred to the Electrical Standardisation Institution for report:

J. Defries and Sons, Limited, 146 and 147, Houndsditch, E.C.	£126	10	0
Cecil Cooper and Co., 14, Gloucester-road, Kensington	193	10	0
P. H. Allin and Sons, 50, Burleigh-street, Cambridge	157	0	0
Cairns and Co., 91, Queen Victoria-street, E.C.	147	0	0
J. Bakewell and Co., 46, King William-street, E.C.	120	10	0
Ward Bros., Bevois House, 28A, Basinghall-street, E.C.	165	0	0
Peplar and Keats, 12, Market-place, Alexandra-street, Southend	102	16	0
Brush Electrical Engineering Company, Victoria Works, Belvedere-road, S.E	260	0	0
Smeeton and Page, 63, Queen Victoria-street, E.C.	151	0	0
Simmonds Bros., Limited, 4, 6, and 8, Newton-street, High Holborn	199	0	0
C. E. Zimdars, 327, Gray's-inn-road, W.C.	150	0	0
F. J. Coleby and Co., 7, Thayer-street, Manchester-square, W.	165	0	0
Thompson Bros. and Co., 44, Old Town-street, Plymouth	200	10	0
E. F. Heath, Sanders, and Co, 47, Dawes-road, Fulham, S.W.	200	0	0
Mercer, Rance, and Co., 166, Iverson-road, West Hampstead	163	3	6
Fothergill and Co., Limited, 53, Victoria-street, Westminster	235	0	0
J. Richmond and Co., Limited, 30, Kirby-street, Hatton-garden, E.C.	228	10	0
Sherman, Redfern, and Muston, 16 and 17, Devonshire-square, E.C.	217	0	0
Société Gramme, 144, Gray's-inn-road, W.C.	123	13	0
W. C. Martin and Co., 116, Victoria Dock-road, E.	165	0	0
F. Troy and Co., 194-6, Finchley-road, South Hampstead, N.W.	180	0	0
Whittaker Bros., Limited, 204, Wolverhampton-street, Dudley	135	0	0
Electric Motor Supply Company, 54, Hound's-gate, Nottingham	159	0	0
A. H. Marshall and Co., 270, High-road, Leytonstone, E.	370	0	0
H. F. Joel and Co. and T. Potter and Sons, 44, South Molton-street, W.	143	0	0
Hubber and Son, South-street, Exeter	153	0	0
May and Calder, 4, Newington-causeway, S.E.	172	5	6
Watkin Bros., Limited, West Bridge Works, Northampton	131	17	3
Bromley and Batstone, Buchanan-buildings, Holborn, E.C.	166	0	0
W. G. Murrin, 111, Aslett-street, Wandsworth	240	0	0
R. H. and J. Pearson, Limited, 141-145, High-street, Notting Hill gate	174	0	0
J. Wilson, Ferrier Works, North-street, Wandsworth	185	5	0
Dudley Electrical Company, 53, High-street, Dudley	155	0	0
W. S. Wilson, 18, Derby-road, Watford	116	0	0
Wells and Co., 56, Paddington-street, W.	163	0	0
H. J. Rider and Co., 27, Chancery-lane, W.C.	162	10	0
J. E. Spagnoletti and Co., Goldhawk-road, W.	173	0	0
Jackson Bros., The Laurels, Broadway, Plaistow, E.	198	18	0
Nunn, Watts, and Co., 82, Mark-lane, E.C.	183	0	0
J. A. M. Smeaton, 25, Victoria-street, S.W.	112	0	0
Smith and Holeman, 97, High-street, Peckham, S.E.	125	0	0
W. Mackie and Co., 122 and 124, Golden-lane, E.C.	192	17	0
H. E. Flood, 96, Geldeston-road, Clapton, N.E.	188	5	6
Johnson Bros., 168, Whitechapel-road, N.E.	215	0	0
Humphrey, Woodger, and Co., 45, Purves-road, Kensal Rise, N.W.	276	11	0
D. Assersohn, 20, Commercial-street, E.	167	0	0

Digitized by Google

Holyhead.—The Urban District Council have accepted the following tenders for works and plant for electric lighting: National Electric Construction Company, plant, mains, etc., £7,000; Meldrum Bros., Manchester, destructor, boiler, etc. £3,333, buildings and steam mill £3,000, erection of chimney £617, alterations to buildings, £290.

Derby.—Edgar Allen and Co., Limited, who recently took over the business of Askham Bros. and Wilson, Limited, have secured through the contractors (Messrs. J. G. White and Co., Limited) the contract for the supply of cast-steel points with renewable centres of their imperial manganese steel and iron-bound crossings of the latest American type with renewable centres, also in their manganese steel, for the Corporation tramways.

Wellington (N.Z.).—The Corporation have accepted the tender of Macartney, M'Elroy, and Co., Limited, for the new tramways, less the power-house, at £113,883. 19s. 7d., and that of the Electric Construction Company, Limited, at £26,956. 17s., being £24,611. 19s. for supplies and £2,345 for erection of power-house. The sub-contractors to these contracts are: permanent-way section — rails, MacLellan and Co., Glasgow; special work, Hadfields, Sheffield; overhead material, made specially for Macartney-M'Elroy; poles, Stewarts and Lloyds; brakes, Westinghouse Company; cars, British Electric Car Company; wire, J. A. Roehlings and Co.; cables and conduits, Callender's Cable and Construction Company; trucks, Brill and Co.; motors, General Electric Company. The power-house section—crane, Jessop and Appleby Bros.; steam-engines, Belliss and Morcom; dynamos and motors, the contractors, Electric Construction Company; condensers, Korting and Co.; feed-pumps, Weir and Co.; economisers, Green and Co.; superheaters, Easton and Co.; mechanical stokers, Erith's Underfeed Stoker Company; boilers, Daniel Adamson and Co.; coal-handling plant, New Conveyor Company; switchboard, the contractors, Electric Construction Company; steam piping, Aiton and Co. Six tenders were received for the contracts in globo, and were as follows: Dick, Kerr, and Co., £170,560. 11s. 10d.; Blackwell and Co., £159,444. 2s. 1d.; British Westinghouse Company, £157,054. 11s.; Brush Manufacturing Company, £165,984. 10s. 8d.; White and Co., £153,918. 4s. 3d.; Macartney, M'Elroy, and Co., £147,436. 5s. 5d. In all 77 tenders were submitted.

BUSINESS NOTES.

LIGHTING AND GENERAL.

Fochriw.—The Postmaster-General has been petitioned for a local telegraph service.

West Bromwich.—Application is to be made for sanction to borrow £1,000 for electric street-lighting.

Stourbridge.—An electric lighting installation is to be provided at the workhouse at a cost of £2,700.

Radstock.—The Urban District Council have decided to apply for an electricity supply provisional order.

Reading.—The important question as to how the streets are to be lighted in the future is still undecided.

Hackney.—Two extensions of electric lighting mains are to be made at a cost of £95 and £100 respectively.

Southgate.—Application is to be made by the Urban District Council for an electric supply provisional order.

Hebburn.—A number of large arc lamps have now been erected in Hebburn New Town, and are lighted each night.

Aston Manor.—The Urban District Council's electric power and lighting station was formally opened on Tuesday.

St. Marylebone.—An application from Post Office authorities to lay telephone wire pipes, etc., in various streets of the borough has been agreed to.

Dartford.—The Guardians have now decided to light administrative buildings to be erected as an extension to the present workhouse by electricity.

Dundee Asylum.—Mr. Richardson, the city electrical engineer, has been asked to report regarding the supply of electric light for the asylum from the town's mains.

Perth.—The question of the street-lighting will shortly be discussed by the Perth Town Council. This year there is an increase of £500, owing principally to a large increase in the number of lamps.

Brighton.—The municipal telephone service will start with 1,200 subscribers, being double the number fixed by experts as the minimum requisite before the project was launched. Further applications are coming in daily.

Dublin.—The formal opening of the new electric lighting system will take place this month. The transfer to the new Pigeon House station was made a week ago, and the whole 180 arc lamps were connected without a hitch.

Kingston.—The infirmary sub-committee who were appointed to go into the subject of electric lighting have been asked to submit their report as quickly as possible, and £1,000 or £1,100 will probably be wanted for extending electric lighting.

Gravesend.—The resident electrical engineer in his last report estimates further sums required in connection with electricity and dust destroying, which, with amounts contemplated by the Electric Committee, and contingencies, amount to £5,100.

Whitehead.—The National Electric Wiring Company have completed their preliminary arrangements for lighting the town, and a prospectus is to be issued almost immediately. It is expected that the whole of the work will be completed within three months.

Wireless Telegraphy.—So numerous have been the instances in coastwise navigation in America during the past year of the breaking away of barges from their tugs, that one of the large towing companies has decided to equip the tugs with a wireless telegraph system.

Stock Exchange.—The Stock Exchange Committee have appointed Oct. 7 special settling day for Bournemouth and Poole Electricity Supply Company's provisional certificates (fully and partly paid) for a further issue of 4,500 ordinary shares of £10 each, Nos. 22,501 to 27,000.

Littlehampton.—At Wednesday's meeting of the ratepayers' association the chairman introduced the subject of the introduction of the electric light into the town for discussion. The meeting decided that it would be to the advantage of the town if a company were introduced.

Dundee.—The Town Council some time ago decided to lay out £15,000 on new electric cables and £10,000 on engines, dynamos, and work in the station, while a considerable sum is required to cover expenditure already incurred. It is therefore considered necessary to go to Parliament to get additional borrowing powers, probably to the extent of £70,000.

Anglo-American Telegraph Co.—The directors have resolved, after placing £6,000 to the credit of the renewal fund, to declare an interim dividend for the quarter ending Sept. 30 of 15s. per cent. on the ordinary stock and £1. 10s. per cent. on the preferred stock, less income tax, payable on Nov. 2 to the stockholders registered on the books on Sept. 30.

Islington.—In order to encourage an increased day load, the Electricity Committee recommend the adoption of the following sliding scale in the case of all electricity for motor power purposes consumed between midnight and 6 p.m.: for all units up to 2,000, 2d. per unit; from 2,000 to 20,000, 1½d. per unit; and from 20,000 and over, 1½d. per unit.

Removals.—Messrs. Edward Le Bas and Co., iron, steel, and metal merchants, have removed to Dock House, Billiter-street, E.C. The telephone numbers and telegraphic address of the firm will remain as before. Messrs. Englebert and Co., lubricant manufacturers, 44 to 47, Bishopsgate-street, E.C., have removed to 119-125, Finsbury-pavement, London, E.C.

London-Paris Telephone.—It is rumoured that arrangements are being completed whereby it will shortly be possible to obtain the use of the telephone between London and Paris during the night at half the present rates—*i.e.*, at 4s. per conversation of three minutes—provided that a monthly subscription be taken for a period of not less than six minutes per night.

Bourne.—The Post Office telephone system is being installed in the town, and will soon be ready for operations. Already the necessary posts for overhead wires have been erected in that part of the town which the trunk line did not serve, and additional wires have been put on the trunk lines. There are over 20 subscribers for the service, which will be ready almost immediately.

Abercanaid.—A fire occurred early on Tuesday in the electrical engine-house of the Hills Plymouth Company at Abercanaid. The loss is estimated at about £1,000. Besides an engine for electric lighting, the building contained a pumping engine, which was not irretrievably ruined, but seven motors, one generator, some expensive belting, and various adjuncts were totally destroyed.

Maidstone.—The Electricity Committee, in the last report, recommend that a flat rate of 4½d. per unit be charged for the lighting of all public buildings, and that an average flat rate of 4½d. per unit be charged for all premises where residences and shops are combined, and that they be empowered to expend the sum of £500 for purchasing motors to let out on hire. The matter has been referred to the Finance Committee.

Macclesfield.—The Electricity Committee have been considering schemes for supplying the borough with electricity, submitted by Messrs. Enright and Co., Messrs. Crompton and Co., and the British Westinghouse Electric and Manufacturing Company. The first scheme is estimated at £26,000, the second £16,000, and the third £32,000. At their last meeting the committee decided to recommend Messrs. Crompton's scheme for acceptance.

Hamilton.—The electric light was formally inaugurated on Tuesday in the principal streets. Provost Keith switched on the new lights, 66 in number, of the Bremner pattern. Provost Keith was presented with the bronze switch with which he turned on the new light, and, along with Mr. Meechan, convener of the Electric Committee, with gold-mounted switches, suitably inscribed, as mementoes of their services in switching on the temporary supply in February last.

Wolverhampton.—The members of the Wolverhampton Trades Council last week paid a visit to the municipal electric light and power station, where they were shown round by Messrs. Howie and Vickers (assistant engineers), Smith (main superintendent), Creasey (assistant main superintendent), Jones (draughtsman), Stubbs (assistant draughtsman), and Dudley (station superintendent). Afterwards refreshments were provided by Councillor Gough Allen.

Leicester.—The electric lighting accounts for the half-year ended June 30 show a net profit, after paying interest on the capital of the undertaking, of £3,847. 6s. Out of this has been paid £2,545. 10s. 1d., the half-year's amount of sinking fund, leaving a balance of £1,301. 15s. 11d. The extension of the electric lighting station at the Aylestone-road works has been completed. Leicester's municipal water, gas, and electric departments show a joint profit of £38,000 on the working of the past half-year.

Swansea.—We are informed that the difficulty which arose some time ago in connection with the scheme for erecting an electrical organ in St. Mary's Parish Church is now practically settled, and Messrs. Norman and Beard are proceeding with the work. The surveyor has

Digitized by Google

prepared a report on the lighting of the boundaries of the borough, showing that 106 new lamps would be required, which would cost £318 and an expenditure of £304 a year. The matter has been deferred till the next half-year's estimates are brought forward.

Greenock.—At Wednesday's meeting of the Parish Council a discussion took place on a proposal that Smithston Asylum and Poorhouse should be lighted with electricity. The sub-committee agreed to ask the Corporation to forego the guarantee of a minimum payment of £300 per annum for 10 years on the understanding that the Parish Council would not generate electricity at Smithston for lighting purposes, nor receive it from any other source during the same period. It was agreed by the Council to hold the matter over for a month.

Agencies.—Messrs. James T. Donald and Co., Limited, engineers and steel merchants, 35, McAlpine-street, Glasgow, have been appointed as the Bell Rock Belting Company's sole agents for Scotland, and will keep large stocks of the company's various kinds of belting. Thomas Parker, Limited, electrical engineers and contractors, of Wolverhampton, have appointed Mr. Haley Hodgson, M.I.Mech.E., their representative for the city of London and district. The offices are at Mansion House-chambers, 20, Bucklersbury, Queen Victoria-street, London, E.C.

Wallasey.—The electricity works capital account shows an expenditure up to March, 1902, of £54,636, increased during the year to £63,179. Of this amount, £3,613 was repaid formerly, and another £1,784 during the year, leaving a total of £57,780. The year closed with £16.074 to the credit of the capital account. The year's revenue was £14 328, and expenditure, including £500 for depreciation and renewals, £8,478, leaving a surplus of £5,849. Of this sum, £1,698 went in interest and £1,784 in loan repayments, leaving a net profit of £2,336 in favour of the district fund account.

Luton.—The electrical engineer in his last report, stated that from July 23 to Sept. 11, 1903, 13,378 units had been generated; that an equivalent to 311 8-c.p. lamps and three motors of 6 h.p. had been connected, making a total of 117 consumers with 8,087 lamps and 24 motors of 70 h.p.; that the units generated showed an increase of 71 per cent. over the corresponding period of last year; and that over 745 lamps and five motors were now being wired. The electric light is to be installed in the new tramp wards now in course of erection, and an estimate obtained for an installation throughout the infirmary.

Para Rubber.—This year's harvest of rubber, which closed June 30, is estimated at 29,890 tons. This is only 108 tons less than that of the year 1901-2, which holds the record. Of this amount 15,261 tons went to Europe and 14,566 tons to America. As compared with last year this shows a decrease of over 500 tons in the exports to Europe and a corresponding increase in those to America. From the port of Manaos 16,600,000lb. went to Europe and 18,400,000lb. to the U.S.A. The corresponding figures for Para were 13,400,000 and 1,360,000; 3,500,000lb. went to Europe from Iquitos. The stock on June 30 amounted to 129 tons, and a large increase in the exploitation of forests is expected.

Cardiff.—At the last meeting of the General Purposes Committee of the Corporation the Chairman of the Electric Lighting Committee said that the net contributions from the rates to his committee had been reduced to £1,818. The revenue balance on March 31, 1903, was £3,073, less £771 appropriated in aid of the rates and £995 instalments on loan fund account. There was consequently a net balance of £1,306. The loans repaid to the same period amounted to £11,042, and there was a reserve fund of £500. The summary of profit and loss account for the last five years was as follows: to March, 1899, loss, £1,067; 1900, loss, £1,794; 1901, profit, £9. 15s. 3d.; 1902. £1,117. 11s. 4d.; 1903, £3,648. The credit balance on the five years yas, therefore, over £1,913.

Wrexham.—The Town Council on Tuesday approved a scheme of extending the electric cables for increased public and private lighting, and instructed the electrical engineer to prepare a statement as to the approximate cost. It was proposed to place 41 arc, 6 Nernst, and 7 incandescent lamps in the principal streets of the town, and to take away 10 Bray and 117 ordinary lamps. The cable will be laid solid in wood casing, and the centre of the town will not be disturbed, as there are plenty of spare ways under the present cables which will be utilised as far as possible. The candle-power of the present lamps is 2,372, but the proposed new arc, Nernst, and incandescent lamps will have a candle-power of 83,615. The total current outlay for lighting is estimated at £932 as against £752 at present. Considerable additional consumption from private persons is expected.

Hammersmith.—Mr. G. Gilbert Bell in his last report draws attention to the fact that the provision of a complete arrangement for using the River Thames water for condensing purposes at the generating station, already referred to by us, and the extension of the supply mains to the northern portion of the borough, have been set to work. A new sub-station has been built in order to supply the King's Theatre. The number of new consumers connected is 234, being an increase of 238 in the number connected during the previous year, and making a total of 1,224 consumers connected at the end of the year. The average number of lamps per consumer is now 48 8 c.p., which shows a steady decrease, proving that most of the large consumers are now connected, and that new business is obtained from private houses. The number of units sold to consumers shows an increase of 277,586 over the previous year, and the maximum demand upon the works has increased by 144 kw. to 1,320 kw.

London Gazette.—A receiving order has been made out in the estate of Thomas Williams, electrical engineer, 54, Bridge-street, Llandaff, lately residing at 13, Despenser-street, Cardiff, Glamorgan. A general meeting of the South Shields Electrical Engineering Company, Limited, will be held at the offices of Messrs. Strachan and Co, 18, Grainger-street West, Newcastle-on-Tyne, on Oct. 30, at 4 p.m., to receive the liquidator's report, showing how the winding-up of the company has been conducted and its property disposed of, to hear any explanation that may be given by the liquidator. A general meeting of the London United Tramways, Limited (in liquidation), will be held at Clare-street House, Bristol, on Oct. 30, 1903, at 12 noon, for the purpose of having laid before the meeting the account of the liquidator, showing the manner in which the winding-up has been conducted and the property of the company disposed of, and of hearing an explanation thereof given by the liquidator.

Keighley.—Last year's accounts show that the consumers have grown from 92 to 133, and the number of units sold from 90,000 to 137,000, or an increase of 50 per cent. The cost of coal was less than the previous year, although nearly half as much more electricity has been sold. There is a steady increase in the quantity of coal consumed—viz., 1901-2, 732 tons; 1902-3, 750 tons—but the price averaged for the previous year 7s. 6d., and for the year under review only 7s. 2d.; 51 per cent. more electricity was sold, but only 2½ per cent. more coal was consumed. The loss of £461 last year has been converted, on working expenses only, into a profit of £168, so that the result of the working was £620 better than the previous year. The interest and sinking fund brought up the total cost per unit to 7·39. The average price obtained has been 3·66, so that, practically, every unit of electricity sold is sold at about half its actual cost, but with a steady increase in the sale of current this loss will be gradually converted into an actual profit.

Portsmouth.—At the conclusion of Monday's enquiry into the Town Council's application for sanction to borrow £12,000 for telephone extensions, Mr. H. Percy Boulnois asked the town clerk (Mr. A. Hellard) to furnish him with a statement of accounts regarding the working of the Corporation telephones since March 31. The accounts of the undertaking from March 31 to June 30 show a profit on the working of the municipal exchange, after charging interest and sinking fund, on the capital of £25,500, the amount originally sanctioned by the Local Government Board. It was explained to the inspector that only from April 1 have the Corporation began to give an effective exchange, and further it was stated the loss on terminals would not reach £50 at the present rate, whereas Mr. Robb stated that it would be nearer £150 than £100. The delay in the publication of the borough accounts is explained by the amount of work entailed in the auditing, printing, and revising. The accounts occupy about 220 pages, and have been in the hands of the printer for a month. Their publication is not expected for at least a fortnight. The accounts up to March 31, which, however, only included one month's actual working of the municipal telephones, and which were handed round at the enquiry, show that there was a balance to the committee's credit of £25. 14s. 10d. The capital expenditure was £19,876. 17s. 3d., and at the end of the month there was £5,623. 2s. 9d. in hand of the £25,500 loan sanctioned.

Iron and Steel Institute.—It will be remembered that at the conclusion of the general meeting at Barrow-in-Furness, Mr. Charles Kirchhoff, of New York, tendered, on behalf of the American members of the Iron and Steel Institute, an invitation to the institute to hold its next autumn meeting in New York. This invitation, which was endorsed by the American Institute of Mining Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers, the Franklin Institute, and the American Foundrymen's Association, was, on the motion of the president, accepted by the general meeting with acclamation. It is proposed that the autumn meeting shall take place in New York on Oct. 24, 25, and 26, 1904. After the meeting there will be an excursion to Philadelphia, Washington, Pittsburgh, Cleveland, Niagara Falls, and Buffalo, returning to New York on Nov. 10. During the trip night travelling will be avoided, and every endeavour will be made to obviate fatigue. The two Sundays will be spent at Washington and at Niagara Falls. The approximate cost of the stay in the United States is estimated at £25. For the convenience of members desirous of visiting the St. Louis Exhibition, arrangements will be made for a limited number to leave Pittsburgh for St. Louis and Chicago, reaching New York on the evening of Nov. 10. This trip will necessitate three nights being spent in sleeping cars, and the approximate cost will be £35. In order to carry on negotiations with the principal steamship companies so as to obtain for members the advantages of reduced rates, the secretary, Mr. Bennett H. Brough, asks to be informed as soon as possible as to the probable number of members who propose attending the meeting.

Motherwell.—Mr. S. E. Britton, in his last report, states: "During the past financial year the number of consumers connected is 74, making a total of 164, being an increase of 82 per cent. The applications made during the year are equal to 12,915 8-c p. lamps, making the total connections 23,209, an increase of 125 per cent. The number of units sold is 291,247, an increase of 124,387. The consumption of light has increased 48 per cent., power 830 per cent., public lighting 13 per cent., which is an average increase of 74·5 per cent. The total cost of producing the energy sold is £1,548. 12s. 5d., or 1·28d. per unit, and is, as compared with the previous year, an increased expenditure of £543. 13s. 2d., and a decrease per unit sold of ·17d. per unit—that is, the cost per unit sold is 13 per cent. lower than the previous year. The cost of attending, repairs, and renewals to public lamps is £234. 9s., as against £343. 4s. 6d. the previous year; the decrease of £108. 15s. 6d. is due to the system of grouping incandescent street lamps. The total expenditure, therefore, is £1,783. 1s. 5d., an increase over the previous year of £434. 17s. 7d. The income from private lighting is £1,467. 15s. 4d.; power, £589. 17s. 11d.; hire of motor and sundry receipts, £276. 0s. 2d.; public lighting, £2,001. 12s.; a total income from all sources of £4,335. 5s. 5d., an increase of 41 per cent. This is highly satisfactory, considering that the prices charged for private lighting and power were 20 and 25 per cent. lower than the previous year. The income provides a gross profit of £2,552. 4s., to which is to be added £12. 14s. (bank interest on deposit), making a total of £2,564. 18s. to meet interest on loans

Digitized by Google

and sinking fund charges. The interest on loans amounts to £1,298. 10s. 1d., and the sinking fund £1,100, together a total of £2,398. 10s. 1d.: this amount, deducted from the gross profit, leaves a net profit of £166. 7s. 11d. From these figures I hope the committee will clearly see the rapid strides the undertaking has made. It is satisfactory to note that, although the charges for private lighting and power were considerably lower than the previous year, the income is still more than enough to meet all charges against the revenue account. The financial result of this second year is such as should enable the Town Council to reduce the charges for light and power. I recommend that for private lighting the charge be reduced from 4d. to 3½d. per unit, small and intermittent users of power remain at 2d., and larger consumers of power be charged on a sliding scale—namely, 1½d. for the first 5,000 units per quarter, 1¼d. for the second 5,000 units per quarter, and 1d. per unit for any further quantity per quarter." Mr. Britton's recommendation has been adopted by the Motherwell Town Council, and the prices are now 3½d. per unit for light and 2d. to 1d. per unit for power.

TRACTION.

Ipswich.—The Town Council have decided to run a service of cars on Sundays.

Rowley.—The District Council are taking steps for obtaining a loan for tramway purposes.

Uxbridge.—The time for completing the tramway to Uxbridge has been extended to April, 1904.

Luton.—A special meeting of the Town Council is to be held to consider the tramway question.

Connah's Quay.—The Urban District Council are supporting the scheme for a light railway in this district.

Maidstone.—Tenders will be shortly invited by the Urban District Council for carrying out the whole work connected with the proposed light railway.

Birmingham.—A Birmingham correspondent informs us that Mr. Baker has arrived in the city to take up his duties as tramway manager to the Corporation.

Pwllheli.—The Town Council are going to oppose the light railway scheme at the enquiry owing to the refusal of the promoters to divert the route so as to avoid Ala-road.

Bexley.—The new electric tramway, six miles in length, from Plumstead to Bexley, was last week examined by the Board of Trade officials, and was opened to the public yesterday (Thursday).

Kirkcaldy.—The extension of the tramway system is being vigorously pushed forward. The extension will provide a circular route, with the addition of a line running west to the public park.

Sunderland.—A new car-shed and repairing shops were formally opened by the chairman of the Tramways Committee on Wednesday. The buildings have cost over £14,000, and taken two years to build.

Perth.—At a meeting of the Town Council on Monday a committee was appointed to carry out the reconstruction of the tramways for electric traction and to take steps to appoint an engineer to advise them.

Croydon.—Memorials were presented to the Town Council at their last meeting and referred to committee for consideration urging the extension of the tramways to the borough boundary at Upper Norwood.

Calcutta Tramways Co.—The directors of the Calcutta Tramways Company, Limited, have declared an interim dividend of 2s. 6d. per share (being at the rate of 5 per cent. per annum) for the half-year ended June 30 last.

Electro-Pneumatic Signalling.—The Lancashire and Yorkshire Railway Company are introducing the Westinghouse electro-pneumatic system of signalling at the new station which is now approaching completion at Bolton.

Torquay.—The Town Council, who propose to adopt the Dolter surface-contact system owing to the narrowness of the streets and their consequent unsuitability for the overhead trolley system, have appointed a committee to confer with the company's representatives.

Altrincham.—The tramway question was discussed at a ratepayers' meeting last week with reference to a proposal to obtain a provisional order for a tramway to connect Altrincham with the southern tramways line at West Timperley. A poll is to be taken on the question.

Bradford.—The question of the amalgamation of the Tramways and the Electricity Committee has been considered by a special committee appointed for the purpose. Opinion was very evenly divided, and on the committee dividing the resolution to amalgamate was lost by one vote.

Southampton.—The Board of Trade have sanctioned the new piece of tramway from Portswood depôt to the borough boundary. A sub-committee has been empowered to purchase a quantity of curve rails for the tramways, and the borough engineer is to make a report on the matter.

London Tramway Employees.—Arrangements have been made by the London Central Council of the Social Democratic Federation for a meeting of the employés of the London United Tramways with the object of "resisting the tyranny of your employers and improving your conditions of labour."

Macclesfield.—At the last meeting of the Council a letter was read from Messrs. Ashwell and Tutin, of Nottingham, with regard to their renewed tramway proposals, and the town clerk was directed in reply to ask them to first satisfy the County Council with regard to their scheme, and then approach the committee.

Heywood.—At a special meeting of the Town Council it was decided to give notice to the Bury, Rochdale, and Oldham Steam Tramway Company to sell all the tramways belonging to them in the Heywood borough to the Corporation. It is proposed to convert the system to electrical working when municipalised.

Birkenshaw.—The tramway to Birkenshaw in connection with the Bradford city system has now been completed to the Half Way House, Birkenshaw, and a trial trip was run over it this week. The line, which is 1 mile 654 yards in length, leaves the main tramway to Tong at the junction of the Drighlington and Birkenshaw roads.

Scarborough.—The work of constructing the electric tramways was to have been commenced on Wednesday, but the preparations are not yet complete, and it will probably be a fortnight before the work can be begun. Offices for the engineer (Mr. J. E. Edmundson) and his staff have been established in Scalby-road, and a start will be made at this point.

North-Eastern Railway.—In our note under this heading in our last issue we inadvertently referred to the motors with which the new corridor cars are being equipped as of the "General Electric" type. This, however, is a mistake. The motors and the equipment throughout will be of British Thomson-Houston make entirely, and not General Electric.

London County Council.—The traffic returns of the London County Council tramways for the week ending Sept. 26 show receipts at £11,054. 4s. 1d., being an increase of £2,575. 6s. 3½d. when compared with the corresponding week in 1902. For the aggregate 179 days of the present year the receipts have been £260,121. 17s. 6d. This sum shows an increase of £41,481. 4s. 11d.

Johnstone.—Plans for the new electric tramways were submitted to a special meeting of the Town Council in committee. These show that Mr. Murphy, the promoter, has fixed the terminus at Hag-road, which is the boundary of the burgh, and only a short distance from Milliken Park. Mr. Murphy is to be again communicated with, so as to explain certain matters in connection with the undertaking.

Belfast.—The City Corporation have received a report from Mr. Chas. H. Merz in regard to the proposed conversion of the city tramways to electric traction when they become the property of the Corporation. Mr. Merz recommends the adoption of the overhead trolley system, and estimates the total cost of carrying out the scheme at £664,621. Mr. Merz is now to be asked to prepare the necessary plans for presentation to Parliament.

Manchester-Liverpool Mono-Railway.—It is reported that this project is at present at a standstill. After the Bill authorising the line received the Royal assent on Aug. 17, 1901, the Monorail Construction Company was formed, and in due course a prospectus was issued to raise £2,000,000 of capital in £10 shares. The response of the public was not, however, such as to justify proceeding with the work, and the scheme, it is stated, is now in abeyance.

Aberdeen.—Colonel von Donop, R.E., on behalf of the Board of Trade, this week made an official inspection of the Ferryhill tramway track from the north end of Crown-street to Duthie Park. This part of the system has been open for some time, the traffic having been conducted according to temporary regulations suggested by the Board of Trade. Arrangements have been completed for the opening of the Torry tramway from Palmerston-road to St. Fittick's-road on Monday, Oct. 12.

Dukinfield.—At the last meeting of the Town Council a resolution was moved opposing any extension of the tramways scheme in which Hyde, Stalybridge, Mossley, and Dukinfield are interested. It was contended that the present scheme was much too large, and until the Joint Board knew whether it would be a success or otherwise, it would not be right to embark on extensions outside the Joint Board's area. After a long discussion the resolution was carried by 10 votes to 6.

German Tramway Deputation to Glasgow.—Herr A. Stavenow, general superintendent Berlin tramways, and Herr A. Münde, engineer and chairman State Railways, Berlin, were in Glasgow last week to study the city tramway system. They were particularly interested in the arrangements for the making and repairing of cars at the Coplawhill works of the tramway department, and also in the design of car in use at Glasgow. They also made very close inspection of the traffic arrangements, routes, fares, etc.

Leeds.—The Tramways Committee have further considered the obtaining of powers to borrow £125,000 for the purpose of constructing the new lines authorised by the provisional order of 1902-3. These lines include extensions in York-road, Stanley-road, Domestic-street, Belle Vue-road, and Hyde Park-road, as well as the extensions to Bramley and Rodley, and the continuation of the line from Kirkstall to the city boundary at Horsforth. Nothing definite was decided, and the committee subsequently inspected the routes in question.

Wigan.—A meeting of representatives of the Corporation and the Ince-in-Makerfield District Council has been held to consider the question of the leasing of the tramways. The meeting arrived at an agreement by which Wigan undertakes to adopt the broad gauge and to equip for electric traction the lines from Wigan to the boundary of Ince at Amberswood, whilst Ince is to grant a 21 years' lease of the tramway in its township to the Wigan Corporation. It is expected that the work of constructing the lines will be commenced very soon.

Additional Traffic Returns.—Anglo-Argentine, £2,223 increase; Barcelona Ensanche y Gracia, £56 increase; Barcelona, £1,015 decrease; Brisbane, £141 increase (month of August, £11,736, increase £294); British Columbia Electric (month of March), gross earnings £10,352, net income £2,658; Buenos Ayres and Belgrano Electric, £122 increase (month of August, £13,431, increase £533); Calcutta, £620 increase; Cape Town (month of August), receipts £15,349, expenditure £8,696; Isle of Thanet Electric, £109 decrease; Mexico Electric (month of August), receipts £48,600; expenses, £27,900; Perth Electric, £157 increase; Port Elizabeth (month of August), receipts £3,875, expenditure £2,305.

Digitized by Google

Middlesbrough.—At a meeting of the Corporation Streets Committee on Friday a letter was read from the Imperial Tramways Company relative to the tramway extensions, and asking that a date be fixed in order that the question might be discussed. The Town Clerk said there would be a meeting of the representatives of the Middlesbrough, Ormesby, Normanby, and Eston authorities this week with reference to the establishment of an independent tramway system. It was decided that it would be advisable to hold this meeting of the authorities first.

Cheshire.—A scheme is being promoted for the supply of electricity and power gas throughout Cheshire. In conjunction with the scheme it is intended to apply for powers to construct an electric tramway connecting Macclesfield on the one side with Hazel Grove and Stockport to Manchester, and from Macclesfield to Congleton, Sandbach, Crewe, and Nantwich, with a branch line from Macclesfield, through Broken Cross, Henbury, Chelford, Knutsford, to Warrington. The scheme will comprise tramways to open out inter-communication with all the towns in Cheshire.

Norwood.—The question of the extension of the London County Council tramways to Upper Norwood continues to engage public attention, and was the subject of discussion at this week's meeting of the Lambeth Borough Council. The following motion gave rise to a long debate: "That this Council, having learned that a poll has been taken in the Upper Norwood postal district, and that a memorial has been presented on behalf of the Upper Norwood Ratepayers' Association showing that three to one were in favour of trams running to that district, respectfully urge the London County Council to run a line of trams to Westow-hill, Upper Norwood."

Lewisham.—The tradesmen of Lewisham, Lee, and Forest Hill have prepared a memorial urging the Borough Council of Lewisham to agree to the London County Council's terms, and intimating that at the November elections only those candidates prepared to make the question of tramways the first consideration will receive their support. At the last meeting of the Borough Council the memorial was presented, and a recommendation from a special committee to the effect that the Council should offer a sixth contribution to four schemes proposed by the London County Council was agreed to. The tradesmen attended in large numbers, and in their petition urged that "trade follows the trams."

North Wales.—The promoters of the Flintshire electric tramways scheme have issued a map showing the proposed line of route Starting from Queen's Ferry, the line will run parallel to the Chester and Holyhead to Bagillt, and thence inland up to the town of Holywell; from there through Halkyn and Northop on to the town of Mold, thence to the colliery centre of Buckley, and down again to Queen's Ferry, a circle in all of some 26 miles. There will also be a branch line from Flint and Northop. The overhead trolley system will be adopted, and both passengers and goods will be carried. The route traversed—with the exception of the eight miles from Queen's Ferry to Bagillt—is at present devoid of railway facilities.

Heckmondwike.—There have lately been numerous complaints about the unsatisfactory running of the tramcars through Heckmondwike. At the last meeting of the District Council it was explained that when the agreement was entered into the estimates were based upon a 76-kw. plant being sufficient, the company having reduced the limit to that figure from 150. Now, however, it was found that a 250-kw. plant was required. The agreement provided for such a contingency arising, but instead of the company paying the extra price stipulated, they had made an offer which the Council regarded as preposterous. The latter body, it was added, were prepared to meet the company without insisting on the full advantage to which the agreement entitled them.

Erith.—The following tramways are to be constructed at the earliest possible date, and Messrs. Hawtayne and Zeden will be employed as consulting engineers: (1) part of tramway No. 1, commencing in Bexley-road at the boundary of the parish of Crayford, at Northumberland Heath, by a junction with the Bexley tramways along Bexley-road to the junction of Queen's-road and Pier-road; (2) tramway No. 2, along Pier-road; (3) part of tramway No. 3, from the corner of Pier-road proceeding in a southerly direction along High-street, Crayford-road, and South-road to the boundary of the parish of Crayford; (4) further part of tramway No. 3, commencing in High-street at the junction of the new road through the Walnut Tree House estate, along West-street and Lower-road, to the intersection of Church-manorway; (5) tramway No. 8, along the new road through the Walnut Tree House estate.

Crewe.—Another effort is being made to get the Town Council to undertake the provision of a tramway scheme for the borough. On the last occasion a public meeting decided against the Corporation having anything to do with it, and a poll of the ratepayers was taken with the same result. The London and North-Western Railway also opposed any municipal scheme. The promoters, however, now believe that the railway opposition would be withdrawn if a less ambitious scheme than that originally proposed was prepared, and a requisition has been presented to the Mayor, signed by several hundred ratepayers, asking that another public meeting should be called to consider the question. The Mayor has intimated that he will accede to the desire of the memorialists, and it is expected that in the meantime the views of the directors of the railway company will be made known, which will largely influence any future proceedings.

Tramway Lifeguards.—At an inquest held in Sheffield in respect of the death of a girl run over and killed by an electric car on Saturday last, the jury expressed the desire to hear something of the lifeguards in use in the city. Mr. A. L. C. Fell, the tramways manager, was called, and stated that their original lifeguards were of wire, but they were not satisfactory. He was sent to Germany to enquire into Continental methods, and he found that the wooden type of guard was almost universally adopted in Germany. During the past four months six or seven accidents had happened to cars fitted with the wooden lifeguards, and in every instance the person knocked down had been pushed on one side, the most serious casualty being a broken arm. This was the first fatal accident with lifeguards of this pattern that had happened in Sheffield. The wooden guard was almost as satisfactory as any guard in use in Sheffield, and recently further experiments had been made with the "drop gate guard." The committee took means to secure the most effectual guard, and were constantly making trials.

Wallasey.—An abstract of accounts of the Urban District Council for the year ended with March last has just been published. A summary of the revenue accounts shows that whereas the year commenced with a balance in favour of the district fund of £5,824, and £308 in favour of the tramways account, the period under review ended with £17,793 in favour of the district fund and £2,806 in favour of the tramways fund. The electric tramways capital account shows that the expenditure up to March, 1902, was £97,902, which was increased during the past year to £120.503, showing at the end of last March a debit balance of £7,134. The revenue account states that the receipts from all sources during the year were £31,474, and working expenses, including £4,500 charged to depreciation and renewal fund, were £23 694, giving a surplus of £7,780, which, added to £308 in hand at the commencement of the year, made a surplus of £8,088. Of this sum, £3.772 went for interest on loans, £1,408 to the sinking fund (making that fund amount to £1,640), and £100 on loan charges, leaving a net profit of £2,806.

Cardiff.—The engineers have been requested to report on the proposed extensions of the Crwys-road and Cowbridge-road tramway routes, and present estimates of the cost at the next meeting of the committee. Mr. Arthur Ellis states that the receipts from the electric tramcars during the last 5½ months—viz., from April 1—showed an increase of £15,500 over the same period last year. It is announced that there will be a decrease in the service of 20 cars for the winter months, beginning Oct. 1. Mr. Ellis has presented a long report dealing with the revision of the fares over the whole system, and a special meeting will be held to consider the report. A novelty will be introduced in Cardiff next week in the shape of an electrically-illuminated tramcar The car will be adorned with about 2,000 lamps, and the Tramways Committee decided that the fare should be 6d. between the terminus on each of the different routes. The innovation partakes of the nature of an experiment, and the car will not be run upon more than one route on the same evening. The committee have been instructed to ascertain the probable income from advertisements on the cars.

A "Tube" Casualty.—On Monday were published details of a fatality which occurred on the Central London Railway late on Thursday night last week. It appears that as a westward-bound train entered Notting Hill Gate Station at midnight a man of the artisan class was seen to fall across the rails from the platform. The train was promptly pulled up, and the officials on making a search found the man lying in the "invert," or narrow channel, which runs between the lines. A hasty examination showed that he was dead, though he had not been injured by the train. A doctor who was summoned pronounced death to be due to a broken neck. The secretary of the Central London Railway informed a Press representative that it was practically impossible for a person to be "electrocuted" on the rails of the "Tube," at any rate, near the platform. The walls opposite the platform were covered with wood, and only an electrical expert would know how to place himself on the lines so as to suffer from shock. Even then it would be necessary for the person to have his boots or clothing wet. In 999 out of 1,000 cases an accidental fall on to the line would result in no harm from shock.

Brighton.—With reference to an enquiry which had been made as to the amount of capital which will have to be gradually written off on the completion of the Southwick power station, Mr. Arthur Wright has reported to the Lighting Committee of the Brighton Town Council that the original cost of the three tramway generating sets was £7,530, of which £205 has already been provided for by the sinking fund. In his opinion these sets would realise between £4,000 and £5,000 if sold any time during the next five years. The evaporative condenser referred to in his previous report had been in use for seven years, and cost roughly £1,500. Of this, about £200 had been provided for by the sinking fund, and the balance should, in his opinion, be written off during the next three years. The 270 meters which Mr. Christie had reported as being obsolete, were of the Chamberlain and Hookham and Thompson types, and had been in use for about 10 years. The amount at which they stood in the ledgers was about £1,400, and this amount would, in his opinion, be at once written off, as they failed in selling any one of them after publicly advertising same. The consideration of the report has been deferred by the committee, The same committee have had before them a report from Mr. John Christie, resident engineer, stating that he found in actual practice that greater efficiency could be obtained out of the storage battery used in conjunction with the tramway supply if they added 12 more cells, which would enable them to take a much greater output from it, and maintain the full pressure to the tramways throughout the whole discharge. He had obtained prices from the Electrical Power Storage Company, who had at present men carrying out some alterations to the existing battery, and they stated that if they place the order with them while their men are here they would erect them complete, and let them fall under the terms of the existing contract, for the sum of £14. 11s. 6d. per cell. He recommended acceptance of this offer, and suggested that the capital to pay for this should be borrowed on the same terms as the existing loan, when the next enquiry was being held. The committee have resolved that the report be approved and acted upon.

Control of Highways.—There was issued this week the report of the committee appointed by the Local Government Board to enquire

Digitized by Google

into the general condition and sufficiency of the roads in England and Wales, and to report whether any, and, if so, what amendment of the law relating to these matters or its administration is desirable in view of the various purposes for which the roads now are, or shortly may be, utilised, and particularly whether any change of the authorities who have control over the roads or of their powers is required. The committee suggest that the maintenance and improvement of all the principal roads in a county should be placed under the direct control of County Highway Boards representative of all the authorities having at present rights and powers with regard to main roads. Some roads, the committee remark, are of more than county importance, and their maintenance in the highest efficiency should be regarded as a matter of national concern under the immediate supervision of a department of the Local Government Board. That part of the report relating to tramways and light railways is, from our point of view, the most important. It reads as follows: "From the evidence which we have received, and from photographs placed before us, we have arrived at the conclusion that the presence of tramcars and light railway cars upon roads of inadequate width is the principal obstruction to the free passage of other vehicles upon such roads, and the main cause of any insufficiency of road accommodation which at present exists. This condition of things is, in our opinion, largely due to the fact that the interests of through traffic have not in the past been sufficiently represented before some of the central authorities from whom permission to lay rails upon the public roads has to be obtained. Except under very special circumstances, such permission should, in our opinion, only be obtainable when the road is, or is to be made, of sufficient width to enable loaded wagons to pass freely on either side of the tramlines. Tramways and light railways are, or are intended to be, remunerative undertakings, and it does not appear to us unreasonable to require that the promoters of such undertakings should either leave to, or provide for, other users of the public roads sufficient road accommodation. Our recommendation is that it should be provided by Parliament that, except under very special circumstances, proved to the satisfaction of the sanctioning authorities, no tramway or light railway should be, in future, laid down upon any road which has not, or will not have when the works are completed, a minimum width of carriageway. The minimum width which we suggest is 33ft. if it is proposed to lay a double line of rails of ordinary gauge, and 27ft. in the case of a single line. It appears to us that even these minimum widths would be wholly inadequate in some places where the traffic is great. We suggest that such cases should be met by giving to every highway authority a full right to appear and be heard before any tribunal which is dealing with a proposal to lay rails upon any road under the control of such authority. We further recommend that, inasmuch as the promoters of light railways have power to purchase lands compulsorily, they should, in districts where the roads are narrow and cannot be widened except at great expense, or are already congested with traffic, be required to exercise their powers and lay the railways on lands acquired for the purpose instead of upon the roads."

Wellington (N.Z.).—Elsewhere in this issue will be found a list of the tenders accepted by the Wellington (N.Z.) Corporation in connection with the tramway scheme for that city. Mr. W. R. Wright, the electrical engineer, who has charge of the scheme, has presented to the City Council a long report on his recent visit to London, and in this he comments on the tenders which were sent in in response to the Council's invitation. In the course of his report, which is condensed in the *New Zealand Times*, Mr. Wright explains that tenders were called for in globo and in section. Tenders in globo included all the supplies and constructional work excepting the raw material for the permanent way. The following were the divisions of the sectional tenders: the supply of plant for the power station, the erection of the plant for the power station, the supply of certain tramcars, the supply of rails, etc., for the permanent way, the laying of the rails, etc., for the permanent way, the supply of cables and overhead equipment, the erection of the cables and overhead equipment. The tender of Messrs. Macartney, M'Elroy, and Co. for sections was considerably higher than the in globo, the difference being £8,671. 4s. 8d. In both cases they were high in the power-house section. Seeing this, he wrote asking if they would accept their in globo tender less the power-house. To this they agreed, and, further, they gave the Corporation the opportunity of 1 per cent. off the scheduled rates if the order was placed before February, thus making a saving of £2,236. 4s. 8d., plus 1 per cent. on £113,883. 19s. 7d., which is £1,138. 16s. 9d. An alteration was made in the number of points and crossings, which again reduced the tender by £411. 1s. 9d., making a total saving of £3,786. 3s. 2d. As to the tenders for the equipment of the power-house, nine were received for the supply and erection and 12 for the supply only. After careful consideration on the part of the Advisory Board, they found they could not do better than recommend the committee to accept the tender of the Electric Construction Company, at a total amount of £26,956. 17s., being £24,611. 17s. 10d. for supplies and £2,345 for erection. Several alterations were made, which reduced the original tender to £23,255, showing a saving of £752. 12s. 4d. In reference to Macartney-M'Elroy's tender, says Mr. Wright, only one sub-contractor was mentioned—namely, the General Electric Company of America. As, however, the power-house equipment was taken from their tender, this firm was to a very large extent cut out. Messrs. Macartney-M'Elroy are not manufacturers, and after the order was placed with them they had to arrange with all the sub-contractors, and found difficulty in getting a firm to take the cars at the price quoted. Before recommending the acceptance of their tender, however, the engineer made a point of obtaining the names of several firms proposed as sub-contractors to Messrs. Macartney-M'Elroy for portions of the supplies. The works or manufactures from them were carefully inspected. In the case of the cars, the works were visited. This was done to satisfy himself, not only as to the workmanship, but as to the quantity and quality of timber kept in stock. The order for this section was finally placed with the British Electric Company, of Manchester. They are a new firm, and do not carry so large a stock of timber as some other manufacturers, but turn out a really good car. Before leaving England arrangements were made for an inspector to visit the works twice a week to see that no green wood was used in the building of the cars. "In the case of points and crossings," Mr. Wright proceeds, "Macartney-M'Elroy submitted two firms, Messrs. Hadfields, of Sheffield, and the Lorain Steel Company, of London and (works) America. These two firms ran very close, and our contractors seemed to be doing their best to bring them down. I allowed them some time and then told them to close one way or the other, and if the two were equal to give the British firm preference. This was not intended to be antagonistic to the American firm, for they have a very good reputation for this class of work, but was done with the feeling that our inspectors, who were in England, would be thus enabled to deal with this matter. Macartney-M'Elroy informed me that they had placed the order with the Sheffield firm, who were a little below the American, and so had the advantage." The section of the rails, the engineer states, was altered a little, as a Standards Committee of the Board of Trade has been sitting to fix standard sections of rails for railway and tramway construction. These are just out, and Wellington is the first municipality to avail itself of this standard section. It will be of great advantage when ordering renewals, and a further supply of points and crossings, as the manufacturers can now stock the standard sections. This advantage also applies to wheel tyres. The inspectors appointed by the Advisory Committee are Mr. J. H. Woodward and Mr. Howard Smith. Mr. Woodward has had a very large experience of manufacture of all kinds of electrical apparatus, and is now engaged as a junior in the firm of Messrs. Preece and Cardew, the consulting engineers, and is looked upon by that firm as a very able man. Of Mr. Howard Smith, who passes the permanent way, nothing need be said except that he is an an authority in permanent-way material, and was elected chairman of the committee set up to standardise the rail sections for tramway and railway purposes. In concluding his report, Mr. Wright says that by dividing the contracts as scheduled instead of accepting them in globo a saving of four or five thousand pounds has been affected. Both firms expect to fulfil their contracts to time—that is to say, the route between Newtown Park and the Government railway station will be ready for running in April next.

PROVISIONAL PATENTS, 1903.

SEPT. 21.

20245. Improvements in or relating to electric rheostats, motor starters, regulators, and analogous electrical apparatus. Robert Frederick Hall, 24, Temple-row, Birmingham.

20249. Electric sparking device for exploding gas-engines, oil-engines, and vaporising engines of every description. William Macaulay, 7, St. John's-place, Larne, Ireland.

20274. Improvements in and relating to electrical casing or conduits. Sir Hiram Maxim Electrical and Engineering Company, Limited, Alfred William Hill, and James Harrington, Gillingham-street, Victoria, London.

20285. An improved machine for the separation of ores and other materials by means of electromagnets. William Blackmore, 5, Bishopsgate-street Within, London.

20291. Improvements in electric fittings, such as switches or the like, having combined insulating and conducting portions. Charles Francis Ritchel, 55, Chancery-lane, London. (Date applied for under Patents Act, 1901, Oct. 13, 1902, being date of application in United States.) (Complete specification.)

20301. Improvements in commutator brushes. The Morgan Crucible Company, Limited, and Charles William Speirs, 4, South-street, Finsbury, London.

20302. Improvements in commutator brushes. The Morgan Crucible Company, Limited, and Charles William Speirs, 4, South-street, Finsbury, London.

20303. Improvements in commutator brushes. The Morgan Crucible Company, Limited, and Charles William Speirs, 4, South-street, Finsbury, London.

SEPT. 22.

20337. Magnetic minder for iron ships. George G. Jackson, 122, Upper Milton-road, Gillingham, Kent.

20366. Improvements in coverings for insulating electrical wires and the like. Leopold Frank, 77, Colmore-row, Birmingham.

20401. Improvements in electric switches. Charles Ernest Hunter and William Hodges Warren, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

20405. Improvements in the method of producing rapid electrical oscillations and system of devices therefor. Frank Schrottke and Gesellschaft für drahtlose Telegraphie m. b. H., 6, Lord-street, Liverpool. (Complete specification.)

20423. Improvements in the ventilation of dynamo-electric machines. Henry Metcalf Hobart, Oswaldestre House, Norfolk-street, Strand, London.

20424. Improvements relating to sparkless running of commutating dynamo-electric machines. Franklin Punga, Oswaldestre House, Norfolk-street, Strand, London.

SEPT. 23.

20435. Improvements in or relating to electric ignition apparatus for internal-combustion motors and the like. John Budge and Charles Edward Forman, 18, Hertford-street, Coventry.

20443. Improved electrical lamp. Emanuel Hermann, 5, Corporation-street, Birmingham.

20450. Improvements in electric arc lamps. Frederik William Edward Schuer, 37, Claremont-square, London.

20497. Electric plant for the synthetical production of nitric products by means of discharges of electricity in gaseous mixtures. Joseph von Kowalski and Ignacy Moscicki, 40, Chancery-lane, London. (Complete specification.)

SEPT. 24.

20517. Improvements in and connected with the fixing of pulleys, electric wires, and such like to ceilings. Colin McCullum and James McGruther, 154, St. Vincent-street, Glasgow.

20523. Improvements in electric switches. August Eckstein and Albert Julius David Krause, Peel Works, Adelphi, Salford.

20547. Improved arm-supporter for telephones and the like. Heinrich Ehret II., 112, Potsdamerstrasse, Berlin. (Complete specification.)

20566. Improvements connected with electric meters for indicating the maximum demand of current. Frederick John Beaumont, 173, Fleet-street, London.

20569. Improvements in or relating to pocket electric lighting devices. Lawrence Gunn Sloan, 6, Lord-street, Liverpool. (The Elektricitäts-Gesellschaft Hydrawerk, Germany.)

20572. An improved electric induction device for medical and like purposes. Victor Reichenberger and Eugen Weiersmüller, 6, Lord-street, Liverpool. (Complete specification.)

20577. Improvements in or relating to magneto-electric machines or motors. Heinrich Hansen Knutzen, 111, Hatton-garden, London.

SEPT. 25.

20606. Improvements in multipolar dynamo-electric machines. John Henry Holmes, Portland-road Works, Newcastle-on-Tyne.

20611. Improvements in dynamo-electric generators. Miles Walker, 7, Skerton-road, Old Trafford, Manchester.

20633. Improvements in attaching electrical insulators to insulator brackets. Edward John Chambers, 7, Staple-inn, London.

20634. Improvements in attaching insulators to the tubular arms of telegraph and like poles. Edward John Chambers, 7, Staple-inn, London.

20635. Improvements in magnetic separators. Arthur Allan and Samuel Benton, 7, Staple-inn, London.

20641. Improvements in telephone selective systems and apparatus therefor. Noble Samuel McKinsey and Anton R. Nelson, 36, Chancery-lane, London.

20645. Improvements in arc lamps. William Tichborne Upton, John Edward Elliott, and Hubert Bevan Pratt, 11, Southampton-buildings, Chancery-lane, London.

20655. Process for the electrolytic production of metals of the earthy alkalies, and more especially of metallic calcium. William Edward Evans, 27, Chancery-lane, London. (Elektrochemische Werke G. m. b. H., Germany.) (Complete specification.)

20658. Improvements in or connected with overhead trolley lines for electric traction. Alexander George Ionides and Alexios Constantine Manuel, 4, South-street, Finsbury, London.

20662. Improved means for guiding the trolley wheels of tramway vehicles at the junctions in overhead conductors. Arthur Henry Holmes and Henry Walter Holmes, 111, Hatton-garden, London.

SEPT. 26.

20685. Improvements in electrical resistance furnaces. William Simm and Thomas James Denny, 29, Great George-street, Westminster, London.

20691. Improvements in or relating to the cells of primary batteries. Albert Joseph George, 33, Hatton-wall, Hatton-garden, London.

20700. Improvements in trolley electric tramways. George Hall, 4, Corporation-street, Manchester.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published Oct. 15, 1903.

1902.

14112. Miners' electric lamps. Prested.

20355. Morse telegraphs. Ducretet.

20571. Alternate-current motors. Fynn.

20572. Alternate-current motors. Fynn.

23021. Apparatus for electrically igniting miners' safety lamps. Best and Ackroyd and Best, Limited.

23037. Signalling apparatus for electric railways. Sheehy.

23022. Apparatus for electrically igniting miners' safety lamps. Best and Ackroyd and Best, Limited.

23255. Apparatus for use in electric telegraphy or the like. Jacobs and Nicholson.

23387. Main and branch electric switches. Ewart.

24212. Brush-holders for dynamo-electric machines. Carolan. (General Electric Company.)

24634. Driving mechanism for use in connection with electric train-lighting systems and for other purposes. Bousfield. (Gerdes.)

24865. Insulating substances for cables, wires, and other electrical devices. Pilkington and Ormandy.

25794. Electric controllers. Middleton and Smith.

25904. Systems of electrical distribution. Carolan. (General Electric Company.)

25949 Gas or electric light brackets applicable for bakers' ovens. Gillard.

27895 Casing for supporting the effective iron rings of electrical machines. Laschet.

1903.

12484. Means for transforming electric waves applicable to wireless telegraphy and the like. Braun.

15532. Dynamo suspension gear for use in connection with electric lighting systems for railway carriages and the like. Electric and Ordnance Accessories Company, Limited, and Hall.

17666. Means for determining the action of Rontgen rays. Holzknecht.

NOTES.

Institution of Mechanical Engineers.—The first monthly meeting of the winter session of this institution takes place on the 16th inst., when a paper will be presented by Mr. Henry Davey on "The Newcomen Engine." Mr. J. Hartley Wicksteed, the president, will be in the chair.

Electro-Harmonic Society.—Mr. Martin F. Roberts, assistant engineer-in-chief at the General Post Office, will preside at to-night's concert of the above society. It marks the opening of the society's winter season, and an excellent programme has been arranged. The concert will commence at 8 o'clock precisely in the Crown Room of the Holborn Restaurant.

Mechanical Engineers' Graduates' Association. The Graduates' Association in connection with the Institution of Mechanical Engineers holds its first meeting of the new session on Monday evening, when Prof. A. B. W. Kennedy, F.R.S., will occupy the chair. The paper to be read is on "The Design of a Town's Tramway Scheme," by Mr. Wm. McDonald.

Junior Institution of Engineers.—A large number of members of this institution paid a visit to the International Fire Exhibition at Earl's Court on Oct. 2. Many of the interesting exhibits were closely inspected, where possible the apparatus being shown in operation. The next visit of the institution takes place on Saturday afternoon, Oct. 17, when the new Vauxhall Bridge works are to be seen.

New Books.—Messrs. Chas. Griffin and Co. have just issued the fourth edition of vol. i. and third edition of vol. ii. of Prof. Andrew Jamieson's text-book of "Applied Mechanics and Mechanical Engineering." The first of these volumes contains some 540 pages of text, 300 illustrations, and 540 questions, including many from Institution of Civil Engineers' examinations. It has been thoroughly revised and enlarged for the fourth edition. Vol. ii. has also been revised and enlarged, and now runs into 608 pages and 371 illustrations. The price of each volume is 8s. 6d.

Glasgow Local Section.—This section of the Institution has now completed its arrangements for the coming session. In order to bring the members and their friends together and to inaugurate the session, the committee have arranged to hold the second annual dinner on Wednesday, Nov. 4, and on the Tuesday following, the 10th, the first business meeting will be held, at which the chairman, Mr. Wm. A. Chamen, will deliver his address. Other meetings during the session will be held on the following Tuesday evenings: Nov. 10, Dec. 8, Jan. 12, Feb. 9, March 8, April 12, and May 10. The annual smoking concert is fixed for Feb. 6.

Engineering Feat in Paris.—In the construction of the extension lines of the Metropolitan Railway in Paris a curious engineering problem has presented itself. At the Place de l'Opera three lines of the railway will cross one over the other at three different levels. The presence of water in the subsoil near the surface renders the construction of the tunnels somewhat difficult at this point, and the engineers are solving the problem in a rather paradoxical way. Large cavities about 70ft. deep are being dug in the earth and these filled with great blocks of cement, forming a solid watertight mass. Then the engineers will commence boring their tunnels through the artificial rock sunk by themselves.

Michigan College of Mines.—The governors of the above institution have sent us their year-book containing the announcement of courses for 1903-04. We are interested to learn that the subject of electrical engineering in its application to mining is given due prominence to in the course of training. The rapid development of electrical methods as applied to a wide field of mining practice in lighting, power transmission, and metallurgical manipulation, makes a broad knowledge of the principles of electricity necessary to the well-equipped mining engineer. A study of electrical engineering, such as is provided at the Michigan College, both fixes these principles and gives some familiarity with current engineering practice.

The Victoria Falls.—It is stated that, in view of the approach of the Cape-to-Cairo Railway to the Victoria Falls, on the Zambesi, Sir Charles Metcalfe, consulting railway engineer to the British South Africa Company, and Mr. J. F. Jones, C.M.G., joint manager and secretary of the Chartered Company, have left England on a special mission to the United States, the principal object of which is to visit Niagara Falls and enquire into the possibilities of the transmission of power, more particularly in connection with the utilisation of the immense energy of the Victoria Falls. They will also pay visits to Chicago, St. Louis, and other great railway centres for the purpose of studying American railway methods. The mission will occupy about six weeks.

Wireless Telegraphy with France.—While so much attention has been given to the attempts to establish a commercial wireless telegraph service across the Atlantic, the narrow strip of water lying between France and this country has been left severely alone, so far at least as wireless telegraphy is concerned. We believe that Mr. Marconi's earliest experiments were made between England and France, across the Straits of Dover, but a regular service of wireless telegraphy has never been suggested, or, at any rate, been put into action. This has been left to the enterprise of the Western of France and the London, Brighton, and South Coast Railway Companies. These companies, it is reported, are shortly to establish a wireless telegraph service between Great Britain and France, and the necessary stations are now being equipped at Newhaven and Dieppe.

Steam-Turbines for Steamships.—The greatest interest is being shown in the crusade in favour of turbine engines for Atlantic and other liners, the one great object in view, of course, being to attain faster speeds. This activity leaves little room for doubt that the practicability of the rotary type of engine for steamships is fully recognised, but a development more rapid than has hitherto been seen may be expected. Orders are now on hand to equip seven vessels with turbine engines—two of which are warships—and further, several of the great Atlantic lines are investigating the claims of the turbine, including the Cunard and the White Star lines. The Allan line, however, is leading the way and has ordered a turbine-fitted steamer for the Atlantic service The results obtained with this vessel will probably decide the other lines in their future course of action one way or the other.

New Rubber-Yielding Plant.—The botanical authorities of Kew Gardens some time ago investigated a plant which was found growing in the sandy plains of the French Congo, and these investigations showed that rubber exists in the roots in sufficiently large quantities to warrant development. The name of the plant, which was discovered by a French botanist in the course of some explorations on the Congo, is Landolphia Thrallonii, and it is to be found in many places on the West Coast of Africa. The plant also thrives in Northern Nigeria, and it is these forests which are to be exploited. One firm which is already

Digitized by Google

engaged in the manufacture of this rubber is placing it on the market at 3s. a pound, and it is said to be in every respect equal to the ordinary rubber. In view of the present comparative scarcity of rubber and its high price, the new discovery is likely to prove of very considerable commercial value.

German Electrical Industry.—The Association for the Protection of the Economic Interests of German Electrical Engineering was held recently at Mannheim, when the question of the prospects of German electrical machinery in foreign markets came in for discussion. A resolution was eventually adopted unanimously by the assembly emphasising that the German electrical industry does not require special protection in the home market, but that the greater value is attached to foreign markets being kept open, and not closed by high import duties. The association regards the new tariffs projected by Russia, Austria-Hungary, and Switzerland as prohibitive for German electrical productions, but it does not seem from the brief official report of the proceedings that the conference discussed the question of the suggested British Zollverein. It is improbable that this was done in view of the present indefinite position of the scheme.

Leeds Local Section.—Following are the arrangements which have been provisionally fixed for the ensuing session of the above section of the Institution of Electrical Engineers. So far as is possible at present we give the dates arranged for the business meetings, together with the titles of the papers which will be read at these meetings: Oct. 22—"Some Notes on Steam Turbo-Electric Generating Plants," by Mr. G. Wilkinson; Nov. 19—"Combined Electricity and Destructor Stations," by Mr. S. D. Schofield; Dec. 17—"Methods of Charging for Electrical Energy," by Mr. E. H. Crapper; Jan. 21—"Alternators in Parallel," by Mr. H. Bohle; Feb. 18—"Some Experiments with Large Gas-Engines," by Mr. W. Emmott; March 10—"Description of the Electrical Equipment of an Engine Works," by Mr. H. O. Wraith; March 24—Mr. T. S. Anderson (title not fixed); April—"Oil Extraction from Exhaust Steam and Boiler Feed Water," by Mr. A. L. C. Fell.

Speech by Telephone.—With the co-operation of the National Telephone Company and the Post Office, the Electrophone Company were enabled to carry out an interesting experiment on the occasion of Mr. Balfour's speech at Sheffield last week. The company's offices in Gerrard-street, London, were put in direct telephonic communication with Sheffield, *viâ* the London-Glasgow line, and some two dozen gentlemen in London—220 miles away—had the novel experience of listening to the delivery of Mr. Balfour's speech. Not only was the Premier's every word distinctly heard by the listeners at the company's rooms, but the occasional thumps on the table with which the speaker sometimes emphasised his argument were faithfully reproduced. The same thing has been done in America before now, and it is coming to be recognised that the reproduction of a speech by telephone so that it may be heard in a room a couple of hundred miles away or so is quite within the limits of practicability.

Salford Technical Institute.—A bulky volume has reached us from Mr. Wm. Wilson, principal of the technical institute of the borough of Salford, setting forth the arrangements of the institute for the session 1903-04. The provision for instruction in electrical subjects is, we are glad to observe, in keeping with the advancement of the science. The department is provided with a special laboratory for heat, light, and mechanics; an elementary electrical laboratory, in which all direct-reading experiments are performed; an advanced electrical laboratory, specially fitted up with a variety of reflecting galvanometers and other instruments—so that students lack nothing in their thirst for practical instruction. The experimental dynamo-room is equipped with a large high-speed vertical steam-engine, two large alternators, and three large direct-current machines, and the test-room is equally up-to-date in its equipment. In fitting up the electrical engineering department special attention has been given to alternating currents, and the needs of those engaged in electrical and kindred trades are specially looked after.

County Council Tramways Manager.—In the report which the Highways Committee presented to the London County Council at their first meeting after the summer vacation on Tuesday, interesting reference was made to the Council's late tramways manager, Mr. Alfred Baker. Mr. Baker, it seems, commenced service with the Birmingham Corporation on the 1st of the present month, but with the permission of the Corporation he will continue to assist the County Council in the conduct of their tramway affairs during the period which must elapse before the appointment of his successor. In acknowledging the readiness with which Mr. Baker has met the convenience of the Council in this matter, the committee take the opportunity of expressing their very high appreciation "of the great ability with which he has always carried out his responsible duties, and of the valuable services he has rendered to the Council during the time he has filled the office of manager." The committee also record their sense of gratitude to the Birmingham Corporation for their consideration in agreeing to the above arrangement.

The St. Marylebone Imbroglio.—As we anticipated in these columns a week or two ago, the Local Government Board have declined to intervene in the St. Marylebone imbroglio, and the decision of the London County Council not to sanction, without further statutory authority, the borrowing by the Borough Council of over 1¼ millions sterling for the purchase of the St. Marylebone property of the Metropolitan Electric Supply Company remains operative. The matter will now have to stand over till the next parliamentary session, when the Borough Council will ask the Legislature to grant them the necessary borrowing powers to raise the required loan, which, together with the accrued interest and other charges, will by that time be considerably above the amount stated above. The present case, we believe, constitutes a precedent, and it will be interesting to see whether in the future the difficulty which has confronted St. Marylebone in raising a loan will be experienced by other local authorities, not holding special statutory powers, who may desire to purchase such undertakings under the provisions of the Electric Lighting Acts. We understand that, in consequence of the present obligations of the Council, there is little or no competition in the forthcoming election of new councillors.

Covent Garden.—The arrangements for the eighth season of fancy dress balls, which will be inaugurated to-night at Covent Garden Theatre, have been conceived on the usual magnificent scale. The general idea is that of Venice at carnival time, and characteristic pieces of Venetian scenery have been chosen for pictorial representation, brilliancy being added by the liberal use of electric lamps disposed for effect by Mr. W. J. Crawshaw, the resident electrical engineer. To take the place of a second orchestra, which it has been the practice during the season of fancy dress balls to station on the grand staircase, a powerful orchestrion has been erected in the foyer of the opera house. It is the largest mechanical orchestra ever made, and gains interest, from our point of view, in that it is driven by electric motors. The effect produced is that

Digitized by Google

of a band of about 70 instrumentalists, and would satisfy the most exacting ear. Special solo stops, introduced for the first time, include the violin, the ophicleide, and the cornet, and these being built in swell boxes, admirable crescendos and diminuendos are possible. A glockenspiel is another notable addition, and a full-sized upright grand piano, with the pedal under mechanical control, is contained within the orchestrion. Messrs. Imhoff and Mukle, 110, New Oxford-street, W.C., supplied the instrument. It is well known that these balls are under the management of Messrs. Frank Rendle and Neil Forsyth.

Cabinet Changes.—The long-awaited announcement of the reconstruction of the Cabinet consequent on the resignation of some of its principal members owing to the fiscal controversy, was made from Downing-street on Monday night. There are but two names in the list of new appointments with which we are concerned. They are those of the Hon. Alfred Lyttelton, K.C., M.P., and Lord Stanley, M P. The former, who has had no previous Ministerial experience, becomes Secretary of State for the Colonies in succession to the Right Hon. Joseph Chamberlain. Mr. Lyttelton will be chiefly remembered among electrical men for the masterly fashion in which he acted as umpire in the arbitration proceedings between the Metropolitan and the Metropolitan District Railway Companies, and for the decision which he gave as a result of those proceedings in favour of the adoption of the direct-current system of electric traction on the Inner Circle. Besides this, Mr. Lyttelton is a distinguished member of the English Bar and a King's Counsel. Lord Stanley, who succeeds Mr. Austen Chamberlain as head of the Post Office, dates his Ministerial career back to 1895, since which time he has successively filled the positions of Junior Lord of the Treasury, Press censor in South Africa, private secretary to Lord Roberts, and financial secretary to the War Office. He is the eldest son of the Earl of Derby, and is 39 years of age.

Arc Furnace for Extracting Zinc.—A patent has been granted to Dr. C. F. T. de Laval in the States on the distillation of zinc from its ores, and especially from zinc lead ores, by means of an electric furnace of the well-known type in which the radiant heat is used from an arc placed over the material to be melted. From a description in the *Electrical World*, it seems that the pulverised ore is introduced at one end of the longitudinal furnace chamber, so as to form a pile or stack sloping towards the other end of the furnace, where the arc is provided by means of two opposite carbons passing through the walls. By the action of the radiant heat upon the sloping surface of the pile, the non-volatile ingredients of the ore melt and flow down the slope into a basin just below the arc, from which they are removed through an outlet. As this melting and running down takes place, new surfaces of the stack are constantly exposed to the heat radiation. Simultaneously with this operation, the metal vapours mixed with the generated gases escape from the sloping surface and pass out of the chamber through an outlet above the arc. These vapours are then condensed by any suitable means. If the pulverised zinc ore has not been previously roasted, it is preferably mixed with iron ore while the ingredients are dry, the whole being afterwards moistened if required. The object is to eliminate the sulphur in the non-roasted zinc ore in which the zinc occurs as zinc sulphide.

Mining for Radium.—If there be any truth in the report of the discovery in the United States of large deposits of radium-yielding ore, the present enormous price of that rare metal will conceivably be considerably lowered. The deposits in question are stated to be in the region of Grand County, Utah, and the report further vouches for the fact that a company has been organised to open up the new industry. Specimens of the ore are said to have been analysed by Prof. and Madame Curie, who found it almost entirely free from gold, but carrying uranium to such an extent as to justify the working of the deposits for radium. The short history of the discovery is not without interest. Some few years ago a Mr. Stephen Lockwood met two prospectors, who in searching for gold and silver had met peculiar ore deposits in Grand County. An analysis of the ore revealed the presence of much uranium, and Mr. Lockwood, knowing its commercial value, urged the importance of the discovery upon the prospectors, and claims were staked out upon the whole deposit. The Utah bed was carnotite, a combination of uranium, vanadium, iron, copper, and barium, and, as latter researches show, radium and polonium. After establishing title to the claim, Mr. Lockwood returned home, and subsequently became interested in Prof. and Madame Curie's discovery. This suggested to Mr. Lockwood that the uranium of the Utah would yield radium, and a company has accordingly been formed to try the experiment.

Experiments on Air Friction.—Mr. Wm. Odell, before Section G of the British Association Southport meeting, described some experiments which he has made with the object of finding a convenient method of determining the power wasted by the windage of flywheels and dynamo armatures. The experiments were made with paper discs, which were mounted on the shaft of an electric motor. The excitation was kept constant, so that the torque was proportional to the current. Thus the extra current required to maintain a given speed after the disc had been fixed to the shaft gave the torque absorbed by the disc. There was found to be an angular speed for each disc above which the torque was accurately proportional to about the 2·5th power of the speed. This critical speed appeared to vary inversely as the square of the diameter. Below it the law followed was of a lower degree; but owing to the multiplication of errors of measurement no definite conclusion as to its exact nature was arrived at. As the three discs originally tried gave uncertain results as to the effects of size, a much larger one, nearly 4ft. in diameter, was also tried; and as a result of all the experiments it was concluded that the torque varies as about the 5·5th power of the diameter. To give an idea of the amount of power thus absorbed, it may be stated that a disc of 47in. required $\frac{1}{10}$ h.p. to keep up a constant speed of 500 revolutions per minute, and that if the above law holds, a 9ft. disc would absorb 10 h.p. at the same speed.

The Pacific Cable.—There has been published as a parliamentary paper an account showing the money issued from the Consolidated Fund under the provisions of the Pacific Cable Act, 1901, and the money received, expended, and borrowed, and securities created, under the Act to March 31, 1903. The return shows that, out of an authorised issue of £2,000,000, the sum of £1,060,935 was issued in 1901-2, and the balance of £939,065 in 1902-3. The expenditure up to March 31, 1902, was £1,044,701, and in the period ended March 31, 1903, a further sum of £916,080 was expended, making a total of £1,960,781, and leaving a balance of £39,218. During the year 1902-3 the money borrowed amounted to £1,215,400, and this with the sum of £784,600 borrowed in the previous year, makes up the sum of £2,000,000, the security created being an annuity of £77,544. 18s. The first payment of this annuity is to be made in December of this year, and the last on Dec. 1, 1952. Particulars of the capital expenditure of £1,960,781 are given, the chief item being £1,795,422 in respect of the contract for the cable. The balance is made up of £67,472 for the cable ship, £51,190

Digitized by Google

for buildings, £25,006 for instruments, £20,135 for engineers' fees and expenses, and other smaller items. The receipts during the year, including a balance of £4,107 brought forward, amounted to £142,768. Of this amount £119,080 represented the parliamentary grant-in-aid, and £19,579 the traffic receipts. During the year £114,205 was expended, leaving a balance of £28,562 on March 31, 1903.

Goldsmiths' Institute. — We have received the annual syllabus of regulations for the 1903-4 session of the physics department of the above institute at New Cross. Mr. Edwin Edser is the head of the department, and has organised a regular series of experimental work for each of the various sections in which instruction is given. Judging from the syllabus, the physics department of this institution is admirably adapted for giving a thoroughly good groundwork both in ordinary physics and in electrical engineering. The aim seems to be to induce the students to learn their theory from the results of experiments carried out in the laboratory, and we know of no better way to impress scientific facts on the mind. The laboratory work is, of course, accompanied by theoretical lectures. As a rule, each subject is divided over two years, and this is an absolute necessity in view of the limited number of hours in the winter students are able to devote to evening work. The experiments which they have to carry out on the subject of electricity and magnetism, seem to us to be well arranged to give an intelligent knowledge of the essential facts of the science. The laboratories are open for 2½ hours at the time on both Wednesdays and Fridays. The other subject, that of ordinary physics, includes sound, light, and heat. We note from the syllabus that students have to keep laboratory note-books, and until they have carefully written up the results of one experiment and drawn their conclusions from the same, they are not allowed to proceed to the next. This regulation is a good one, and should be strictly enforced. We wish the department all success.

Use of Controlling Mechanism.—We recommend to the attention of managers of electric tramway systems in this country the following notes on "The Use and Abuse of Controlling Mechanism," which are taken from a paper presented by Mr. Z. F. Carver at the annual convention of the American Street Railway Association: The secret of successful mechanical management is watchfulness, care, systematic inspection. Several times every day the controller cases should be opened and the whole interior mechanism given a hasty cleaning, and a little lubrication of the contact fingers with a good quality of refined lubricant, vaseline being one of the best, though somewhat expensive. There is a tendency on some well-managed roads to have only two points on the controller—viz., on and off—the various graduations of resistances being largely a matter of form. This method gets the cars over the road, and pleases passengers who like a jolt now and then, but it is exceedingly hard on the motor equipment, and runs its cost of maintenance into large proportions. There are some methods provided to limit the rate of turn of the controller handle in going toward the loop, and in the larger equipments the rate of application is automatic, and not under the control of the motorman. In city traffic, where cars and vehicles have to go over the same ground, and where the vehicle has by common consent the right of way, it is not good practice to limit very much the rate of travel of the controller handle, because the men will find they cannot make ordinary slow-downs for the vehicle traffic with a controller slow of application and cover the ground on schedule time, so they resort to the much worse evil of only operating the controller in case of a last resort, and using the brake to hold down the speed, making the motors work against the load on cars as well as the brake. This is especially easy to do with power brakes—except the electric—and is a violation of rules which is very hard to detect.

Gas-Engine Explosions. — Following is a short abstract of a paper on this subject read by Mr. H. E. Wimperis before Section G at the recent Southport meeting of the British Association. In the autumn of 1901 the Institution of Mechanical Engineers published the second report of the Gas-Engine Research Committee drawn up by Prof. F. W. Burstall, and in this manner there was presented to the scientific and engineering world a very large mass of experimental results containing most valuable information regarding the internal economy of gas-engines. Prof. Burstall comes to several conclusions, prominent among which is his contention that the results of his experiments cannot be reconciled without the use of a variable specific heat. The writer has already published in the engineering Press an account of certain consequences which follow from this hypothesis, but before the matter could be considered upon a satisfactory basis it was necessary that the classical experiments of Mr. D. Clerk and Mr. Grover should be brought into line. In a paper contributed to the British Association last year the writer analysed Mr. D. Clark's results, and showed that they were in complete harmony with the variable specific heat hypothesis. In the present paper the writer deals with the experiments of Mr. Grover, and shows that not only is there no inconsistency between this hypothesis and Mr. Grover's results, but that by its adoption the explanation of certain difficulties in these results is the more easily given. Thus in the present paper, and in the one submitted last year, the writer claims to have achieved the object with which he set out—namely, to ascertain whether there was anything in past records of experimental work with gas-engines which would prove to be incompatible with the adoption of a variable specific heat in all future gas-engine calculations. The conclusion is that there is nothing in the classical investigations of Mr. D. Clerk or Mr. Grover which should afford any ground for hesitation in the matter.

Electric Speed Trials.—The most hopeful anticipations of the organisers of the Berlin-Zossen Electric Railway speed trials have been more than realised. On Tuesday it was announced in Berlin that a speed of 125 miles an hour had been obtained, which means an increase of over 10 miles an hour in the past fortnight. The Siemens-Halske Company, who built the car which gave this speed, may well be satisfied with the result, but the Allgemeine Elektricitäts-Gesellschaft will immediately attempt to emulate the triumph of their rivals with a car built by themselves. Of course, it must not be forgotten that this high speed of 125 miles an hour was obtained under the most favourable possible conditions on a track which had been specially constructed for high speeds, and is a straightaway stretch of 14 miles, with moderate curves at either extremity. Discoursing on these things, and the fact that the track rests upon rock-embedded sleepers, the correspondent of the *Daily Telegraph* in Berlin is led to speak of the "tremendous 96lb. rail"; but we may remind our non-technical contemporary that this is by no means an outside weight, and that some electric tramrails laid in the ordinary roads weigh several pounds in excess of that figure. However, the chief point to note about the trials is that the road bed has in no way been disturbed by the great speeds, and the track has remained practically unscathed. As our readers are aware, the three-phase alternating-current system is used, current being delivered to the cars from the overhead conductors

Digitized by Google

at 13,000 volts, which is transformed on the cars to 350 volts for the motors. The experimental car on Tuesday was driven by Dr. Reichel, its constructor. It is assumed that in practice an average speed of, say, 93 miles would be obtained, and a definite project to that end—an express line between Berlin and Hamburg—has been afoot awaiting the development of these trials. The trials, so happily conducted without accidents, will probably induce the promoters of this scheme to push on to completion without delay.

Cathode Rays.—Following is an abstract of a paper condensed in the Chemical Society's *Journal* for the current month, describing the action of cathode rays on inorganic and organic substances. The author, E. Goldstein, says that if Elster and Geitel's assumption is true, that the colour of metallic chlorides which have been exposed to the cathode rays is due to a subchloride formed by the liberation of halogen, ammonium salts should remain colourless when subjected to the rays; but it is found that, at the temperature of liquid air, ammonium chloride becomes greenish-yellow, ammonium bromide yellowish-brown, the iodide olive-brown, and the fluoride deep blue. The colour disappears when the temperature is raised and the product exposed to daylight. Tetra-alkylammonium halogen salts behave similarly, giving various shades of colour, and yellow to green shades are also obtained with substances such as chloroacetic, trichloroacetic, and bromoacetic acids, bromoform, and chloral, which contain a halogen. On the other hand, acetic acid and aldehyde remain colourless, so that the colour of the ammonium salts and of the substituted compounds is apparently produced by the halogen. That the metal in metallic salts also helps in the production of colour is, however, shown by Giesel's results. It should be noted that the halogen in these cases must have its power of absorbing light enormously increased by the cathode rays, as it is known that the halogens, including iodine (in very dilute solution), are colourless at the temperature of liquid air. Sulphur, which at low temperature is perfectly white, becomes bright chamois-coloured in the cathode rays; the colour becomes very faint in daylight, even in liquid air, and rapidly disappears when the temperature is raised. The change here produced by the rays must be that of one allotropic form to another. The following colourless compounds also become coloured in the cathode rays when cooled in liquid air: sulphuric monohydrate (saffron-yellow), concentrated hydrochloric acid (green), phosphoric acid (hyacinth-red), hydrobromic acid of sp. gr. 1·49 (intense green), chloric acid (chamois), phosphorus pentachloride (bright yellow).

Electrolytic Copper Refining.—Perhaps the most important and valuable paper read before the recent Niagara Falls meeting of the American Electro-Chemical Society was that contributed by Dr. Wilder D. Bancroft on "Electrolytic Copper Refining," in which he gave an account of a series of tests made in Cornell University to find the most economical conditions. An abstract appears in the *Electrical World*, which states that the principal factors varied in these experiments were the temperature and the current density. Two sets of curves were plotted, one showing the relation between the cost to precipitate a ton of copper and the temperature of operation; the second set showing the relation between the cost to precipitate a ton of copper and the operating current density. From these curves it appears that a temperature of 70deg. is most satisfactory. Although the cost runs very high at this temperature for a current density of one ampere per square decimetre, it begins to drop off very rapidly as the current density increases, until it assumes a practically constant value at the higher current densities. Between 3·5 and 3·75 amperes per square decimetre would be the best current density for obtaining economical results, for at this density no extra power would be required to heat the solution. Operating at this current density, and with covered tanks, in order to prevent the heavy radiation losses, the current alone would be sufficient to heat the electrolyte to over 80deg. In order to secure a good circulation, essential for a good deposit with high current densities, the present method of pumping could be retained. If the gutters leading to and from the pump were properly insulated, the solution would not drop below 70deg. before returning to the tanks. Moreover, running at this high current density there would be a considerable saving in the first cost of the plant, inasmuch as fewer tanks are needed for the precipitation of a given amount of copper in a given time. The lower the cost of heating, the greater the advantage of a high temperature. The author sums up the results of the investigation by recommending, first, covered tanks; second, a current density of 3·5 amperes per square decimetre; third, a temperature of 70deg. C.

Pendulum Apparatus for Testing Steel.—The above apparatus for carrying out brittleness tests of steel was described before the Engineering Section of the British Association at the Southport meeting by Mr. E. G. Izod, who in the course of his paper also outlined the more general systems in use for carrying out such tests. He complained that at the present time, probably owing to the state of perfection to which the testing machine has been brought, there is too much inclination to neglect other properties of material which the usual tests do not detect, but which are quite as important as the usual standard physical tests; and that this is so is shown by M. Fremont's paper, published by the Société d'Encouragement pour l'Industrie Nationale, September, 1901, in which he throws an extraordinary light on the brittleness question, and gives several instances where serious fractures in structural and other steel were not accounted for by any of the ordinary testing methods, but were readily explained when tested for brittleness by an impact machine. At Messrs. Willans and Robinson's, Rugby, it has long been felt that a method of testing such as used by M. Fremont and others was wanted to detect the reason for certain fractures which were inexplicable by the ordinary methods used; and an experimental pendulum impact machine was made, and the tests carried out with it gave promise of such good results that a standard machine was made and is in use at the present time, giving results which gain in importance with every series of experiments carried out on it. Many types of impact machines are used, but the pendulum form of apparatus seems to give most satisfactory results. It can be calibrated to give direct readings for energy absorbed, and lends itself to very quick working even by an inexperienced operator. The idea of the arrangement is as follows: A weight is suspended pendulum-wise on a stiff rod, which swings from a centre designed to be as frictionless as possible. This weight or tup is then moved out of the vertical, and allowed to fall on to the free end of a test piece gripped by the other end in a vice, the specimen being notched to locate the break, the height of fall being always made sufficient to cause fracture with one blow. A suitable measuring arrangement is used to record the energy remaining in the weight after fracture of test-piece has occurred, and this subtracted from the calculated energy in the tup before fracture gives the energy required to break the specimen. Measurements are taken of the test-piece, and results are transferred to equivalent energy absorbed on specimen 1in. square.

PORTSMOUTH CORPORATION TELEPHONES.

Considerable interest has recently been shown in the Corporation telephone undertaking at Portsmouth, from the fact that an enquiry has been held on an application to the Local Government Board for a further loan of £12,000 for extensions. We accordingly took an opportunity of visiting the exchange, which, owing to the

ALDERMAN W. T. DITTMAN, J.P., CHAIRMAN OF THE TELEPHONE COMMITTEE.

courtesy of the consulting engineer (Mr. A. R. Bennett) and the telephone manager (Mr. C. M. Gardner), was open to our inspection. Before proceeding to give a description of the equipment, which in itself is highly interesting, a few words may be said on the commercial policy of the telephone undertaking, for which the Telephone Committee, under the chairmanship of Mr. W. T. Dittman, J.P., is responsible. It will be remembered that the Tunbridge Wells Corporation telephone undertaking, while a complete success from a technical point of view as

MR. C. M. GARDNER, MANAGER OF THE PORTSMOUTH CORPORATION TELEPHONE EXCHANGE.

a telephone exchange, failed owing to its commercial organisation being defective. Our opinion is that if the Telephone Committee of that Corporation had shown the same careful supervision over the commercial affairs of the undertaking as was taken by the consulting and resident engineers respectively over the technical details, the Tunbridge Wells undertaking would not have been purchased by the National Telephone Company. As it was, neither the committee or the Corporation knew what they were spending, nor would they allow the engineers to know, with the usual result that estimates were exceeded and contracts undertaken which were bound to cause unremunerative expenditure. To compare the two undertakings would be, perhaps, invidious, but the chief difference between them lies in the fact that at Tunbridge Wells a very extensive network was organised to connect up a few widely scattered consumers throughout the large area controlled by the Corporation. The cost of this network was excessive, and yet the charges made to these outlying consumers, who were not rate-

MR. A. R. BENNETT, M.I.E.E., CONSULTING TELEPHONE ENGINEER TO THE PORTSMOUTH CORPORATION.

payers of Tunbridge Wells, was exactly the same as if they had been situated within a short distance of the exchange. At Portsmouth, on the other hand, while equal rates are charged to consumers in all parts of the area, the Corporation do not lay down trunk wires to outlying villages unless they are guaranteed a sufficient number of subscribers to make the outlay remunerative. In the same way, the committee have kept a close hand on the expenditure by obtaining from their resident engineer monthly accounts, which clearly show how the undertaking is pro-

MR. T. HOLME, ASSISTANT MANAGER.

gressing and how the cost of maintaining their system compares with the actual revenue. The result of this is that while there was much captious criticism at the recent enquiry, the committee were able to show that their consulting engineer's estimate of capital cost for a given number of lines had not been exceeded. All the time this businesslike policy is followed the committee at Portsmouth will retain the confidence of the Corporation, and the undertaking will not get into financial difficulties owing to the accumulation of an unknown deficit, as was the case at Tunbridge Wells.

Digitized by Google

The history of the Portsmouth telephone undertaking is only a comparatively short one. The license granted by the Postmaster-General was for an area of about 100 square miles. In Fig. 1 we give a reproduction from an Ordnance map, upon which this area is included within a shaded line. The heavy black lines on this map denote the routes of the junction wires connecting up the various villages. It will be seen that the junction lines to the west terminate in the town of Gosport. Thus telephone communication between Portsmouth and Gosport is carried out by means of long junction wires, although the two towns are comparatively a short distance apart, being only separated by the harbour. At the time we inspected the exchange we tried speech with various outlying districts, and found that when conversing with an operator at Gosport the clearness of the conversation left nothing to be desired. The outlying places now connected have the number of subscribers given in the following list: Cosham, 13; Fareham, 35; Gosport, 77; Havant, 10; Emsworth, 5.

The Portsmouth undertaking was commenced in April, 1902, when the then Mayor (Major W. T. Duprée) laid the first pips for telephone wires to be drawn into, and speech was first possible between different subscribers in November, 1902. The exchange was opened in March this year, when there were 701 subscribers connected and 15 junction wires. The charge for the telephone was also commenced that month, and it is worthy of note that the first month's return showed that the undertaking had a revenue greater than the working expenses. The opposition between the Corporation exchange and that of the National Telephone Company is, of course, very great. The result of the competition is yet to be ascertained, but up to the present the Corporation are holding their own exceedingly well. Thus at the end of July this year the Corporation had connected 1,014 subscribers, as against 824 on the National Telephone Company. Of these, 376 subscribed to both undertakings. The system of charging leaves a number of options to the subscribers, and, we should think, makes it somewhat difficult for an inexperienced trader to judge both as to which undertaking he will support and under what rate. Thus, on the Corporation system, he has the

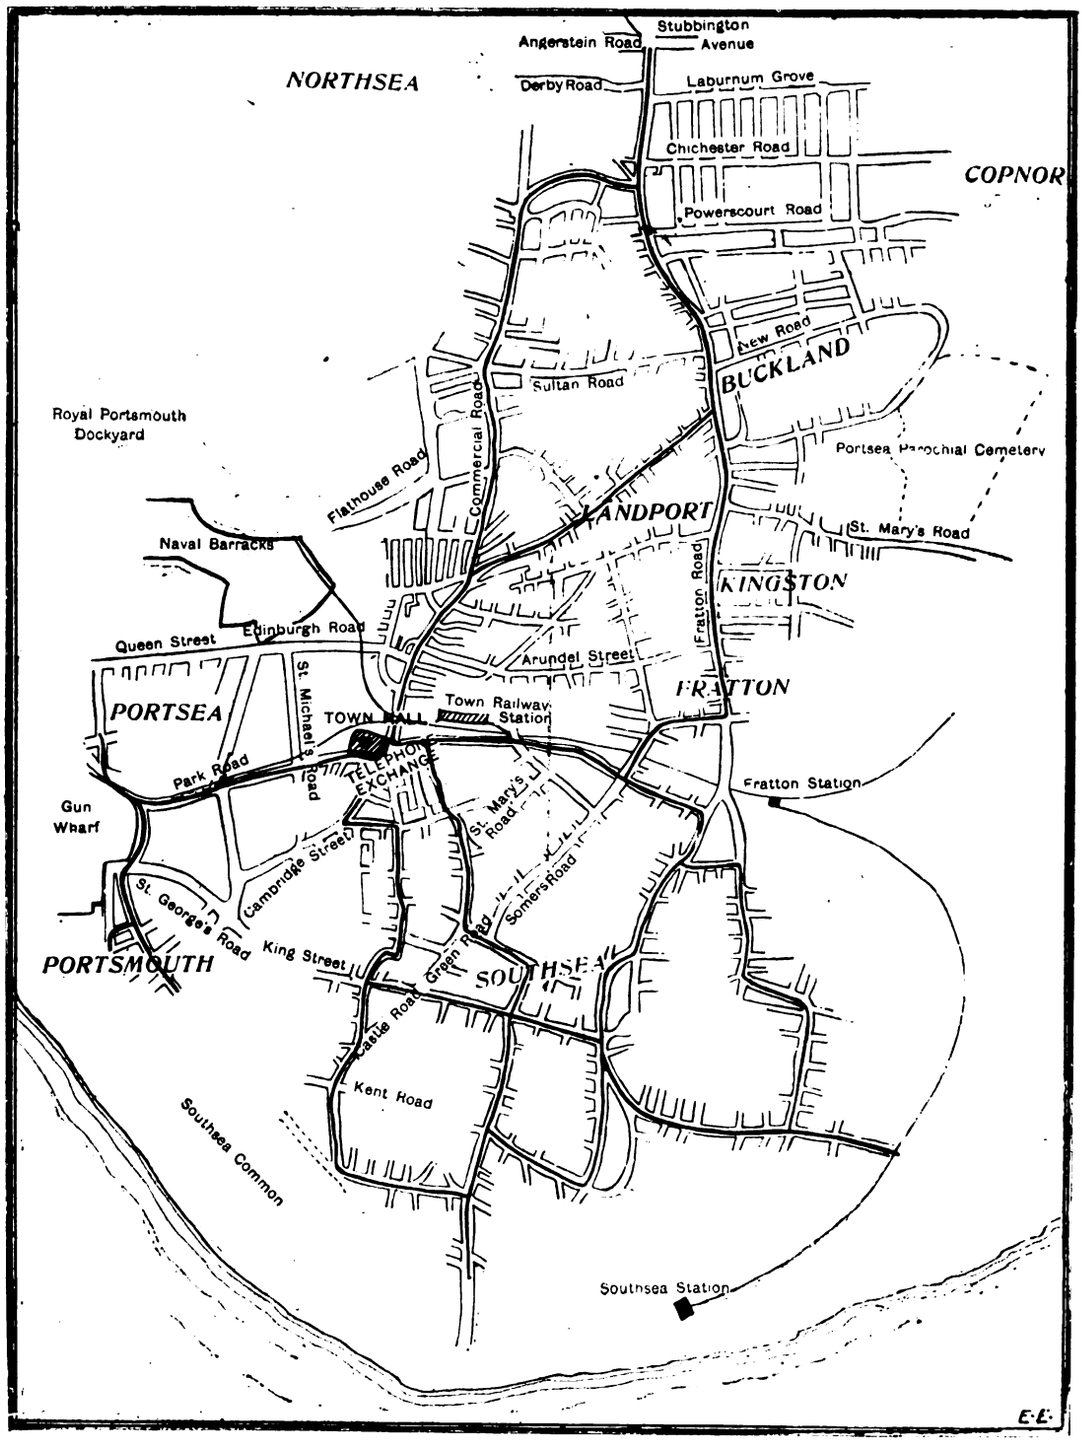

FIG. 2.—Map of the Underground Telephone Cable System at Portsmouth.

Digitized by Google

following options: (*a*) unlimited service at £5. 17s. 6d. per annum; (*b*) unlimited service, two-party line, at £3. 10s. per annum; (*c*) toll service at £5 per annum (1,800 outward calls free), ½d. per call afterwards; (*d*) toll service at

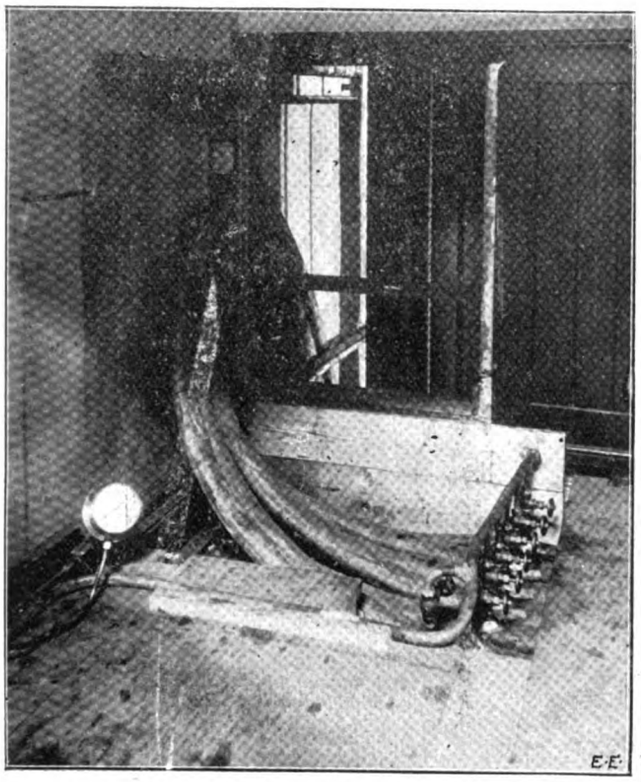

FIG. 3.—View of the Lead Cables coming into the Exchange, showing Air Cocks.

£3. 10s. per annum and ½d. per call; (*e*) toll service at £2. 10s. per annum and 1d. per call. Of the subscribers now connected more than one half pay the full rate of £5. 17s. 6d. for the unlimited service with a private wire.

The National Telephone Company were somewhat hampered in bringing their prices to conformity with the above from the fact that, under their license, they cannot reduce prices for telephone service in Portsmouth without giving an equivalent reduction to the other large towns in England of about the same size. The following figures, however, will show that by introducing alternative tariffs they have evaded the spirit of the terms of the license. On the company's Portsmouth exchange one can now obtain connection with the following annual rentals, with additional charges as given for outward calls: (*a*) unlimited service for £10 per annum; (*b*) £5. 10s. per annum, with 2,500 calls free and ½d. for calls over this number; (*c*) £5 per annum, with 1,800 calls free and ½d. for calls over this number; (*d*) £3. 10s., plus ½d. for every outward call; (*e*) £3 per annum for unlimited service with a two-party line; (*f*) £1. 5s. per annum for connection to an omnibus wire, with 600 free calls; (*g*) a still further alternative is a connection to a 10-party line, paying 1d. for every outward call, with a minimum of one call per day. From the above it will be seen that the company by introducing a call charge for telephone service have rates equal to those of the Corporation. It remains to be seen how far the company can be made to give an equal number of alternatives in the other large towns throughout England.

The system of distribution employed in Portsmouth is a combination of underground cables with overhead distribution from the ends of these cables. Fig. 2 shows the underground mains already laid or under construction for extending the system to 2,000 stations. The cables—air and paper insulated—are laid in 9in. cast-iron pipes 3in. internal diameter, and are jointed and distributed from junction boxes of Staffordshire blue brick with ventilated covers. The main cables are led into the testing-room and connected to the main distributing board for testing purposes; they are also fitted with taps for pumping dry air into the lead covering, as shown in Fig. 3. The lines are then cross-connected on to the lightning arresters and high-tension guards supplied by the International Electric Company, from where they are led to the switchboard. The switching system adapted is the central battery signal with local batteries in the subscribers' instruments. The subscribers' instruments were manufactured by the Ericsson-Bell Telephone Company, and the whole of the underground work, including the supply and laying of pipes and cables, was carried out by the British Insulated and Helsby Cables.

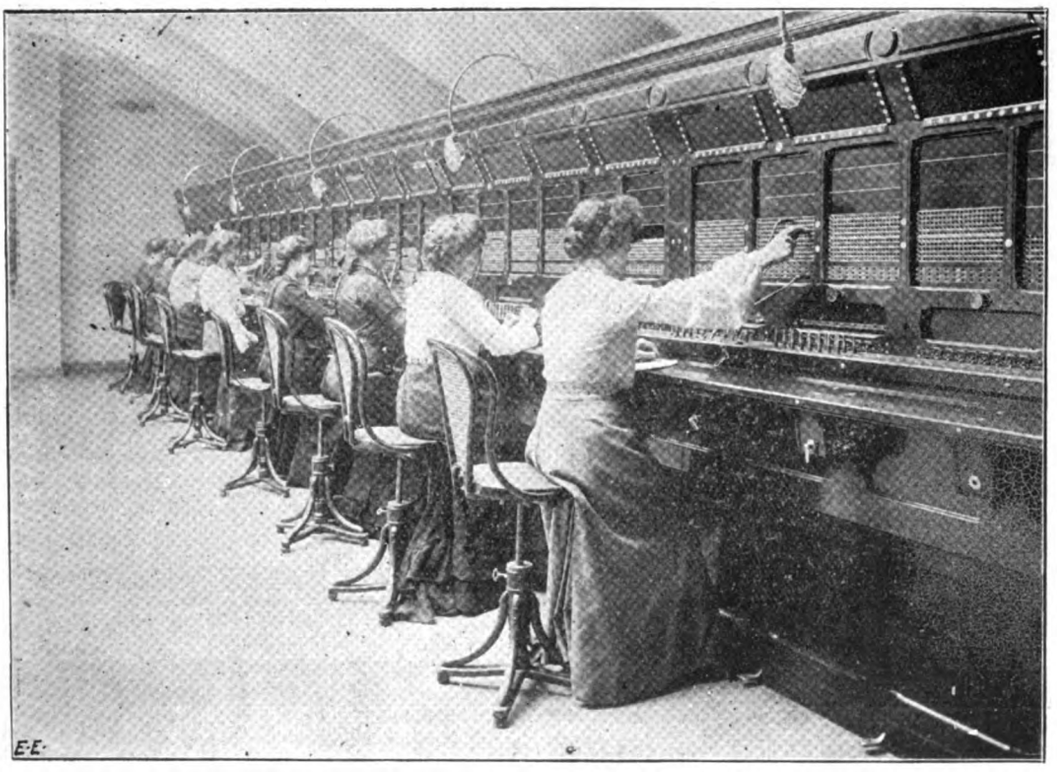

FIG. 4.—The Portsmouth Corporation Telephone Switchboard.

The switchboard is situated on the third floor of the town hall in an ideal room for telephone exchange purposes, as will readily be seen from Figs. 4 and 5. This room is excellently lighted, and a false floor gives ample space

Digitized by Google

under it for the connecting wires. The switchboard was manufactured and supplied by the Telegraph Manufacturing Company, now the British Insulated and Helsby Cables, Limited. Each operator's position is fitted for 50 lines with "star" informer, which indicates when any of the 50 are calling. Each subscriber's metallic circuit is fitted with an indicator, which operates whenever a subscriber calls by simply pressing a red button on his instrument. When the answering plug is inserted in the local jack the indicator is automatically cut out of circuit, and the metallic loop is in direct communication with the operator. On learning the number required she tests with the thimble, and if the line is disengaged rings the subscriber by means of a pedal worked by the foot, and then completes the circuit. The completion of the circuit cuts off the operator's telephone and throws in a "ring-off" indicator. A general idea as to the construction of a section of the switchboard is shown in Fig. 6. The power for supplying the current necessary for the signalling of the subscribers to the exchange, the "ring-off" indicators, the test circuit, operator's telephones, and "star" informer circuit, is derived from the accumulators, which are charged from the electric light mains through a motor-generator, as shown in Fig. 7.

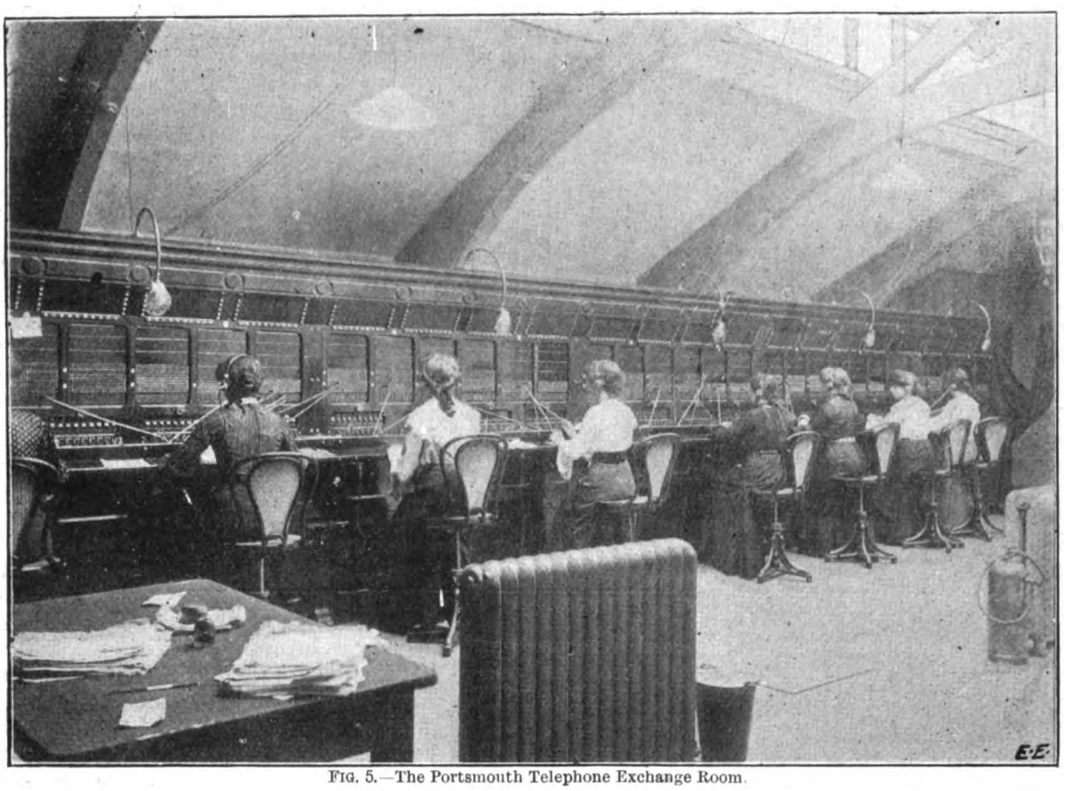

FIG. 5.—The Portsmouth Telephone Exchange Room.

The following more detailed description of the central battery multiple switchboard will be of interest to all telephone engineers: To signal the exchange a subscriber depresses the red button on his instrument, which earths one side of his line, and actuates the grid indicator. The circuit can be traced on reference to Fig. 8, a current flowing from the central battery through the indicator, the inner springs of the home jack, the inner springs of the

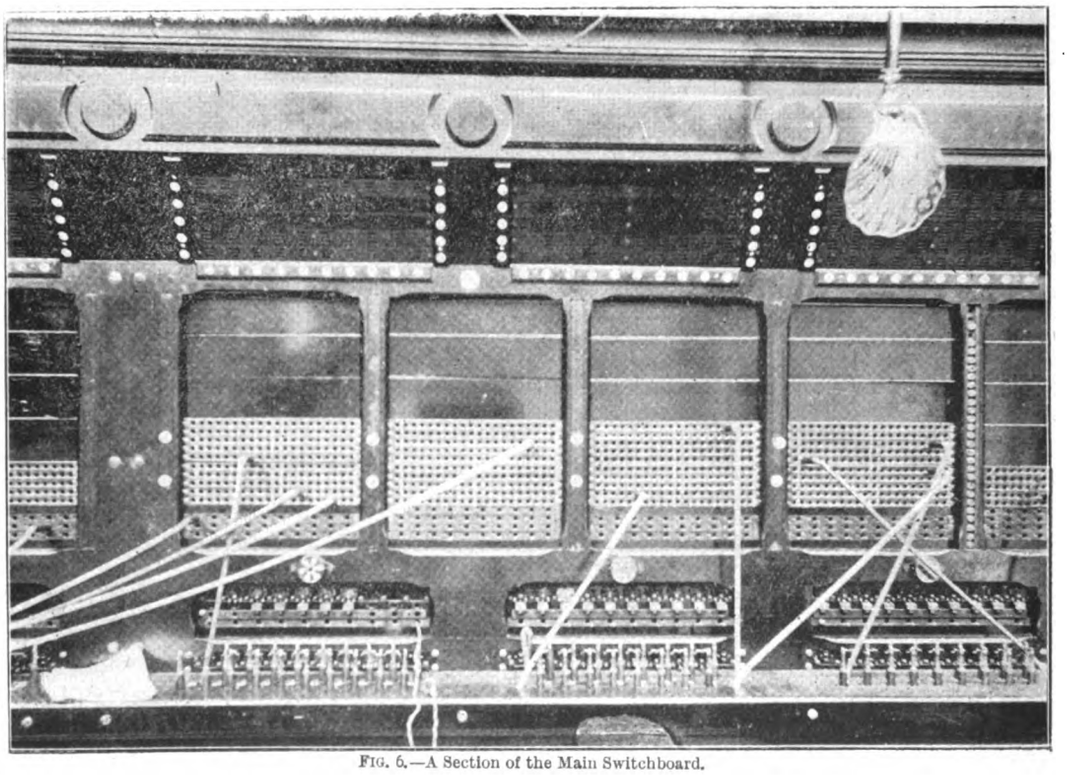

FIG. 6.—A Section of the Main Switchboard.

Digitized by Google

multiple jacks to the first multiple, where the inner spring is connected to the earthed side of the line, whence there is a return to the earthed side of the battery. The indicators close the usual night-bell circuit through the star informer. In answer to a call the operator lifts the answering plug and inserts it in the local jack. This breaks the contact of the inner springs, thereby cutting the battery circuit and restoring the indicator, and at the same time connects the operator's telephone on to the plug. On ascertaining the number required the operator touches the bush of the wanted subscriber's jack, and if engaged hears a click in her receiver. The circuit which causes this is from the bush of the jack touched by the test thimble to the bush of the jack on the multiple where the line is already engaged, thence to the barrel of the plugs which are connected to one side of the battery, through this battery, the other side of which is joined to a double contact relay, through the coil of the relay to the test thimble. This energises the relay, thereby closing another circuit through the operator's receiver, as shown on the diagram, causing the click or engaged signal. If the line is not engaged she lifts the calling plug, which automatically disconnects the cord key from the operator's telephone and connects it to a ring-off indicator. This indicator is wound so that a current passing through both coils in series will not work it, but if a current enters between the coils the shutter falls. From a point between the two coils a connection is made to the negative side of a clearing battery, the positive side of the battery being connected direct to earth. On the completion of a conversation the subscribers replace their telephones and momentarily depress the red button, thereby causing the ring-off indicator to fall, a current flowing from the clearing battery to the centre point between the two coils, through one of the coils, one side of the line which is earthed, and thence to the earthed side of the battery. A subscriber can ring through to another without being cut off, and consequently need not listen at the telephone while information is sought at the other end. The current for ringing the subscribers' bells is derived from an alternating generator, giving 75 volts at 1,000 revolutions, driven by a Robinson hot-air engine.

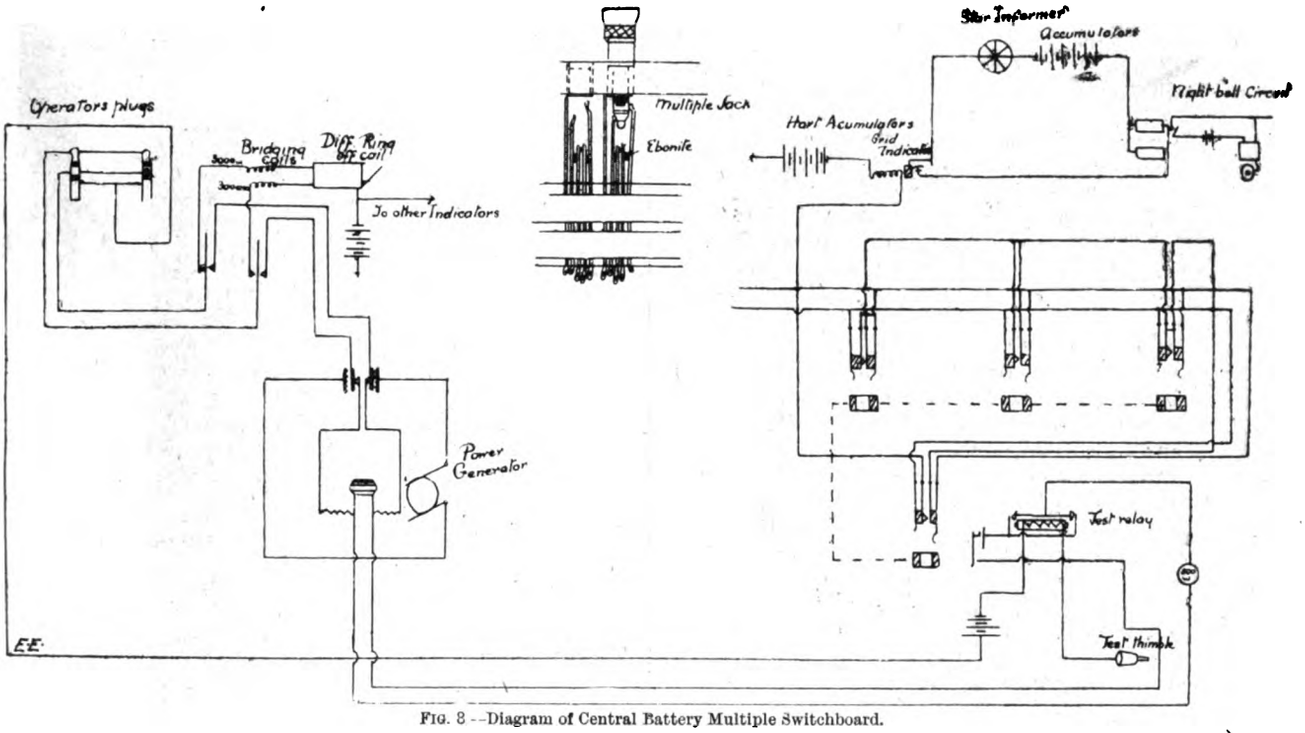

FIG. 8.—Diagram of Central Battery Multiple Switchboard.

The procedure of connecting up for Post Office trunk messages is as follows: The Post Office trunk operator selects the junction and passes the demand on the call wi e. The municipal operator then turns the lever of the speaking and ringing key (as shown in Fig. 9) associated with the circuit named into the speaking position, lifts the plug and tests by momentarily touching the socket at the wanted subscriber's jack. Unless the subscriber be engaged upon another trunk circuit, the plug is then inserted into the jack, and if the subscriber be disengaged the municipal

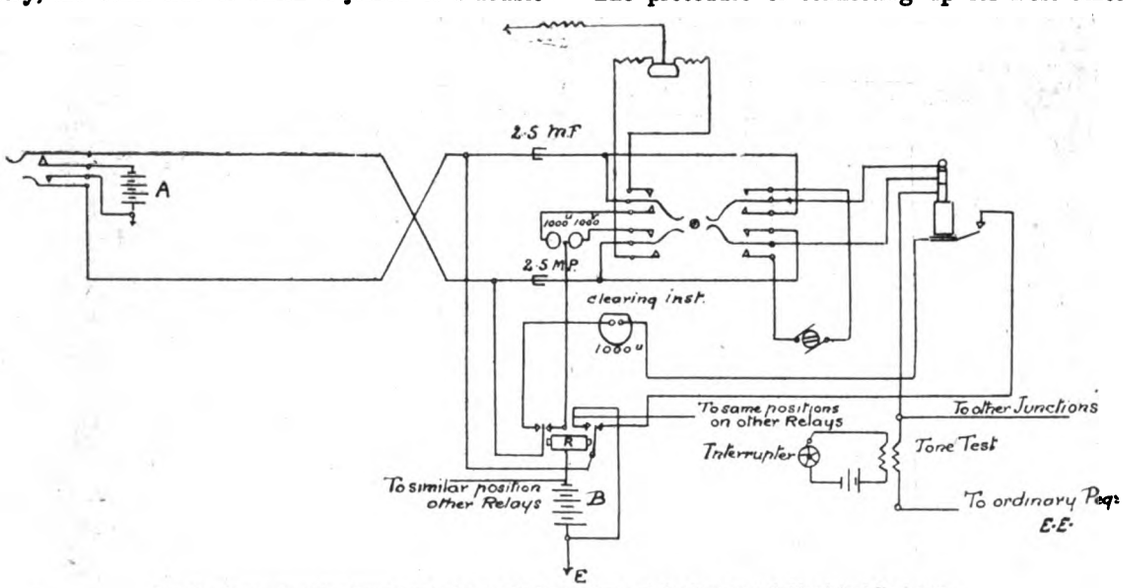

FIG. 9.—Connections for Junctions between the Post Office and the Portsmouth Municipal Exchange.

Digitized by Google

operator rings until attention is gained. If the subscriber be already engaged upon a local conversation the trunk call is offered, and if it be accepted the local connection is severed. When the conversation terminates the subscriber rings off in the usual manner by depressing the red button on his instrument, thereby momentarily earthing the circuit. Relay R is in consequence actuated and closes a circuit which includes R itself, the junction

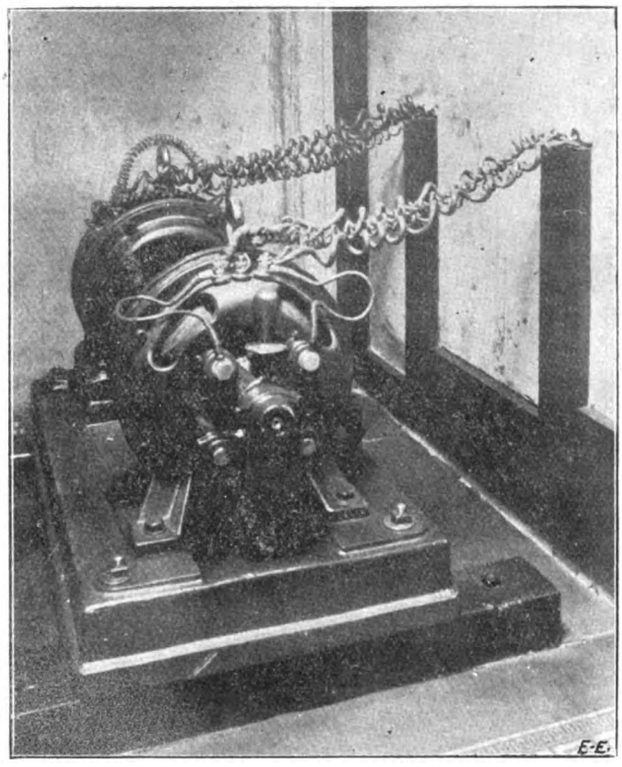

FIG. 7.—The Motor-Generator.

circuit, the indicators at the Post Office, and the battery B. A current then flows from the latter, which retains relay, R, and at the same time causes the indicator at the Post Office to display a clearing signal. The trunk operator then clears, throwing battery A into opposition to B, and consequently relay, R, ceases to be energised and again connects up the clearing indicator, which now gets a current from the battery A. The local operator then clears, the restoration of the plug breaking the clearing indicator circuit. If, owing to the expiration of the time allowed, the Post Office operator disconnects before the subscriber clears, the clearing signal is sent to the municipal exchange even if the subscriber omits to earth the circuit.

The power plant at Portsmouth for converting the alternating currents from the town mains into direct current for telephony consists of three panels of polished slate, as shown in diagram Fig. 10, the left-hand panel being the motor panel, the right-hand the dynamo, and the centre the

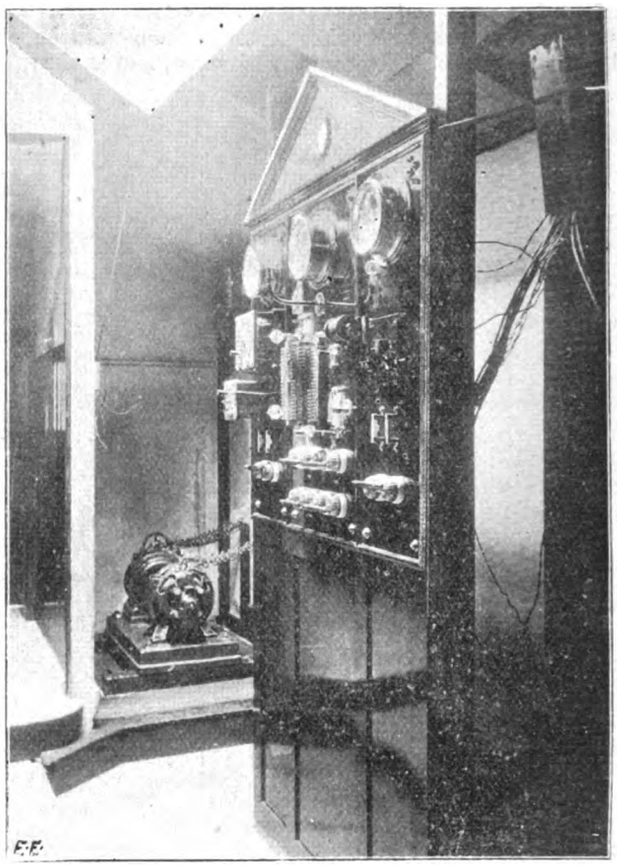

FIG. 11.—View of the Power Switchboard and Motor-Generator.

feeder. On throwing over the switch on the motor panel, the 100-volt alternating town supply is connected to the starting box, and on moving the starting-box switch to the centre stud the motor starts up from rest. When run up to speed the switch is moved to the next stud, which cuts out the resistance coils and allows the motor to attain full speed. The dynamo field is then joined in series with

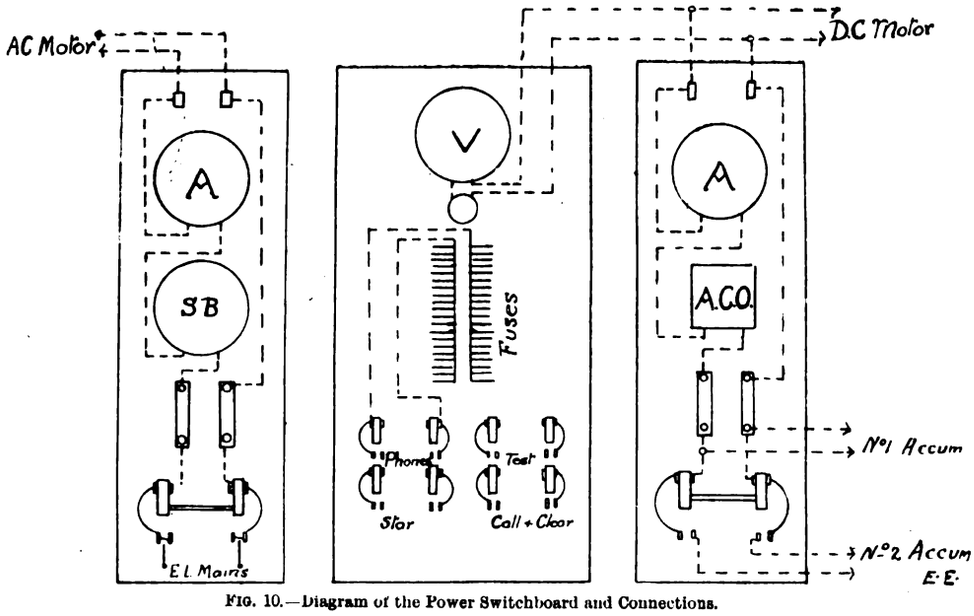

FIG. 10.—Diagram of the Power Switchboard and Connections.

resistances, the machine being shunt wound, and the dynamo volts taken before the accumulators are thrown into circuit. The double-pole accumulator switch on the right-hand panel is then thrown over, and the automatic cut-out set into the circuit. On a reversal of the current the cut-out automatically falls down, thereby disconnecting the dynamo. The feeder panel is mounted with copper bus bars, the

Digitized by Google

various circuits for the calling, ring off, test, and operators' telephones being bridged across same by means of double-pole throw-over switches. In all the circuits are pilot lamps, which indicate any undue leakage of current. There are ampere-meters in the alternating-current circuit and the charging circuit, and a voltmeter to indicate the volts in the charging circuit and each of the feeder circuits. The dynamo is fitted with choking coils, so that in the case of the breakdown of the accumulators, which are connected in shunt, all the circuits can be worked direct on the machine. In the case of the breakdown of the dynamo there is a duplicate set of accumulators, which can be thrown into circuit until the fault is rectified. We were surprised to find that when working direct from the dynamos there was no dominant note from the commutators superimposed on the telephone speech. This, we learn, is avoided by special construction in the dynamos which involves the use of choking coils in the circuit. All the wiring of the circuits for starting the motor-generator and charging the accumulators, as well as feeding the switchboard circuits mentioned above, are brought on to the power board. This board was specially designed for the work, being the only one of its kind fitted in this country. A general idea as to this view of its construction and of the motor-generator may be gathered from Fig. 11.

The outside construction and the instrument fitting were carried out by the Corporation's own staff in preference to letting same out to contract. In extension work even more will be done by direct labour. The chairman of the Telephone Committee, Alderman W. T. Dittman, J.P., along with the committee, has guided the scheme to its present success in face of great opposition.* In conclusion, we have to thank the consulting engineer for the scheme, Mr. A. R. Bennett, of Glasgow, for permission to prepare the above description. Our thanks are also due to Mr. C. M. Gardner, manager, and to Mr. T. Holme, assistant manager, for kindly showing us all the details of the undertaking.

THE VENTILATION OF DEEP-LEVEL UNDERGROUND RAILWAYS: A SUGGESTION.

BY B. PONTIFEX.

The controversy lately carried on by various energetic daily papers about the state of the air in the "Twopenny Tube," apparently settled down to a dispute concerning the comparative deadliness of the carbonic acid from the coal in use on the Metropolitan Railway and that given off by the thousands of more or less washed humanity who patronise the tubes. Various schemes have been proposed, and some are under trial, with a view to giving fresher air at the deep levels, but they all fall under one of the following headings: (*a*) practicable, but barred by financial considerations; (*b*) utterly useless, even when not expensive; (*c*) a compromise between *a* and *b*—not too expensive, but only half doing the work.

The chief point about any system of ventilation is that, to be effective, it must be both continuous and automatic. Further, it is quite hopeless to expect the trains to accomplish anything but a somewhat useless churning of the air already in the tubes, because the Board of Trade would probably condemn any system of automatic shutters which would enable the trains to force air in and out of the stations by way of the lift-wells and staircases.

A solution of the difficulty lies in drawing off the foul air by pipes which have their suction inlet in the tunnels midway between stations, and discharging it by an upcast shaft at the level of the housetops. Fresh air would then enter the line at every station, instead of a nauseating draught of foul air slowly struggling out on the footpath, as at present. The suction inlet of the pipes is necessarily midway between stations, because it must be at the greatest possible distance from the fresh-air inlets in order to make sure that every particle of foul air is withdrawn.

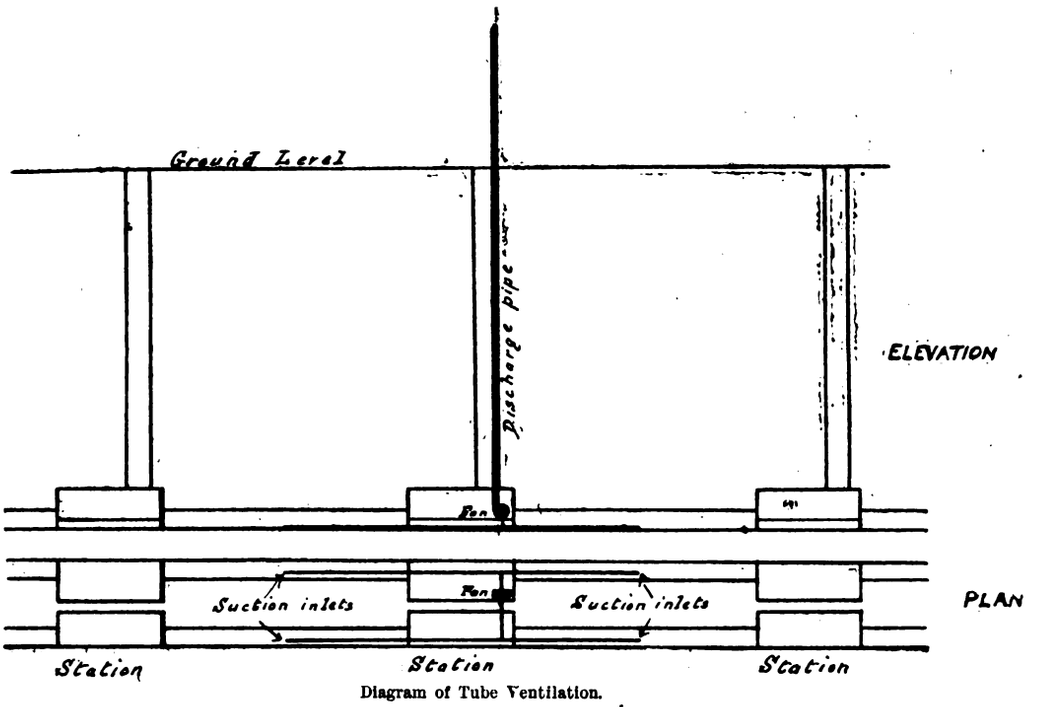

Diagram of Tube Ventilation.

The suction pipes can either be run in the tunnel invert under the rails (if these are laid on longitudinal sleepers), or can be fastened to the side in a similar manner to the cables, while the delivery shaft can be carried up the centre of the stair-well. Their cross-section would have to be arranged to get the greatest area without allowing undue flattening at corners, which would increase friction in an unnecessary manner.

The average distance between "tube" stations works out at about 700 yards, which, with a fan at alternate stations, give a total of 2,200,000 cubic feet of air to be dealt with by each fan. For this calculation the lift shafts have been taken as 30ft. diameter by 60ft. deep, station tubes 35ft. diameter by 250ft. long, and running tunnels 12ft. diameter. Some of these dimensions are excessive in order to allow for passages, etc. To entirely renew this quantity of air three times during the 20 hours when a tube line is at work, means that the fan must deliver 5,500 cubic feet of foul air per minute at a pressure (at the fan) of about 4½in. water-gauge. A reference to a fanmaker's catalogue will show that a 36in. by 4½in. fan will deliver 5,900 cubic feet per minute at 4½in. water-gauge pressure when driven by a 10-h.p. motor at 950 revolutions per minute.

* The first loan obtained was one of £25,500, and with the £12,000 now applied for the department will have capital funds to last some two years at the present rate of progress.

Digitized by Google

To sum up, to obtain a thorough change of air three times a day in any average tube railway by continuous ventilation it is necessary to fit a 10-h.p. motor and fan at alternate stations, fitted with suction pipes running in both directions in each tunnel, and a delivery shaft carried up the centre of the stair-well. To make sure that the motors were at work whenever traffic was running, they could be supplied with current from the track through automatic starters. The whole scheme is practically automatic, and does not require any special closing of air-tight doors when traffic ceases, neither does it entail the use of a huge fan that is idle 20 hours of the day, and whose efforts are nullified five hours after traffic starts in the morning. Moreover, it can be fitted to any existing tube railway.

A SIMPLE OSCILLOGRAPH.*

For the purpose of studying the occurrences in an alternating circuit, especially if the results are to be exhibited to an audience, by far the best instrument is an oscillograph. Unfortunately, these instruments, as perfected by Messrs. H. Blondel and W. Duddell, are too expensive to come into general use. The writer has, however, constructed a simple oscillograph which has proved quite successful in the case of comparatively slow periodic changes, such as alternating currents at ordinary frequencies. The principle of this instrument is the same as that employed by Mr. Duddell. A loop, D, of hard-drawn silver wire is tightly stretched between the poles, N_3, of an electromagnet (Fig. 1). The two sides of the loop are parallel, and lie 2mm. to 3mm. apart, and a small mirror of thin glass is stuck to them. When a current is sent through the wire with the magnets excited, the moving system is deflected to an extent approximately proportional to the current strength, just as in a D'Arsonval

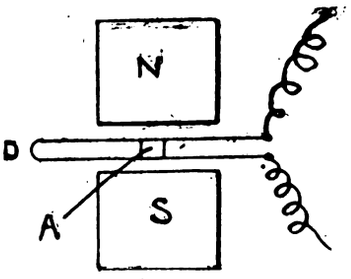

Fig. 1.

galvanometer. If the current varies periodically, the instantaneous deflections will still be proportional to the instantaneous current values provided that the natural period of the moving system is very short compared with the period of the current, and also that the damping of the system is very great. By employing a powerful magnet and a tightly-stretched wire both these conditions may be fulfilled.

Fig. 2 is a photograph of the apparatus as constructed by the writer. Two identical oscillographs are supported in an easily adjustable manner. Each consists of an electromagnet with bevelled poles very close together. The wire is mounted on ebonite, with a tightening arrangement. Each oscillograph is mounted complete with its terminals on a baseboard, A. The double apparatus shown is useful for taking two curves simultaneously. The arrangements for exhibiting curves are shown diagrammatically in Fig 3. The writer employs a small $3\frac{1}{2}$-ampere arc lamp as a source of light, L, and the beam from this passes through the lens, A, which makes it parallel, and falls on to the small oscillograph mirrors. From these the light is reflected to the revolving mirror, Sp, and thence on to the screen, S, the images of the two mirrors being made to fall on the same spot. When the mirror, Sp, is rotated the curves become visible on the screen. The amplitude of the curves can be varied at will by altering the tension of the wire or the distance of the screen from the mirror, Sp. If the screen is placed 2m. away, an amplitude of 100cm. can easily be obtained with about half an ampere in the wire loop.

For the purpose of demonstrating phase displacement between two circuits of which one is inductively loaded, the arrangement shown in Fig. 4 may be used.

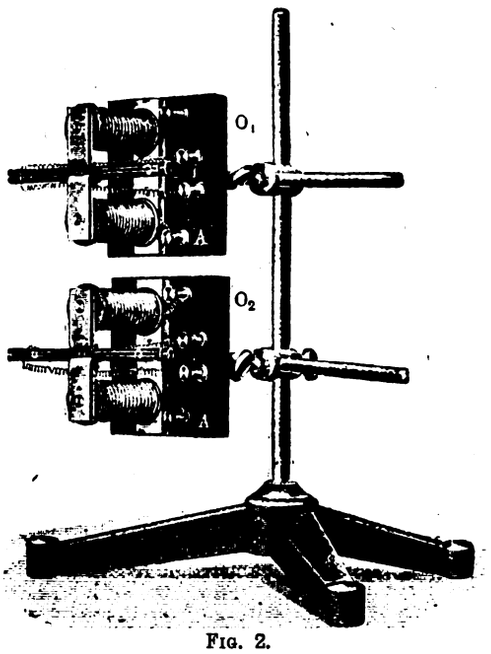

Fig. 2.

Two circuits are connected to the alternator or rotary converter, U, one containing a large non-inductive resistance, W_1 and one oscillograph, O_1, and the other containing a change-over switch, C, and a small adjustable resistance, W, to which the second oscillograph, O_2, is connected. By

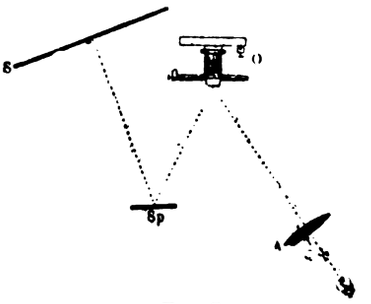

Fig 3.

means of the change-over switch either the non-inductive resistance, W_2, or the inductive coil, L, can be inserted into this second circuit. W_2 is chosen so that the current strength may be the same with either inductive or non-inductive resistance. In this way oscillograph O_1 shows the E.M.F. curve and oscillograph O_2 the current curve.

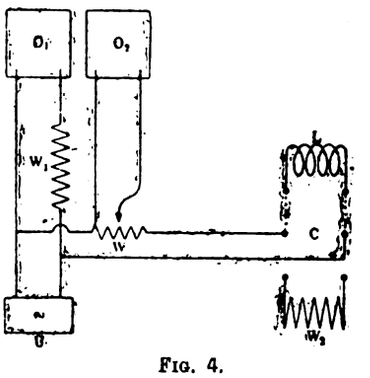

Fig. 4.

When W_2 is in circuit there is no phase displacement and the one curve lies over the other, the amplitudes being preferably made different by adjusting W or W_1. If, however, L is inserted the two curves will be seen to separate on the screen. By gradually inserting an iron core into the coil L the simultaneous effect of self-induction on the phase displacement and on the current value can be

* Translation in abstract of a paper read by A. Wehnelt before the German Physical Society.

Digitized by Google

shown on the curves. By means of condensers the reversed phase displacement due to capacity can be demonstrated. The oscillograph is also very successful in showing the voltage and current variations occurring in the alternate-current arc. The curve of current on breaking circuit either with a metallic switch or a liquid one can also be easily shown. Many other applications will suggest themselves, the only limiting factor being the speed of variation. Thus, if the periodic time of the changes to be considered is under ·01 second, the natural swing of the system will interfere with the results, as with such an instrument the natural time of swing is about ·003 second, whilst in the Duddell oscillograph it is only about ·0001 second.

BRIGHTON MUNICIPAL TELEPHONES.

What is described as the "informal opening" of the Brighton municipal telephone system was performed by the Mayor (Mr. J. C. Backwell) on Monday in the presence of the members of the Telephone Committee and representatives of the Press. This is the second town on the South Coast to inaugurate a municipal exchange within the space of a week, the other case being that of Portsmouth. The Mayor opened the exchange by send a message to Councillor Beryl, of the Theatre Royal, who had the privilege of being the first subscriber to be rung up on the Corporation system. Subsequently several other subscribers were rung up and conversed with by the Mayor and other gentlemen present. Heartiest good wishes were expressed at both ends of the wire for the success of the undertaking, and everything passed off without anything in the nature of a hitch. The section of the system inaugurated on Monday is that covering the central portion of the town. The laying of the underground ducts was commenced on March 9 last, and up to date 25 miles of duct have been laid within the borough of Brighton. The work of laying ducts within the borough of Hove was commenced at the end of last month, and will be completed within two months. This portion of the work, both in Brighton and Hove, is being carried out by Messrs. W. T. Henley's Telegraph Works Company, Limited, of London. The cable which has been drawn into the ducts commences at the exchange with 626 wires and extends to the borough boundary on all sides, gradually diminishing, as connections are made to subscriber's premises, to 12 wires at the extremities. The number of wires at the exchange is over 3,000 at the present time. The British Insulated and Helsby Cables, Limited, of Prescot, Lancashire, are responsible for this part of the work.

The switchboard is being supplied and erected by the Ericsson-Bell Telephone Company, of Glasgow, and is unique of its kind. To call the attention of the operator the subscriber lifts the phone from its rest, and when conversation is finished replaces it, and thus gives the clearing signal automatically. A special feature is that in the event of a called subscriber not responding at once, the caller may himself ring without affecting the exchange. This will materially accelerate the operating. The switchboard is at present fitted for 1,000 subscribers, with an ultimate capacity of 5,000. The number of applications for telephone service having already considerably exceeded 1,000, the work of extending the board is to be proceeded with at once.

The instruments, which are of elegant design, bearing the borough arms, are a combination of the latest devices for giving an excellent service with a minimum of trouble to the subscribers, and are also supplied by the Ericsson-Bell Company. The fitting of these, together with the wire leading from the underground points, is being carried out by the department, instead of by contractors as originally intended. The area covered by the license extends to Burgess Hill on the north, Shoreham and Steyning on the west, and Rottingdean on the east, and embraces a number of smaller places and villages near Brighton. The extensions to these places are at present under construction. The subscription of £5. 10s. per annum for unlimited service covers the whole area without extra charge, and subscribers may also speak to any other town in the United Kingdom over the Post Office trunk wires on payment of the usual fees. The formal opening of the system for the public use will take place in the course of a few weeks when the construction is further advanced.

COMBINED REFUSE DESTRUCTORS AND ELECTRIC LIGHTING WORKS.

In view of the great deal that has been written and urged in favour of the combined dust destructor and electrical generating station, and the economical results which are said to result from such combination, the following report will, we think, be read with particular interest by electrical engineers at the present time. It has been prepared jointly by Mr. H. Mair (the borough surveyor) and Mr. G G. Bell (the resident electrical engineer of Hammersmith), who were instructed by the Cartage and Electricity (Joint) Committee of the Hammersmith Council to report upon the question of a refuse destructor for the borough. The report, which we reproduce in full, reads as follows:

"In accordance with your instructions, we herewith beg to report upon the question of a refuse destructor for the borough of Hammersmith. It is perhaps unnecessary to explain, in the first instance, that the primary object of refuse destruction is the disposal, in a sanitary manner, and rendering innocuous, all waste materials collected from the private house dustbins and trade refuse. If at the same time not only can this object be realised, but some useful product obtained by so doing, without any corresponding disadvantages or drawbacks, the cost can be materially reduced and the financial aspect of the question becomes more favourable. It is our duty to lay before you the *pros* and *cons.* of this question from these points of view.

"In the first place, there is no doubt whatever that a proper system of refuse destruction is the most sanitary method of dealing with the house refuse collected from large communities, as it can be dealt with close at hand, thus avoiding the risks and cost of transit to the dust shoots, which must of necessity be some distance from the large centres of population. The question of cost, however, is to a very large extent the ruling factor, and as the available shoots near at hand are gradually filled up, this simple method of dealing with the matter becomes more and more expensive, although from a sanitary point of view it does not materially affect the persons whose refuse is carted away. Dust destructors, therefore, really affect the community at large, and if the cost of dealing with our refuse by means of a dust destructor is heavier than by sending it away, we are paying this extra money simply for a more ideal state of affairs.

"At the present time the disposal of refuse is receiving the very serious consideration of the authorities throughout the whole of the kingdom, and up to the present time about 160 towns in Great Britain and Ireland have adopted some form of destructor. A large number of these, however (nearly one-third), have been erected quite recently, so the actual cost of dealing with refuse in this manner cannot be accurately ascertained with a modern form of destructor. It must also be borne in mind that many of these towns have no other possible method of dealing with their refuse. As, however, some municipalities have been carrying out experiments in this direction for a number of years, it will not be difficult to arrive at a figure which will give the approximate costs and be suitable for basing our estimates upon.

"The perfect dust destructor has not yet been designed, and should be a combination of the following points, but there are some very good approaches to it on the market: (1) perfect cremation of the refuse, so that there can be no offensive nuisance from partly burned gases; (2) must be capable of dealing with the refuse immediately it is delivered, so that it is not necessary to store same, as it quickly becomes offensive under these conditions; (3) no nuisance to the surrounding neighbourhood through fine dust or grit being distributed from the chimney stack; (4) the furnace temperature should be so great that the residue

Digitized by Google

is melted and forms hard clinker, which then becomes a useful by-product. None of these points should be sacrificed in order that the refuse should be used instead of coal for any useful purpose, and if these points can be fully met and any surplus heat used for generating steam, then this steam may and should be used for driving the necessary machinery required in the destruction of the refuse, and we believe that there would be very little, if any, heat available for any other useful purpose.

"It would perhaps be as well to examine the conditions which prevail at Hammersmith, and ascertain the cost of erecting and working a destructor, and also see if any useful purpose could be served by the apparatus after its true functions have been carried out. The actual amount of dustbin and trade refuse dealt with last year was approximately 28,000 tons, but as the population of the borough is continually increasing, any destructor erected should be capable of dealing with 30,000 to 35,000 tons per annum, which, taking 300 working days in the year, will give an average of about 100 tons daily. The cost of the necessary dust destructor, as well as tipping floors, boilers, dust-catcher, buildings, and chimney, would be about £18,000, to which must be added the cost of the land. The area required would be approximately one acre, as provision must be made for a necessary inclined approach road, stores, and other buildings. This may be estimated at £2,500. The London County Council would lend this sum to be repaid within 50 years, on which we should have to pay interest at the rate of 3½ per cent. per annum, so the capital charges for interest and sinking fund on the land would amount to £93. 10s per annum. The amount, £18,000, to be borrowed for the buildings and machinery, we may take it, would have to be repaid within 30 years, and interest at the rate of 3½ per cent. per annum, so these capital charges for interest and sinking fund would amount to £915 per annum.

"In provincial towns where destructors are at work it is found that 1s. per ton is the average cost for labour only at dust destructors combined with electricity works, but this is increased to 1s. 8d. per ton if the London installations are included, so we must infer that the cost for labour here will be at least 1s. 8d. per ton, which must be added to the above figures. A further amount must also be included for depreciation, which we believe will ultimately prove to be a very heavy item, and it is not safe to estimate this at less than another 5 per cent. on the whole cost of the plant, in addition to the sinking fund previously mentioned, which will amount to another £900. When the refuse has been tipped into the destructor cell this is not the end, as there is a very heavy residue to be dealt with, which varies from 25 to nearly 50 per cent. of the total quantity placed in the cell. This must be disposed of in some manner or other as rapidly as it is made, and where building operations are in active progress or a large number of new streets and roads are being made up in the district it might be disposed of, but in our case, where sand is abundant and the number of new roads to be made is extremely small, we believe there would be difficulty in disposing of approximately 10,000 tons of clinker without barging away.

"These items may be briefly summarised thus: Cost of land—£2,500 for 50 years at 3½ per cent., £93. 10s; buildings—£18,000 for 30 years (£600 sinking fund, £315 interest) at 3½ per cent., £915; 30,000 tons of refuse at 1s. 8d., £2,500; add 5 per cent. for depreciation, £900; 10,000 tons of clinker at 2s. 7d., £1,291—total £5,699. 10s. The cost of barging away dust at the present time is 2s. 7d. per ton, which at 30,000 tons per annum equals £3,875, showing an increase of £1,824 per annum. Of course, it is possible to use the hard clinker for manufacturing artificial stones for paving, but the plant necessary to do this—*i.e.*, mills, crushers, hydraulic press, etc.—would cost a further £2,000 before we could deal with this clinker satisfactorily and economically.

"Taking it for granted that we should be able to get rid of the whole of the clink, the question arises as to whether any surplus steam which the destructor would generate could be utilised for any useful purpose. This entirely depends upon the amount of steam and the steadiness at which the supply can be maintained, as, of course, an intermittent supply would not be of any use from a commercial point of view. Mr. Goodrich, in a paper on 'Refuse Destructors,' recently stated that out of 160 towns in Great Britain and Ireland whose authorities have adopted dust destructors, 45 are combined with electricity works, 26 are combined with sewage works, whilst the remaining 89 towns use their destructors for destruction only, and do not attempt to make anything else out of same. This question is one turning upon the calorific value of the refuse, and the position which Hammersmith occupies does not justify one in looking for a very high calorific value for the following reason: it is not the centre of any very large industrial activity, so that the amount of trade refuse is absolutely a negligible quantity; it is not the centre of a rich residential district, so that the amount of combustible material in the house dustbins is reduced by the residents to the lowest possible denomination. An examination of the refuse tipped will bear this out, and, in fact, we are afraid that in order to obtain a sufficiently high temperature to ensure perfect cremation of the gases it would perhaps be necessary to add a little coal to the refuse to obtain this result. If we are fortunate enough to burn the refuse without the aid of coal, then the surplus heat, after driving the necessary plant for producing the forced draught, lighting the building, driving any artificial stone machinery, etc., will be such a negligible quantity that it is not safe to allow any credit for this in making out the estimates. Taking the average cost per ton as shown above, we arrive at a total cost of 3s 9¼d., which, we think, is a fair estimate, and may be taken as the average cost.

"The actual ascertained cost at Fulham is 3s. 7d. per ton, before, however, allowing a sufficient sum for depreciation, and working a more expensive plant suitable for assisting the electric light works. Upon examination of the annual returns of six London municipal electric light stations, three of these having the assistance of destructors, and three with coal only, the following comparison shows the value of a dust destructor: Capital expenditure per kilowatt of non-destructor stations, £80; capital expenditure per kilowatt of destructor stations, £118. The working costs of non-destructor stations is 0·2d. per unit higher than the destructor stations, which upon 5,774,644 units (their total output) represents £4,895. The extra cost of the capital involved to effect that saving is, apparently, at 5 per cent., £7,395, showing a net loss of £2,500 per annum as the cost of combining dust destructors and electric light stations. Turning again to the Fulham result: the resident engineer reports that the value of the fuel saved by using dust was £2,260 per annum, which, however, we find would be turned into a loss of about £200 if a proper amount were set aside for the depreciation of the special plant.

"We have arrived at the following conclusions: (1) That barging away is more economical at the present time. (2) That the refuse has not sufficient calorific value to justify the combination of a dust destructor with the electricity works. (3) That there is every probability that the cost of cremation of refuse will greatly decrease, whereas the cost of barging is more likely to increase. A time will come when the destructor will be necessary, and it would be good policy to obtain the necessary ground at once, having easy facilities for transport, thereby reducing the cartage."

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

AWARDS AND AWARDS—VALUABLE OR OTHERWISE.

[The following is the copy of a letter we understand was sent to the secretary of the International Fire Exhibition.—Ed. *E. E.*]

"*Re* Awards.

"Dear Sir,—We are obliged by your favour of the 16th inst., accompanied by a list of the awards made by the jury.

Digitized by Google

"We are surprised to note that we have been awarded a bronze medal under Group 3—'Fire alarms, telephones, and telegraphs'—and it is very remarkable that we should have been awarded a bronze medal for something which we did not exhibit.

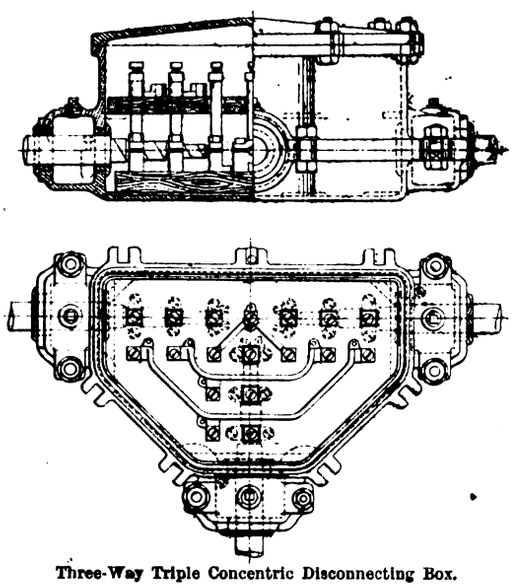
"If you will refer to our inventory sent you at your request for use of the jury, you will see that on the two pages of foolscap there is no reference whatever to any exhibit of this kind, and while the jury were at our stand we did not show them anything pertaining to telegraphs, fire alarms, or telephones.

"Perhaps the fact that our exhibit was examined immediately after lunch may account for the extraordinary classification.—Yours, faithfully, ———

TRADE NOTICES AND NOVELTIES.

Junction Boxes, etc.

Catalogue J. B., just issued from Messrs. Johnson and Phillips's Electric Cable Works, Old Charlton, Kent, deals with the various kinds of junction boxes and cable accessories manufactured by this firm. Included among the apparatus illustrated is a special form of mains disconnecting box, with fittings mounted on a marble slab on the 'bus-bar principle, so that any cable may be disconnected by means of its link without disturbing the rest. Another speciality shown is a mains fuse box, the position of which on a network system is generally on a set of distributor cables, which connect two feeding points, and its function is to blow its fuses when a fault occurs on either feeding area, and thus isolate the fault. The two outer conductors of the three-wire system have fuses and handles with clip contacts, and the neutral wire is connected by a solid link. One of the essentials of such a box is, of course, accessibility of the fittings, and we note that attention has been given to this point, also that ample clearance is allowed between fittings of opposite polarity and the sides of the box.



Three-Way Triple Concentric Disconnecting Box.

The accompanying illustration shows the arrangement of a three-way triple-concentric disconnecting box arranged on the principle that either of the cables may be disconnected electrically without affecting the connections of the two others. All the links for this purpose are above the compound level, and it can be at once seen to which cable they belong.

Thomson Polyphase Recording Wattmeter.

Pamphlet No. 151, recently issued by the British Thomson-Houston Company, Limited, Rugby, deals with the Thomson polyphase recording wattmeter, an instrument which is supplied for use on either two-phase or three-phase circuits, with balanced or unbalanced loads. It is claimed that this meter gives a perfectly accurate record when used on a circuit having a mixed load of lamps, motors, and other devices, no matter how unbalanced the load may be. Two different patterns are made—viz., round and rectangular.

Primary Cells.

From Le Carbone (late Lacombe et Cie.), 17, Water-lane, Great Tower-street, E.C., we have received a number of leaflets describing several new primary cells, etc., which they are introducing. One of these leaflets deal with the firm's patent carbon headed plate, in which direct contact between the carbon plate and terminal is obtained by means of an arrangement of transverse and longitudinal slots. Increased efficiency, durability, and economy are claimed for this plate. Another of the leaflets describes a form of their "Carbi" cell, which is recommended for open circuit work, and especially for bell, telegraph, and telephone installations. "Carbi" ignition cells; Sack cells for testing sets, alarms, etc., porous carbon cells, and Star agglomerate blocks are dealt with respectively in the remaining leaflets.

David Bridge and Co.'s Manufactures.

We have received from Messrs. David Bridge and Co., Castle Ironworks, Castleton, Manchester, a complete set of their trade catalogues, each of which is profusely illustrated. This firm's manufactures are very numerous, and include a variety of apparatus having a bearing on electricity supply undertakings and electrical manufactures, such, for example, as indiarubber and guttapercha machinery; oil separators for treating the exhaust steam of condensing or non-condensing engines, and for purifying live steam; oil pumps; milling and boring machines; friction clutches, etc. With regard to the oil separators, these are of the "Baker" type, and have been supplied to many of the principal electricity supply stations in this country, we understand.

Sundries.

The latest list of electric sundries (Section S) issued by Mr. G. Braulik, 217-218, Upper Thames-street, London, E.C., contains illustrations and particulars of a large variety of electrical apparatus, including accumulators, accessories for use with accumulators, novelties of various kinds, small motors and dynamos, medical coil sets, induction coils, etc. A patent coupling for arc lamps is dealt with among other apparatus in another list. Our attention is called to a considerable reduction in the price of this coupling.

Brush Lamps and Fittings.

Bulletin No. 4, just issued by the Brush Electrical Engineering Company, Limited, 106-112, Belvedere-road, London, S.E., contains particulars and illustrations of the firm's specialities in the way of incandescent lamps and fittings, together with a number of examples of the practical application of the same.

Ebonestos.

Messrs. B. Weaver and Co., 22, Rosoman-street, Clerkenwell, London, E.C., have sent us some illustrated sheets and tabulated price-lists of their standard "Ebonestos" insulating switch-handles, bushes, and nipples. We note that the listed articles can be delivered from stock.

Simplex Steel Conduit.

We note that the Simplex Steel Conduit Company, Limited, Westinghouse-building, Norfolk-street, Strand, W.C., have been awarded a gold medal in Group 1, Class 3, of the exhibits at the International Fire Exhibition, Earl's Court. This is but one of a number of awards of merit which the above firm have obtained from time to time for their Simplex system of conduits for interior wiring.

Tramway Motors.

Pamphlet No. 152, issued by the British Thomson-Houston Company, Limited, Rugby, deals with tramway motors of the firm's well-known types of manufacture. This pamphlet supersedes Nos. 61, 67, 125, and 132.

Steam Appliances.

The latest addition to the trade literature issued by Messrs. Holden and Brooke, Limited, Sirius Works, West Gorton, Manchester—viz., List 58—is well calculated to convey an idea as to the range of the firm's manufactures, and thus fulfil its intended purpose. The steam users' appliances illustrated include injectors of various patterns, oil separators, steam dryers, feed-water heaters, automatic feed regulators, steam traps, water gauges, strainers, valves, etc.

FORTHCOMING EVENTS.

FRIDAY, OCT. 9.

Electro-Harmonic Society.—At 8 p.m., first smoking concert, Crown Room, Holborn Restaurant.

MONDAY, OCT. 12.

Institution of Mechanical Engineers (Graduates' Association).—At 7.30 p.m., ordinary meeting. Paper: "The Design of a Town's Tramway Scheme," by Mr. Wm. McDonald.

FRIDAY, OCT. 16.

Institution of Mechanical Engineers.—At 8 p.m., ordinary meeting. Paper: "The Newcomen Engine," by Mr. Henry Davey.

SATURDAY, OCT. 17.

Junior Institution of Engineers.—At 3 p.m., visit to the New Vauxhall Bridge Works. Assemble at the Westminster entrance.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notices of Meetings, Issues of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	— 6s. 6d.	— 13s. 0d.
Other Places	5s. 6d.	— 10s. 6d.	— 21s. 0d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Bound Volumes of "THE ELECTRICAL ENGINEER," *containing half-years copies, bound in Dark-Blue Cloth, Gold Lettered, price 8s. 6d. New Volume, January to July, 1903, now ready.*

FISCALITY.

"And so the murder is out." Thus spake Mr. Chamberlain at Glasgow. He has commenced his campaign of missionary work to convince the British and Irish electorate that the axiomatic statement is still true, "Other times, other manners." He has sketched briefly, but lucidly, the direction in which he thinks Great Britain should act if she is to retain her place among the nations. The suggestions he makes are extremely simple, but none the less wise because of that extreme simplicity. If Mr. Chamberlain were a mathematician, he might probably point out that our export trade was the summation of two factors—the one exports within the Empire, and the other exports outside the Empire. He has strongly emphasised the fact that the exports within the Empire have been increasing while those without the Empire have been decreasing, the increase and decrease having been somewhat proportionate, so that, broadly speaking, the total has remained substantially constant. There are indications, however, that the increase within the Empire may be successfully challenged by the competition of outsiders, and if this should be the case his most virulent opponents will be compelled to acknowledge that it would be a bad day for this country. Mr. Chamberlain's proposal is twofold in character. In the first place, he wishes to unite in closer bonds the various constituents of the Empire, and to do this he would shift the incidence of taxation. He does not propose to increase taxation, and, so far, the country as a whole would neither gain nor lose by accepting his suggestions, but he strenuously points out that by shifting the incidence of taxation in the way he suggests we should be enabled to draw closer the bonds of Empire, to render the Colonial markets more secure, and make competition more difficult. Mr. Chamberlain has gone far enough to show that his ambition is to see these small British Islands stands in the same relation to the Empire as London does to the British Isles. Here he would have the heart, there he would have the limbs—each active and important members of one giant organisation. A further point he mentioned, which ought to be considered, is that politically, socially, and commercially the Empire might be absolutely self-contained, and then need not for a moment fear the vagaries of politics or commerce which traverse the world. We trust this is a true exposition of his suggestions. They have met with great opposition, and an opposition conducted upon the worst possible lines and in the worst possible taste. Those who wish Mr. Chamberlain's policy success have to combat half truths, and here is the extreme difficulty. No suggestion for so vital a change of policy to the Empire can be without its weak points, but we hold that for the moment—although there may be differences as regards details—it is the bounden duty of every man in these islands who thinks the broad suggestion the true solution of the present difficulties of the Empire to support that suggestion by all the means in his power. *Bis dat cui cito dat* is probably more true at the present moment than it ever has been in the history of English politics. Individual assistance given now, if the result of conviction after examination, will be ten thousand times more valuable than the assistance given when it is seen which way the cat jumps, or, in other words, which way the majority is going. It would be nonsensical for us to attempt to place Mr. Chamberlain's issues more clearly before the public than they have been placed by himself. He will possibly elaborate in greater detail in future speeches; but meanwhile good can be done by considering advantages and exposing fallacies. Tariffs are not necessarily methods of protection. They

Digitized by Google

may be methods of free trade—absolutely free trade. Let us explain. Every nation may be looked upon as a market. That market has been erected, equipped, and maintained at an annual cost by the nation. Surely, it is but right that every person who trades in that market should pay rent for the use of it. If, then, tariffs were looked upon and adjusted so as to return the legitimate rent for the market provided, we maintain that that might in reality be called free trade, because every person who did business in the market would pay his proportionate share of the cost. The ordinary idea of tariffs, however, is something different. It is a higher duty than is just, in order to prevent competition in the home markets, and this brings about another phase of the question when the home business men are in a position to more than supply their own markets. An argument largely used by so-called free traders — or, as Mr. Chamberlain calls them, free importers—is that such surplus thrown upon our market is beneficial to us, in that we get it much cheaper than we ordinarily should. Has it ever occurred to a single individual who uses these arguments to carry it to extremes, and to really go into the matter far enough to come to a right conclusion? Take a case. Assume that America can supply us with all the iron and steel we require more cheaply than we can supply it ourselves, because their own market is amply protected and the surplus can be dumped down here at a low price. Were this done it would mean that the labour at present employed in these industries would no longer be wanted. What would they do? Transfer their labour to some other direction, say the enthusiasts. It is easy to say this, but anyone acquainted with what has occurred in the past through the decaying and transferring of trade knows that that conclusion is an absolute impossibility. A gentleman recently wrote some letters to the *Times*, in which he argued that if a grate could be bought at Sheffield for one pound and at Belfast for fifteen shillings, by buying at Belfast he would be the gainer of five shillings, and he proceeded to argue that it did not matter whether he bought at Belfast for fifteen shillings or in Belgium, he was clearly the gainer of five shillings. Admitted, so far as Belfast is concerned, but transfer the manufacture of all grates from Great Britain to Belgium and purchase each one at fifteen shillings instead of one pound. He contends that this would be good business, and that the country would be a gainer. Perhaps if he looks further into the matter, he may see that a very different interpretation can be put upon the transaction. Certainly he buys a grate at Belfast for fifteen shillings instead of paying one pound at Sheffield, and is a gainer of five shillings, which is much as if he had bought a pound of sugar at a grocer's on one side of the street at threepence instead of going on the other side and buying a pound for threepence-halfpenny, and thus gains one halfpenny. Take for a moment that fourteen shillings is the value of the labour expended in the construction of the grate. Each one of these fourteen shillings pays its quota, whether the grate is made in Sheffield or Belfast, to the support of the English market; while if the money goes to Belgium, not one penny of the whole lot pays its quota, and whatever that quota may be, it has to be borne among the individuals who pay taxes in this country. It might be also, when the case is carried to extremes, that a very large quantity of labour will not be able to transfer itself, and again the remainder has to support this labour in idleness. Among Mr. Chamberlain's proposals is one to impose a duty on imported manufactures, probably limiting such duty to manufactures competing with those carried on in this country. If the electrical industry will confine its attention to this one suggestion, it will see how enormously different the conditions of business would be under such circumstances.

BALLADS OF BUSINESS.

No. 3.—Estimating.

From high on Mount Olympus
The god-like buyer comes;
Prepare your wares, ye travellers;
O! drummers, beat your drums.
If Fate be kind unto you
He'll grant the boon you crave,
Of asking rates and estimates,
Till you are in the grave.

On much beprinted paper
All gloriful bedecked:
"Your lowest price, in half a trice;
"And send us, to inspect,
"Full samples, detail drawings—"
For sixpence worth at most.
And orders may proceed your way,
Ere you give up the ghost.

O! tempora. O! mores.
When orders are so scarce
That profits fair they cannot bear,
Though shareholders may curse.
But stay! there are, most busy,
Men working night and day,
Producing rates and estimates
And—giving them away.

B. C. H. J.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

625. If a ·15 three-core distributor was supplied at one end with three-phase currents from three single-phase transformers connected on the mesh system, having 220 volts on the secondary coils; if incandescent lighting constituted the whole of the load, and consumers were supplied with single-phase current from one of the three sides at the rate of one ampere per two yards of run, and arranged so as to obtain a good balance—(1) How would the carrying capacity and drop be calculated? (2) To what distance would it distribute efficiently? (3) How would the lamps on each side be affected if (*a*) one of the transformers burnt out, (*b*) one of the three low-tension main fuses blew, (*c*) one of the high-tension transformer fuses blew?—S. R.

626. Give sketch and description of a good clock switch for use in switching on and off incandescent lamps?—H. P.

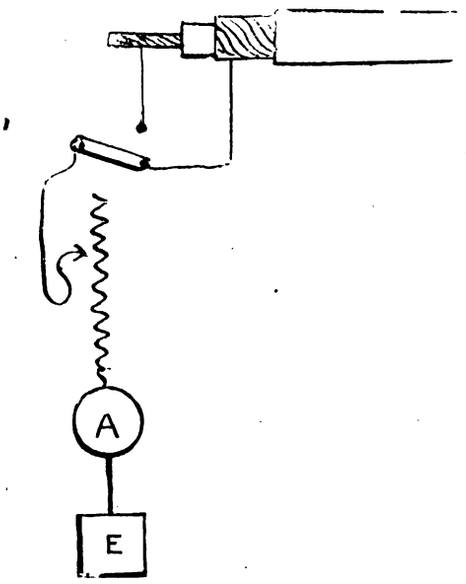
ANSWERS.

Question No. 617.—In an alternating-current system generating at 2,000 volts, with the outer earthed at the works, where the area of supply is a scattered one and house transformers are used connected to the high-pressure mains, what is the best way of testing the insulation of these mains without disconnecting the transformers, so as to keep ahead and get warning of any faults which may be developing?

Best Answer to No. 617 (*awarded* 10*s.*).—Perhaps the simplest way of detecting incipient faults in a system such

Digitized by Google

as described, is to measure the leakage current from each main to earth while the other is insulated. There must for this purpose be a switch in the earthing connection of the outer main, and a suitable arrangement of apparatus is shown in the accompanying diagram. It will be seen that either main can be earthed through an ammeter and a variable resistance. Normally the outer would be kept earthed through the ammeter, with the resistance cut out of circuit, or nearly so. Before changing over the two-way switch increase the variable resistance as a precaution, then, having switched over, the variable resistance may be



cut out altogether if the ammeter reading does not become too great. The resistance used need not be at all elaborate; a water resistance would be the cheapest, and a switch for short-circuiting it might be used for cutting out the last few ohms.

This device is extremely simple, and can be used at frequent intervals, and the leakage to earth from each main when the other is insulated carefully noted; any deterioration of insulation on the unearthed main would cause an increase in the ammeter reading. Of course, one would not expect this reading to be quite constant from day to day, as insulation resistance is affected by the weather, but any marked increase in the leakage current would be a sign of a fault, and if the fault was at all a bad one, the ammeter reading would be too great to allow the resistance to be cut out, for, of course, the voltage across the fault is 2,000, unless the fault is actually in the winding of one of the transformers, in which case the leakage current is choked down by the action of the transformer as a choking coil. The insulation resistance of either main is given, of course, by dividing 2,000 by the current to earth from the other main "dead-earthed." The ammeter should be in a conspicuous position, so that the leakage current from the inner main to earth may be always visible: it should also be provided with a fuse. Care should be taken that faults are attended to at once, and that the outer is kept earthed except for the very few seconds required for testing its insulation, or it would be a source of great danger, especially as it is supposed to be earthed.

The disadvantage of this method of insulation test is, as before stated, the fact that faults in the transformer windings themselves are not revealed in anything like their true proportion; but nothing is said in the question concerning the keeping of the system "alive"; and as in all probability the load is almost purely a lighting one, there is no reason why the system should not be switched off, say, in the middle of each day, the earthing switch opened, and the insulation resistance of the whole system tested with an ordinary testing set. Any discrepancy between the results obtained by the two methods would indicate that the fault was in one of the transformers.

The great advantage of the first method is its extreme simplicity, and the fact that the test can be applied at any time under any conditions of load.—P.

Answer to No. 617 (*awarded* 7*s.* 6*d.*).—The high-tension system of a supply station is usually tested once a week, generally Sunday morning, when plant is shut down by breaking the outer by means of plug usually provided for the purpose (Fig. 1) at the station and testing insulation to earth, using Silvertown or other testing set. As transformers, etc., are across mains we shall get the insulation of inner and outer, and as there will be a considerable amount of surface leakage the test will probably be low, but we can notice any fall in insulation from previous week, which at once should be accounted for. This leakage might, of course, be on the outer, and would not affect us to any extent, but it should be removed, as the Board of

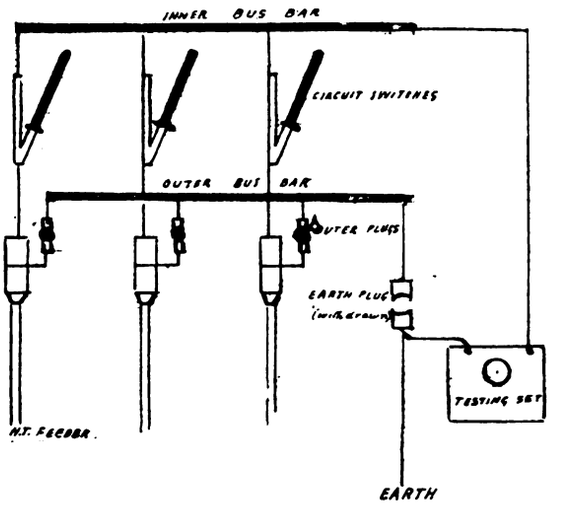


Fig. 1

Trade only allow the system to be earthed at one point, and if the leakage is on the inner, it would mean trouble if not remedied at once. Another way of testing for leakage is to break the outer, also withdraw the earthing plug and connect a low-reading ammeter between the outer bus bars and earth (Fig. 2), and run up machine on mains. Any leakage current will now return to machine through this ammeter, and if it approaches the allowable amount stipulated by the Board of Trade the circuits should be switched off until faulty one is found, and then disconnect portions

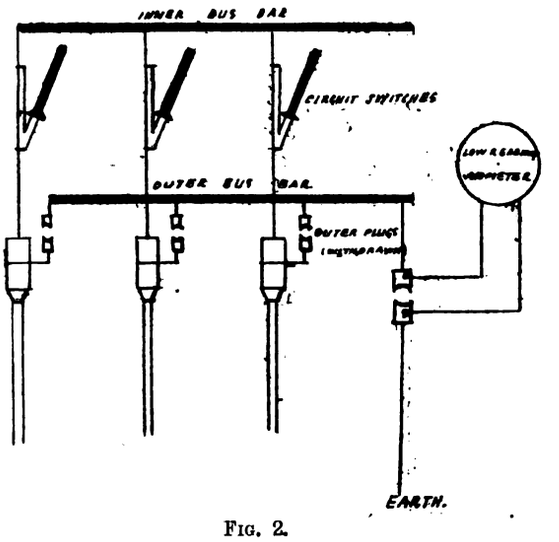

Fig. 2.

of main where possible and localise in usual way with testing set.—A. Thompson.

Answer to No. 617 (*awarded* 5*s.*).—It appears, on a consideration of the above query, that the aim of the questioner is not to produce, or that the above question shall be the means to produce, a discussion on the merits or demerits of the various systems of insulation testing which at the present time are in vogue, but that he seeks to preclude such an idea, and seems rather to desire a solution of the special difficulties which he has to contend with in this, a special and specific case. In other words, the question implies the thought of the possibility of obtaining the con-

Digitized by Google

dition of the mains which will make it possible from time to time to take the tests which it is desirable should be taken. To that end, therefore, of solving that part of the case involved as indicated, it may be well to consider one or two important points in connection with and included in the question. (1) No disconnection of the transformers from the source of supply must be made—*i.e.*, that during the tests the consumers must not suffer that objectionable inconvenience of the extinguishing of lights in their houses. (2) No tests for insulation qualities can possibly be taken upon cables or mains when such at the time are in use supplying power to the transformers. (3) Therefore, some arrangement must be provided so as to make it possible that the requirements of No. 1 are fulfilled and that the disadvantages of No 2 are obviated.

Fig. 1 gives an approximate idea of such an arrangement. The method there represented is that, instead of transmitting the power simply by one concentric cable, as indicated in the question, to divide the cable, as it were, by using two cables of one-half the cross-sectional area of the single cable each, so as to transmit the power with the

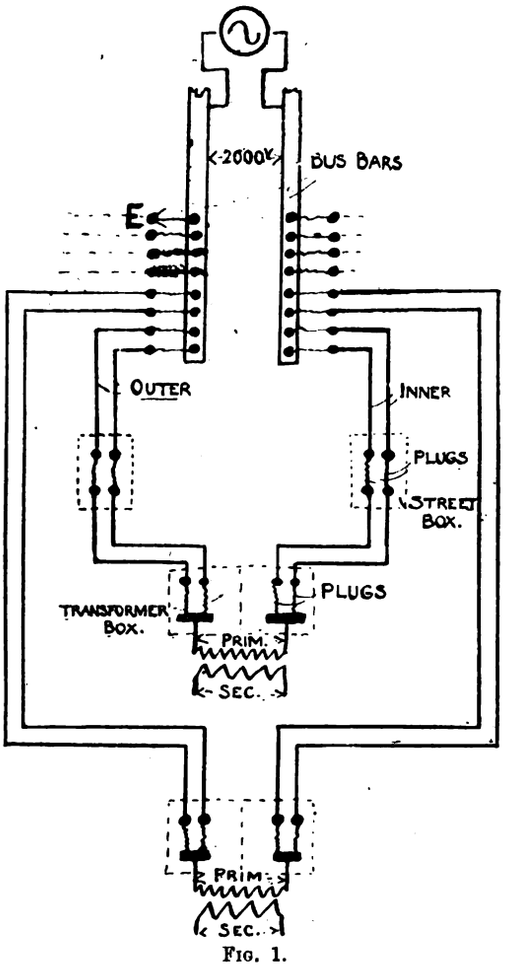

Fig. 1.

same efficiency and economy as before. The arrangement provides, also, special disconnecting boxes, so that it is possible to disconnect one cable entirely from the supply and the transformer to facilitate the testing. As the question indicates that the area of supply is a scattered one, it is quite possible that the mains from the 'bus bars at the works are connected up to street connecting boxes, and from thence, as a central point, the cables branch off to their respective districts; or else the cables might, without the intervention of street boxes, be laid from the station to the individual transformers. In either case, however, little difference exists as regards the matter that is being considered. It will be seen by a reference to Fig. 1 that two cables are employed in place of one, originally. These cables are fed separately from the station 'bus bars or auxiliary 'bus bars, so that it is possible to disconnect the cables from the aforementioned 'bus bars. The means adopted to produce such a possibility might involve the employment of either high-tension switches or plugs. In the figure plugs are represented, but these are not absolutely necessary. At the transformer end of the mains a transformer box of special type might be used (per Fig. 1). It consists of a small 'bus bar connected to the primary winding of the transformer, and plugs from terminals on the bar connect the cables to the bar, and, therefore, to the winding of the transformer. It will be seen that, provided the plugs are in their respective and proper places, both at the station and the transformer ends, the supply of power will be carried on as usual. In order to prepare the cables for the tests, each cable should be disconnected separately, and *not* at the same time. Care should be taken that both ends of the cable are disconnected by pulling the plug from *each* end out, for, if such is not attended to, an accident might possibly occur to the tester. Under the condition of one of the cables being made useless for the time being, the other cable will have to carry the whole current, which is double its ordinary current traversing its length; therefore the test should not be a prolonged one, the shorter the length of time occupied being the better compatible with accuracy of test. When the test on that cable is finished it should be reconnected into circuit again, the other cable being then disconnected and the same tests undertaken upon it.—G. W. B.

Question No. 618.—A 1-h.p. continuous-current motor, running at 1,200 revolutions per minute, drives a machine by means of gearing at the rate of 100 revolutions per minute. This machine requires to have its direction of rotation reversed every two minutes. Describe some automatic arrangement controlling the motor by means of which these reversals can be obtained.

Best Answer to No. 618 (*awarded* 10*s.*). — There are several ways of reversing a motor every two minutes.

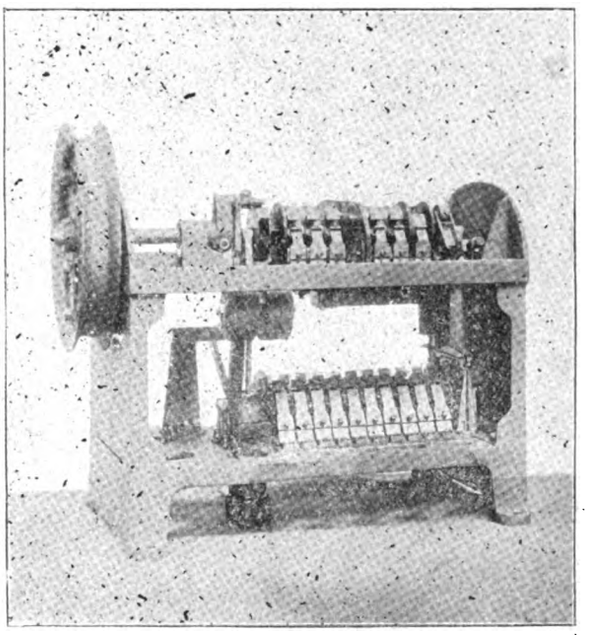

Fig. 1.

One way is to gear the switch up to the motor in such a manner that the motor operates the switch. If the motor is geared up to a shaft making 100 revolutions per minute, it follows that after the line shaft has run 200 revolutions the motor is required to be reversed. For reversing a shunt-wound motor special switching arrangements are required for the shunt, so arranged that a non-inductive resistance is placed across the field circuit before it is broken. For rapid stopping and reversing, a brake should also be fitted so that the motor is brought quickly to rest. A suitable switch for this purpose is made by Messrs. Royce, Limited, Manchester.

Fig. 1 shows the arrangement of the switch as used for hoists, etc. In this case the pulley keyed on the shaft of the switch will require removing, and in its place a disc, C, with lugs on it to engage with the weight, D; on the same shaft are keyed a crank and crank-pin, the crank-pin driving the main switch. The main switch is made up in a similar manner to a controller barrel, and it is in two parts—one negative and one positive—each part having

Digitized by Google

the required number of contacts on it, for the mains, armature, shunt, and brake. On each side of the main barrel on the top plate are fixed a row of contact fingers. The main switch is only in contact with one set of finger contacts at a time, depending on which direction it is required to run the motor. The main switch is locked in position by means of a sprocket wheel, so that it is impossible for it to remain in an intermediate position. On moving the main switch to either of the "on" positions, the core of the ratchet coil is lifted, the coil being in series with the shunt of the motor. The core of this coil gears into a wheel fixed on the lower barrel spindle. On this

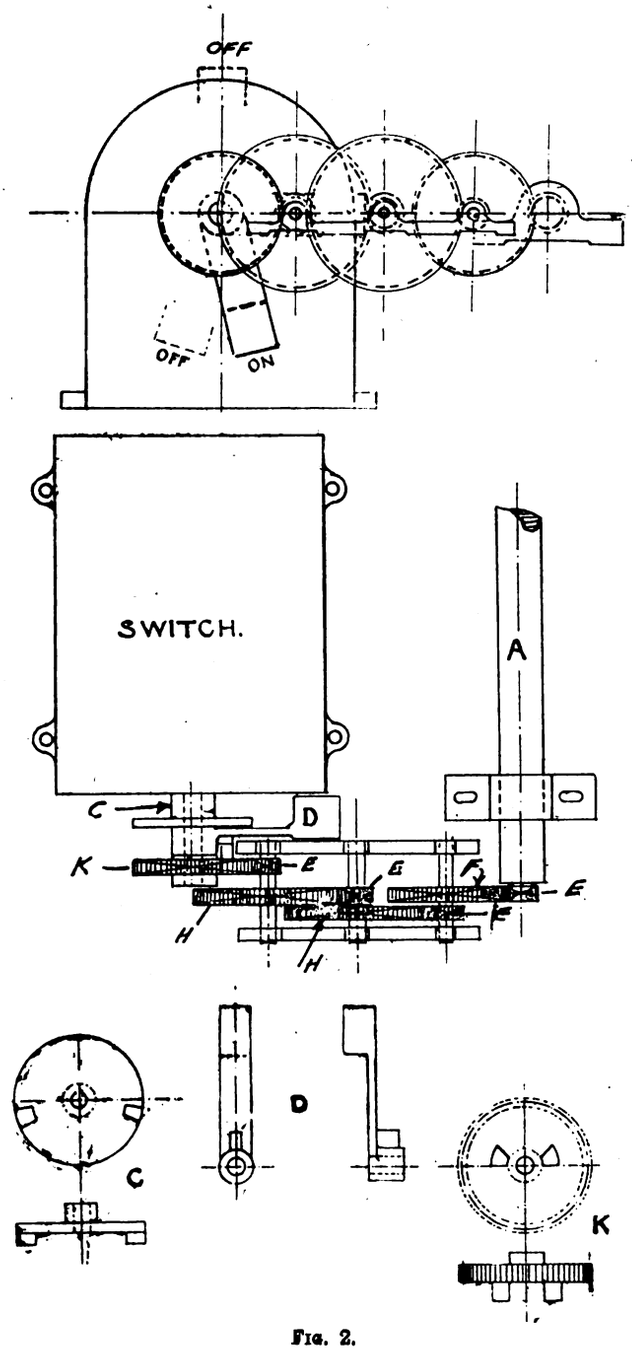

Fig. 2.

spindle is mounted a many-way switch of the tramcar controller pattern, to cut in or out the armature resistance. At the end near to the rope wheel this spindle has a small pinion fixed on it, which gears into a quadrant on which a weight is fixed, the quadrant being connected up to a dash-pot. On the main switch being put in the brake is lifted, also the core of the ratchet coil, so allowing the weight to cut the resistance out of circuit.

Fig. 2 shows the general arrangement of the required gearing and details of it for gearing the switch up to the motor so that the motor is automatically reversed. A represents line shaft; C, disc keyed on switch shaft; D, weight; E, pinions, 24 teeth, 12" diametral pitch; F, spur-wheel, 96 teeth; H, spur-wheel, 120 teeth; K, spur-wheel, 120 teeth, with clutch cast on. The line shaft, A, making 100 revolutions per minute, is geared up to the switch in such a manner that for every 200 revolutions of the shaft, A, the switch is moved from one full-on position to the other full-on position. To do this the wheel, K, has lugs cast on it. Supposing the motor is running clockwise, the weight, D, would be at one of the full-on positions. The wheel, K, would immediately start to lift the weight, D, and on D just getting over the vertical axis it would change over the switch from one full-on position to the other full-on position, leaving the wheel, K, behind. The wheel, K, will now be running in the opposite direction, and so lift the weight, D, again, and the switch changes over, the motor now being reversed again, so that by this means the motor is reversed every two minutes.—C. G.

Answer to No. 618 (*awarded* 7*s.* 6*d.*).—Although it is possible to automatically reverse the direction of rotation of a motor, the successful working of any device capable of fulfilling the requirements of the question depends upon the amount of attention it is likely to receive, which may be said of most automatic arrangements. As the question does not state the type of motor used, the writer has made

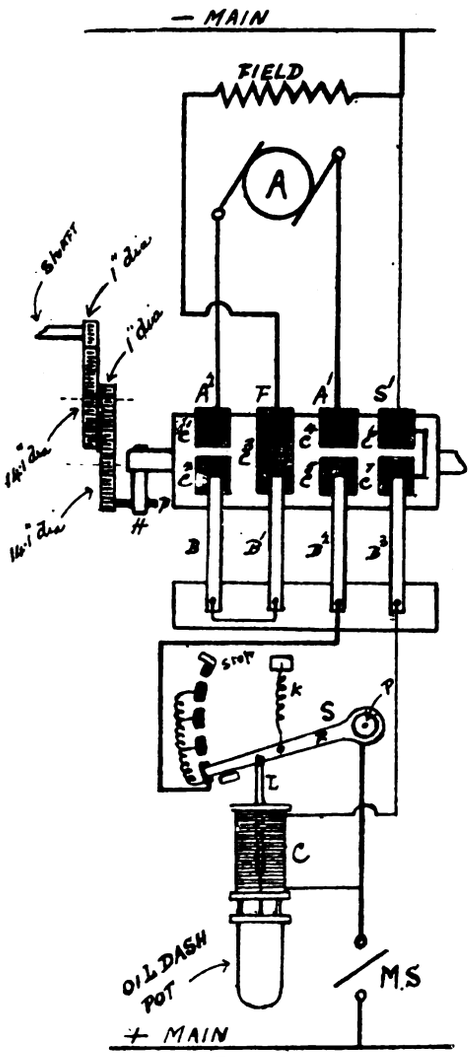

Fig. 1.

his idea of an automatic arrangement applicable to the series type of motor, as the fact that the armature and field are in series will be some protection for the motor against the vagaries of most automatic devices which will occur at times, notwithstanding every precaution. For this reason, in the writer's opinion, it would pay to replace the motor at present in use, if of the shunt type, by a series motor, as its employment would greatly increase the possibility of obtaining satisfactory working of any automatic arrangement.

As the question gives no dimensions of the driven machine, it will only be possible to give the outline and rough sketches of an arrangement which may give satisfaction. To reverse the direction of rotation of a series motor

Digitized by Google

UNIVERSITY OF MICHIGAN

you reverse the armature current, the direction of current through the field coils being in each case the same, so that the controlling device must reverse the direction of the current through the armature. This may be brought about by the arrangement shown in Fig. 1, in which S is the starting switch for the motor, shown in the "full on" position. From this switch current passes through three brushes, B, B^1, and B^2 (of which B and B^1 are connected together, B^2 being insulated from them), to the commutator, C, and from it to the motor. The construction of this commutator will now be explained. It consists of seven copper contacts mounted on a wooden drum, the connections between them being shown in Fig. 2. Of these contacts, C^1 to C^5 are in the motor circuit, C^6 and C^7 being in the circuit of the coil C, which is a shunt across the mains when brush B^3 bears on either contact. Contacts C^1, C^3, C^4, and C^6 must be longer than C^2, C^5, and C^7, and reach about half way round the drum, as they have four other brushes (not shown in figure) bearing on them which conduct the current to the motor. The drum is mounted on a shaft supported at each end by a bearing, and at one end of this shaft is fixed a bar, H.

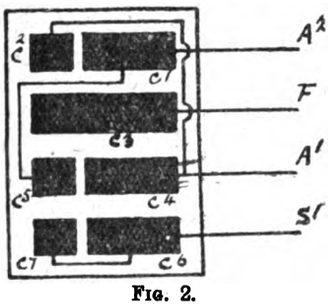

FIG. 2.

The working of the electrical part of the device is as follows. When the main switch, M S, is closed, current flows first through the coil C to brush B^3 and so on to the negative main. This causes the plunger, L, attached to the arm, R (pivoted at P), of the starting switch to be pulled down over the contacts against the resistance of the spring, K The oil dash-pot also offers a resistance to the descent of the plunger, and by so doing it prevents the starting resistance being cut out too quickly; but it does not offer any resistance to the plunger, and also the switch arm being pulled up by the spring K, when the current in coil C is interrupted.

Having explained the electrical part of the controlling device, it will be necessary to describe the method by which it is actuated by the driven machine. We have given that the speed of this machine equals 100 revolutions per minute, and also that its direction of rotation must be reversed every two minutes; therefore, it follows that the controlling device must be operated every 200 revolutions of the machine, and this may be brought about in the following manner: Fix a 1in. pinion on to the end of the machine shaft, and by means of gearing reduce the speed so that the last spur-wheel turns one revolution in two minutes. A pin, P, is fixed to the outer face of this spur-wheel, which engages with the bar, H, once in every revolution (and, therefore, once in every two minutes), pushing it over so that the brushes B, B^1, B^2, B^3 bear on contacts C^2, C^3, C^5, and C^7 respectively, thus reversing the direction of the armature current, and consequently the direction of rotation of the motor (supposing the brushes to have been on contacts C^1, C^3, C^4, and C^6 before the operation of the controlling device).

It will be seen that the current in the coil C is not reversed, but simply interrupted for an instant when the the main circuit is opened, thus allowing the switch-arm, R, to be drawn up against the stop, where it remains until brush B^3 reaches the other contact. The contacts on the commutator must be sufficiently close together to allow the brushes to bear on the second set of contacts the instant after they leave the first set. On the other hand, they must not be too close together, as this will allow the brushes to bear on both sets of contacts at the same time, When the brushes leave one set of contacts the supply of current to the motor is interrupted, but as the armature will continue revolving for a short period in virtue of its momentum, its motion will be sufficient to bring the other set of contacts on the brushes (if the space between the contacts is not too great), when the motor will start up in the opposite direction as regards its rotation. To prevent the brushes catching, the space between the two sets of contacts must be filled in with vulcanite or some other insulator having the same thickness as the contact pieces, so that the brushes will have a continuous path to travel over. Although this arrangement looks fairly satisfactory on paper, several details would have to be carefully worked out before satisfactory working would be obtained. The writer would suggest that "W. F. S." employs a reversing arrangement between the motor and the machine similar to that employed on Green economisers to reverse the direction of motion of the scrapers, as the employment of such an arrangement would ensure more satisfactory working than any device controlling the motor without submitting the latter to any strains.—J. W. R.

Answer to No. 618 (*awarded 7s. 6d.*).—"W. F. S." may attain his purpose either mechanically or electrically. As

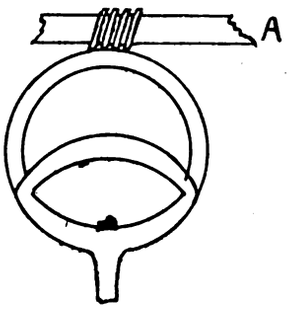

FIG. 1.

the motor is only 1 h.p., electrically would, no doubt, be more suitable, but Fig. 1 shows a mechanical method. The machine is driven by gearing through the mechanism used in planing machines for reversing the table. The striker has a heavy weight on it actuated by the cam shown. A is the dynamo shaft. No doubt a double reduction would be necessary to get the slow speed so that the cam might operate the striker once in two minutes. The electrical method shown has been used successfully by the writer for a different purpose, but applies to the case of "W. F. S." C is a powerful clockwork mechanism; D a vulcanite coupling; E an ordinary commutator; B is the starting switch with long arm; A is an electromagnet with armature and catch, G. A clock is provided with two-minute wheel instead of one-minute. A contact is fitted

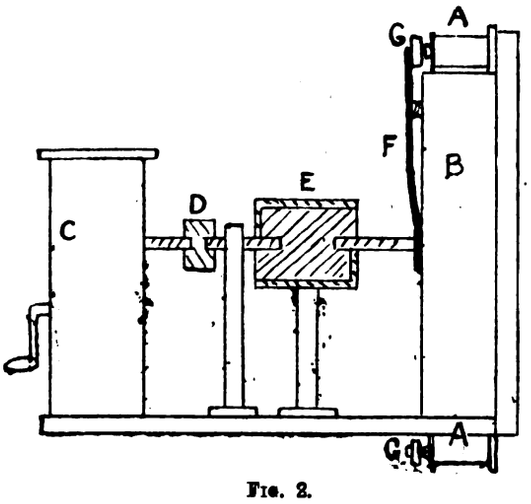

FIG. 2.

on this, with dry cell connected up to the electro-magnets, A A. The action is as follows: When the clock makes contact the arm is released. The current is immediately cut off. Next the fields of the motor are reversed. The current is again switched on, till at full speed the arm is stopped by the catch, G, at the bottom. In other two minutes the bottom catch is released, current cut off, fields reversed, and motor turned on again. H is a spring against which the arm, F, strikes each time. The

Digitized by Google

idea is that if the winding-up of C is forgotten the motor will at last stop, as the arm, F, will not have power to go past H. The contacts shaded black are the live contacts.

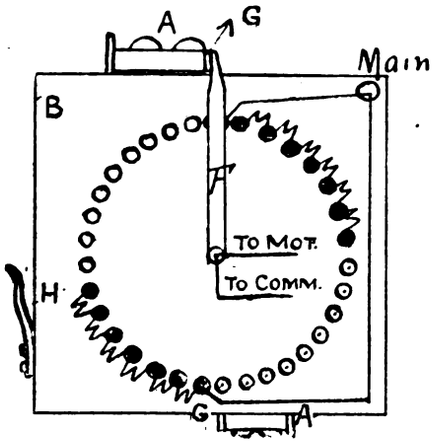

FIG. 3.—A A, Release Magnets; B, Starting Switch; C, Driving Mechanism; E, Commutator; D, Insulator; F, Switch Arm; G G, Catches.

The two sets are in parallel. The clock should be an 18-day mechanism, with switch, S. It should be noted also that the carbon take-off pieces should be on the starting switch at two points, and that the mechanism, C, should

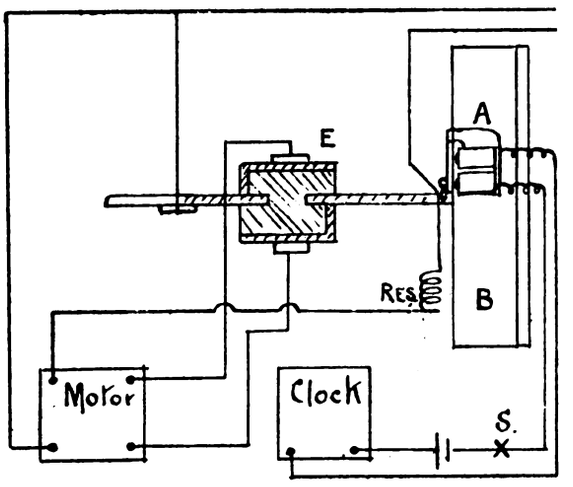

FIG. 4.

have a "fly" to regulate its speed; two lamps of 8 c.p. should be put in series across the fields to take up the "kick" at breaking of contact —POLYPHASE.

Answer to No. 618 (*awarded* 7*s.* 6*d.*).—The most satisfactory arrangement would be to always keep the motor running in one direction and have a mechanical reversing motion. A suitable reversing gear is shown in Fig. 1.

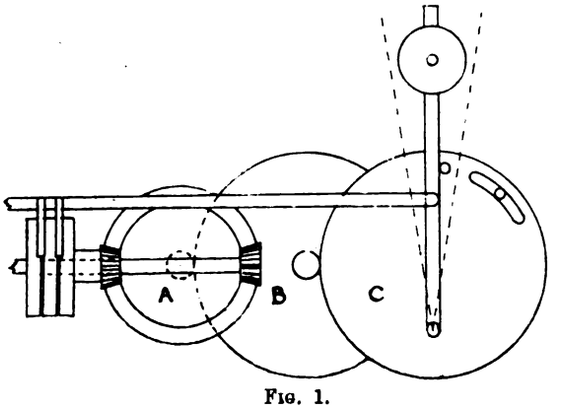

FIG. 1.

There are two fast and one loose pulley with one belt; this belt is thrown on each of the fast pulleys in turn at intervals of two minutes. The bevel pinions are connected each to its own fast pulley, one being on a "quill," through which passes the shaft of the other; the wheel A will then rotate in opposite directions, such direction depending on which pulley the belt is driving. On the axis of A is a pinion driving B, from the axis of which latter another pinion drives C. Motor runs at 1,200 revolutions per minute; if the diameter of pulleys shown in sketch are to the diameter of pulley on motor, their speed will be $1,200 \div 3 = 400$ revolutions per minute. With a ratio between bevel wheel and pinions of 4 to 1, A will run at 100 revolutions per minute; the machine may therefore be driven from its axis. With pinions for reversing gear having 20 teeth each, and each of the driven having 300, in two minutes C will turn $\frac{2 \times 100 \times 20 \times 20}{300 \times 300} = \frac{8}{9}$ of a revolution. The wheel C carries two pins which push lever to the vertical position; the balance weight then shifts the fork on to the other pulley. By having eight-ninths of a revolution in two minutes, for C two pins may be employed, one fixed and the other adjustable, giving some latitude when setting the gear. Of course, any suitable wheels could be used. For instance, by introducing another pair of drivers of 20 and driven of 120 teeth, the wheel actuating lever would in two minutes make $\frac{2 \times 100 \times 20 \times 20 \times 20}{120 \times 120 \times 120} = \frac{25}{27}$ of a revolution.

If, however, it is desired that the motor should have its direction of rotation reversed, a method is suggested in Fig. 2 The sketch almost explains itself. A clock-making contact for desired time at regular intervals causes a relay

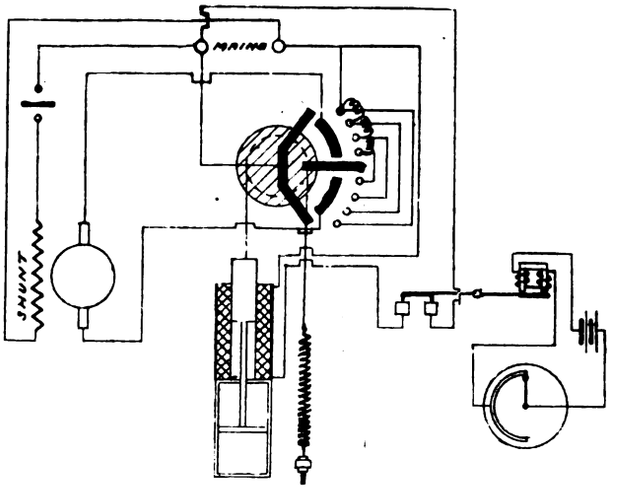

FIG. 2.

to actuate solenoid by closing the circuit through two mercury-cups. When the solenoid is energised, core is pulled down and switch turns in a counter-clockwise direction. On the circuit being broken by the withdrawal of copper connecting piece from the mercury-cups, the spring pulls switch round in clockwise direction. A dash-pot is fitted below solenoid to prevent hunting and allow of a more or less gradual movement of the starting switch. It is only necessary to have one set of resistances.—M. M.

PERSONAL.

Mr. Percy E. Rycroft, a senior engineer-on-watch, City of London Electric Lighting Company, Limited, has been appointed assistant engineer and works manager to the Islington Borough Council's electricity department. There were 101 applicants for the post. Mr. C. H. Yeaman has been appointed chief assistant and distributing engineer at the electric lighting station at his present salary of £300 per annum.

We are informed that Mr. Henry M. Sayers, M.I.E.E., has left the staff of the British Electric Traction Company, and is carrying on a consulting practice at 36, Victoria-street, Westminster.

Messrs. G. L. Badger, London, and G. L. Stonier, Lincoln, have been appointed junior engineers at the Dundee Corporation electricity works.

Mr. Liddle, Edinburgh, has been appointed electrical engineer to carry out the arrangements for the wiring of the new hospital at Bo'ness.

Mr. C. G. Eley, of Old Charlton, has been appointed charge engineer at the Plumstead electricity works.

Mr. W. E. Rogers having decided not to accept the post of second engineer-in-charge at Bermondsey to which he had been appointed, Mr. W. W. Alston, of the electricity works, Oldham, has been appointed to the position at a salary of £125 per annum, subject to his acceptance of the same.

LARGE GAS-ENGINE GENERATING PLANT.

There are increasingly numerous signs of the coming popularity of the gas-engine, and those who pin their faith to this form of prime mover will probably have no cause for disappointment in the near future. Putting on one side for the present the question of the superiority or otherwise of gas-engines in large electric generating stations for the supply of electric light and power generally, there is no doubt that in one line of business especially the gas-engine is the coming thing. We refer to paper mills. In several parts of the country in which the papermaking machinery is controlled by electricity, the gas-engine has superseded the steam-engine, and the change has been amply justified by the results Generally speaking, it is found in practice that the greatest saving is effected in the coal bill, and it will be found on the average that the consumption is about 1lb. of coal with gas to 3½lb. with steam working, and when it is considered that the average number of hours of working in a paper mills is 144 a week, it will be seen that the economy effected in this direction alone must be very considerable. We are led to make these remarks in view of what is being done at Messrs. McMurray's Royal Paper Mills at Wandsworth. These mills, originally driven throughout by steam-engines—were recently completely gutted by fire, and the directors have placed the responsibility for their reconstruction, together with the electrical equipment, entirely in the hands of Messrs. Handcock and Dykes, consulting engineers, of Victoria street, Westminster. Most of the contracts for the work have now been let, and the scheme is to go on to completion without delay. Under the new proposals, about which we are able to give some interesting information, four or five of the old boilers will be retained for the production of steam for heating purposes and for working one of the paper machines. All the rest of the power will be supplied by a bituminous producer-gas plant. As will be seen from the list of tenders given below, four Willans engines are to be installed, and two of these will drive direct on to shafting, from which the beaters are driven, the remaining machinery, including one of the large paper machines, being driven electrically by means of continuous-current 220-volt motors. We hope to be able to give particulars of the motor equipment later on. The directors of the mills are confident that when the scheme is completed in accordance with the plans which Messrs. Handcock and Dykes have prepared, they will effect a saving in fuel and in other directions which will repay the cost of the new power plant in about three years. The complete installation, which is expected to run with a cost approaching £40,000, will be ready for working in June next, when we trust the hopeful anticipations of the millowners will be realised. In view of the great interest which is being taken in this question just now we make no apology for appending the full list of tenders for the generators, gas-engine plant, and buildings, in the hope that they may interest engineers who are about to carry out installations of a similar character. The accompanying tenders are for four 230-b.h.p. gas-engines, bituminous producer plant, and all accessories. The engineers' estimate of May 24, 1903, amounted to £11,000 with contingencies.

Dick, Kerr, and Co.....	7,625	0	0
Drake and Gorham	9,460	0	0

For the rebuilding of the mills and foundations, etc., the engineer's estimate was £6,596, and the following three tenders were received:

W. Guthrie and Co. (accepted)	£5,135	10	7
C. Leather and Co.	5,754	17	10
J. O. Richardson	8,394	4	8

APPOINTMENTS VACANT.

Resident Electrical Engineer, Leek Urban District Council, £150 per annum. See advertisement in last issue.

Mechanical Engineer to superintend machinery, Commissioners of the Port of Calcutta, Rs.1,000 per month, Oct. 15. See advertisement.

Telephone Switchboard Inspector, Portsmouth. See advertisement.

Assistant Electrical Engineer, Shipley Urban District Council, Oct. 19. See advertisement.

Shift Engineer, Reading. Oct. 16. See advertisement.

Assistant Mechanical Engineer, Commissioners for the Port of Calcutta. Candidates must be specially qualified in electrical engineering. Salary, Rs.600, rising in annual increments of Rs.50 to Rs.750. Applications will be received up to 15th inst. by the Commissioners' London agent, Mr. J. H. Apjohn, M.A.M.I.C.E., 17, Victoria-street, Westminster, London, S.W.

Engineer, Sheffield, who will have charge of highway, sewer, and tramway work. Applications should be made by 14th inst. to Mr. Charles F. Wike, M.I.C.E., city surveyor, on forms which may can be obtained from his office, Town Hall, Sheffield.

LEGAL INTELLIGENCE.

SPEED OF ELECTRIC CARS.

Judge Emden, sitting at Lambeth County Court on the 1st inst. without a jury, had before him a case in which Joseph Beardshaw sued the London County Council to recover damages for personal injuries sustained. On the morning of Sunday, July 12, Beardshaw was crossing Camberwell New-road in a wagonette going for an excursion, when one of the London County Council electric tramcars struck the rear of the vehicle, smashing it and knocking out several of the occupants.

Mr. J. H. Rider, electrical engineer to the Council, stated the proper speed for cars on level roads was 10 miles an hour. It was possible by turning the handle 180deg. to increase the speed to 18 or 20 miles an hour. Under ordinary conditions the cars going at 10 miles an hour could be pulled up in their own length—33ft. 6in.

Judge Emden, in giving judgment, said he could not agree that because 10 miles an hour was the limit that was not too great a speed, especially along a road studded on each side with streets from which traffic was always coming. He held that in this case the speed was more than 10 miles an hour, and that the driver had not the car under proper control. He awarded plaintiff £21 damages. Four other persons injured on the same occasion were awarded damages varying from £7. 10s. to £21.

Three drivers of the London United Tramways Company were summoned at Brentford for excessive driving, the rates at which it was stated they were going being 16, 18, and 15 miles per hour. It was also said that numerous complaints had been made of accidents caused through excessive driving. The defendants denied that they were exceeding the speed limit, and applied for an adjournment in order to call witnesses.

Mr. Montague Sharpe said he failed to see any difference between them and motors, who were continually brought up, and why they should doubt what the stop-watches registered. It appeared to him that the drivers did not know at what rate they really went. An adjournment was granted on payment of costs.

The adjourned hearing of the case brought by Mr. Moffat Ford against four drivers of electric tramcars for exceeding the limit of speed laid down by the Board of Trade has been fixed by Mr. Rose to be heard at the West London Police Court to-day (Friday) afternoon.

COMPANIES' MEETINGS AND REPORTS.

SOUTH LANCS. ELECTRIC TRACTION AND POWER.

The stockholders of this Company held a meeting at Liverpool on Wednesday to consider the scheme submitted by the Board for the reconstruction of the capital of the Company, by which the present 4½ per cent. first mortgage debenture stock is to be converted into 5½ per cent. second mortgage debenture stock, each holder receiving as a bonus an amount of fully paid ordinary shares in the Company equal to 20 per cent. of his holding in debenture stock and a new terminable first mortgage debenture stock to be issued under the borrowing powers of the Company to provide the money for continuing the work of constructing the tramways and for other purposes, the issue of each class of debenture stock to be limited to £600,000, and no borrowed capital beyond these limits to rank in priority to or *pari passu* with the proposed second mortgage debenture stock without the consent of the holders, given by extraordinary resolution passed at a general meeting of such holders.

The scheme was ultimately adopted after discussion.

CAPE TOWN CONSOLIDATED TRAMWAYS.

The ordinary general meeting of the shareholders in this Company was held on Tuesday at London-wall-buildings, E.C., Baron E. B. D'Erlanger presiding.

In moving the adoption of the report (which appeared in our last issue), the **Chairman** said the whole tramway system only came into operation in November, 1902, and the traffic was increasing at a satisfactory rate. In January, 1903, they carried 90,406 passengers, in February 102,474, and in March 103,634. From April to November, which were the winter months, there was a falling-off in the traffic; but the passengers carried showed a substantial increase over the numbers carried in the same period in 1902.

Mr. L. Breitmeyer seconded the motion, which was agreed to.

SWANSEA TRAMWAYS.

The report of the Swansea Improvements and Tramways Company for the half-year ended June 30 last states that the gross receipts of the tramways undertaking amount to £12,982, being an increase of £718, and expenses (including debenture and other interest) to £9,564, an increase of £529. The increase in expenses is caused almost entirely by increased local taxation. The profit on the half-year's working is £3,417, which, added to the balance of £204 brought forward, makes a total of £3,621 at credit of profit and loss account. The directors recommend that this sum be applied in reduction of amount due to the British Electric Traction Company, Limited, £1,000; to dividend on 984 preference shares at the rate of 6 per cent. per annum, and on 4,016 preference shares at the rate of 5 per cent. per annum, leaving to be carried forward £1,322. The working of the Mumbles Railway and pier shows a deficiency. The gross receipts amount to £8,247, as compared with £7,598 for the corresponding period of last year, and expenses to £10,791, as compared with £10,002. As in the case of the tramway undertaking, the increase of £789 in the expenses is largely owing to increased local taxation. The deficiency on the half-year's working of £2,543 is carried forward. For some time past the efforts of the Board have been directed towards realising the assets of the Improvements undertaking. Some progress is being made. The statement of accounts for the tramways shows that during the half-year a sum of £315 was expended on additions, bringing the total capital outlay on the reconstruction of the old tramways, together with the expenditure on reconstruction and electrical equipment of the lines, to £136,949. The principal items on the debtor side of the balance-sheet are as follows: to British Electric Traction Company, Limited, balance of advances for reconstruction, £23,000; to sundry creditors, £10,558; to reserve and depreciation fund, £10,611. The profit and loss account shows traffic receipts amounting to £12.645, and advertising receipts, £204. Power and running expenses came to £5,053; repairs and maintenance, £1,379; administration of general expenses, £1,783. The accounts of the improvements undertaking, which comprises the Palace Theatre of Varieties, show a deficit for the half-year of £821. The lease account of the Mumbles Railway and pier shows expenses amounting to £10,791, and receipts amounting to £8,247, leaving a deficiency of £2,543. The traffic receipts on this line came to £7,440, the pier and refreshment-room receipts to £1,493 (less £1,128 on pier, shops, and refreshment-room expenses), and the advertising receipts, rents, and sundries to £442.

WILLANS AND ROBINSON.

The report of the directors for the half-year ended June 30, 1903, states that after writing off as depreciation from plant, etc., the sum of £6,849. 3s. 11d., and paying interest upon debenture stock, the balance to the credit of profit and loss account at the end of the half-year (including £1,374. 19s. 11d. brought forward) is £24,227. 12s. 8d. Out of this the directors propose that dividends be paid at the rate of 6 per cent. per annum upon the preference shares and at 6 per cent. per annum upon the ordinary shares, amounting in all to £19,999. 16s. The amount payable to directors, in accordance with the articles of association and with the resolution of Oct. 2, 1901, is £391. 8s. 10d., leaving an available balance of £3,836. 10d. From this the directors propose to carry £1,500 to the reserve fund, and to increase the amount carried forward by £961. 7s. 11d., raising it to £2,336. 7s. 10d. Certain important orders have lately been taken on the basis of payment being made in part in shares of the companies giving the orders. The Queen's Ferry Works are still not in a position to earn profits for the Company, but satisfactory progress has been made in overcoming the difficulties which have been met with. The gas-engine business, to which allusion was made six months ago, promises to be very successful. A vertical gas-engine of 375 i.h.p., which has lately been erected by the Corporation of Redditch, is working extremely well. The Corporation of St. Helens has placed an order with the Company for a horizontal gas-engine of 750 i.h.p., and two of about 1,000 i.h.p. each have been ordered for the electric light station at Reading. Two smaller vertical engines are also on order, and four other horizontal engines of about 300 i.h.p. each. It is believed that the patents which the Company holds, combined with its reputation for good work, will ensure it a large business in gas-engines.

Dr. PROFIT AND LOSS ACCOUNT.	£	s.	d.

	£50,516	6	9

ELECTROLYTIC ALKALI.

The directors in their report on the working of the year ended Aug. 31 last state that the accounts show that the net profit for the year is £483, which, with the amount of £368 brought forward, makes a total of £852. The directors recommend that this amount be carried forward. The directors regret that the result is not more satisfactory; but it is largely accounted for by the conflict between foreign and English manufacturers of bleaching powder, resulting in great depression of prices—a result over which the directors have had no control. Those who are familiar with the situation will be somewhat gratified to find, notwithstanding the low price which the Company have been obliged to accept for the product named (during eight out of the twelve months under review), that no loss of capital whatever has been incurred. All buildings, as well as plant, machinery, and tools, have been kept in a high state of efficiency during the year, and adequate allowances have been made for depreciation. The offices of the Company have been completed, and, without any outlay on furniture more than was absolutely necessary, the staff are enabled to do more and better work. During the year the parent company have acquired certain patents for improvements in the process, and, in accordance with their agreement as vendors, they have placed these additional patents at the service of this Company.

CHILIAN ELECTRIC TRAMWAY AND LIGHT.

The report of the directors for 1902 shows, after payment of interest accruing on advances for construction and other charges, a balance to debit of £3,626. From this amount is deducted the balance to the credit of profit and loss account carried forward from 1901, £3,301, leaving a net balance to debit of that account, to be carried forward, of £324. The net profits for the year 1902 on the operation of the tramways amounted to 271,058dol. During the first half of the year 1902 a net profit was made of 92,998dol., but during that time time business generally was very depressed, owing principally to the strained relations existing with the Argentine Republic, and the constant fear of war between the two States. When this condition of suspense was put an end to on the resumption of friendly intercourse between the two countries, emphasised by the visit of the Argentine Peace Commissioners to Santiago in September, 1902, business began to improve all round; and the net profit from the tramways from July 1, 1902, to Dec. 31, 1902, amounted to 178,060dol. During the 12 months ended Dec. 31, 1902, the Company carried 45,175,916 passengers, earning 2,003,487dol., as against 43,831,591 passengers, earning 1,965,660dol. for the preceding year. The reconstruction of the tramway to electric traction is now completed with the exception of two to three kilometres. During 1902 the electric lighting department showed a total profit of 113,390dol., which has been carried to the profit and loss account. An amicable arrangement has been arrived at with the Municipality of Santiago, and that Corporation is now gradually taking the Company's light over an ever-increasing area of the city. Capital outlay has exceeded the authorised issue of capital and debentures, and the directors will have to bring forward proposals at an early date for increasing the capital to the necessary requirements of the undertaking.

NEW COMPANIES REGISTERED.

Cross Electric Engineering and Manufacturing Company, Limited (78,669).—Capital, £4,000. Objects: to acquire and carry on the business of A. H. Sparkes and W. F. Carter as manufacturing electricians, etc.

Jarrow and District Electric Traction Company, Limited.—Capital, £50,000. Objects: to carry on in the United Kingdom and elsewhere the business of carriers of passengers and goods, electrical engineers, etc. Registered office: Donington House, Norfolk-street, W.C.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Luton.—The Guardians invite tenders for lighting the new tramp wards by electricity.

Macao.—The Colonial Office at Lisbon invite tenders for the electric lighting of Macao. Tenders by Oct. 21.

Nelson.—The Corporation invite tenders for a 400-kw. engine and dynamo, by Oct. 19. See advertisement.

Lisbon.—The Public Works Department require tenders for the public electric lighting of Macao. Tenders by Oct. 21.

Paris.—The Post and Telegraph Department, 103, Rue de Grenelle, require switchboards for telegraph and telephone offices by 15th inst.

Army Contracts.—A notice from the Secretary of State for War referring to tenders for annual supplies will be found in our advertisement columns.

Pietermaritzburg.—Tenders are invited by the Natal Government Railways Electrical Department for additional plant for the power station at Pietermaritzburg.

Swindon.—The Corporation invite tenders for the supply of and delivery of (a) maximum demand indicators and (b) fuse boxes for 12 months. Tenders by 14th inst.

Dudley.—The Guardians invite tenders for the supply and fixing of the various appliances for the electric installation to the laundry and boiler house. See advertisement.

Swansea.—The Corporation invite tenders for the supply, delivery, fixing, and connecting of ducts, troughs, cables, wires, street boxes, etc. Tenders by Oct. 31. See advertisement.

Transvaal Colony.—The Chairman of the Tender Board, Pretoria, requires tenders for installing and working the electric lighting of Potchefstrom for about five years. Tenders by Oct. 30.

France.—The Prefect of the Isère requires tenders for laying and working two tramway lines, about 49 miles. Tenders by 15th inst Particulars may be obtained from the Prefecture of the Department.

London, N.E.—The Bethnal Green Borough Council invite tenders for clearing the site of proposed electricity works. Specification may be obtained from the Borough Surveyor. Tenders by 4 p.m. on 13th inst.

London.—The Directors of the Metropolitan Railway Company invite tenders for the erection of a repairing shed and shops for electric rolling-stock at Neasden. Specifications, etc., after 5th inst. Tenders by 19th inst.

Kilmarnock.—The Corporation invite tenders for the supply, delivery, and erection of three Lancashire boilers, engines and dynamos, overhead hand travelling crane, storage battery, and switchboard, by Nov. 18. See advertisement.

Blackpool.—The Corporation invite tenders for the supply of arc lamp carbons for the ensuing year. Specification, etc., may be obtained on application to Mr. Charles Furness, borough electrical and tramway engineer, Electricity Works, Blackpool.

Liverpool.—The Tramways Committee invite tenders for the supply of ticket punches from Jan. 1, 1904. Specification, etc., may be obtained from the General Manager, Corporation Tramways, 6, Sir Thomas-street. Tenders by 10 a.m. on 14th inst.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

Russia.—The Russian Minister of the Interior has sanctioned a plan for the reconstruction of three lines of municipal tramways—namely, those in Newsky, Sadovaia, and Wassiliostrow districts. Each car is to provide for two classes of travellers, and will accommodate 52 persons.

Todmorden.—The Corporation invite tenders for one Lancashire boiler, two steam dynamos and balancer booster, two feed pumps and one injector, economiser, surface or jet condenser, switchboard and instruments, storage battery, cable work, and overhead hand crane. See advertisement.

West Ham.—The London County Council invite tenders for the supply and erection of (a) engine, dynamo, switchboard, etc., and (b) electrical wiring, mains, and fittings required in connection with the installation of electric light at the Abbey Mills pumping station. Tenders by Nov. 3.

Leicester.—The Tramway Committee invite tenders for erection of two district car-sheds, offices, and all other buildings and works in connection therewith. Specifications, etc., may be obtained at the office of Mr. E. George Mawbey, M.I.C.E., Town Hall, Leicester. Tenders by 23rd inst.

Salford.—The Tramways Committee invite tenders for the installation of electric light at their central car depôt in Frederick-road, Pendleton. Specifications and plans may be obtained from the General Manager, Tramway Offices, 32, Blackfriars-street. Tenders by 5 p.m. on 19th inst.

Canterbury.—The Urban Sanitary Authority invite tenders for the supply of 2,220 yards of ·4 square inch t c/c cable. Specification may be obtained from the Engineer, Electricity Works, Canterbury. Tenders by 10th inst. to the Town Clerk, Burgate-street. See advertisement in last issue.

Halifax.—The Tramways and Electricity Committee invite tenders for (a) 750-kw. continuous-current dynamo, driven direct by horizontal engine; (b) two 9ft. by 30ft. Lancashire boilers; (c) high-tension three-phase cable, etc. Tenders to Mr. Keighley Walton, town clerk, by Oct. 21.

East Barnet.—The Urban District Council will receive proposals for carrying out the provisions of their electric lighting order within the Council's district. Further particulars upon application to Mr. Henry York, the Council's surveyor, Council Offices, Station-road, New Barnet. See advertisement in last issue.

Johannesburg.—The Municipality require tenders for gas generating plant or for steam generating plant and for gas motors or steam motors, with electric generators and accessories. Particulars may be obtained from the Town Clerk, Johannesburg, or from Messrs. Mordey and Dawbarn, 82, Victoria-street. Tenders by Oct. 19.

Swansea.—The Corporation invite tenders for (1) laying of permanent way, including rail bonding; (2) rails and fishplates; (3) steel tiebars, bolts, and nuts; (4) points, crossings, cast-steel curved rails, and special work; (A) overhead electrical equipment; (B) ducts, troughs, cables, wires, section and other boxes, etc. Tenders by Oct. 31. See advertisement in previous issue.

Aberdeen.—The Town Council invite tenders for the construction of the following works: about 700 lineal yards of cable subway, 6½ft. high by 4½ft. wide; about 750 lineal yards of pipe sewers, 9in. to 30in. internal diameter; together with cable-distributing chambers, manholes, shafts, diversion of sewer, and other works in connection therewith. Tenders, etc., by 11 a.m. on 14th inst.

Salford.—The Tramways Committee invite tenders for the supply and delivery of planing, turning, boring, drilling, grinding, milling, screwing, punching, and shearing, and wood-working machinery, power hammer, shafting motors, etc., at their central car depôt, Frederick-road, Pendleton. Specifications, etc., can be obtained from the General Manager, 32, Blackfriars-street, Salford. Tenders by Oct. 19.

Harrismith (South Africa).—The Town Council invite tenders for the following electrical machinery and accessories f.o.b. and alternatively erected in Harrismith, Orange River Colony, South Africa: two water-tube boilers and one 25-kw. and two 80-kw. steam alternators, with ejector condensers, switchboards, pipework, and other accessories. Specifications, etc., may be seen and obtained at the offices of Messrs. Mordey and Dawbarn, 82, Victoria-street, Westminster, S.W. Tenders to Messrs. Webster, Steel, and Co., 5, East-India-avenue, Leadenhall-street, London, E.C., by noon on 19th inst.

Great Western Railway.—The Directors invite tenders for the supply of telegraph instruments, telegraph apparatus, copper wire, G.P. wire, etc., telegraph ironwork and tools, telegraph drysalteries, electric light carbons, incandescent electric lamps, iron rivets, bolts and nuts, etc., fishplates, and bolts and nuts for permanent way, and telegraph poles and yellow pines, etc., from Dec. 1 next to Nov. 30, 1904. Samples, etc., may be seen from 6th to 15th inst., at the office of the Stores Superintendent, Swindon. Specifications, etc., may be obtained at the office of the Stores Superintendent. Tenders by 19th inst. to Mr. G. K. Mills, secretary, Paddington Station, London. See advertisement in last issue.

RESULTS OF TENDERS.

Kingston.—The tender of Mr. T. Button has been accepted for wiring private premises at £21. 10s.

Honley.—The Council have accepted the tender for a countershaft by Messrs. Joseph Beaumont and Sons.

Edinburgh.—The tender of Messrs. Johnson and Phillips for arc lamps, at £6 per lamp, has been accepted.

Buxton.—Messrs. J. Wolstenholme and Son's tender, £42. 10s., for piping and valves has been accepted by the Urban District Council.

Aston.—The tender of the Brush Electrical Engineering Company for the overhead electrical equipment of the tramways, at £4,742, has been recommended for acceptance.

Rotherham.—The tender of the British Electric Car Company for £813 for a watering-car has been accepted. A magnetic Westinghouse brake is to be attached to the car.

Dewsbury.—The tender of Messrs. Siemens and Co., of London, for the delivery and fixing of a 300-kw. dynamo, with engine, for the electricity works has been accepted.

Worthing.—Seven tenders for reconstructing the storage battery at the generating station, the prices varying from £683 to £1,205, have been referred to the consulting engineers for report on same.

Newcastle-under-Lyme.—The Corporation have placed the contract for the storage battery with the Electrical Power Storage Company, Limited, of 4, Great Winchester-street, London, E.C.

London, W.C.—The tender of W. J. Fryer and Co., Bravington Engineering Works, Paddington, and Sloane-square, £497, has been accepted for supplying and fixing electric lift and conveyor, for Messrs. W. H. Smith and Son, 186, Strand.

Paisley.—Messrs. W. T. Glover and Co., Limited, Trafford Park, have obtained the contract from Mr. W. M. Murphy for the whole of the mains, ducts, troughing, excavation, etc., at £13,088, in connection with the extensive tramway scheme.

Digitized by Google

Burghill (Hereford).—The tender of W. J. Fryer and Co., Bravington Engineering Works, Paddington, and Sloane-square, at £2,198, for additions to the electric light plant and supplying and laying new cables for the Asylums Committee, has been accepted.

London County Council.—The tender of Messrs. J. Westwood and Co., Limited, Millwall, amounting to £36,808. 14s. 6d., has been accepted for the supply, delivery, and erection of the steelwork for the first portion of the Greenwich electricity generating station.

Derby.—The tender of Mr. J. Dickinson, amounting to £8,066. 4s. 1d., has been accepted for the erection of car-sheds. The Tramway Committee have arranged for J. and G. White, Limited, to fix bonds of rails at 9d. each instead of the work being done by the Corporation themselves, as originally proposed.

Dundee.—The Corporation have accepted the following tenders: for the relaying of distribution mains in the central area—British Insulated and Helsby Cables, Limited, for three single cables, paper insulated, lead-covered, laid solid in three-chase troughing; taking down of wall between the two engine-rooms—J. Carnegie, 94, Commercial-street, Dundee.

Fulham.—The following tenders have been recommended for acceptance: Messrs. Windsor and Co., for the construction of sub-stations for the sum of £520 (Contract A); Mr. Thomas Pearce, £455 for constructing a transformer chamber in Townmead-road (Contract 25); British Electric Transformer Company, Limited, for supply of transformers for £292 (Contract 26).

Turbo-Dynamos.—Messrs. C. A. Parsons and Co., Eaton Works, Newcastle-on-Tyne, have received an order from the Scarborough Electric Supply Company, Limited, for the supply of two 300-kw. special traction turbo-dynamos, 450-550 volts, complete with surface condensers and air and circulating pumps; also from the Dalmellington Iron Company for one 290-kw. turbo-dynamo, 500 volts, complete with condenser.

Stoke-upon-Trent.—The following tenders have been accepted for the supply and erection of the following plant in connection with the proposed electricity and destructor works, for the Corporation: (Contract 10, Section A) pipework; (B) non-conducting covering; (C) water-softening plant—(A) Crompton and Co., piping; (B) lagging (sub-contractor, Mica Boiler Covering Company); (C) Pulsometer Engineering Company, water softener.

Hammersmith.—The following tenders have been obtained for covering sundry steam-pipes with a non-conducting composition so as to increase their efficiency:

G. Pidduck and Co. (accepted)	£26	5	0
F. Leroy and Co.	34	0	0
A. Haacke and Co.	31	3	4
Hobdell, Way, and Co.	41	10	0

Hastings.—The Town Council have accepted the tender of the Key Engineering Company, Limited, for 75 10-ampere, 37 25-ampere, and 13 50-ampere Stanley magnetic suspension meters at £613. 5s. Contracts have also been recently placed with the Key Engineering Company by the Southport Corporation for 74 Stanley meters, the County of London Electric Lighting Company for 75 meters, the Bexley Corporation for 50 meters, and by other undertakings for smaller trial orders.

Bermondsey.—The Borough Council have accepted the tender of A. White and Co., of 82, Paradise-street, at £8,363, for the erection of buildings in connection with extensions to the dust destructor house, electric light station, boiler-house, etc.; the tender of Messrs. Hughes and Stirling, Clock House, Arundel-street, Strand, for Contract No. 12, at £3,837; also the tender of Messrs. Siemens Bros., Electric Light and Power Department, Woolwich, Kent, for Contract No. 13, at £6,893 Contract 12 includes the construction, supply, and erection of two dust destructor cells, with furnace, flues, etc., and storage bins; of one watertube boiler and brickwork setting, one water-storage tank with supports for same, and the consequent necessary extensions to steam, feed, and exhaust piping systems. Contract 13 includes the construction, supply, and erection of two 300-kw. steam generators, two 20-kw. feeder boosters, one 15-kw. motor balancer, and sundry switchgear and connecting cable required in connection with the extensions in Rotherhithe. The accepted tender specifies Willans triple-expansion engines.

London County Council.—Tenders for low-tension switchboards for New Cross and Camberwell sub-station have been received as follows:

B. Thomas, Manchester (recommended for acceptance)...	£1,746	2	6
J. G. Statter and Co., Birmingham	1,935	19	6
Electrical Company, Limited, London	1,984	1	0
Kelvin and J. White, Glasgow	2,006	2	0
F. Suter and Co., Limited, London	2,021	8	0
Electrical Construction Company, Limited, Wolverhampton	2,026	0	0
W. Sanders, Wednesbury	2,027	0	0
Siemens Bros. and Co., Limited, London	2,090	0	0
Electric and Ordnance Accessories Company, Limited, Birmingham	2,098	19	0
Cowans, Limited, Manchester	2,110	5	0
Dorman and Smith, Manchester	2,202	0	0
British Westinghouse Electric and Manufacturing Company, Limited, London	2,223	0	0
Berry, Skinner, and Co., London	2,270	0	0
Ferranti Limited, Hollinwood	2,336	0	0
A. Reyrolle and Co., Limited, Hebburn-upon-Tyne	2,682	4	0
International Electrical Engineering Company, London	2,684	4	0
Torque Electrical Engineering Company, London	2,699	3	0
Elliott Bros., London	2,836	2	0
Clift Manufacturing Company, London	3,630	0	0
General Electric Company, Limited, London	3,639	0	0

Bristol.—The City Council have accepted the following tenders for electrical plant: Babcock and Wilcox, Limited, boilers, £9,324; Oliver and Co., Limited, arc lamps, £2,556; Alley, Maclellan, and Co., condensing plant, £3,285. 12s.; British Westinghouse Electric and Manufacturing Company, Limited, exciters £774. 2s., transformers £723. 18s. 6d.; C. A. Hayes, erection of arc lamp standards, £375; Newton Electrical Engineering Company, Limited, motors, £509; J. P. Hall and Sons, pumps, £408; Ferranti Limited, switchgear, £395. 10s.; Doulton and Co., Limited, water-softening plant, £352. 8s.

BUSINESS NOTES.

TRACTION.

Southend.—Since Jan. 1 2,700,000 passengers have been carried by the electric cars.

Batley.—The electric cars are expected to be running in the town in a week or two.

Colchester.—The Town Council have decided to apply for a loan of £61,164 for tramway purposes.

Blackpool.—Fares on the electric tramways will be considerably reduced during the winter months.

Aston Manor.—The Urban District Council are negotiating loans of £27,000 and £36,000 for tramway purposes.

Trawden.—The District Council have approved plans of the proposed single and double lines of tramways at Winewall.

Dewsbury.—The Gomersal section of the tramways is completed, and some successful trial trips have been made over the line.

Newark.—Promoters of a tramway scheme are seeking the support of the Urban District Council to a line through their district.

Kidderminster.—Damage to the extent of £1,000 has been done by a fire at the Kidderminster Electric Traction Company's depôt.

Burnley.—The 10 new cars which the Corporation are about to have constructed for them are to be fitted with glass wind-shields.

Guildford.—Plans of the proposed tramways between Stoughton, Merrow, and Guildford have been referred to a committee for consideration.

Rowley Regis.—The amount of the loan for which the Urban District Council are applying for tramway purposes, as mentioned last week, is £30,000.

Dover.—It was unanimously decided by the Corporation on Tuesday to run special workmen's cars on their electric tramway system at ½d. fares for the two miles' journey.

Rochdale.—It is stated that negotiations will be opened between the local authorities and the tramway company's directors in reference to the transfer of the company's undertaking.

Glasgow.—A deputation representing the Tramways Committee of the Glasgow Corporation has visited Huddersfield and Bradford and inspected the electric tramway systems there.

Bury.—In connection with the proposed tramways purchase the respective authorities of Bury and Heywood have been unable to agree, and the negotiations have been broken off.

St. Helens.—The borough treasurer's annual report shows that on the tramways the capital expenditure amounts to £123,153. The net profit for the year is put down at £118. 17s. 11d.

Llandudno.—A conference is to take place between representatives of the Town Council and the promoters of the Llandudno and Colwyn Bay light railway with reference to the carrying out of the scheme.

Torquay.—Representations are being made to the Town Council by the Motor Omnibus Company in favour of motor 'buses for the town instead of electric tramways. The matter is having the attention of the Council.

Middlesbrough.—An appeal has been lodged by the Imperial Tramway Company against a decision of the local Bench this week fining the company 10s. and 14s. 6d. costs for permitting overcrowding of the tramcars.

Stirling.—A report by the electrical engineer on the whole question of electric tramways between Stirling and Bannockburn, and Stirling and Bridge of Allan, was submitted at the last meeting of the Town Council and discussed in private.

Johnstone.—The preliminary arrangements are now so far advanced that operations are to be commenced next month for the construction of the tramways. Promise is made that the line will be opened about the end of May next or in June.

Leeds.—The Town Council on Wednesday decided to make application to the Board of Trade for sanction to borrow £125,890 for tramway purposes, the works proposed to be carried out having been previously approved by the Council.

Leeds-to-Wakefield.—Rapid progress is now being made with the tramway which will ultimately connect Leeds with Wakefield. This is part of the scheme which provides for a network of trams for the district of which Wakefield is the centre.

Tramways in the City.—The Common Council have decisively rejected a proposal to allow the County Council's tramway system to enter the City by way of Southwark Bridge in connection with the impending improvement of that structure.

Lowestoft.—During the week ending Saturday, Oct. 3, 51,585 persons patronised the trams, and the receipts amounted to £231. 11s. 9d. The total number of passengers carried since the opening day is 780,102, and the takings amount to £3,589. 12s. 11d.

Digitized by Google

Hammersmith.—The Borough Council have refused their consent to the proposal of the London United Tramways Company, in connection with the laying of the tramlines crossing Goldhawk-road, to run the tramway in a transverse direction so as to do away with the use of points as originally proposed.

Beckenham.—At the last meeting of the Urban District Council an attempt was made to reopen the tramway question and have the subject of the Council's promotion of a Bill in Parliament discussed *de novo*. The proposal fell through, and the Council's decision in favour of a Bill was confirmed.

Trafford Park.—Last Friday the Light Railway Commissioners enquired into the merits of two rival schemes of light railways for Trafford Park—one promoted by the West Manchester Light Railway Company and the other by the Stretford Urban District Council. The Commissioners reserved their decision.

Newcastle.—Colonel von Donop has made an inspection of the new tramways recently laid down at Benwell, from the toll-gate to Condercum-road, on the Elswick-road and Westgate routes; also from the Byker car depôt to the Wallsend terminus, and also the extension from the Stack Hotel to a point near the railway station at Low Walker.

Sunderland.—The Corporation Tramways Committee have agreed to recommend the adoption of an increased scale of pay for conductors. Under the present scale the men start at 22s. 6d. per week, and the committee recommend that the wages shall start at 23s. 9d., rising at the end of three months' service to 25s., and after a further six months to 26s. 3d.

Metropolitan District Railway.—We understand that the work of electrically equipping the above line is proceeding rapidly. The sub-stations for the rotary converters are being placed above ground. A number of the sub-station buildings are well in hand, and the work of placing machinery in them is likely to be commenced at the end of this month.

Ashton.—The electric tramway system is now about completed, and a settlement has been arrived at in Stalybridge with regard to temporary through running cars on the basis that Ashton draws four-sevenths and Stalybridge three-sevenths of the receipts after deducting Ashton's share of interest and sinking fund and actual cost of working per car mile.

Ossett.—At a special meeting of the Town Council resolutions were passed authorising application to be made to the Board of Trade for a provisional order allowing the Corporation to construct tramways in the borough, commencing in the Market-place, and passing along Dale-street, Church-street, and Dewsbury-road, to the borough boundary at Chickenley.

Exeter.—Although pledged to carry out a tramway scheme for the city, the Corporation have not yet definitely decided on the system to be adopted. The overhead trolley is most favoured, but in order to be fully informed on the subject, a deputation of the Council has been appointed to inspect the surface-contact systems and the conduit system laid down at Bournemouth.

Reading.—The borough engineer reported to the last meeting of the Town Council on the fractured axles on some of the electric cars. These are now being replaced, but he gave it as his opinion that the gauge to which the wheels have been pressed is too full for the track. The old wheels, now they are being replaced on the new axles, are brought nearer together to allow of the flange having a proper play on the groove.

Hampstead Tube.—A correspondent to the *Times* states that sinking for the tube to Hampstead and Golder's Green has been suspended at the top of the High-street, Hampstead, because several feet of water have been encountered. This water is derived from springs, and it must be pumped out and its source emptied, or the channel diverted, before further operations become possible. There are a number of other known springs to be encountered, drained, or diverted between the High-street and North-end in the course of the proposed tube.

Liverpool.—At the last meeting of the Tramways Committee it was proposed that a double line of tramways be laid, at a cost of £4,000, along Everton-road, between West Derby-road and Fitzclarence-street. After discussion it was decided to request the general manager to report upon the proposal. The new service between Everton Church and the Pierhead has been inaugurated. At the meeting of the City Council on Wednesday it was decided to equip the tramway depôts with refreshment stalls on a self-paying basis, to be managed by the men.

Snowdon.—Messrs. A. Krauss and Son, of Bristol, have secured the contract for the construction of a light railway which will complete the scheme in connection with Snowdon. A connecting section will run from Portmadoc through Beddgelert to Rhyd-ddu to join the present narrow-gauge railway, the whole of which will be operated by electricity. The Snowdon Mountain Railway is also to be electrified, and electric power is to be supplied to the great quarries of the district. A generating station is to be erected at Llyn Llydau, a lake on the slopes of Snowdon, where a fall of 1,300ft. is obtainable, and which it is estimated will give 60,000 h.p. in electricity.

Cheltenham.—The Town Council have been informed by Mr. T. A. Nevins that he is now prepared to let the contracts for the construction of the proposed extensions of the tramway system to Charlton Kings and Leckhampton. At the meeting held this week plans for the proposed extensions were approved, subject to some minor alterations as to paving and design of poles. Some dissatisfaction was shown owing to the extensions not being carried out as were originally agreed, and a resolution was unanimously passed urging Mr. Nevins to construct the line in High-street as authorised. The plans for the extensions were prepared by Messrs. Dodd and Dodd, civil engineers, of Birmingham.

Cleckheaton.—At the last meeting of the District Council a member called attention to the fact that the British Electric Traction Company had postponed the construction of the intended branch lines to Hartshead Moor from Liversedge and Cleckheaton, and urged that as the completion of other lines was prejudically affecting trade in the town, the company should be urged to proceed with the branch in question without delay. It was rumoured, he added, that they intended to apply for a further extension of time. It was also decided to request the chamber of commerce and the tradesmen's association to make similar representations to the company.

Additional Traffic Returns.—Anglo-Argentine, £2,120 increase; Barcelona Ensanche y Gracia, £88 increase; Barcelona, £705 decrease; Brisbane, £242 increase (month of August, £11,736, increase £294); British Columbia Electric (month of March), gross earnings £10,352, net income £2,659; Buenos Ayres and Belgrano Electric, £348 increase (month of September, £13,793, increase £1,317); Calcutta, £399 increase; Cape Town (month of August), receipts £15,349, expenditure £8,696; Isle of Thanet Electric, £87 increase; Mexico Electric (month of August), receipts £48,600; expenses, £27,900; Perth Electric, £169 increase; Port Elizabeth (month of August), receipts £3,875, expenditure £2,305.

Sutton Coldfield.—The town clerk has received a communication from the City of Birmingham Tramways Company enquiring whether the Corporation would be prepared to consider an arrangement by which the company might be enabled to promote tramways in Sutton Coldfield to be constructed in continuation of the lines which will be for the next 21 years controlled by the company running from Birmingham through Aston as far as the Sutton boundary at Erdington. At the Council's meeting on Wednesday the General Purposes Committee, which had considered the communication, recommended that the company be informed that the Corporation cannot see their way at present to consider any arrangements for the construction of tramways within the borough.

Simplon Tunnel.—A Reuter's telegram from Berne says that the Grand Council of the Canton of Berne has agreed to grant a subvention for the construction of the projected Jura Tunnel for a line between Soleure and Muenster, which will give access to the proposed tunnel through the Bernese Alps for communication with the Simplon Tunnel. An agreement has also been arrived at between the Federal Council and the Simplon Tunnel Company, by which the latter will receive an increased amount for the construction of the Simplon Tunnel, but will not be liberated from its obligation to construct a second tunnel. On the other hand, the company agrees to the transfer of the tunnel to the Federal Government. The Federal Assembly will ratify the agreement at the end of this month.

Greenwich.—At the last meeting of the Borough Council the General Purposes Committee reported that they had had under consideration a further letter from the London County Council, enquiring whether the Council were prepared to give their consent to a proposed tramway from Deptford to the Herbert Hospital, *via* Blackheath, and to make a contribution thereto. On the proposition being first discussed, the London County Council were asked to consider a route through Westcombe Park, to which a reply was received that they were then unable to adopt the proposed alternative route. The committee recommended that, in the event of that Council deciding to construct a tramway from Deptford to the Herbert Hospital, this Council would have no objection to the tramway, but would not be prepared to contribute any sum for street widenings. After discussion the recommendation was adopted.

Wallsend.—It was reported at the last meeting of the Town Council that the Tyneside Electric Tramways Company intend to try and negotiate with Newcastle Corporation relative to an exchange of traffic over the systems, and if they fail they will seek fresh parliamentary powers in accordance with their undertaking to the Wallsend Council. In view of the electrification of the Tynemouth branch of the North-Eastern Railway, the Town Clerk stated he had received communications from the Board of Trade and the engineer to the railway company concerning the safety of the public at level crossings. The former stated that the responsibility for securing proper protection lay with the railway company, whom the Board presumed would be fully alive to their liability in the matter. The engineer to the company wrote saying that the exact nature of the protection had not yet been decided upon; but the Council were assured that everything possible would be done to safeguard the public.

Cardiff.—At a special meeting of the Tramways Committee a report prepared by Mr. Arthur Ellis, electrical engineer and manager, was considered in reference to a proposed revision of fares throughout the town. Mr. Ellis stated that his object in submitting the report was to avoid any further reduction of fares and to place each route on an equal basis. Referring to the new scale, Mr. Ellis said that he had as nearly as possible made the stages 2 200 yards for 1d. and 3,300 yards for 1½d. Some time ago, he said, the committee reduced the fare upon the Splott section to 1d., and the result was that on other routes passengers paid 2d. for shorter distances. He did not recommend ½d. fares for any stage, as he considered it an impossibility for the conductor to collect the whole of the fares, especially on busy days, but ½d. stages could be adopted with a minimum payment of two stages for 1d. or three stages for 1½d., and so on. The proposed new scale was gone through very carefully, and some alterations made in the stages. Mr. Ellis was then requested to include these alterations in a supplementary report, giving the length of each, and submit it to a future meeting.

Wolverhampton.—Another meeting of the Corporation Tramways Committee was held on Friday, when some discussion took place in regard to the proposed extensions to Dudley-road, Wednesfield-road, Willenhall-road, and Waterloo-road. A detailed comparative statement showing the estimated capital and annual cost of the overhead and Lorain systems, prepared by Mr. C. E. C. Shawfield, the borough

Digitized by Google

electrical engineer, was placed before the members of the committee and considered. The question as to whether the extensions should be carried out on the overhead or the Lorain system was debated, and finally a resolution to equip the additional routes with the latter was carried. Not only was it decided to equip the extensions with the Lorain system, but to proceed with the work as early as possible Thus the town is committed to the Lorain up to the hilt. The Wolverhampton Tradesmen's Association forwarded to the Tramways Committee the following resolution: "That this meeting of the Wolverhampton Tradesmen's Association requests the Town Council to equip the Sedgley-road and Willenhall-road on the overhead system at the earliest possible moment, with a view to promptly securing proper and adequate intercommunication."

Pontypridd.—At the meeting of the Electrical Committee last week a letter was read from the British Electric Traction Company as to the purchase of their horse tramway undertaking within the Council's area between Pontypridd and Porth. The company stated that, subject to their agreeing with the Rhondda District Council for the purchase of the land, buildings, and premises at Porth, they were prepared to accept £6,050 for their undertaking in the Pontypridd district. This includes the permanent way, a proportion of the cost of the Act of Parliament, and half the estimated value of the rolling-stock, plant, machinery, and furniture at Porth. The committee decided to recommend the Council to take steps to get the property valued. The combined lighting and tramway scheme is now on the move, both the contractors for the permanent way and for the distributing cables being at work in the principal thoroughfare of the town. Many of the streets are in a deplorable condition, and the advent of the trams should be a great boon to Pontypridd and district. Numerous alterations will be necessary in the level of a good many of the streets, and there is no doubt that the permanent way will enormously improve the thoroughfares of the town.

Nevin Light Railway.—A public enquiry was held on Thursday week at Pwllheli by the Light Railway Commissioners into the expediency of granting the application which has been made by the North Wales and District Light Railway and Electric Power Syndicate for an order to authorise the Pwllheli, Nevin, and Portinlleyn light railway. It was explained that the proposed railway would run for a distance of 10 miles 4 furlongs past Morfa Nevin to Portinlleyn, and would have a branch of 1 mile 6 furlongs to Nevin. The district was agricultural, but there were slate and fishing industries, which could be developed greatly if railway facilities were afforded, the whole of the Lleyn peninsula being now without any form of railway service. Mr. E. Ward Thomas, the engineer to the scheme, estimated the cost at about £170,000, which included a deviation in the amended route. Colonel Boughey, after a short deliberation, said that the Commissioners thought further time should be given to consider the question of deviation. That deviation might be desirable if it could be carried out under two conditions—a junction with the Cambrian Railway Company, which would enable them to work, and that it should not involve too much expense. Failing that, it would mean the widening of Ala-road, and before giving a final decision the Commissioners would wait for the parties to come to an agreement.

Southwark.—The Works Committee reported at the last meeting of the Borough Council their consideration of a proposal by the London County Council to again seek powers to construct an electric tramway on the underground conduit system from the present tramways in Southwark-street, along that street westward across Blackfriars-road, along Stamford-street and York-road, to join the tramways in Westminster Bridge-road. The proposed tramway would have double lines, and was regarded by the County Council as of great value in affording means of communication between the main thoroughfares radiating from the Elephant and Castle to the river. In reply to the committee, who considered that double tramway lines would necessitate the widening of portions of the streets in which they would pass, the County Council said they did not contemplate undertaking such improvements. True, there are places where the width of the carriageway was a little less than that prescribed by the Tramway Acts, but this would not cause any inconvenience, nor was it anticipated that any difficulty would be raised by the frontagers to the construction of the tramway as proposed. The Works Committee, having very carefully considered the whole matter, were of opinion that the construction of the proposed tramway across Blackfriars-road would effectually block the traffic at this already congested spot. The borough engineer had also pointed out that the suggested lines would practically destroy the entrance to the railway goods depôt, and would in all probability necessitate the removal of the underground convenience at the corner of Southwark-street. Unless some substantial improvements were made towards obviating the difficulties alluded to, the committee could not recommend the Council to approve the scheme. It was decided to inform the County Council that the Council are unable to grant the necessary consent to the introduction of a Bill in Parliament for the necessary powers to construct such tramways.

London County Council.—The Board of Trade regulations for the running of the London County Council electric tramways have now been hung in all the trams. They are signed by Colonel Sir Herbert Jekyll, assistant secretary to the Board of Trade, and lay down the following as the rates of speed, which are not to be exceeded: 12 miles an hour on Clapham Common south side, between Clapham Park-road and Nightingale-lane. Eight miles an hour (*a*) in Kennington-road and Westminster Bridge-road, between the Horns and Stangate; (*b*) in Kennington Park-road, Newington-butts, London-road, St. George's-circus, and Blackfriars-road, between the Horns and the terminus; and (*c*) in Waterloo-road. Six miles an hour in Westminster Bridge-road, between Kennington-road and Waterloo-road; four miles an hour (*a*) through facing points, whether fixed or movable; (*b*) under the Balham railway bridge; (*c*) under the Clapham-road railway bridge; (*d*) on the curve leading to the Balham car-shed; and (*e*) on the curve leading to the Clapham car-shed. At all other places the speed shall not exceed the rate of 10 miles an hour. At the first meeting of the County Council after the summer vacation on Tuesday the Highways Committee presented a statement, in which they report that the reconstruction for electrical traction of the tramways (*a*) in Harleyford-street, Kennington Oval, and Harleyford-road—*i.e.*, between Brixton-road and Vauxhall Station—and (*b*) in Brixton-road, between Camberwell New-road and the commencement of the cable tramway near Handforth-road, has been completed; and the Board of Trade has, in the exercise of the powers conferred upon it by the London County Tramways (Electrical Power) Act, 1900, and the London County Council (Tramways and Improvements) Act, 1901, consented to, and approved of, the use of electrical power on these lines. The Board has also certified that the tramways in Harleyford-street, Kennington Oval, and Harleyford-road, which have been reconstructed as double lines under the powers conferred upon the Council by the Act of 1901, and not under the Electrical Power Act of 1900, as is the case with the Brixton-road line, are fit for public traffic. The Board has forwarded, with its consent, a copy of a minute by Lieut.-Colonel Yorke, R.E., stating the speed and stops which should be observed on the lines in question, and the Board's requirements upon these matters are being complied with. The tramways have been opened to the public, and through services of electrical cars are now run between Camberwell-green and Vauxhall, as well as from Westminster and Blackfriars bridges to the junction of the electric and cable lines in Brixton-road, where the electrical cars are fitted with cable-grippers to enable them to travel to and from the Streatham terminus. The Council have for some time past been giving careful consideration to the management of the advertising business in connection with their trams, and the committee who have had the matter under consideration have agreed to recommend the Council to appoint an officer at a salary of £300 a year and commission at the rate of 2½ per cent. on the actual receipts from advertisements. It is reported that the Council have decided to abandon the plan which has been in vogue for only a few weeks of carrying the electric cars over the cable route from Kennington to Streatham in consequence of the obstruction caused through changing from the electric system to the cable, and to the extra strain which the heavier electric cars put on the machinery which works the cable. The object, of course, was to enable passengers to make the through route from the London termini to the Streatham terminus in one car, but the arrangement has not worked well In future, therefore, passengers by the Council's system from the London termini to Brixton and Streatham, and *vice versa*, will have to change cars where the electric and cable systems join at Kennington. With reference to the complaints which have been made in the public Press and elsewhere as to the frequent blocks that occur on the main routes and the slow progress of the electric cars on the sections between Kennington and the London termini, we must entirely repudiate the suggestion that has got abroad that it is in any way due to the electric conduit system. Where horse and electric cars are running on the same lines, it is obvious that the rate of speed is set by the horse cars, which the electric cars are powerless to increase except when they get on the all-electric lines such as between Kennington and the Tooting terminus. The aspersions which have sometimes been cast at the electric system are entirely unwarranted, and we look forward to the time that the lines can be operated entirely by electricity, when it will be soon enough to say whether or not the electric system is a success or not. The following report was presented by the Highways Committee at Tuesday's meeting: "The construction of a portion of the tramway subway under the new thoroughfare between Southampton-row and the Victoria-embankment has been commenced, and it will be necessary for an engineer to be engaged temporarily to supervise the execution of the work. For this purpose we suggest that we should be authorised to obtain the services of a suitable person at the rate of pay of £6 per week. The necessary expenditure, which we anticipate will not exceed £375, is covered by the estimates approved by the Council on March 10, 1903 (p. 359). We recommend that the Highways Committee be authorised to arrange for the temporary employment of a resident engineer, at the rate of pay of £6 per week, to supervise the construction of a portion of the tramway subway under the new thoroughfare between Southampton-row and the Victoria-embankment." The committee also asked for authority to arrange for the temporary employment of a resident engineer, at the rate of pay of £8 per week, to supervise the construction of the pier and river-wall required in connection with the Greenwich generating station.

LIGHTING AND GENERAL.

Camberne.—Steps are being taken for the electric lighting of the new Council offices.

Leeds.—The Corporation are seeking powers to borrow £220,00 for electric lighting purposes.

Aston Manor.—The Urban District Council are negotiating a loan of £52,439 for the electric light undertaking.

Beckenham.—The Electric Lighting Committee are extending the cable in Croydon-road at an estimated cost of £50.

Wood Green.—The tenders for cables for the electricity supply have been left to the Electrical Committee, with power to act.

Brynmawr.—The Council have decided to at once apply for a provisional order to supply the urban district with electric light.

Embankment.—The City of London Electric Lighting Company intend to lay mains along a portion of the Victoria-embankment.

Pontypridd.—The Reading Town Council are lending the Urban District Council £2,000 for purposes of electricity and tramway undertakings.

Long-Distance Telephones. — Telephone connection between St. Petersburg and Berlin is contemplated, the cost being estimated at £40,000.

Digitized by Google

Barnstaple.—A report on the electric lighting of the outside area has been referred back to the Electric Lighting Committee for further consideration.

Dudley.—The specification for proposed electric power and lighting at the workhouse, as submitted by the architect and amended, has been approved.

Bath.—The last report of the Electric Lighting Committee shows that the load is increasing very rapidly. It amounts at the present time to 638 kw.

Sale of Plant.—Particulars of sales of various electrical lighting plant and of a complete electric light generating plant will be found in another column.

Uxbridge.—The Urban District Council have appointed a committee to close an agreement with the Uxbridge and District Electric Lighting Company.

Dewsbury.—During the first fortnight in September 13,467 units of electricity (against 9,415) were used for lighting, and 16,834 units (against 16,398) for power.

Bray (Ireland).—The electric lighting extensions are to be undertaken by Mr. Evans, the assistant electrical engineer, under direction of Mr. M'Kenna, chief engineer.

Heysham.—At the next meeting of the Urban District Council the advisability of the Council applying for a provisional order for electric lighting will be discussed.

The Lizard Light.—The old double light at the Lizard has been replaced by a single electric five-seconds flash light, which is said to be the most powerful in the world.

Direct United States Cable Co.—The directors have declared an interim dividend of 3s. per share (being at the rate of 3 per cent. per annum (for the quarter ended Sept. 30.

St. Helens.—The last electricity account shows that the balance of assets has increased by £4,316. 6s. 6d., the total excess being £12,385. The capital expenditure now stands at £132,658.

Perth.—It has been remitted to the Sub-Lighting Committee to experiment and report to the Council as to the respective merits of electricity and incandescent gas for street-lighting.

Faversham.—The installation of the electric light is proceeding apace. It is rumoured that candidates are coming forward at the municipal election in favour of selling to a company.

Hastings.—The workshop at the electric light works is to be fitted with new lathes, shafting, etc., and application will be made for sanction to the borrowing of the estimated cost (£160).

Obituary.—We regret to learn of the death of Mr. J. T. Marsh, electrical engineer to the Dudley Corporation, caused by fractured limbs and internal injuries sustained by a fall from a horse.

Newark.—The form of agreement entered into between the Council and the Derbyshire and Notts Electric Power Company is being circulated amongst the members of the Urban District Council.

Edinburgh.—The number of 8-c.p. lamps applied for from Sept. 10 to 24 was 12,952, as against 2,527 for the same period of last year, making the total for the year 46,687, as against 35,620 last year.

Bootle.—With regard to the loan of £40,000 for electric lighting purposes, the Local Government Board have sanctioned the borrowing of £38,750, but have requested farther particulars with reference to the balance.

Water Power.—A 50,000-h.p. electric plant has been installed in the upper valley of the Hudson. Large power-houses utilising waterfalls to generate electricity are now so common in America as to cause little comment.

New Telephone Trunk Line.—The postal authorities have opened a new telephone trunk line connecting Pengam, New Tredegar, and Tredegar with Newport. This will relieve a great deal of the pressure in the Rhymney Valley.

Clitheroe.—The Town Council have decided to apply to the Board of Trade for a provisional order under the Electric Lighting Acts, 1882 and 1888, authorising the Corporation to supply electricity for public and private use within the borough.

Woolwich.—The clerk and electrical engineer have been instructed to obtain information from other boroughs relating to assisted wiring schemes in operation and report thereon, and a sub-committee is to formulate a scheme of assisted wiring.

Northallerton.—The postal authorities are now busily engaged in extending their trunk telephone line to Northallerton. All the necessary subscribers have been obtained, and it is expected the local exchange will be in working order next month.

Gloucester.—At the last meeting of the City Council several members spoke strongly in favour of improved lighting in various parts of the city, and Alderman Fielding took the opportunity of advocating the electric light being used wherever possible.

Bray (Berks).—The Council have decided not to object to the application from the borough of Maidenhead to the Board of Trade for a provisional order to authorise the supply of electricity for public and private purposes within the parishes of Cookham and Bray.

Mica Boiler Governing Co.—We are informed with regard to the Mansfield electricity works and also the Bexley electric lighting and tramway works that all the steam-pipes in both these installations and the boilers in the latter were covered by the above company.

Exeter.—Mr. Perry, in moving the adoption of the electric lighting report at the last Council meeting, said the profits earned by the plant of their inadequate station augured well for the future when the new electricity station was completed, and that would be very soon.

North Wilts.—Calne, Chippenham, and Devizes are considering, or about to consider, the advisability of having municipal installations of electric lighting. Chippenham is most advanced, Devizes comes next, and Calne is in the very earliest stages of consideration.

Bethnal Green.—This is the only borough in East and North-East London not lighted by electricity, but the Borough Council have secured a site for an installation, and have decided to apply to the London County Council for a loan of £15,750 for the purchase money.

Chester-le-Street.—At a recent very largely attended open-air meeting promoted by the Chester-le-Street Trades and Labour Council a resolution was passed calling upon the Parish Council to take the necessary steps to secure a supply of electric lighting for the streets and by-roads.

Colchester.—The electrical engineer in his last report gives the following figures: output of electricity in units during August, 1903, 19,099, 1902 12,043, 1901 6,578; number of consumers at end of August, 370, (299), (189); total number of 8-c.p. lamps connected, 23,206, (17,462), (13,322).

Middlesbrough.—The electrical engineer, Mr. Taylor, has been instructed to prepare specifications for extending the plant at the electric lighting station, it being pointed out that the extent to which the light would be used during the winter months would necessitate the use of the reserve plant.

Gateshead.—The North-Eastern Railway Company have decided to substitute electricity for steam power for the driving of the whole of the machinery comprised in the company's locomotive works at Gateshead-on-Tyne. Power will be supplied by the Tyneside Electrical Power Company from their Neptune Bank station.

Whitby.—The Urban District Council have decided to utilise electric power for the working of the pumps in connection with the sewage outfall works, and to apply for sanction to the raising of a further electric lighting loan of £5,000 for the extension of cables and additional plant in connection with the electric light undertaking.

St. Annes.—The electric engineer in his last report states that the units sold during August were 48,811, against 9,824 last year, and for the present year 153,300 against 37,313. The consumers now number 195 against 120. During the month applications have been made for 196 lamps. Additional Nernst lamps are to be fixed in various roads.

Whitehaven.—The Guardians have, we understand, adopted electric lighting for the workhouse under a contract by which they bind themselves (1) not to use any other light than electric light at the workhouse for a period of 10 years; (2) to pay not less than £100 a year; and (3) to commence this payment as soon as the work of laying the cable is completed.

Change of Address.—We are informed by Messrs. Wimshurst, Hollick, and Co., Limited, that on and after Oct. 9 all communications to them should be addressed to South Fambridge, near Rochford, Essex, the head office and works of the company. The firm's London office will be removed to 90, Cannon-street, E.C., telephone No. 937 Bank, from the same date.

Longton.—The manager in his last report states that the number of units of electricity generated during the past month was 4,237, being an increase of 1,195, compared with the corresponding period of last year; and that 57 16-c.p. lamps had been connected to the electricity mains during the month; and that an application had been received for current for motive power.

Islington.—It is proposed that to encourage an increased day load the uniform flat rate of 2d. per unit be modified for all electricity for power purposes consumed between the hours of midnight and 6 p.m. by the following sliding scale: for all units up to 2,000 per annum, 2d. per unit; from 2,000 to 20,000 units per annum, 1½d. per unit; from 20,000 and over per annum, 1¼d. per unit.

Hornsey.—The Council have adopted the following resolution: "That the time being opportune for the Council to give its assistance to the movement for introducing the telephones into the district, it be referred to the Highways and Lighting Committee to consider the advisability of urging his Majesty's Postmaster-General to include Hornsey in the Post Office system of telephones at an early date."

Wrexham.—The borough electrical engineer's last report contains the following figures: Connections and supply — units generated August, 1903, 31,804; units generated August, 1902, 8,737; used for tramways, 14,157; used for lighting, etc., 17,647. Connected during the month—one consumer with 44 lamps of 8 c.p. Total number of consumers connected to date 132, 10,610 lamps of 8 c.p.

Kingston.—The Town Council have received sanction to the borrowing of £7,784 for electric lighting. The Surbiton Urban District Council have given notice to the Corporation to terminate at the expiration of one month from the 1st inst. the supply of electricity to premises in Surbiton. An arrangement is to be made for taking over the cables laid by the Corporation to such premises. It is proposed to light St. Luke's Church clock by electricity.

York.—The report of the Electric Lighting Committee, presented to the City Council on Monday, states that the works on Foss Islands are proceeding in a satisfactory manner, and that the destructor, which has been undergoing repairs, is now in full working order. With a view to improving the lighting of certain parts of the city, the York Electric Lighting Committee have decided to alter certain public arc lamps at a cost of £28 per annum, and an outlay of £50.

Mansfield Woodhouse.—The Urban District Council have resolved to retain the services of Mr. Warden-Stevens as electrical engineer to advise the Council in their application to obtain a provisional order enabling them to supply electrical energy to the district. The surveyor has been requested to prepare plans, showing the compulsory area in which it is proposed to supply electrical energy within a period of two years from the date of obtaining the provisional order.

Digitized by Google

Derby.—The Electric Lighting Committee have been in communication with the Local Government Board with respect to the appropriation for the purposes of an electricity generating station of the land in Full-street, acquired for the extension of the Full-street baths, and a letter has been received from the Board to the effect that having regard to the powers conferred upon the Council by Section 96 of the Derby Corporation Act, 1901, the approval of the Board is not necessary.

London County Council.—The Fire Brigade Committee, reporting on the Bayswater sub-station, stated that they proposed that the station should be lighted by electricity, and in due course they would obtain and submit tenders for the necessary wiring and fittings. An expenditure of £848 in connection with the electric light and electric bell installations at the Bayswater sub-station, and of incidental expenses arising out of the erection of the building, has been authorised.

King's Lynn.—At the meeting of the Guardians it was reported that the cost of electric lighting for the Michaelmas quarter was: workhouse and casual ward, £8. 7s. 3d.; infirmary, £11. 14s. 9d.; laundry motor, £13. 9s.—total, £20. 15s. 9d., as compared with £23. 14s. 8d., the cost of gas for the corresponding period 1901, and being a saving of £2. 18s. 11d. The Chairman said the report was very satisfactory, as in the new infirmary there were 45 lights, and these were not included in the 1901 cost.

Ramsgate.—The report of the committee of the whole Council adopted last week is as follows: "The town clerk submitted a draft agreement received from the Isle of Thanet Electric Tramways and Lighting Company, Limited, as to application by them for taking over the Ramsgate Electric Lighting Order, 1900, and it was resolved that Messrs. Edmundson's be asked to submit within seven days a draft agreement carrying out the proposals contained in Messrs. Pressland and Fippard's letter of the 21st inst."

Rotherham.—Important additions are being carried out by the Parkgate Iron and Steel Company, Limited, which will add considerably to the productive capacity of the works, and will also bring the plant thoroughly up to date. The plant is being increased by the construction of two "close-top" blast furnaces, equipped with Sahlin's water-cooled boshes, electric hoists, and automatic charging apparatus. This company were among the first iron and steel makers in England to introduce electric lighting and power into the works.

South Wales Electric Power Co.—The building near Pontypridd for the first generating station is practically completed. Several Galloway boilers have been delivered and are awaiting erection. A considerable mileage of mains is already laid. We understand that the Urban District Council of Ammanford is negotiating with the company to take a supply, and if terms can be arranged the Council will apply next year for a Board of Trade provisional order. Arrangements have also been entered into with Port Talbot, and they will most likely take a supply in bulk.

Glasgow.—At the last Council meeting Mr. Kennedy asked whether the £1 of free terminals granted to certain telephone subscribers was not equivalent to those subscribers getting the service at £4. 5s., while other users not requiring trunk services paid £5. 5s. He wished to know if this did not constitute an illegal preferment. Sir James Marwick, town clerk, stated that the telephones manager had been asked to make a report on the matter. The Electricity Committee's recommendation of a scheme for selling or hiring out electric motors and other fittings has been defeated.

Finchley.—A letter from the East Barnet Valley Urban District Council in reference to the supply of electricity is before the Electricity Committee. The Electricity Committee's estimate for the half-year ending March 31, 1904, is as follows: Expenditure—generation, £595; distribution, £60; public lighting, attendance and renewals, £60; management, £310; capital charges and contingencies, £179. 9s. 11d.—total, £1,204. 9s. 11d. Receipts—estimated receipts from private consumers for public lighting, rents of meters, etc., £965; estimated sum to be provided by rate, £239. 9s. 11d.

Black Forest Industries.—Owing to co-operative enterprise in the Southern Black Forest, the looms of upwards of 500 domestic weavers are to be driven by electricity. The total cost of establishment for the power plant is estimated at about £17,000, this sum to be supplied by the Wald-Elektra Saekingen Waldshut Power Company, apart from a subvention granted by the Baden Government. The great advantage of this enterprise will be that silk ribbon weaving will be enabled to be preserved as a domestic industry, securing a yearly income of about £15,000 to the poor inhabitants of the forest.

Dundee.—The Works Committee of the District Lunacy Board have asked Mr. Richardson, the burgh electrical engineer, as to whether the present electric lighting installation should be repaired or a supply of energy got from the town. Mr. Richardson has now reported that he could not give a statement of the relative cost of the two schemes as there was no data to estimate the cost of the present supply, and he suggested that arrangements should be made for keeping a record of the energy consumed during the next 12 months, when the question could be more satisfactorily dealt with. This has been agreed to.

Belfast.—The minutes of the Gas and Electric Committee contains the following paragraph: "It had come to the knowledge of the committee that the Law Committee proposed retaining the services of an expert electrical engineer who had had experience in connection with tramway and electrical undertakings, to prepare plans and make a preliminary report for the guidance of the Council. It was resolved that the Law Committee be informed that that committee was quite prepared to undertake through its officers the electrical portion of the work, and saw no necessity for engaging costly outside assistance."

University College of North Wales Electrical Engineering Department.—With the opening of the college on Oct. 1 the electrical engineering department will enter upon its fourteenth session. Two of the students who left last session have been admitted to the British Westinghouse Works at Trafford Park, Manchester, and two into the British Thomson-Houston Works at Rugby. The department is maintained by means of a grant made by the Worshipful Company of Drapers, London, which enables the college to appoint as an assistant to Prof. Taylor Jones a special assistant lecturer in electrical engineering.

Brighton Accounts.—With reference to the abstract of accounts of the Brighton electric lighting undertaking which appeared in our last issue, we have now received a corrected proof from Mr. A. Wright, the consulting engineer. The chief alteration occurs in the revenue account in the repairs items. These figures should read as follows: repairs to buildings, £361. 9s. 2d.; repairs to machinery, £2,492. 0s. 8d.; repairs to mains, £1,687. 12s. 2d. (less £627. 13s. 4d., amount charged to tramways department for overhauling mains). The sum total, however, remains the same. The revised figure in respect of total capital expenditure to date is £463,374, in place of £466,746 originally given.

Hammersmith.—Since the last Council meeting 10 additional consumers have been connected, representing a maximum of 619 8-c.p. lamps. Nine consumers have been disconnected. The present number of consumers now taking current from the mains is 1,289. The engineer has a quantity of plant in the station which is not now used, and is of no use to the department—viz., No. 1 set, pumps, etc.—and Messrs. Wheatley, Price, and Kirk have been instructed to dispose of the same for a commission of 5 per cent. on the amount realised. The postal authorities are about to take up the footway on the west side of Bamborough-gardens for the purpose of laying a line of underground telegraph.

Sunbury.—The Twickenham and Teddington Electric Supply Company are prepared to supply electric current for public lighting over the entire district. In regard to the company's application for a provisional order, they proposed to insert clauses which would give the Council power to purchase the undertaking at a valuation in 7, 14, or 21 years. Also to supply current to private consumers at 7d. per unit for the first hour per day as the maximum demand, and 8d. per unit for further quantities. They are prepared to enter into agreement to supply current for public lighting at a price not exceeding 2½d. per unit. The subject has been deferred, and the surveyor instructed to make enquiries.

Maidenhead.—On Sunday the electric light at St. Joseph's Church, Cookham-road, was used for the first time. The church is lighted by 16 lamps of 25 c.p. each. The contractor was Mr. F. J. Bloomfield, King-street. A committee has been appointed to arrange for the proposed street-lighting extensions. Messrs. Percy Johns, borough surveyor, and C. O. Milton, electrical engineer, propose seven 10-ampere 46-volt 2,000-c.p. arcs, two 35-n.c.p. Nernst, one 500-n.c.p. arc, one 230-volt 500-c.p. arc, one 115-volt 200-c.p. arc, one 32-c.p. British Prism Globe Company's incandescent, one 16-c.p. Imperial Electric Company's incandescent, two ½-ampere 35-c.p. Nernst. Together with the former scheme 54 lamps would be installed. A loan of £10,000 is being raised for the purpose.

Stock Exchange Settlements.—The Stock Exchange Committee has appointed Oct. 22 special settling day for Underground Electric Railways Company of London's fully and partly paid provisional certificates for £3,599,268 5 per cent. profit-sharing secured notes. The committee have also ordered the Metropolitan District Railway Company's £2,116,666 3 per cent. consolidated rent charge stock, in lieu (partly) of the 4½ per cent. Ealing rent charge stock and the 4½ per cent. Fulham rent charge stock now quoted, to be quoted in the official list. Application has been made to the Exchange Committee to appoint a special settling day in and to grant a quotation to the London United Tramways (1901), Limited, further issue of £206,000 4 per cent. first mortgage debenture stock.

Swansea Telephones.—Considerable progress has been made towards the completion of the system, and there appears to be some prospect of opening the exchange early next month. A large number of subscribers are already connected to the exchange, and will enjoy the free use of the system up to the date of the opening ceremony. Cables have been laid under the docks to connect up the eastern portion of the town and local exchanges established at Morriston and Oystermouth. Terminals will be charged to the Corporation telephone department by the National on all messages sent through the Corporation's system, and the Corporation will charge the National Company for all messages received from National subscribers in other towns. The subscribers who have been using the Corporation lines to speak to Cardiff, Liverpool, London, etc., have not been asked to pay anything more than the Post Office charge, which the National subscribers have to pay on all trunk messages.

Carnarvon.—The Town Council have received an offer from the North Wales Power and Traction Company to provide the borough with a continuous electrical supply suitable for both power and lighting, the company undertaking the erection of a distributing station within the borough and supplying the energy at a maximum rate of 3d. per unit for power and lighting, with a suitable discount for power consumers, the company conveying the current at their own expense to the station, delivering in bulk at a voltage suitable for both lighting and power, the distribution being done by and being the property of the town. The company also offered an alternative scheme, itself undertaking the distribution and delivering the wires to the consumers' terminals at a maximum rate of 4d. per unit for lighting and 2d. per unit for power, but the order and the whole undertaking becoming the company's property, the company re erving for the Corporation a call for any power required for tramway purposes at special rates. The Electric Committee have been empowered to employ an expert to report fully on the details of all the schemes now before the Council, and advise on their respective merits.

Digitized by Google

Inverness.—The Town Council have resolved to accept the offer of Edmundson's Electricity Corporation, Limited, to establish and carry on the lighting of the town by electricity. The company will repay the costs incurred in connection with the provisional order, and they will have the option of terminating the permanent leave by giving 12 months' notice at the end of seven years, or at the end of any subsequent term of seven years, the price to be paid by the Town Council to be the capital expended by the company with the addition of 15 per cent., and a sum sufficient to make up profits to 5 per cent. per annum. The works must be completed within 12 months from the date of the lease. The company will adopt the system of free wiring. The Town Council selected the offer on the recommendation of Messrs. Buchan and Hogarth, consulting electrical engineers, Edinburgh.

Bridgend.—The agreement between the Council and the South Wales Electrical Power Distribution Company provides that the Council shall pay for electrical power 2½d. per unit, plus ¼d. for transformation, for 50,000 units, and that the price per unit shall decrease according to a scale agreed upon as the total amount of electricity taken increases. It is furthermore provided that when any similar body in the district obtains energy from the company at a lower rate the Council rate shall be similarly reduced. Some months ago the company voluntarily reduced the charge to 1⅜d. per unit, plus an eighth for transformation, upon which terms they had recently agreed to supply the asylums. Within the urban district the company have no right to supply energy for lighting purposes without the consent of the Council. They, therefore, represented to the Council that they would lose several large power customers whom they had in view, unless they were allowed to supply them with electricity for lighting purposes as well as power. The Council gave consent, but it was conditional upon their being allowed the ⅛d. which the company charged for transforming the town supply. This met with a refusal, and the Council have now decided to prohibit the company from supplying light to any firms within their district.

Fulham.—The borough electrical engineer has submitted the undermentioned statistics with regard to the quantity of refuse destroyed and connections for current:—Previously reported 5,794 loads (8,653 tons); from July 17 to 30, 1903, 722 (1,135½); from July 31 to Aug. 13, 664 (1,022); from Aug. 14 to 27, 606 (973); from Aug. 27 to Sept. 10, 652 (1,007½)—total, 8,438 (12.791). Trade refuse: previously reported, 104 loads (104½ tons); from July 17 to 30, 17 (18); from July 31 to Aug. 13, 12 (14½); from Aug. 13 to 27, 10 (9½); from Aug. 27 to Sept. 10, 14 (17) - total, 157 (163). Clinker disposed of: Previously reported, 3,931 tons; from July 17 to Sept. 10, 1,607—total, 5,538. Connections for current: Previously reported 752 = 33,578 8-c.p.; from July 12 to 30, 19 (572); from July 31 to Aug. 13, 24 (507); from Aug. 14 to 27, 37 (1,165); from Aug. 28 to Sept. 10, 25 (1,207)—total, 857 (87,029); consumers not ready for connection, 23; consumers not paid deposits, 9. Mr. J. H. Clack, the chief clerk of the electricity department, is to be allowed to continue the work of canvassing for consumers of electric light and power, and is to receive, in addition to his salary, 1d. per equivalent 8-c.p. lamp connected to the mains up to a connection of 5,000 lamps per annum, and ½d. per equivalent 8-c.p lamp connected to the mains for all connections above 5,000 lamps per annum.

London Gazette.—The first meeting in the estate of William Thomas, electrical engineer, 54, Bridge-street, Llandaff, lately residing at 13, Despenser-street, Cardiff, Glamorgan, will be held at 11.30 a.m. on Oct. 15 at 147, St. Mary-street, Cardiff. The partnership heretofore subsisting between Walter Andrew Mathew and Herbert Raymond Wilding, under the style or firm of W. A. Mathew and Co., at 59A, High-street, Beckenham, Kent, as motor, electrical, and general engineers, has been dissolved by mutual consent from Aug. 31, 1903. At an extraordinary general meeting of the members of the Renewable Electric Lamp Company, Limited, held at Brunswick Works, Brunswick-place, City-road, London, N., on Sept. 22, 1903, the following extraordinary resolution was passed: "That it has been proved to the satisfaction of this meeting that the company cannot, by reason of its liabilities, continue its business, and that it is advisable to wind up the same, and accordingly that the company be wound up voluntarily." Mr. D. L. Chalmers, of Vron House, Llangollen, was appointed liquidator for the purpose of such winding-up. A general meeting of the members of the English and General Tramways Company, Limited, will be held at 1 and 2, Great Winchester-street, London, E.C., on Nov. 9, 1903, at 3 p.m., for the purpose of having an account laid before them showing the manner in which the winding-up has been conducted and the property of the company disposed of, and of hearing any explanation that may be given by the liquidator, and to determine the manner in which the books of the company shall be disposed of.

Acton.—The Dowsing Radiant Heat Company, Limited, have written to the District Council with reference to the supply of electrical current for lighting, heating, and motive power at Oldfields, Acton-vale, as follows: "We are taking the above premises in Acton, and require a large supply of electrical current for lighting, heating, and motive power. We should, of course, be glad to take the current from your Council, but we are aware of the fact that you are unable to supply, as you have not yet put your electrical powers into force. As, however, the property referred to is within about 200 or 300 yards of the Hammersmith boundary, we have approached the Borough Council of that district, and are given to understand that they would be willing to supply us the electricity we require, if you will give your sanction to the necessary mains being laid along the footway from their boundary along Acton-vale up to Oldfields. We believe that the Hammersmith Corporation would require the right to supply for five years, and we trust that you will agree to give your sanction to the above, as it is most important so far as our business is concerned. We may state that the writer has been resident in Acton for some three years past, and has been compelled to put down machinery to generate the electricity, but in our new premises we shall require a much larger amount of current, and do not wish to go to the expense of putting down electrical machinery for the purpose." The Council have declined to consent.

London County Council.—On Tuesday it was agreed to lend the Hackney Borough Council £906 for electric lighting works, and the Fulham Borough Council £13,509 for electric lighting and other works in connection. A report was submitted on a notice served upon the Council by the Metropolitan District Railway Company of intention to proceed with the work, authorised by the Metropolitan District Railway Act, 1900, of laying electric mains along Fulham-road, King's-road, Uverdale-road, and Lots-road, Chelsea, as shown upon the plans which accompanied the notice. The Highways Committee on a former occasion stated that these plans did not indicate to what extent the Council's sewers would be affected by the proposed works, and they, as a matter of urgency, disapproved the works on behalf of the Council. The Underground Electric Railways Company of London, which was intimately connected with the company above named, has since submitted for the Council's approval cross-sections of Fulham-road, King's-road, and Lots-road, where the proposed mains would cross those thoroughfares, indicating the positions of the various sewers affected. Having considered these further particulars submitted by the company, there appeared to the committee to be no objection to the proposed works being put in hand, and, acting under the authority given by the Council to deal with urgent matters during the summer vacation, they approved the proposed works on behalf of the Council, subject to the works in Fulham-road, King's-road, and Lots-road being carried out in accordance with the cross-sections forwarded by the company, and to the road boxes being constructed at some distance on either side of the sewer in King's-road. The following notices to lay mains, etc., under Electric Lighting Acts and orders were also agreed to: from the Blackheath and Greenwich District Electric Light Company, Brompton and Kensington Electricity Supply Company, Charing Cross and Strand Electricity Supply Corporation, Kensington and Knightsbridge Electric Lighting Company, Lewisham and District Electric Supply Company, City of London Electric Lighting Company, County of London and Brush Provincial Electric Lighting Company, Metropolitan Electric Supply Company, Notting Hill Electric Lighting Company, Westminster Electric Supply Corporation, and St. Pancras Borough Council. The receipts of notices, as follows, served under orders granted to local authorities, and under which the Council has no power of approval or disapproval of works, was reported: from the Bermondsey Borough Council of intention to lay mains along Neckinger, Spa-road, Rouel-road, Dockley-road, St. James-road, Tranton-road, and Southwark Park-road; Hampstead Borough Council, to lay mains along portions of North-end, Hemstall-road, Belsize-road, and South-hill-park; Islington Borough Council, to lay mains along a portion of Wallace-road; Stepney Borough Council, to lay mains along portions of Cannon-street-road and Cable-street, and along portions of Upper East Smithfield, Three Colt-street, Watney-street, St. George's-street, and High-street, Shadwell.

Brighton.—The Council have confirmed the following proceedings of the Lighting Committee: With reference to Councillor Butt-Thompson's enquiry as to the amount of capital which would have to be gradually written off on the completion of the Southwick power station, Mr. Arthur Wright, consulting engineer and manager, reported to the committee that the original cost of the three tramway generating sets was £7,530, of which £205 has already been provided for by the sinking fund. In his opinion these sets would realise between £4,000 and £5,000 if sold any time during the next five years. The evaporative condenser referred to in his previous report had been in use for seven years, and cost, roughly, £1,500. Of this, about £200 had been provided for by the sinking fund, and the balance should, in his opinion, be written off during the next three years. The 270 meters which Mr. Christie had reported as being obsolete were of the Chamberlain and Hookham and Thomson types, and had been in use for about 10 years. The amount at which they stood in the ledgers was about £1,400, and this amount should, in his opinion, be at once written off, as they failed in selling any one of them after publicly advertising same. The consideration of the report was deferred by the committee. Mr. John Christie, resident engineer, reported that he found in actual practice that greater efficiency could be obtained out of the storage battery used in conjunction with the tramway supply if they added 12 more cells, which would enable them to take a much greater output from it, and maintain the full pressure to the tramways throughout the whole discharge. He had obtained prices from the Electrical Power Storage Company, who had at present men carrying out some alterations to the existing battery, and they stated that if they place the order with them while their men are here, they would erect them complete, and let them fall under the terms of the existing contract, for the sum of £14. 11s. 6d. per cell. He recommended acceptance of this offer, and suggested that the capital to pay for this should be borrowed on the same terms as the existing loan, when the next enquiry was being held. The committee resolved that the report should be approved and acted upon. For the carrying out of the numerous short extensions of the mains which were passed from time to time, Mr. Christie reported that he required for stock one mile of one triple-concentric lead-covered cable. He asked four of the leading firms to quote for the standard cable, which was now manufactured by all the cablemakers, and recommended the acceptance of the cheapest—viz., that of Messrs. Callenders, at £310 per mile. With reference to the supply and distribution by the Council of electricity in parishes outside the borough, the Town Clerk reported that under the Brighton Corporation Act of last session the Council were empowered to supply and distribute electricity within the parishes of Rottingdean, Ovingdean, Patcham, Falmer, Preston Rural, Hangleton, Portslade Rural, Old Shoreham, Kingston-by-Sea, Lancing, and West Blatchington, subject to compliance with certain provisions. It was resolved that application should be made to the Rural District Councils of Steyning East, Steyning West, and Newhaven for their consent to the supply by the Corporation of electricity to consumers within the

Digitized by Google

parishes named in Section 30 of the Brighton Corporation Act, 1903, which are within their respective districts.

Reading.—At the last Council meeting a report from the sub-committee appointed to consider the advisability of purchasing the undertaking of the Reading Electric Supply Company, Limited, was read. It stated: "The terms upon which the Corporation may acquire the undertaking of the company are set out in Section 58 of the Reading Electric Supply Order, 1893, which provides as follows: (1) The local authority may at any time before the expiration of 42 years after the commencement of this order—namely, July 27, 1893—give notice in writing to the undertakers requiring them to sell the undertaking authorised by this order to the local authority, and thereupon the undertakers shall sell the same to the local authority upon the terms of the local authority paying to the undertakers an amount of money as shall be equal to a sum of £133 for every sum of £100 properly expended by the undertakers upon the said undertaking and chargeable to capital account . . . provided that if the local authority shall exercise the power conferred by this sub-section before the expiration of 21 years the local authority shall in addition to the amount of money to be paid to the undertakers as aforesaid pay to the undertakers a sum equal to the aggregate amount of a dividend of 5 per cent. per annum on the said capital expenditure less the aggregate amount of the dividends declared by the undertakers. (There are other provisions as to the purchase of the undertaking after the expiration of 21 or 31 years.) The sub-committee have considered a statement which has been prepared by the borough accountant from the published accounts of the company showing that the amount of stock which would probably be required to be raised for the purchase of the company's undertaking on the basis of the section above referred to would amount to the sum of £178,395. The following is a copy of the statement: The capital expenditure to Dec. 31, 1902, as stated in the last published balance-sheet of the company was £112,750; add 33 per cent. to the above amount in accordance with the purchase clause in the company's provisional order, £37,208—total, £149,958. In addition to the above sum of £37,208, the Corporation would have to pay the difference between the amount actually paid by the company for interest and dividends, and an amount calculated at 5 per cent. on the capital expenditure. 1894, capital expenditure £11,192, (equivalent to 5 per cent. dividends £280—half-year); 1895, £17,875 (£1,453), 1896, £6,146 (£1,761); 1897, £7,199 (£2,121); 1898. £11,776 (£2,709); 1899, £21,447 (£3,782); 1900, £15,663 (£4,565); 1901, £8,798 (£5,005); 1902, £12,654 (£5,634)—£112,750 (£27,313). Deduct dividends declared, year ended Dec. 31: 1899, £1,448; 1900, £3,184; 1901, £4,692; 1902, £5,096—£14,420. Interest on capital temporarily raised by the issue of debentures and bank interest: 1896, £147; 1897, £641; 1898, £864; 1899, £640; 1900, £3—£2,295—£16,715. Total cash payable to the Reading Electric Supply Company, Limited, in the event of purchasing their undertaking, £160,556; this would necessitate an issue of stock, assuming £90 net cash for each £100 of debt created amounting to £178,395; the annual charge for interest and sinking fund on the above sum at 5 per cent. repayment in 30 years would be £9,102; the profit declared by the company last year, being after the rate of 5 per cent. per annum was £5,006—difference, £4,006. Having regard to the fact that according to this statement the amount which would be required each year to provide sinking fund and interest would be very considerably in excess of the profit declared last year, the sub-committee are of opinion that the Corporation would not be justified in purchasing the company's undertaking under the terms of the order above referred to. They, however, recommend that the company be informed that the Corporation will be willing to consider any proposals which the company may make to the Corporation for the sale of their undertaking." It was resolved that the report be received and the recommendation adopted.

PROVISIONAL PATENTS, 1903.

SEPT. 28.

20788. Improvements in or relating to electric arc lamps. Adrian Denman Jones, Hartham Works, Hartham-road, Holloway, London.

20791. Improvements in terminals for wiring motors or any other electrical appliances. Ernest Henry Ainsworth, 21, Tindal-street, Chelmsford.

20820. Improvements in or relating to electric machines. Henry Chitty, Westinghouse-building, Norfolk-street, Strand, London.

20825. Improvements in and relating to electric lamps. Walter Charles Head and William Arthur Snape, 20, Filey-avenue, Clapton, London.

20834. Improvements relating to lamp casings and reflectors principally for incandescent electric lamps. Dennis Joseph O'Brien and Tullis Antonio Rotanzi, 18, Buckingham-street, Strand, London.

20836. Improvements in or relating to disinfecting fabrics and articles particularly applicable for telephonic and other apparatus. Alfred Julius Boult, 111, Hatton-garden, London. (Charles Fuchs and Henri Chrétien Kelterer, Belgium.)

SEPT. 29.

20875. Improvements in electric lamp holders and means for securing shades or globes thereto. John Thomas Lambert, 32, John William-street, Huddersfield.

20888. Improvements in and connected with a mechanism for ascertaining and recording thermic pressure, kinetic, and potential differences. John Fisher Le Page, 8, King-street, Manchester.

20907. Improvements in telegraph systems. Charles Kinney Jones, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

20916. Improvements in current regulators. Sydney Elliott Page, 28, New Bridge-street, London. (The International Electric Controller Company, United States.) (Complete specification.)

20921. Improvements in insulated electric conductors and method of producing the same. John Allen Heany, 18, Southampton-buildings, Chancery-lane, London. (Complete specification.)

20922. Improvements in magnetic separators. Julius Buss, 6, Great Winchester-street, London.

20926. An improved electric current converter. Albert Richard Müller, 6, Lord-street, Liverpool. (Complete specification.)

20933. Improvements in contact trolleys for electric tramcars and the like. Adalbert Domanski, 18, Buckingham-street, Strand, London.

20934. Improvements in electric switches, bell pushes, or fittings, and the like. Frederick Edward Dotchin, 18, Buckingham-street, Strand, London.

SEPT. 30.

20989. Improvements in or relating to electrolytic electricity meters. The Bastian Meter Company, Limited, and Charles Orme Bastian, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

20997. Automatic switch for control of starting electric motors. Frederick Collyer Newton, 30, Clovelly-road, Hornsey, London

21005. Improvements in and relating to alternating-current electric motors. The British Thomson-Houston Company, Limited, and Hans Sigismund Meyer, 83, Cannon-street, London.

21008. Improvements in mounting a number of electrical fittings or instruments upon a common base or panel. Renter Wolter Hendrick Hofstede Crull, 4, South-street, Finsbury, London.

21016. Improvements in or relating to alternate-current measuring apparatus. Arthur Francis Berry, 46, Lincoln's-inn-fields, London.

21027. Improvements in and relating to electricity meters. William Hamilton, 18, Southampton-buildings, Chancery-lane, London.

OCT. 1.

21043. Electromagnetic trolley rope check. Richard N. Eaton, 110A, Upper Leeson-street, Dublin.

21055. Improved methods of collecting currents of electricity in connection with a conduit system of tramways. Frederick John Anson and Joseph Walter Anson, 26, Mervan-road, Brixton, London.

21067. Improvements in electric motors. Joseph Henry Kaye, Commercial-street, Halifax.

21078. An improved party-line telephone system. Henry Conrad Heide, 1, Broad-street-buildings, Liverpool-street, London. (George Archibald Lowry, United States.)

21088. Improvements in and connected with telephone connections on the party-line system. Hermann Oppenheimer, 55, Redcross-street, Barbican, London. (Aktiengesellschaft Mix und Genest, Germany.)

21090. Improvements in or relating to dynamometers for electric currents. Alfred Julius Boult, 111, Hatton-garden, London. (Mathias E. Turner, United States.) (Complete specification.)

21093. Improvements in or relating to electrical switches (and their analogues). James Porter, 111, Hatton-garden, London.

21104. An improved electrolyte for electric batteries and method of preparing the ingredients composing said electrolyte. Alfred Blackman and Charles Ernest Warren, 45, Southampton-buildings, Chancery-lane, London.

21127. Improvements in controllers for electric motors. George Forbes, 24, Southampton-buildings, Chancery-lane, London.

OCT. 2.

21153. A splicing fitting for splicing or jointing trolley wires, cables, wire ropes, and metal rods of any description. Archibald Robert Dayson, Electric Car Depôt, North Bridge-street, Sunderland.

21194. Improvements in or relating to the method of transmitting printing telegraphic messages over long lines, and to the apparatus therefor. Antonio Battaglia-Guerrieri, 37, Essex-street, Strand, London. (Complete specification.)

21208. Improvements in alternating-current meters. The Compagnie pour la Fabrication des Compteurs et Material d'Usines a Gaz, 70, Chancery-lane, London. (Date applied for under Patents Act, 1901, Dec. 16, 1902, being date of application in France.) (Complete specification.)

21216. Improvements in electric railway systems. William Mantz Eader, Norfolk House, Norfolk-street, Strand, London. (Complete specification.)

Digitized by Google

Oct. 3.

21219. Improvements in secondary batteries. Sherard Cowper-Coles and Co., Limited, and Sherard Cowper-Coles, 82, Victoria-street, Westminster, London.

21220. Improved process for recovering copper from its alloys. Sherard Cowper-Coles and Co., Limited, and Sherard Cowper-Coles, 82, Victoria-street, Westminster, London.

21227. Improvements in or relating to lifeguards for electric tramcars and other road vehicles. William Arthur Turner and George Alfred Webster Turner, 55, Market-street, Manchester.

21240. An improved starting switch and automatic cut-out adapted for series-wound electric motors. Arthur Denby Smith, Highfield-lane, Keighley.

21261. A new or improved indicating device for use in connection with the trolleys of electric tramcars. George Herbert Babb, 33, Chancery-lane, London.

21294. Improvements relating to dynamo-electric machines and electric motors. Erik Artur Fagerlund, 45, Southampton-buildings, Chancery-lane, London.

21302. Improvements in automatic telephonic installations. Bernhard Kugelmann, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

21304. Improvements in driving electrical machines by means of steam-turbines. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Actien-Gesellschaft, Germany.) (Complete specification.)

21305. Method of and apparatus for maintaining uniform speed in electric motors. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Actien-Gesellschaft, Germany.) (Complete specification.)

21306. Improvements in electric lamps. John Benjamin Butler Burke, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

COMPLETE SPECIFICATIONS ACCEPTED.

To be published Oct. 22, 1903.

1902.

21346. Electric arc lamps. Jandus Arc Lamp and Electric Company, Limited, and Jones.

22031. Mariner's compass. Baron Kelvin, Clarke and Kelvin, and James White, Limited.

22152. Telephone call boxes. Hall.

23231. Signal devices for telephone systems. Baird.

23504. Overhead lifeguards for the protection of passengers from broken trolley wires on electrically-driven tramways. Teers.

23933. Supports or hangers for overhead electric wires. Bentley.

24705. Contact clamps for electric conductors. Carolan. (General Electric Company.)

24712. Alternating-current electric motors also applicable to meters of the induction type. Carolan. (General Electric Company.)

24713. Induction electromotors. Carolan. (General Electric Company.)

24715. Systems of electrical distribution. Carolan. (General Electric Company.)

24750. Covering or insulating material for electric cables. Johnson and Paterson.

24829. Disconnecting and junction boxes for underground electric cables and manhole covers and frames for same. Sowden.

26032. Controlling the speed of electric motors. Carolan. (General Electric Company.)

26036. Means for automatically stopping an electric railway car or train. Carolan. (General Electric Company.)

26042. Electric motors. Carolan. (General Electric Company).

26043. Electrical synchronising devices. Carolan. (General Electric Company.)

26045. Electric rock drills. Carolan. (General Electric Company.)

26047. Electric transformers. Carolan. (General Electric Company.)

26272. Alternate-current motors. Ablett.

26375. Electrical connecters. Carolan. (General Electric Company.)

26376. Insulation of electrical switches and the like. Carolan. (General Electric Company.)

26382. Electric rheostats. Carolan. (General Electric Company.)

26429. Switchboard frames. Statter.

26455. Electrically-operated railway or tram rail point shifters and the like. Meatchem.

26694. Electrical appliances for controlling and lighting gas burners. Down. (Framzen.)

27089. Electric power transmitters for sewing machines and the like. Rosenberger.

27150. Electrical sparking plugs for explosion engines. Ramoneda.

27897. Electric ignition apparatus for internal-combustion engines. Pognon.

1903.

11552. Section insulating bridges for electric overhead conductors. Harris.

13221. Magneto semaphore mechanism. Magneto-Electric Company and Leonidus G. Wooley.

14106. Electrically-operated ventilating fans. Haddan. (Bergmann-Electricitäts-werke Aktien-gesellschaft.)

14979. Electricity meters. Aron

15337. Magneto-electric igniting apparatus for internal-combustion engines. Roos.

16132. Rectifying polyphase alternating currents by means of unipolar or aluminium cells. Evans. (Allgemeine Elektricitäts-Gesellschaft.)

16450. Signalling apparatus worked by alternating currents. Siemens Bros. and Co., Limited. (Siemens und Halske Aktien-gesellschaft.)

17072. Method of syntonising two electric circuits and apparatus for use therein. Payne. (Secret document under Section 44, Patents, etc., Act., 1883.)

18376. Connection block for electric conducters applicable also as an insertion contact and ceiling rosette. Thompson. (Firm of O. and H. Keller.)

18586. Porcelain and other electric insulators. Langdon, Fuller, and Fuller.

UNIVERSITY OF MICHIGAN

NOTES.

Screw and Wire Gauges.—Our readers may be interested to know that Colonel A. H. Bagnold, R.E., of the Royal Arsenal, Woolwich, has specially compiled for the proprietors of the *Model Engineer* a table of small screw and wire gauges. From a hasty glance through the table it seems to be very complete in detail and carefully compiled. It may be obtained at the price of 3d. a copy.

Electric Telpherage.—We hear of a scheme which is now taking shape to instal a system of electric telpherage across the River Usk at Newport. The Alexandra Docks Company are the originators of the proposal, which has for its object the quick transport of goods across the river from the docks to the works on the east side. The scheme is as yet only in the initial stage, and we hope to be able to give details when something more definite has been decided on.

Radium.—The Vienna Academy of Sciences has appointed a committee to study pitchblende, the mineral from which the substance radium is derived. Baron Auer von Welsbach has placed his laboratories at the service of the committee during its researches. Pitchblende is one of the uranium series of minerals. It is of a greyish or brownish colour, and has a somewhat metallic lustre. It is found in Cornwall, Scandinavia, Germany, the United States, Hungary, and elsewhere.

Translation.—Opinion of the work by Charles Proteus Steinmetz, entitled "Theory and Calculation of Alternating-Current Phenomena," which was published originally in America, evidently ranks high in Germany, whence we have received a copy of a translation. To complete its German guise, the work has been rechristened "Theoretische Grundlagen der Starkstrom-Technik." Mr. J. Hefty is credited with the translation. We note that the symbols used for the calculations have been altered to conform with German practice; also that the chapter devoted to armature windings for direct-current machines has been revised by the translator. The publishers are Messrs. Friedrich Vieweg und Sohn, Braunschweig.

Tomb of Volta.—The bronze shield subscribed for by the students of the Institution of Electrical Engineers at the beginning of the present year has now been placed upon the tomb of Volta at Camnago, near Como. The ceremony of fixing it in place was performed on Sunday, Oct. 5, with many expressions of international good feeling, in the presence of Prof. Count Alessandro Volta, Cav. Franchi, the Sindaco of Camnago, with several members of the Volta family, and a number of other guests. The shield is mounted on a slab of green marble supported on granite in front of the tomb. The electrotype reproduction, which was officially deposited on the tomb on the occasion of the visit of the Institution in April last, has been transferred to the civic museum in Como, where it is placed in the collection of Volta relics.

Electrocution.—A well-meaning correspondent has sent us a copy of the *Ottawa Valley Journal* of Oct. 2, inviting—by means of the orthodox blue pencil—our attention to an announcement to the effect that "the Von Warmers" were executed by electrocution at Dannemara, N.Y., the previous day. Our correspondent evidently thinks that the event is of public if not of scientific interest, although one could imagine from the blunt, hard, matter-of-fact way in which the paper records the occasion that electrocution of criminals was an everyday occurrence over there. The one point of interest about the affair seems to be that three persons were electrocuted one after the other in the same chair in the space of 15½ minutes, but those who have a preference for the sensational may be more interested to learn that all three "died carelessly."

Marconi's Experiments.—Mr. Marconi arrived in this country on Saturday on board the "Lucania" from New York. It will have been noticed that in his utterances to the Press Mr. Marconi is nothing if not optimistic. In fact, even the recent wet weather does not seem to have damped his ardour, and he was again able on landing at Queenstown to predict that within two months his system will be sufficiently developed to start a commercial service of wireless telegraphy across the Atlantic. His experiments during the passage were most successful, and he was in daily communication with land during the entire voyage, the simultaneous reception of messages from Europe and America being effected for the first time. What most appealed to the passengers on the "Lucania," however, was that a summary of Mr. Chamberlain's Glasgow speech wa received on board on Thursday night when the vessel was many miles off the English coast.

A Snow Automobile.—During the coming winter the Allgemeine Elektricitäts-Gesellschaft will carry out some trials with a snow automobile or motor sleigh on what is known as the "Haidebahn"—a trolley omnibus line between Dresden and Klotzsche—on which electrically-propelled 'buses are run for passenger transport. The system of running electric 'buses fed from overhead trolley lines on the ordinary roads has more than once been described in this journal, and the same practice will be followed in the case of the snow automobile. The vehicle is very similar to the electric 'bus, with the difference that the hind pair of wheels is replaced by a pair of sleigh runners, while the driving wheels in front are fitted with tyres specially designed for taking hold of the slippery surfaces which have to be counted upon in Germany and France. The experiments which were made with this type of vehicle last winter were sufficiently successful to warrant further trials with it this year, and some interesting results are expected.

Motor Transport for Goods.—The possibilities of motor transport for goods as compared with horse transport over long distances and for heavy loads were discussed before the Society of Engineers last week in a paper contributed by Mr. Douglas Mackenzie. It is generally conceded that for loads less than 5 to 5½ tons weight the horse is cheaper than the motor, and Mr. Mackenzie puts the ideal load for motor transport at from 5 to 10 tons for distances exceeding 10 miles. Incidentally, the author urged upon inventors the great future that lies before the internal-combustion engine when it can be made to work with crude petroleum or residue. Another point which Mr. Mackenzie emphasised was that the speed of motor-wagons should be left unrestricted, so that each size could be run at the speed that proved most economical and most suited to the traffic encountered; also that motors should be confined to hard roads. Discussing the wear and tear produced on the roads, Mr. Mackenzie concluded that if the roads be of a proper standard, there is less wear and tear from the use of motor vehicles than from any other form of transport.

Underground Telegraphs.—In the Post Office estimates this year, Mr. Austen Chamberlain obtained the money for completing the connections between Warrington and Carlisle and between Manchester and Leeds of the underground telegraph system to the North. The cost of the work, together with a 20-mile extension at Beattock Rise, in the south of Moffat, was estimated at £135,000,

Digitized by Google

as against £160,000, which the 113 miles from London to Birmingham cost. The three new sections referred to cover about 120 miles, so that it will be seen that the cost of construction now is considerably less than a few years ago, due to the cheapening of materials. The Post Office authorities are urging on the contractors to complete the new pipes along the north-west route to Glasgow and Edinburgh. Practically all the exposed parts in the North of England will be dealt with in this manner before the end of next year, when the whole scheme will probably be completed. It is more than likely that the next extension of the underground system to be undertaken will be in the direction of Portsmouth, Bristol, and Land's End, recent storms having shown the susceptibility of the wires in the South of England.

Institution of Civil Engineers.—This institution will begin its winter session on Tuesday, Nov. 3, when the president, Sir Wm. H. White, K.C.B., will deliver his inaugural address. There will be a reception in the library at eight o'clock, followed by the presentation of the council's awards. The council have, in addition to the medals and prizes given for communications discussed at the meetings of the institution in the last session, made the following awards in respect of other papers dealt with in 1902-3: a Telford gold medal to George Deuchars (London); Crampton prizes to A. B. Brady (Brisbane) and G. Maxwell Lawford (London); Telford premiums to T. Johnstone Bourne (Tientsin), R. H. Rhind (London), H. T. Hincks (Marikuppam), G. A. Hobler (Cairns), A. J. Goldsmith (Brisbane), F. H. Frere (Derby), R. Appleyard (London), and P. Hamilton, B.Sc. (London). For students' papers the awards are: the James Forrest medal and a Miller prize to Waude Thompson (Burton-on-Trent); the James Prescott Joule medal and a Miller prize to I. V. Robinson (West Hartlepool); Miller prizes to H. A. Bartlett (London), J. D. Morgan (Glasgow), H. S. Watson (London), J. V. Thomas (Gloucester), O. B. Rattenbury (Doncaster), and C. M. Skinner (Newcastle-on-Tyne).

St. Louis Exhibition.—We have received a list of the rules laid down for governing the supply of electricity for light and power purposes during the continuance of the World's Fair at St. Louis next year. There are 18 of them in all, and the length to which the instruction goes in some cases should remove all ambiguity as to their meaning. To cite a few of the points insisted on, the charges for light and power are to be on a flat rate, and must be paid monthly in advance. No electric service will be furnished through meter except for storage batteries. The rates for incandescent lighting for the period of the exposition have been fixed as follows: for 16-c.p. lamps, not exceeding 60 watts per lamp, 28s.; for 8-c.p. lamps, not exceeding 30 watts per lamp, 16s.; and for 4-c.p. lamps, not exceeding 22 watts per lamp, 12s. A 5 per cent. discount will be allowed on accounts amounting for the term of the exposition to £35, 7½ per cent. on £70, 10 per cent. on £140, 12½ per cent. on £210, and 15 per cent. on £280. A minimum charge for current for any motor for the exposition term will be £2. 16s. The above are the general charges to be enforced, and the rest of the rules apply to special cases. We may state for the information of manufacturers on this side that a company has been formed in St. Louis under the name of the Electrical Exhibitors' Representative Company, the purpose of which is to represent small and medium-sized electrical firms in the Palace of Electricity during the exhibition.

Electric Power from Space.—Such is the wild dream of an American "inventor," who says he is able to draw electricity from the heavens above in unlimited quantities. We remember the New York correspondents of the London papers sending to this country long accounts of how this gentleman was going to revolutionise the electrical industry, but since then things seem to have prospered a little, and details of the inventor's scheme have found their way into the columns of the New York technical Press. The proposal is nothing more nor less than to fire a cylinder vertically into the air containing a magnet, a coil of strong copper wire, and a time clock. When a height of two miles is reached, the clock (if still in running order) will open the cylinder, and the wire will begin falling and uncoiling as the magnet ascends. Finally, the magnet will reach the ether and be held there, while the end of the coil of wire touches the earth. The unbelieving may, perhaps, wonder why the wire should fall and not the cylinder, but the reason for this, we are told, is the presence of the magnet in the cylinder, which at that height, according to the originator of the scheme, is attracted strongly up into the ether. One of our New York technical contemporaries satirically warns aeronauts of having any magnetic material used in the construction of their machines. They should remember, as stated in the inventor's prospectus, that "from the earth's mass outward in every direction the mind of man contemplates persistent and insatiable distance, engulfing persistent and insatiable distances," lest they too be caught up by the mighty ether, that "unfathomable mystery," which as it "rolls along swallows up, in utter contempt of their magnitude, all these distances and passes on."

Ventilation of the House of Commons.—Although from a scientific standpoint the method of ventilation in vogue at the House of Commons might be considered all that could be desired, it has, after exhaustive enquiry, been found to be deficient and inadequate for the requirements. Indeed, this enquiry has been going on for nearly 18 months, and it was only quite recently that the recommendations of the committee appointed to consider the question were made known. Electrical engineers will not be surprised to learn that the committee's first suggestion is that electrical fans should be substituted for the exhaust furnaces at present in use. Among the other recommendations is one that a more powerful intake fan should be provided, and that an officer of recognised scientific knowledge and experience should be appointed specially to watch the ventilation. Under the present system of ventilation air taken in on the river front and in certain courtyards is washed by a spray of water and passed through a layer of scim cloth to remove solid particles. After being heated by steam batteries it enters the chamber through grids under the matting of the gangways and through panels at the ends of the hall. In foggy weather the air is passed through 6in. of cotton wool, and in summer it can be cooled by blocks of ice placed in the airway. Under this system the air was found to contain, with half the seats in the chamber occupied, five parts per 10,000 of carbonic acid, and to have a mean temperature of 62deg. F., with a humidity of from 60 to 72 per cent. Altogether, the committee declare, the air as regards purity may be said to far exceed that found in many such buildings. Unfortunately, however, this conclusion is not confirmed by the subjective test of the members' own feelings.

English Transporter Bridge.—Since we last wrote on the subject—more than a year ago—much progress has been made with the construction of the transporter bridge which is to span the River Mersey between Widnes and Runcorn. The Bill authorising the structure was passed in the 1900 session of Parliament, and no time was lost in

Digitized by Google

UNIVERSITY OF MICHIGA

proceeding with the scheme. The type of bridge adopted is familiar enough in the States, but we believe is the first example of its kind in this country. In general design the bridge consists of a suspension bridge stiffened with side girders, having a platform and car suspended below the bridge. This platform and car are moved from end to end of the bridge by means of a trolley resting on track rails on the bridge, and the motive power is electricity. The river at this spot is about half a mile in width, and the span is of 1,000ft.—the greatest span of any bridge in the United Kingdom carrying road traffic. The towers, of which there are two on each bank, rise to 190ft. above high-water level. Two electric motors of about 36 b.h.p. will be provided to work the trolley, and will give a large margin of power. The motors are fixed in a kind of bogie in the trolley, so constructed that in the event of any curvature of the bottom boom the driving wheels will remain hard on the rails. The operator's cabin will be placed on the top of the car, and will contain a switch-board, by means of which the motors and the movements of trolley and car can be controlled. The bottom of the car will be about 12ft. above high-water level, and each journey will occupy about 2½ minutes; or, allowing for loading and unloading, about nine or ten trips will be made an hour. The total cost of the scheme will likely run into £130,000, and it will inaugurate a type of bridge which will probably come into larger use in this country for conveying low-level traffic over estuaries frequented by shipping.

The Smoke Nuisance.—It was only last week that a London magistrate, in a prosecution for smoke nuisance, was asked to say that a "funnel" was a "chimney" for the purposes of the Act, and that a steamer going down the Thames had infringed the statute by emitting black smoke from its funnels. This rather liberal translation of the word "chimney" was accepted by the magistrate, who in doing so no doubt had the common good at heart. There are some, however, who would hesitate to declare a ship's funnel to be a chimney, and something more may be heard of the matter in an appeal which has been lodged to a higher tribunal. We are reminded of this case by a suggestion thrown out by the *Lancet* this week that smoke need not necessarily be black to constitute an offence, and calling for a more liberal construction of Section 24 (*b*) in the Public Health (London) Act, where the word "black" as applied to offensive smoke is retained. Our contemporary is presumably inspired by the Society for the Prevention of the Smoke Nuisance when it quotes Dr. W. Collingridge as saying, "Many complaints are received of smoke nuisances which we are at present unable to deal with by reason of the fact that the smoke emitted—although intolerably objectionable—is not black, but of some less pronounced tint, as yellow or brown. On occasions we get complaints of nuisance from even white smoke." It is noteworthy that the Westminster City Council and the Corporation of London are anxious that the word "black" should be deleted from that section of the Public Health Act dealing with the smoke nuisance. The ultimate object, no doubt, is to rid thickly populated areas, like the city of London, of smoke altogether; otherwise it would hardly seem to be common fairness to put it in the hands of the authorities to prosecute in all cases of the emission of smoke within the prescribed area, whether it be black, yellow, brown, blue, or white smoke. Such a state of things would lead to authorities prosecuting everyone who had a fire within their area, and hence would paralyse industries which at present are quite sufficiently hampered.

Acheson Electric Furnaces.—At the Niagara Falls meeting of the American Electro-Chemical Society last month, Mr. Francis A. J. Fitzgerald read a paper in which he discussed the conditions for efficiency of several forms of electric furnaces of the type in which the current passes along a definite path or paths, thus localising the heat. The author gave a description of the various types of electric furnaces developed by Mr. E. G. Acheson, including the graphite, the electrode, the carborundum furnaces, and the furnace for moderately high temperatures. In all of these furnaces there is one common characteristic—the electrical resistance is a variable quantity, and after any furnace is started there are no means of adjusting internal conditions so as to effect regulation in this respect. In general, the resistance of these furnaces is high at the beginning of a run and low at the end. Therefore, means of varying the voltage at the furnace terminals must be used. The resistance of the furnace may be varied by altering the dimensions of the core, or that part of the furnace which acts as an electrical conductor. There are limits to the variations that can be made in this respect on account of other considerations, but the resistivity of a mass of carbon granules varies with the size of the latter, and further variation may be obtained by the judicious choice of different forms of carbon, which themselves have different resistivities. By taking advantage of this, any desirable variations in the resistance of the furnace may be obtained. The case of the electrode furnace is a special one, the adjusting of the resistance being obtained to a certain extent by the spacing between the piles of electrodes. The paper then proceeds to develop equations involving the various variable factors, from which deductions are made as to the practical limits of improvement in furnace regulation. In no case considered are the various fundamental equations rigorously applicable, for these involve numerous assumptions that do not represent the actual conditions, and take no account of certain conditions that are invariably present. Nevertheless, by keeping the theoretical considerations in view, a great help will be obtained in the building of furnaces and waste of time prevented in experimenting with designs that cannot possibly be satisfactory.

Tramways in London.—In the approaching municipal elections in the London boroughs the tramway question promises to be one of the chief, if not the chief bone of contention. Since the first set of London borough councils was elected three years ago the tramway system in the South of London has made great strides under the management of the London County Council, and there is one factor which may be expected to weigh heavily with the electors—*i.e.*, that since the County Council took over the control of the tramways, nearly £300,000 has been set aside in relief of rates. Mr. J. Williams Benn, the indefatigable chairman of the London County Council's Highways Committee, has prepared an interesting pamphlet on the tramway question which is being widely circulated. In it he deals more particularly with the "partnership" which he says exists between the borough councils and the County Council. He says: "The position with regard to tramways in London is completely changed since the London County Council became the tramway authority. Formerly the vestries made the tramway companies seeking powers pay as much as possible for the use of the streets. Now the London County Council and the borough councils are in partnership: first, to complete and electrify our tramway system. The central body does the work, and the profit balance is placed at the disposal of the borough councils. For financial reasons, as well as many others, it is to their interest to assist the London County Council to multiply tramways. Further, this partnership

Digitized by Google

in the ownership and use of the streets is of the greatest value in keeping them free from disturbance by companies, who naturally work for dividends rather than the convenience of the public. The Metropolitan Board of Works, and later the London County Council, have contributed one-half of the cost to street improvements of a local or semi-local character. Now, owing to the opportunity of earning tramway profits, the London County Council bears two-thirds of the cost, leaving the road authority to find one-third only. This, of course, only applies to cases where tramways are permitted. Some districts, through refusing such a contribution, have lost, for the present, both street improvement and tramway. Any saving in cost of these tramways goes, of course, to increase the profits, which are eventually divided among the borough councils."

St. Marylebone Electric Lighting.—Still more about the St. Marylebone muddle. Having failed to influence either the Board of Trade or the Local Government Board in their behalf, the Borough Council are forced to take the only course left open to them—*i.e.*, to seek statutory powers in the next session to borrow the necessary moneys for enabling them to acquire the St. Marylebone property of the Metropolitan Electric Supply Company which they have agreed to purchase. Even now it is not all smooth sailing, as the propriety of promoting a Bill for this purpose must be submitted to a special meeting, and carried "by an absolute majority of the whole number of the members of the Council." Then, having been deposited for public inspection, the Bill will have to be considered by the new Council after the November elections, and confirmed again by "an absolute majority." A public meeting of the electors must also be held to get their approval of the Bill, and, unless a poll is demanded, the decision of this meeting will be final. When the matter at last comes to be discussed in the parliamentary committee-rooms, there may or may not be much opposition, but in any case the measure cannot possibly receive the Royal assent and become operative before well on towards the end of the session. Of course, the main object of the Bill is to get rid of the technical difficulty which the London County Council say prevents their granting the required loan, but the Borough Council are also seeking powers with regard to the control and direction of the undertaking when it comes into their hands. For instance, Parliament will be asked to make special provision with regard to the repayment of the moneys borrowed, and for the application of the revenue arising from the undertaking; again, to authorise an increase in the maximum charge for the supply of electricity, to alter the method of charging, to empower the Council to change the pressure and mode of supply, and to make special provision in the case of premises having a separate supply. Among other powers sought are authority to enter into arrangements with contractors for the installation on consumers' premises of motors, wires, and other apparatus; to purchase lands and to erect generating stations thereon; and to alter and amend certain provisions of the Electric Lighting Acts and the St. Marylebone Electric Lighting Order, 1901. There is little doubt but that the Council will unhesitatingly agree to the promotion of the Bill, but when the ratepayers come to be consulted matters may assume a different complexion. There will probably be things said at the public meeting which should be worth reporting.

Controlling Motors from a Distance.—Often it is desirable to control a motor or several motors from some central position at a considerable distance from the machines. To avoid the necessity of conveying the whole working current to and from the point of control, which would involve the use of heavy cables and a large controller, a device has been patented by William Baxter, jun., of Jersey City. A small current derived from the main current is transmitted in a unidirectional constantly closed parallel set of small conductors and distributed to the various controller movers by a small switch, there being but three small wires necessary to effect entire control of the apparatus. From a description of the invention in the *Western Electrician*, it seems that situated at each motor is a controlling device for varying the current in the armature or field windings. Either geared or direct connected to the shaft of the controller is a "mover." The outer ring of the mover is a field magnet, and is magnetised by two sets of coils. One set of coils acting alone will develop a magnetic flux that will cross the central space in one direction. The other two coils acting alone will develop magnetic lines of force that will cross the central space in a direction at right angles. If the two sets of coils have the same number of turns, and are traversed by currents of equal strength, their magnetising forces will be equal, and as a result, if both act at the same time, the actual field will be the resultant of these two magnetisations, and in a direction midway between the two. If the current flowing through one set of coils is stronger than that flowing through the other, the resultant field will be in a direction somewhere between the two forces, but nearer the greater force. From these facts it follows that by increasing the current in one or the other set of field coils, the direction of the magnetic field can be caused to swing around from a position nearly in line with one of the component forces to a position nearly in line with the other. The field ring consists of an iron core, upon which the coils are wound. The armature is made of iron, and as the air-gaps between its pole-faces and the core of the field ring are shorter than the distance between the sides of the core and the field, it will be drawn into a position parallel with the field magnet's lines of force. Hence to be able to move the armature to any desired position, all that is necessary is to provide means whereby the currents flowing through the coils may be proportioned so as to swing the field magnetisation into that position. The armature being in turn connected to the controlling apparatus, the motor may be controlled from the distant point with only the interposition of such small wires as are necessary to operate the mover. An operating switch located at the central point controls the flow of current through the windings of the mover, controlling the magnetic flux so as to swing the armature in either direction, and thus move the motor controller as desired.

Elmore Copper-Depositing Process.—At the present time, when the commercial application of the Elmore patents for the manufacture of copper tubes by electrolysis is assuming extensive proportions, it will not be without interest to give a short account of the present position of the process. According to the *Electro-Chemist and Metallurgist*, the process emanated from patents by Stanley and Frank Elmore, and is shortly as follows: The positive pole of a dynamo is connected to an anode of raw granulated or block copper laid at the bottom of a pitched wooden vat containing an acidulated solution of copper sulphate. About 1·2in. away from this anode a copper or iron cylinder, forming the cathode and connected to the negative pole of the dynamo, is rotated at a suitable speed. In order to give the copper thus deposited on this cylinder or mandril a firm and dense structure, and to prevent any crystalline forming, an agate burnisher travels up and down the length of the cylinder and exerts a constant pressure on the surface; and as the conditions are regulated in such a way that the layer at any point only increases in thick-

Digitized by Google

ness by some ·0013in. before the agate brush has again returned there, the depositing copper is obtained in a homogeneous state. A comparatively light current density, 56 amperes per square foot, is employed, so that the deposition of a copper tube ·2in. thick would take just under a week. With ordinary processes of copper refining, the current density employed is about a tenth of the above. When the deposited tube has attained the desired thickness, it is stripped from the mandril and is ready for the market. Tubes of small diameter are comparatively more expensive to manufacture by the process, so that the German Elmore Company turn their attention more particularly to those of larger diameter. As an example of this, our contemporary illustrates what is claimed to be the biggest seamless copper tube in the world, which was manufactured by the Elmore process and exhibited at the Düsseldorf Exhibition. It was designed for a condenser cover, and weighs 7,940lb., is 16·4ft. long, 8·2ft. in diameter, and has a thickness of ·39in. The copper obtained by the Elmore process has very satisfactory mechanical properties. For example, a tube of 11·8in. diameter and ·12in. thick, when subjected to hydraulic pressure, expanded to 13in. at 14 atmospheres, and did not finally burst until the pressure had reached 52 atmospheres. At present there exist three Elmore works—one at Schladern, in Germany, one at Leeds, in England, and one at Havre, in France—having a total weekly capacity for producing 396,000lb. of copper, and a total amount of power available amounting to 5,600 h.p.

American Institute of Electrical Engineers.—Upon assuming the presidency of the American Institute of Electrical Engineers for the current year at the first meeting of the winter session, Mr. Bion. J. Arnold gave a short address, in which he commented on the remarkable development and growth of that body during the past two years. He also gave a general *résumé* of what the institute was doing at the present time, and the several objects to which its energies were being directed. He cautioned the members against allowing their enthusiasm in the local sections, born of novelty, to wear off, and urged the husbanding of the institute's financial resources on the ground that the recent great rate of increase of membership could not continue indefinitely. The new president further advocated allowing authors more time for reading their papers and the meetings more time for discussing them. All this is good and level-headed advice, but the point in the address to which we particularly want to draw attention is the reference to a scheme in which the institute is participating to build a "union engineering building," which will be jointly owned and used by several of the large engineering and kindred societies in the States. The idea appeals to us as being exceptionally good, and one that carries equal benefit to all concerned. As an illustration of what we mean, we may take the case of the large engineering societies in this country which have their headquarters in London. There are several large and well-equipped buildings in London to-day owned by individual bodies, such as the Institution of Civil Engineers, the Institution of Mechanical Engineers, etc. Each is provided with a large central hall or theatre in which the weekly, fortnightly, or monthly meetings, as the case may be, are held. Practically speaking, these magnificent halls are unused except at these times and others when they are kindly lent to sister societies for the purposes of similar gatherings. Now, the Institution of Electrical Engineers is collecting a fund to be applied to providing a central building of its own in which to hold the usual fortnightly meetings and transact the ordinary business of such an Institution, which is now very capably conducted from private offices in Victoria-street. We say no more than that the course which the American Institute is taking in this matter may cause engineering societies on this side to reconsider their position, and weigh up the possibilities of combining in erecting a common engineering building in London which would give equal advantages and meet the ends of all. The American Institute has started a special fund with this object, to which will be credited all moneys received for building purposes now on hand. The general preliminaries of the scheme have been perfected, and the work of the coming year will consist in the crystallisation of the plans and the originating of definite means and methods for raising funds and for promoting the material progress of the work.

Dielectric Hysteresis.—Steinmetz's work has shown that alternating-current cables become hot, even in the case of their transmitting no work. This phenomenon is chiefly noted with higher tension, the opinions as to the causes of this heating effect being different. Some experimenters, in fact, consider insulating materials as high-resistance conductors traversed by a current, though of very feeble value, and giving rise to a Joule heat effect. According to another interpretation adopted by most, the heating found by experiment would be explained as a sort of dielectric hysteresis in the insulating material, the heat developed being out of proportion to the amount of heat corresponding to the resistance measured on Joule's formula. Though this cause of heating is of a more theoretical interest, Dr. P. Holitscher (see *Elektrotechnische Zeitschrift*, No. 33), has made in the laboratory of the Elektricitäts Actien-Gesellschaft vorm. W. Lahmeyer und Co. some special experiments in this direction on high-tension machines, with a view to obtaining for these losses some constants independent of the volume for the different metals, this affording a means of testing the products used and the thickness of the latter. An important point for practice was the design of a measuring method allowing of the energy loss in insulating materials being determined with the greatest possible accuracy and without much apparatus. From these experiments it is inferred: (1) That a relatively accurate and convenient method for determining great losses by dielectric hysteresis, as is the case with great strain on the dielectric, is obtained by applying the capacity to be tested to the high tension of a transformer, the losses of the transformer being deducted from the output supplied to the latter. (2) With smaller losses measurements are made direct in the high-tension circuit by means of a wattmeter, the high and low tension coils of which are interchanged. Incandescent lamps are used as shunt resistance in the pressure circuit. (3) The losses met with are practically proportional to the number of periods, a loss by the passage of current being negligible as compared with dielectric hysteresis. (4) The capacity and accordingly dielectric constant is with the material tested (micanite) by no means a constant quantity, being altered within appreciable limits according to the electrostatic strain. (5) The variation of the capacity being an unknown quantity, it is impossible to determine in anticipation the increase in the dielectric hysteresis with the increase of the pressures. The usual law, according to which the loss by hysteresis would be $c\,E^2$, is only approximately true with materials the capacity of which is not altered—*i.e.*, with small electrostatic strains. (6) In high-tension machines with micanite tubes, the dielectric hysteresis loss with higher strains on the micanite is approximately proportional to the third power of the tension. (7) In determining the efficiency of a high-tension machine, the loss by dielectric hysteresis is absolutely negligible, comparatively thick material being mostly chosen on account of their safety against piercing.

POWER SIGNALLING.

An interesting installation of power signalling is being erected by the North-Eastern Railway Company at their Severus Junction, York, where some 12,000 vehicles are marshalled every 24 hours. The installation was brought into partial use on Sept. 20, and the work is being rapidly completed by the contractors, the Railway Signal Company, of Fazakerley. The system selected is that known as the "Crewe," and is similar to that already installed at Crewe on the London and North-Western Railway. With the exception of the mechanical interlocking of the points and signals, all operations are performed by electric power.

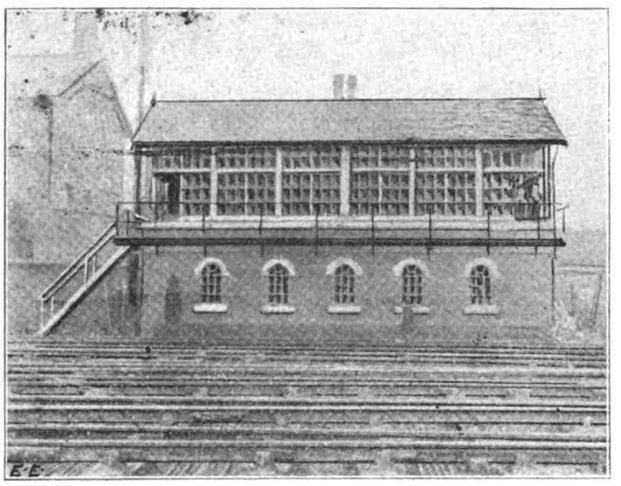

FIG. 1.

Fig. 1 is a view of the signal cabin, and Fig. 2 shows the lever frame operated by the signalman. The frame carries 133 levers arranged in two tiers, and has a length of nearly 22ft. The levers are only used to operate the electric switches controlling the motor and signal apparatus and the mechanical interlocking, and the physical labour entailed is therefore very much smaller than with the ordinary type of frame.

Fig. 3 is a diagram of the lines. Fig. 4 shows the relative positions of the mechanical interlocking, *a*, the switches, *b*,

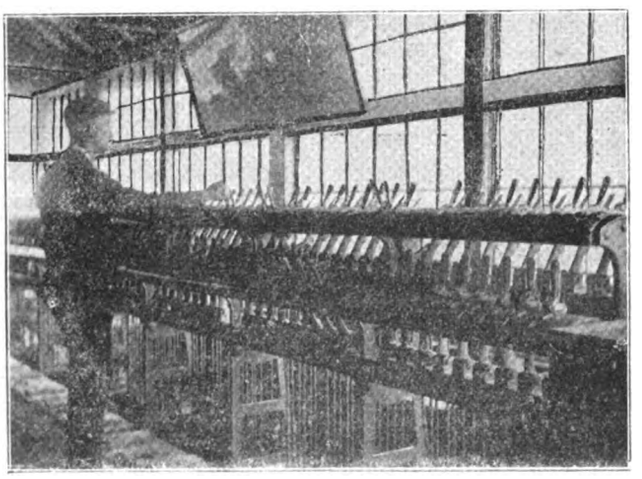

FIG. 2.

and the check locks, *c*. Fig. 5 shows the sunk box containing the motor for operating the points, and the mechanism is shown more detail by Fig. 6. Fig. 7 shows the long-pull Timmis electromagnet by which the signals are operated, and the switch by which the resistance introduced into the circuit when the arm has been lowered is inserted. Fig. 8 shows the circuit switches for both motors and signal magnets. Both the moving and stationary contacts are of carbon. Fig. 9 is a more detailed drawing of the check locks for controlling the motor circuits. Fig. 10 shows the detector switches for the points, and Fig. 11 shows the general arrangement of the circuits. The

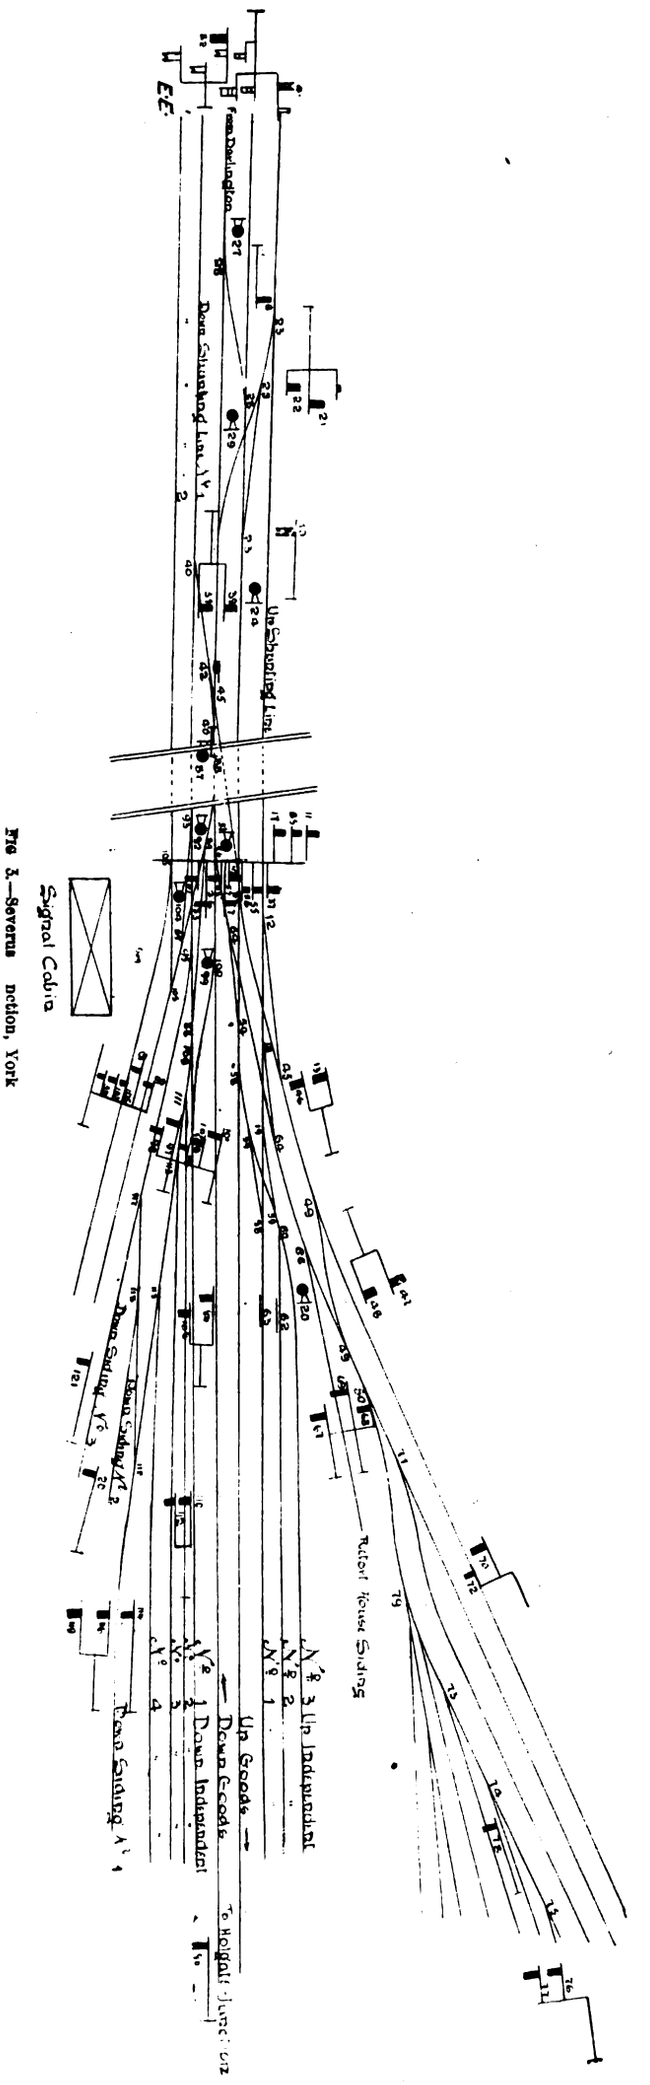

FIG. 3.—Severus Junction, York

Digitized by Google

motors for operating the points are of 2½ h.p. The long-pull magnets take five amperes to operate the signal arm and about ·5 ampere to hold it in the off position. Supply is taken from the North-Eastern Railway Company's power station at 200 volts.

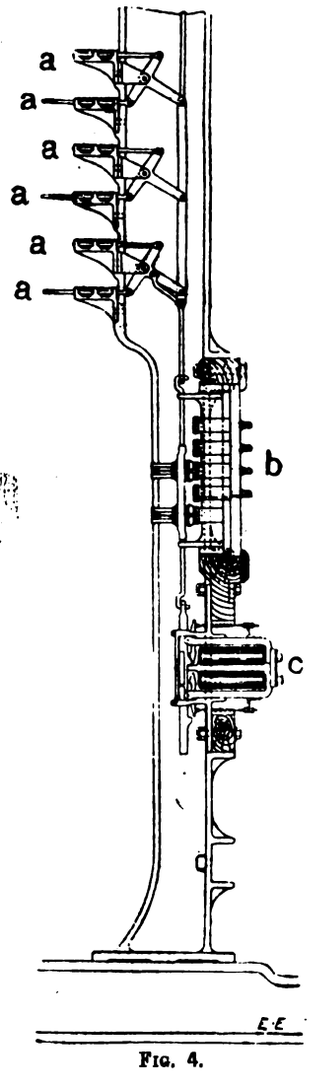

FIG. 4.

The motors for working the points are reversible, and are geared through a worm and worm-wheel and automatic clutches to a cam wheel, by which the rods operating the point locks, safety bars, and the points themselves are worked. The clutches are brought into operation in turn

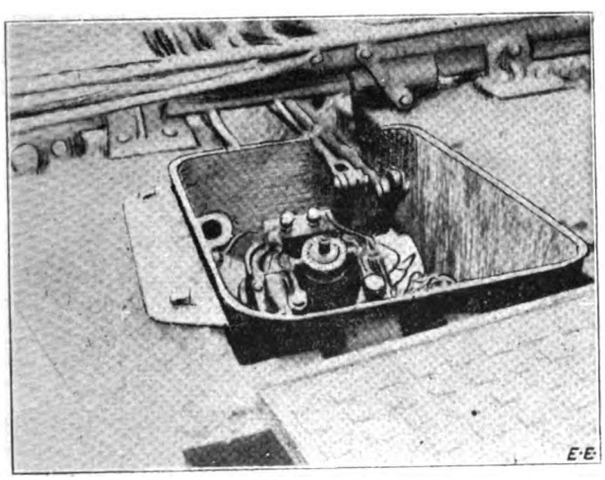

FIG. 5.

by a striker bar, *b*, shown in the plan and section (Fig. 6), which is appropriately moved at the end of each operation of the points by the curved projection, *d*, on the periphery of the cam wheel. The motor runs free and out of gear with both clutches when the striker bar has been moved, which the mechanism is arranged to do when the operation of the points is complete.

It is of the utmost importance that there should be no fear of the completion of the various operations for moving the points without the points being fully closed, and this is effected by the check locks and detectors. The latter are shown by Fig. 10, and consists of a two-way switch, one way of which is always closed, except during the actual operation of the points.

A reference to Figs. 4 and 9 will show that the lever in the cabin cannot be fully pulled over or put back by the

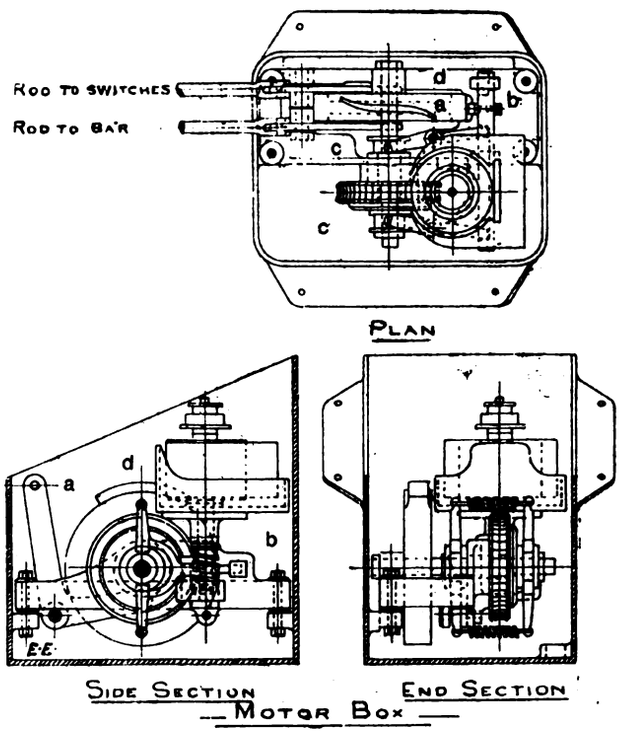

FIG. 6.

signalman unless the armature of the proper check block is attracted by the check lock magnet. The movement necessary to close the switch can, however, be made, and the motor moves the points. When this is completed, the

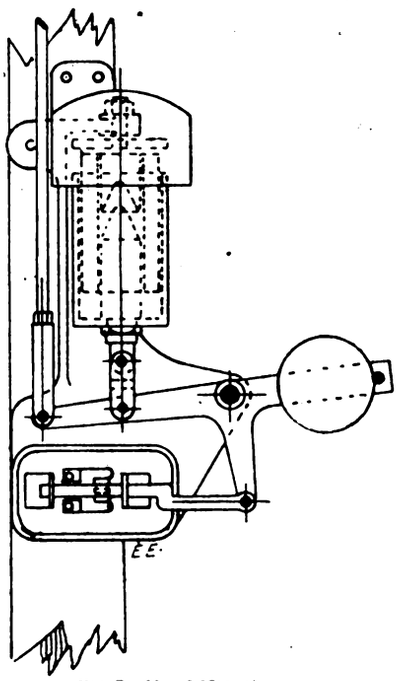

FIG. 7.—Signal Magnet.

check lock circuit controlling the completion of the lever movement is closed, and the armature is attracted. The motion of the lever can now be completed, and the motor circuit is broken. Hence it is necessary for the signalman to pause in the operation of the points lever until he hears

Digitized by Google

the click of the check lock armature permitting the completion of the movement.

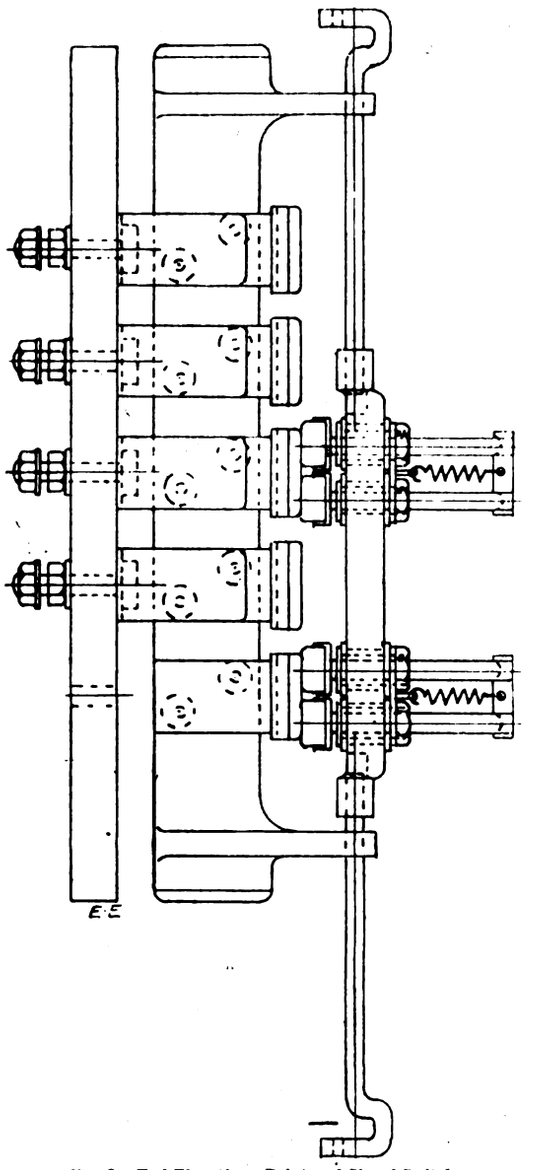

FIG. 8.—End Elevation—Point and Signal Switch.

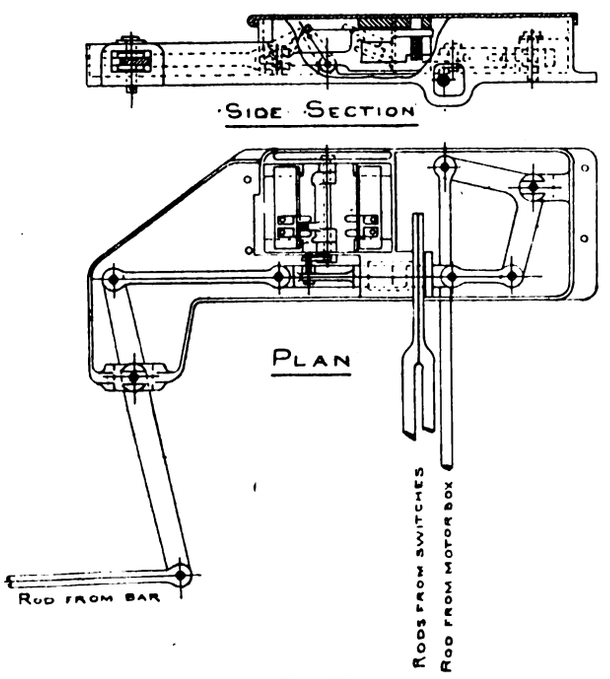

FIG. 10.

The completion of the lever movement actuates a two-way switch fixed on the check lock magnet, shown in diagram in Fig. 11, by which the check lock circuit is set for the next operation. Hence, after the commencement of an operation of a set of points, the movement cannot be stopped

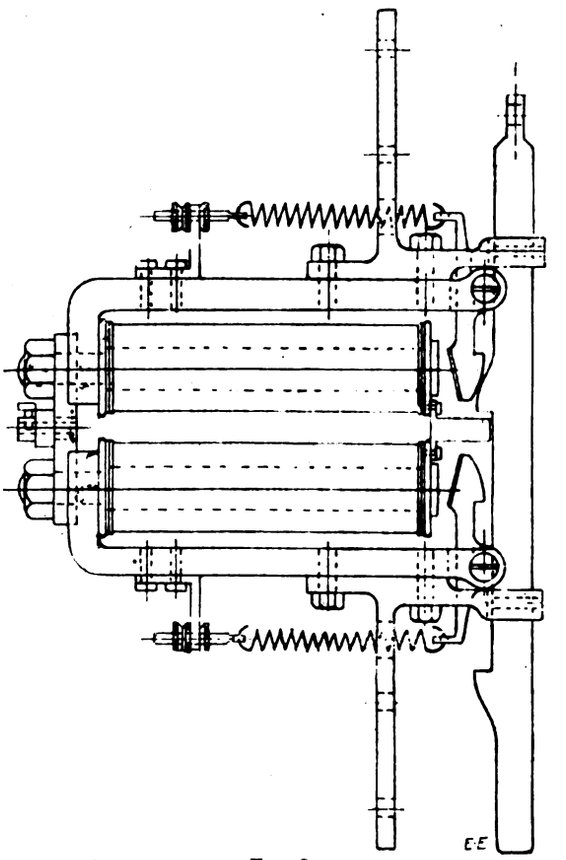

FIG. 9.

until the points are indicated to be in the position desired. Further, a reversal of the movement cannot be made unless the previous operation has been fully completed. All this, of course, is in addition to the safeguards provided by safety bar and point lock on the line, and mechanical interlocking between the points and signal levers in the cabin.

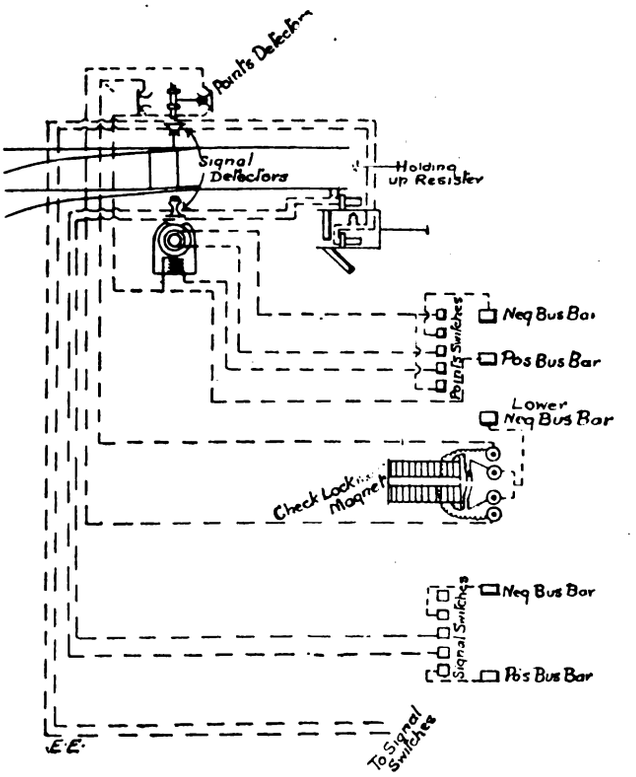

FIG. 11.—Diagram of Circuits.

The operation of the signal levers is made at one movement, there being no check locks in connection with them. An examination of the circuit diagram (Fig. 11), however,

Digitized by Google

will show that the circuit of any signal cannot be completed unless the points are laid in the proper position and the signal detector switch closed.

The use of power for the operation of points and signals in preference to hand labour is becoming very pronounced, and it will be interesting to see how far such systems are able to justify their existence. Advocates of power signalling have many powerful arguments in favour of their opinion, not the least of which is that a diminution of physical labour leaves the signalman at a busy junction more alert, mentally, for his duties. For such a system as that described an electric power supply is indispensable and it can only, therefore, as matters are at present, find a somewhat limited application, as the establishment of a generating station for this purpose alone is unthinkable. It is, however, likely in the near future that railway companies will have a much more general supply of electric power than they have at present, and a large extension of the system may be looked for.

INDEPENDENT TELEPHONY IN GREAT BRITAIN

BY GARDNER AND HOLME.

(Continued from page 508.)

2. Maintenance of Exchanges.

Before entering into the details of the maintenance of an exchange it is necessary to arrive at a unit exchange which can be worked by a given staff. A village exchange of 25 subscribers, if completely isolated as regards technical staff, would cost approximately the same to maintain as an exchange of 250 subscribers, and so a central exchange should be taken where the staff can supervise the smaller exchanges. From actual experience it is found that an exchange of 300 direct lines is self-supporting with its own staff, at low tariffs. This is the smallest exchange a local authority should establish as the central, and surrounding villages can then be supplied with smaller exchanges controlled by the central technical staff.

With reference to the details of maintenance, exchanges should not be opened up where there are insufficient railway facilities, as the cost becomes heavy owing to the travelling expenses. With the development of light railways this is becoming almost an impossible case.

The best material should be used and great care exercised in inspecting deliveries, thorough tests being made as to insulation; a little extra time devoted to this particular alone being amply repaid in the process of time. Great care should also be exercised in the handling of stores, as much loss can result from carelessness in this direction. A record of stores should be kept at the store, the quantities being booked out on the card system, and duplicated on requisition notes, handed in by the inspectors, and kept at the office, so that quantities may be ascertained apart from visiting the stores and new supplies ordered in time. Running out of a class of stores and consequent waiting for new deliveries is a loss to the undertaking which frequently happens where a good card system with duplication is not in existence

Apart from a good organisation, the main question of maintenance is the subscriber, and when planning new methods the subscriber's point of view should not be lost sight of; and it should also be borne in mind that a subscriber has his own business to look after, and the least you give him to do or think about when using the telephone the more he will appreciate it, provided at the same time he gets good attention and efficient speaking.

Leaving this part of the subject for the present, we will take the expenses in material for upkeeping a system. First, as to the outside work. If a good portion of this is overhead, the expense of keeping it in repair and clearing faults is heavy, and as much of the wire as possible should be placed underground. The use of standards on roofs for carrying the wires should also be avoided wherever a ground pole can be used, as, although the ground pole is much more expensive, the roof repairs entailed by the standard if capitalised would exceed the cost of the pole.

The Portsmouth Corporation in their telephone system have only used four standards, and these are all placed on flat lead-lined roofs, whereas several hundred of poles have been erected. In any case, the roof repairs should be carried out by the department's own staff, and not let out to contract. Heavy junction routes should also be erected on taller poles than the country surrounding necessitates, as it is found a little extra height greatly diminishes insulator breakages due to stone-throwing. The insulators themselves should also be thoroughly tested on delivery before being used.

Another constant maintenance charge is the inspection and renewal of materials in the local batteries of the subscribers' instruments. With the common battery system this is reduced to practically nothing, owing to the concentration of the electrical energy in accumulators at the central exchange. The question then arises as to whether this saving is at the expense of the subscriber, as the talking efficiency of a common battery exchange is not so good as a local battery system, and the failure of the battery connections, although remote, would be very serious, in so far as the whole exchange would be cut off. It is, therefore, very doubtful, except in the case of the capitals of the world, where the upkeep of 100,000 local batteries is a serious item, whether the cheapness of maintenance charges of a common battery system should be considered. Local battery inspection when well organised is also not quite as heavy a charge as would at first appear, good primary cells lasting a considerable time without attention. A card system should be used giving the dates of the visits of the battery inspector and the condition in which he found the battery.

Date..... Time.....	Date..... Time.....

Fig. 3.

With regard to faults in general, a subscriber, when he has a complaint to make, does not stop to think to whom to make it; consequently faults may come into one department and be lost sight of. For instance, a subscriber may send one of his clerks round to the office to make a complaint; he may go to a neighbouring instrument and ring up the manager, chief operator, or complaints department. Consequently some means must be devised whereby these complaints may be centralised and recorded. The best method is to have intercommunicating lines between the several departments and the complaint clerk, whose duty it is to test out and record the faults, so that whenever a fault is reported it can be transmitted to the responsible person at once. On receipt of a complaint, he should book the same on a form as shown in Fig. 3, ascertaining as far as possible the nature of the fault, as a smart test clerk from one or two words can locate the fault closely before testing. In large exchanges it is necessary also to employ a traffic superintendent to receive complaints regarding the service apart from the apparatus. Intercommunicating lines should run from his desk to the manager's, chief operator's, and complaint clerk's.

A strict analysis of the faults is also very necessary, as the record shows which parts of the apparatus are the weakest, and consequently guides the storekeeper or person responsible for testing new deliveries. A form similar to the one shown in Fig. 4 is very useful in this direction. On presentation to the committee at their monthly meeting they can immediately see the comparative efficiency of the exchange. Too much stress cannot be laid on the importance of keeping junctions in good working order. Whenever these pass an exchange to another one, they should be looped in for testing purposes. In fact, every oppor-

Digitized by Google

tunity should be taken of looping them into a test box, as this not only affords a rapid method of clearing a fault when it occurs, but also reduces maintenance charges, as the outside faultsman can locate faults at a great saving of time. In an underground system periodic tests of the cables should be made and the insulation at the different

come on at the busy hours of the day to relieve the sections where the traffic is heaviest. A good means of showing the rise and fall of the traffic is to draw a "load" curve of the calls per hour received at the exchange, as shown in Fig. 6. To summarise, the following statistics prove a useful source of information as to the general

FAULT REGISTER.

dates carefully recorded. Pumping dry air into them should also be done constantly, so as to keep all moisture back. The condition of the accumulators at the central should also be recorded, as shown in Fig. 5. A recording milliampere meter should be fitted in the main circuit, so as to indicate any undue leakage of current.

working of a system: (1) analysis of faults; (2) cable tests; (3) accumulator tests; (4) "load" curve.

Having now gone into the various details as to the maintenance of an exchange, it is necessary to arrive at the maintenance per instrument in money value, so that a fair tariff to charge subscribers may be deduced. This,

Fig. 5.

Various methods have been tried from time to time to distribute the operating evenly. Some subscribers use the telephone more frequently than others, and sometimes these busy lines are concentrated on one or two sections, the operators of these sections being very busy while the traffic at the remaining sections is very quiet. At some exchanges an intermediate distributing board is placed

of course, can only be done from actual experience. The working cost per station at Glasgow, apart from interest, sinking fund, and depreciation charges, is £2. 5s. 9d., and at Portsmouth £2. 4s. 11d. From the Postmaster-General's forty-ninth report it seems that the maintenance of the London telephone system, apart from interest, sinking fund, and depreciation charges, to March 31, 1903,

..... Corporation Telephone Department.

LOAD CURVE.

..... Exchange. ..... 19 .....

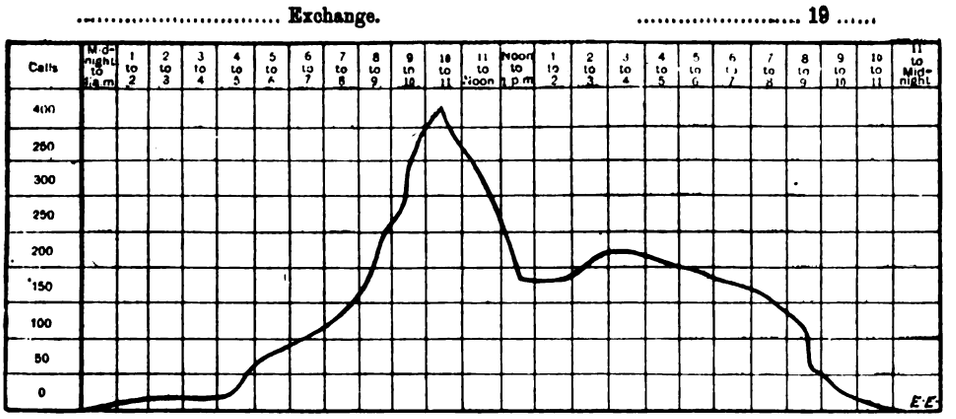

Fig. 6.

between the main distributing board and the switchboard, and the lines here can be easily taken from one section and transferred to another, and the traffic thereby evenly distributed, but the numbers do not run consecutively, and testing is thereby slower.

Another method, and from several points of view a better one, is to employ half-time operators, as learners, to

amounted to £23,278, and the number of instruments working was 9,122, which gives £2. 11s. per station. The next question is the amount of reserve to be set aside in addition to the sinking fund in order to provide against new inventions and depreciation. Opinion varies considerably as to the actual life of telephone plant, but practically all are agreed that the life of cables, which represent 50 per

Digitized by Google

cent. of the total capital cost in a good underground system, is unlimited, and at any rate more than 25 years, the time generally given in which to repay the loan. With regard to the switchboard and instruments, the actual life has been given varying from 15 to 30 years, but much stress has been laid by opponents of municipal telephones on the supposition that in case of a new invention the switchboard and instruments may have to be replaced before they have been in use many years. Even supposing they had to be entirely replaced every 12 years (a very remote contingency), the sinking fund would have reached 50 per cent. of the capital cost, and would consequently be more than sufficient to entirely replace them. Of course, the sinking fund is to repay the loan, and if a corporation wishes to be safe against the remotest of contingencies, it will be necessary to open a reserve account at $2\frac{1}{2}$ per cent. in addition to the sinking fund. There has been considerable discussion on the depreciation of a telephone plant, opponents of municipal telephones contending that 10 per cent. depreciation is necessary. A similar discussion is proceeding in America, and on looking closely into the matter it will be found that a sinking fund of $2\frac{1}{2}$ per cent. and a reserve fund of $2\frac{1}{2}$ per cent. on the capital cost for 20 years, total up to considerably more than 10 per cent. depreciation.

The one-time monopolists in America are the Bell Company, and the following tabulation is extracted from the sworn testimony of a Bell treasurer. In giving evidence he stated: "This charge of 10 per cent. is in addition to the regular maintenance charge. What you find in our regular pay rolls for maintenance is simply general repairs to the system, as it is then running. Beyond that there is the new construction that has to be done for the entire change of system—small poles taken down and big poles put up in their places, and finally big poles taken down altogether and underground work put in."

	Cost of plant, Jan. 1.	Cost of construction during year.	Cost of plant, Dec. 31.	Depreciation 10 per cent.

1895 ...	642,185·29	59,622·33	701,707·62	—

In explaining the tabulated data, the treasurer testified as follows: "We commenced our construction in 1881, and we went on constructing and expending different amounts in different years until 1895. At the end of 1895 we had completed a new system, and to be sure that it agreed with what we had in our books on account of capital expenditure, we had it revalued, and the valuation came then to 648,232dol. We then took the amounts that had been spent year by year, and took off 10 per cent. each year, and added the new construction; and the amount that it showed was, according to that, 701,707·62dol. These amounts are so nearly correct that it confirmed what we had previously arrived at generally and in other places, that 10 per cent. was the proper amount for depreciation of telephone plants for that time."

On examining the figures, it will be observed that the preceding year's depreciation fund is subtracted from the year following, and then 10 per cent. taken off the remainder. Consequently the depreciation slowly diminishes. Taking plant worth £100 and depreciating it in this manner, only £80. 2s. would have been written off in 20 years, whereas with a sinking fund of $2\frac{1}{2}$ per cent. and a reserve fund of $2\frac{1}{2}$ per cent. on the capital cost, the whole £100 would be written off in 20 years.

The Postmaster-General has stated in his forty-ninth report that 36 years is the average life of a telephone plant. The Bell Company method of depreciation is very interesting, as it will be found on working out the calculation that the number of years required to write off £90 to £100 would be somewhere between 90 and 100 years. It will thus be seen that a sinking fund of $2\frac{1}{2}$ per cent. and reserve fund of $2\frac{1}{2}$ per cent. is very liberal, and these figures will consequently be given.

Taking the exchange system of 920 lines, already referred to, the total maintenance charges would work out as follows:

Interest, 3 per cent.; sinking fund, $2\frac{5}{8}$ per cent.			
Special reserve fund, $2\frac{1}{2}$ per cent. = $8\frac{1}{8}$ per cent. on £20,680	£1,680	5	0
Maintenance of 920 stations at £2. 7s. each (the average of Portsmouth, Glasgow, and London)	2,162	0	0
Total	£3,842	5	0

Or £4. 3s. 6d. per station.

From these figures it is now possible to arrive at a fair tariff to be charged for the rental of telephones.

(To be continued.)

THE HARISON AUTOMATIC SIGNAL.

It will be remembered that we commented favourably upon the working of the Harison automatic signal so far back as June 13, 1902, in connection with its installation at Portsmouth, but full details of the invention were not

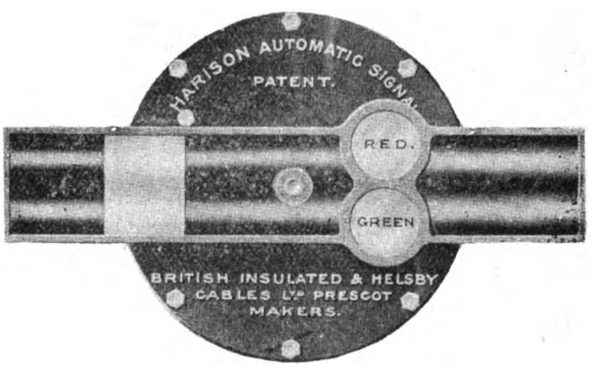

FIG. 1.—View of Signal with arm and lid in position—Harrison Automatic Signal.

at that time available for publication. Referring to Figs. 1 and 2 herewith, it will be seen that the signal is arranged with the usual semaphore, fitted with red and green spectacles, for the illumination of which incandescent lamps are provided. This semaphore arm is weighted so

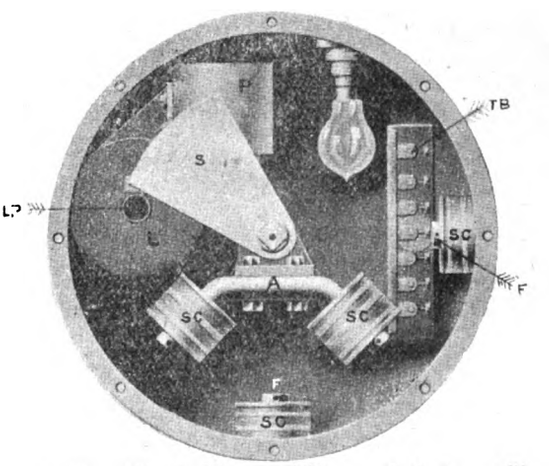

FIG. 2.—View of Signal with arm and lid removed, showing position of mechanism when arm is at danger—Harrison Automatic Signal. S C, signal coils; A, armature; F, fixed pole-pieces; L P, locking plunger; S, shield; L, locking solenoid; P, preference solenoid; T B, terminal board.

as to return from the "line clear" position to "danger" entirely by gravity, thus complying with the Board of Trade regulations. On a current being passed through the signal coils, S C, the armature, A, carrying the semaphore arm is attracted by the fixed pole-pieces, F, thereby lowering the arm to the "safety" or "line clear" position. The arrangement for locking the arm at the "danger" position and unlocking the same, is accomplished by two

Digitized by Google

solenoids provided with a common plunger, L P. When current is passed through the front or locking solenoid, L, the plunger is drawn into it and engages with the "shield," S, on the shaft carrying the arm, thereby preventing it from lowering. When a current is allowed to pass through the rear or unlocking solenoid, the plunger is drawn back into it and disengages from the shield, and the arm is left free to lower. The preference solenoid, P, is provided in one only of the two signals protecting a section. It is a device for preventing the preference signal from being locked, and comes into action when two cars are trying to enter the protected section at opposite ends at the same instant. It has no effect if the preference signal is already locked, nor till it is unlocked. The mechanism of the signal proper is, therefore, extremely simple, there being no electrical contacts to wear, spark, or get out of order.

The whole of the mechanism is worked by current from the trolley wire, third rail, or other source of energy at hand—that is to say, there is no need for batteries, either primary or secondary. The installation can be carried out either on the shunt or series system, both of which are applicable to single or double trolley lines, while the shunt is best suited for underground lines employing the third rail. The shunt system, as applied to single lines with turnouts, is shown diagrammatically in Fig. 3. For this arrangement the erection in a suitable position of special overhead contacts, operated by the trolley head or wheel, is necessary. Connection is made between the trolley wire and the overhead contact, and a shunt circuit established through the signals to earth during the time the car is under the contacts. Four auxiliary leads, made up in one cable, are also required between the signals, these being of small cross-section, as the amount of current used is only about 2½ amperes. Contacts 1 and 4 (see Fig. 3) are arranged so that a car always stops underneath them whilst waiting on the turnout. Contacts 2, 3, 5, and 6 are placed so that there is no possibility of a car stopping underneath them. Suppose a car arrives at A and makes contact with 1, the circuit completed is P, S_1, and L_2 to earth. If

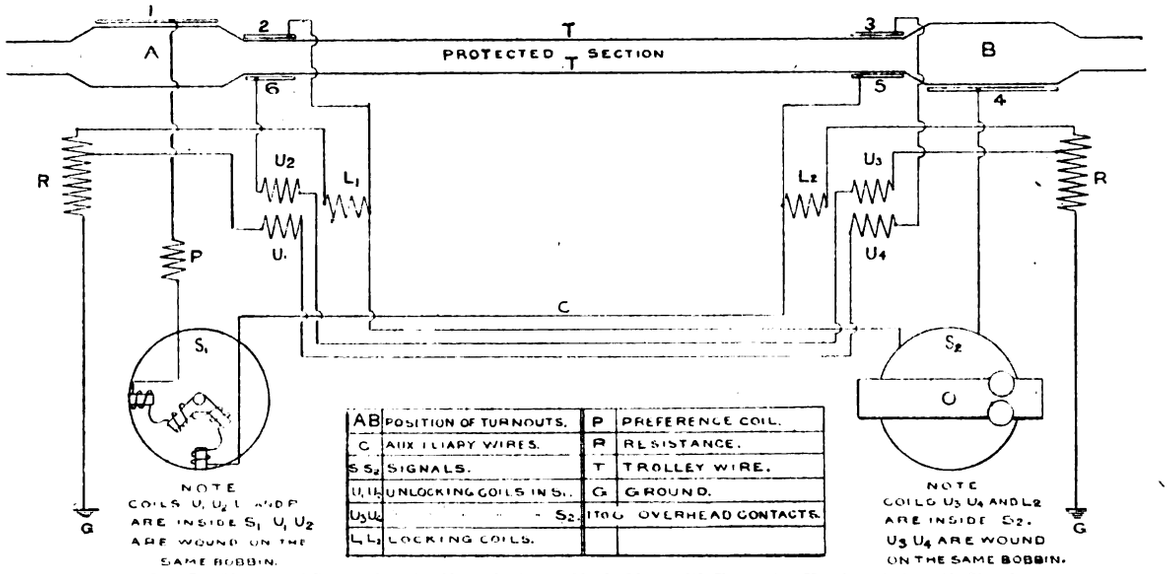

FIG. 3.—Diagram of Connections for Shunt System. Single Lines with Turnouts—Harrison Automatic Signal.

the line is clear S_1 is lowered and S_2 is locked. The car then proceeds to 2, where the circuit made is L_1 to earth, thereby locking S_1 behind it; the line is now blocked. When it arrives at 3 the circuit made is U_4 U_1 to earth, and thus both signals are unlocked. The operations of Nos. 4, 5, and 6 contacts are identical with Nos. 1, 2, and 3 respectively. It will be noticed that 3 and 6 are provided with separate unlocking circuits, which can never be alive at the same time. The windings

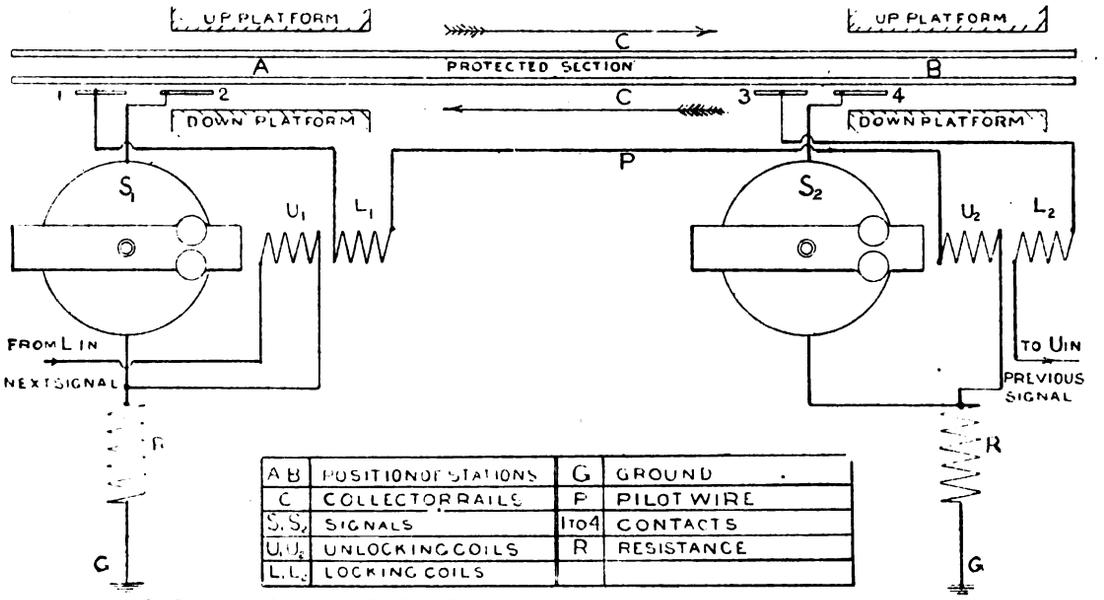

FIG. 4.—Diagram of Connections for Shunt System for Double-Line Tube Railways—Harrison Automatic Signal

of the locking and unlocking solenoids are so arranged that if

U_1 and L_1 are both energised, S_1 remains locked.
U_2 and L_1 „ „ „ S_1 is unlocked.
U_3 and L_2 „ „ „ S_2 remains locked.
U_4 and L_2 „ „ „ S_2 is unlocked.

Also, if L_1 and L_2 are dead, U_1, U_2, U_3, U_4 are each by themselves capable of unlocking their respective signals. The following cases may be taken by way of illustrating the action of the signal: (1) Suppose car A reaches 1 before car B reaches 4, S_1 is lowered, S_2 is locked. (2) If

Digitized by Google

car B reaches 4 before car A reaches 1, S_2 is lowered and S_1 is locked. (3) If cars A and B arrive at 1 and 4 simultaneously, S_2 is locked but S_1 is not, since the preference coil prevents it, car A thereby having the preference over car B. (4) If car A and car B are waiting at 1 and 4, and a third car C is on the protected section, then if car C arrives at 3 S_3 is unlocked, but not S_1. If, however, car C is going in the other direction and arrives at 6, S_1 is unlocked and not S_2.

The same system as applied to double-line underground tube railways is shown diagrammatically in Fig. 4. In this case special contacts worked by the train are required to effect contact with the third rail or other source of energy. These establish shunt circuits in the signals while the train is on the contacts. Here only one small auxiliary lead is required between the signals. Referring to Fig. 4, suppose a block to comprise the distance between two stations—*e.g.*, A and B. A train arrives at station B and makes contact with B_4, thereby establishing a circuit through S_2 to earth. The signal arm of S_2 (presumed to be unlocked) is lowered and the train proceeds, allowing S_2 to return to danger. The train then reaches B_3, causing current to flow through L_2 and U in the signal behind to earth. S_2 is therefore locked and the last signal unlocked. The arrival of the train at station A on A_2 contact, causes S_1 to lower if unlocked. The cycle of operations in then repeated at A_1, where S_1 is locked and S_2 is unlocked, thus ensuring that no train can leave station B until a train on any portion of the line between B_3 and A_1 has left station A and locked signal S_1.

It is unnecessary to describe the series systems in equal detail here. Suffice it to say it is so termed on account of the signal windings being in series with the overhead trolley wires, an arrangement which involves the erection of a few section insulators and the use of two auxiliary wires.

The chief advantage claimed for the Harison system of automatic signalling over other systems of its kind, is that it provides for the contingency of two cars on a single-line system trying to enter the protected section from opposite ends simultaneously. It may be added, in conclusion, that the British Insulated and Helsby Cables, Limited, Prescot, Lancs., are now the sole makers of these signals, which are working not only at Portsmouth, but also at Batley, Wallasey, etc.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

627. What are the advantages and disadvantages of the underfed type of mechanical stoker, as compared with the moving grate and shifting firebar types?—R. M.

628. What is the best method of improving the draught in a central station which at present has a very poor natural draught?—R. M.

ANSWERS.

Question No. 619.—How can the pressure and vacuum gauges be calibrated in the station without the use of standard instruments?

Answer to No. 619 (*awarded* 7*s.* 6*d.*).—The most convenient method of testing pressure gauges without using a standard instrument is by means of the "dead-weight gauge tester." Fig. 1 is a diagrammatic sketch of the apparatus, and will give an idea of its action. The piston is a good fit, generally of an area equal to one square inch, and may be loaded with weights as desired up to a pressure of several tons to the square inch. The pipes connecting piston with the gauge under test are filled with glycerine, a cock below the gauge cuts off pressure due to the weights. The gauge may then be checked through the whole of its scale. Gauges are adjusted by moving the needle or pointer on its spindle; it is generally driven on a taper and by altering positions of the linked levers which actuate the rack. In bad cases, when it is impossible to get

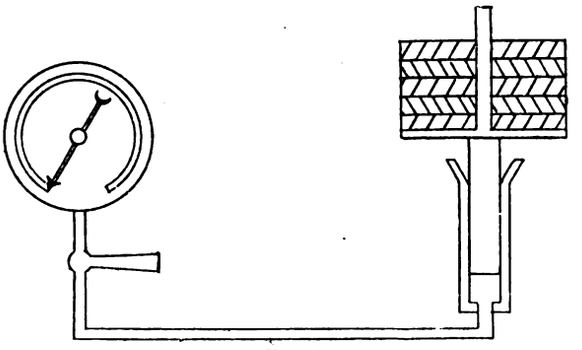

FIG. 1.

correct readings all round the scale, one may generally get the gauge fairly accurate for some distance on each side of the average working pressure. Of course, if a new scale is made this approximation will be unnecessary. Some engineering establishments use a mercury column. (A sketch of such an arrangement is given in Fig. 2.) With this apparatus, by allowing for temperature and barometric pressure, the length of the mercury column provides an accurate method of calibration. A drawback to this arrangement is the height of column required when testing gauges for high pressures. Approximately, each 30in. of mercury give a pressure of 15lb. per square inch. It is, therefore, a question of a convenient wall and a ladder. The plunger is moved by means of a screw and hand-wheel; the operator is thus enabled to alter the pressure to suit work in hand. In place of water, air is sometimes employed

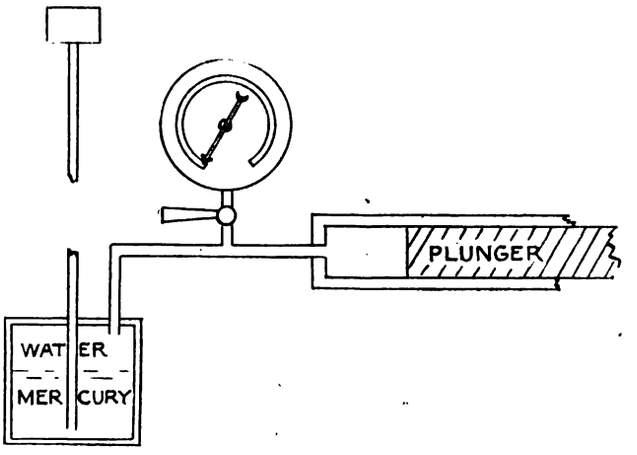

FIG. 2.

to transit pressure from plunger to mercury. Even with practice the calibration of gauges is at best a tedious process; to obtain good results the pointer should be taken round the scale two or three times, and both rising and falling pressures carefully noted.

For the vacuum gauges an air-pump is required; the gauge is connected with a mercury column rather more than 30in. in length and the pump worked. As exhaustion proceeds, the gauge is calibrated against the varying length of the column of mercury. There is a very compact testing machine on the market for the combined purpose of checking both pressure and vacuum gauges in a similar manner to the above description.—M. M.

Answer to No. 619 (*awarded* 7*s.* 6*d.*).—The most direct method for calibrating pressure gauges is by means of the open mercurial gauge as sketched in Fig. 1, in which the column of mercury in the glass tube, A, is a direct and unimpeachable index to the pressure in the vessel, B, and

Digitized by Google

the gauge to be tested, C. The lower part of the vessel, B, is filled with mercury, the tap, D, opened, and water is pumped into the tube at E. An ordinary hydraulic force pump will do for this purpose, and, all joints being tight, pumping water in will, of course, drive the mercury up the tube, A, which is open to the atmosphere, as shown. F is a glass to show the height of the mercury in the vessel, B, which for high pressure should be made of iron, because iron is not attacked by mercury and is strong. The height of the column of mercury in the tube, A, must be read in inches, starting from the level of the mercury in the glass, F; when 10in. height of mercury will indicate a

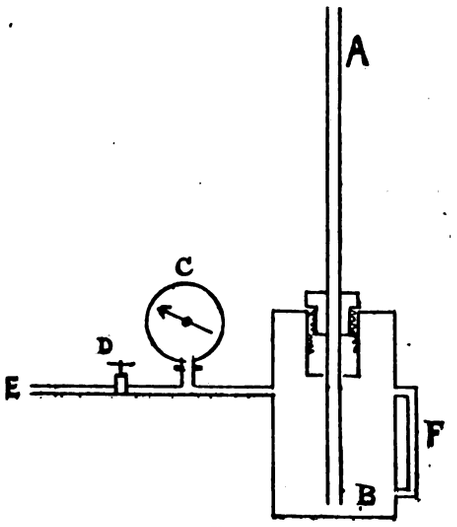

FIG. 1.

pressure of 5lb. per square inch, 20in. a pressure of 10lb. per square inch, and 30in. a pressure of 15lb. per square inch, and so on in proportion. This is a very nice way of calibrating pressure gauges up to moderate pressures, but when high pressures are required the column of mercury in the tube, A, becomes inconveniently long. For example, 100lb. pressure per square inch would require 16ft. 8in. of mercury, and 150lb. per square inch would require 25ft. of mercury in the tube, A. Mercury being very heavy, a very strong tube must be used, and it must be well supported if of great length by being carefully bedded in a groove made of wood and well fastened to a substantial wall.

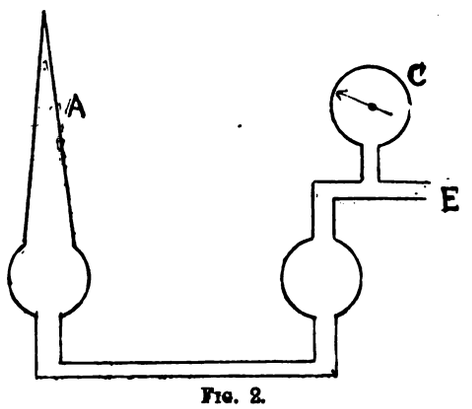

FIG. 2.

However, there is a way of obviating the inconvenient length of tube when dealing with high pressures, and the instrument is called a manometer. It depends upon Boyle's or Marriotte's law, which shows that atmospheric air when under pressure occupies a space in inverse ratio to the amount of the pressure—*e.g.*, a vessel of air exactly full at, say, 3lb. per square inch, would only be half full of air if the pressure were increased to 6lb. per square inch. The best form of this manometer is shown in Fig. 2, where the indicating tube, A, is shown tapering towards the top, so that the highest readings may be on a fairly open scale. The difficulties in using it are to get the mercury level in the two bulbs with the certainty that there is no pressure in the tapered tube, and then, of course, a small addition must be added to the reading on the scale in proportion to the height of the column of mercury—viz., 5lb. presure for every 10in.—in order that the gauge to be adjusted may be accurate. Further, of course, there is a risk of explosion, as the tapered tube must be made of glass. Altogether this instrument is not so good or so accurate as Fig. 1. C is the gauge to be calibrated. The same force pump as suggested for Fig. 1 may be used. Time must be allowed for the compressed air to cool before taking a reading.

For calibrating the vacuum gauges we require an air-pump, as, of course, we must make a vacuum. Any efficient air-pump will do—*e.g.*, one already on the engine. The rest is very simple, as almost all vacuum gauges are graduated in inches of mercury. Fig. 3 almost explains

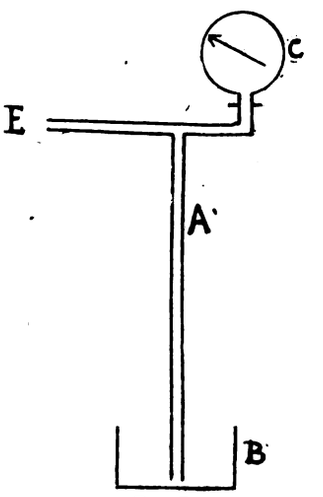

FIG. 3.

itself. E is the tube to which the air-pump is attached, A is a glass tube dipping into a basin of mercury, B, and C is the gauge to be calibrated. On starting the air-pump, the mercury begins to rise in the glass tube, A. When it has risen 1in. above the level of the mercury in the basin, B, we mark the dial of the new gauge 1, and so on until we reach 30in., beyond which we can seldom go—*i.e.*, only when the barometer is standing at more than 30in. Of course, it is very important that there should be no leak in the apparatus. If it is desired to graduate the gauge to pounds as well as inches, the same proportion as that given for Fig. 1 will be correct for all practical purposes; but if the utmost precision is required, then one atmosphere is generally reckoned as 14·7lb. per square inch, and this would make 30·053in. of mercury equal to 15lb. per square inch.—F. G. A.

Answer to No. 619 (*awarded* 5*s.*).—If "W. F. F." has a good steam-engine indicator at hand, he can use it to calibrate the station steam gauges as follows: Attach the indicator to boiler or steam-pipe close to gauge to be calibrated, say in the top or steam opening of water-gauge glass; one glass can be removed for this purpose. After the indicator has been fixed, put a paper on to paper drum and raise steam slowly; heat indicator, and take atmospheric line in usual way; the short movement required can either be done by hand, or the drum can be rotated by any simple and smooth mechanical device. Apply the pencil at regular intervals, and repeat the movement of paper drum. At the instant the drum is moved, the gauge under test must be marked in a similar manner, the marks being made directly under the pointer at the moment of taking. Take a series of readings thus, with a slow and steady rising pressure, until range of the indicator is reached, or, if possible, up to the lifting of boiler relief-valve, afterwards working out pressures in the usual way. The intermediate points between test marks can be proportioned off according to calibration desired. Marking in steps of 5lb is quite close enough scale for central stations, and the test points may be approximately in 10lb. or 20lb. values. In addition to indicator, the bulb of a mercurial thermometer should be inserted in steam space of boiler and simultaneous readings taken from all three instruments. Pressures of steam at temperatures ranging from 10lb. to 300lb. can be got from tables in any engineering pocket-book, and the readings

Digitized by Google

compared with those obtained with the indicator. The mean of the two readings may be accepted as correct. With a good type of indicator (such only should be used in a central station) and thermometer the amount of error if carefully taken should not exceed one half of 1 per cent.

To calibrate the vacuum gauges, the indicator will require a lighter spring, but the best method would be to use a mercury column in the form of a V tube. Fix tube with the bent leg into condenser, then run up air-pump slowly, marking mercury column and vacuum gauge as before. Measure off distances between marks on V tube, and then proportion scale of vacuum gauge in inches of mercury, and divide according to scale desired. To reduce to pounds pressure below atmosphere, multiply the readings by ·49. Take barometer reading.—J. C. STEWART.

Answer to No. 619 (*awarded* 5*s.*).—Pressure gauges are usually calibrated by reference to the height of mercury in a vertical U tube, pressure being applied to the mercury in one leg of tube, and the value read off on a scale attached to the tube. This system would not be applicable very readily in a central station; as, for instance, a tube of 25ft. in height would be required for a pressure of 150lb. per square inch. The easiest way, although not so accurate, would be to adjust pressure of steam in the boiler (to which gauge to be calibrated is attached) by means of the safety valve. This can be done so as to mark the gauge from a very low pressure up to point at which the valve usually releases, by altering the weight on a dead-weight safety valve so as to make the boiler "blow" at various pressures, and marking the gauge face with pressure value at the position which pointer is at when the valve releases at the various pressures. In the case of a lever type of safety valve, the alteration can be effected by sliding weight along lever, or by altering the weight at the end of the lever. The releasing pressure in each case is got in the usual way by calculation, and care should be taken not to load the valve above its original blowing "off" limit.

The best way to calibrate a vacuum gauge would be to construct a mercurial vacuum gauge. This consists of a vertical glass tube a little over 30in. long, with its lower end dipping into mercury contained in an iron bottle, while its upper end is connected to the same condenser as the gauge to be adjusted. The more perfect the vacuum in the condenser, the higher the mercury will rise in the tube, due to atmospheric pressure on the mercury in the bottle. As the mercury rises, the gauge can be marked at the various pointer positions as follows: when the mercury has risen 1in., the position occupied by pointer should be marked 1, and when it has risen 10in. the pointer position should be marked 10, and so on until the complete range had been gone through.—J. WALKER.

Question No. 620.—With a shunt-wound motor it is found that the no-volt release on the starting switch takes an appreciable time to act after the current is broken to motor. If the motor is heavily loaded when current is broken, it has stopped running before the switch arm is released. But if main current is left on, and circuit broken at field shunt connection or starter, the no-volt release immediately releases switch arm, but the motor takes much longer to stop than when main current was broken. Explain this fully.

Best Answer to No. 620 (*awarded* 10*s.*).—The probable reason for the peculiar action of the no-volt release on the starting switch observed by "C. W. G." (assuming that the connections are as shown in Fig. 1), is that the

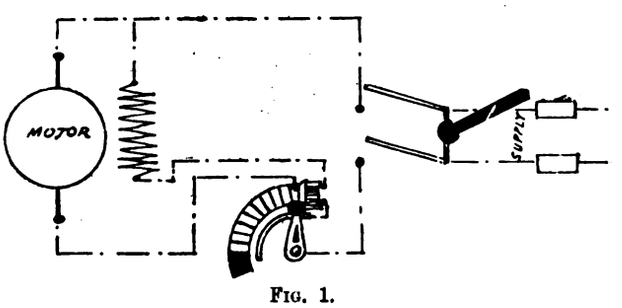

FIG. 1.

momentum of the apparatus coupled to the motor is sufficient to drive the latter for a short time as a shunt-wound dynamo, and it would supply current to the field circuit and also energise the hold-on magnet, but this magnetism would, of course, die away as the apparatus slowed down, until the strength of the hold-on magnet was not sufficient to hold the switch arm, which would then fly back to the "off" position. The motor being driven as a generator would form an electric brake, the momentum stored up in the apparatus being transformed into the electric energy passing round the field circuit, and this load would, therefore, pull up the apparatus sooner than if it simply had to turn the motor round with the field circuit broken.

From the foregoing remarks it will be noticed that if the field circuit was broken immediately after the supply cut off from the motor, the hold-on magnet would not have any current passing round it, and would be demagnetised immediately; also the apparatus would not have any load upon it, and would run for a longer period than if it had to drive the motor as a dynamo and supply current to the field circuit. Fig. 2 shows a main switch and starter which

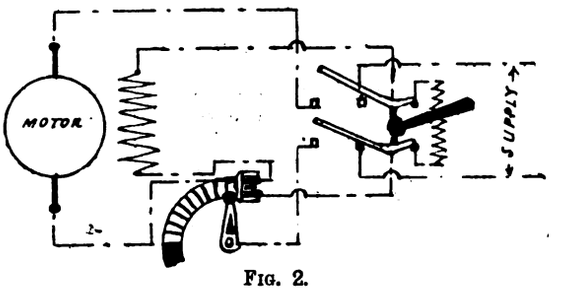

FIG. 2.

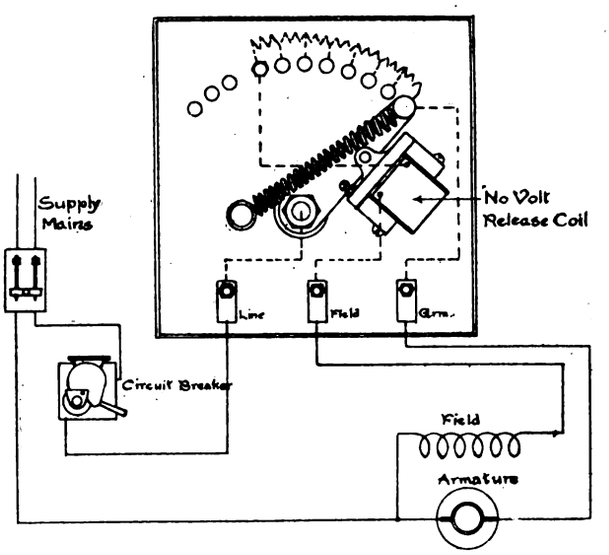
would cause the switch arm to fly to "off" position immediately the supply was cut off, which is essential, as the supply might be resumed before all resistance cut in armature circuit. It will be noticed that, on closing the main switch, the field circuit is first energised, and then the armature circuit; and on opening switch the armature current is first cut off, then the non-inductive resistance is put in parallel with the field, the supply then being cut off from the latter, and the induced E.M.F. due to breaking the field circuit allowed to die away through the resistance, which prevents the insulation of field coils being broken down.—A. T.

Answer to No. 620 (*awarded* 7*s.* 6*d.*).—The phenomena stated above may be explained best by a diagram of the internal connections of a motor-starting rheostat. The accompanying figure shows the complete connections of a starting rheostat for a shunt motor with "no-volt" release. It will be seen on reference to the figure that the release coil is in series with the shunt field. This coil is proportioned so as to "hold up" with the smallest field current taken by the motor for which the switch is rated for, and adjusted to release when the motor has slowed down to about quarter speed when running light.* We



will suppose that the motor is running light, and the main D.P. switch is thrown off. The motor still continues

* The object of the "no-volt" coil (as its name implies) is to cut the motor out of circuit should the machine lose its field.

Digitized by Google

to run, and the arm of starting switch is still held up. This is readily accounted for when the connections are traced out, for if this be done it will be found that when the arm is held up there is a path from one brush to the field spools, and thence to field terminal on rheostat, no-volt coil, and starting resistance to armature terminal, and back to the other brush. Thus the machine runs as a generator with self-excited field (the residual magnetism in the fields being sufficient to cause the machine to "build up"). It should be pointed out that the direction of rotation is the *same* for a shunt machine when run as a motor or a generator if the polarity of the brushes is the same. Hence a shunt motor (of moderate size) when run as a generator will build up if the direction of rotation is the same in each case (provided, of course, that the field connections are all right). With a series machine the converse is the case. Release of the arm of starting switch takes place when the field current (and likewise speed) falls to a certain value. The machine then continues to run (on account of the kinetic energy of the revolving armature) until stopped by its own friction.

The retarding forces at work in the first case, when the motor is running light, are: (1) the current in the armature for exciting the field; (2) the core loss; and (3) the friction losses (including bearing and brush friction). When the arm is released, the only retarding force is the friction of the machine (3). In the second case, when the motor is heavily loaded, the load rapidly absorbs the kinetic energy of the armature, and the latter very quickly stops. The rate of decrease of magnetism in the "no-volt" coil with regard to time is, in this case, not so great as the rate of decrease of speed with regard to time, and consequently the "no-volt" coil is slow at releasing. In the first case, however, the rate of decrease of the magnetism with regard to time is greater than the rate of decrease of speed with regard to time, and hence release takes place when the motor is running at a fair speed. When the circuit is broken at the field terminal of the machine, as in the third case, the arm is at once released, for the motor cannot generate, on account of the field circuit being disconnected, and hence there will be no current in the holding-up coil on the starter. In this case the only retarding force at work is the friction of the machine (which is generally small compared with (1) and (2) above) and the machine, therefore, takes a much longer time to stop. The time taken by a motor in stopping under these conditions depends on the speed it is running at and the square of the diameter of the armature (approximately), and thus it will be seen that motors with armatures of large diameters will take a longer time in stopping than those of the same size and speed with small diameter armatures. The writer has come across cases where the time taken by a moderate sized motor to stop has been two to three minutes after the machine has been switched out. In the second case the arm may be made to release sooner by increasing the air-gap between the poles of the hold-up coil and the contact arm. In starting rheostats by some makers a small brass set screw and locking nut will be found on the contact arm, which is arranged to come in the middle of one of the pole-pieces of the hold-up coil (see figure). By adjusting this screw the arm may be released at any speed desired. Of course, it should be seen that the point of the set screw always projects slightly on the "holding-on" side of the contact arm, otherwise the latter may be held up by the residual magnetism in the iron.—A. D.

Answer to No. 620 (*awarded* 7*s.* 6*d.*).—The time taken for the no-volt release to act is probably due to three causes—(1) the residual magnetism in the keeper of the release; (2) the self-induction of the coil; (3) the small current flowing through the field. Taking the first cause, when a piece of iron or steel is subjected to an increasing magnetising force, and then this magnetising force is decreased to zero, some magnetism remains in the metal, and is known as residual magnetism. The remanence, or residual value of B, depends on the material partially and on the degree of investigation (B). From the curves (Fig. 1) it can be seen that these values of B vary in different metals for a given value of the magnetising force, H, and that the ratio of B : H, known as the permeability, also differs. This residual magnetism causes the no-volt release to maintain its action as a magnet after the current has been broken, but, of course, only momentarily. There is always a certain amount of self-induction in any coil, which tends to oppose the current and prevent it from either growing or dying away. Thus, when the circuit is broken, the current does not die away instantaneously.

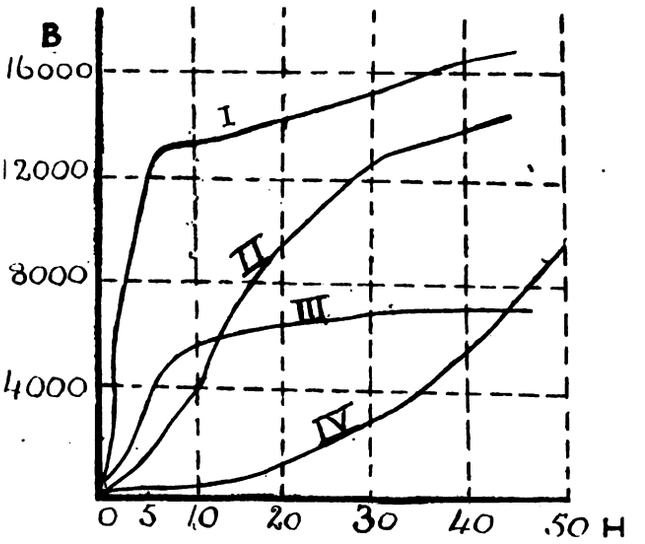


FIG. 1.—I., soft annealed iron; II., steel annealed; III., cast iron; IV., steel glass, hard.

Now, in this instance, where current is broken to the *motor*, the momentum of the armature causes it to continue revolving, and a current, though small, is being sent round the field circuit by the back E.M.F. of the motor. From Figs. 2 and 3 it is clear that the direction of this current is not reversed, one of the

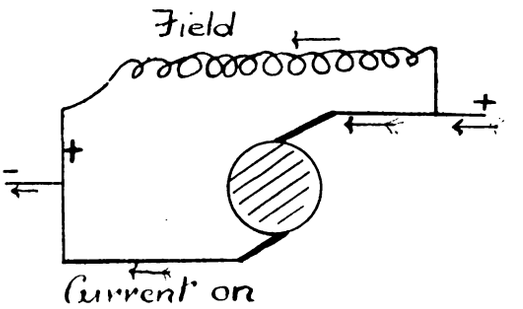

FIG. 2.

characteristics of a shunt motor being that the current in the field is never reversed. Hence the switch arm is held in place until the residual magnetism in the keeper has weakened (the time taken being increased owing to the effect of self-induction), and until the speed of the armature has slowed down sufficiently to weaken the back E.M.F. to

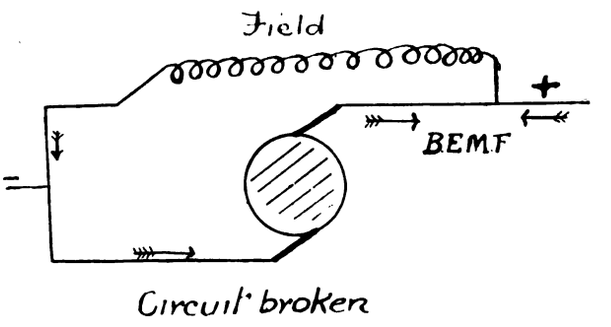

FIG. 3.

such an extent that it can no longer drive sufficient current through the high resistance of the field. In a good starter, the spring of the switch arm is strong enough to overcome some of these effects. In general, when a motor is heavily loaded (the field is always practically constant in a shunt

Digitized by Google

motor) on constant-potential system, the speed is at once reduced. But this lowers the back E.M.F., since speed is proportional to back E.M.F. in a motor. Consequently the armature current rises and the torque is increased.

In this case, therefore, the armature, owing to the heavy load, would quickly be brought to rest when the circuit was broken, and, the conditions of the field circuit being the same as before, the arm would be released slightly after the armature had ceased to revolve, especially if the switch arm spring were weak. When the field circuit is broken, either at the shunt connection or at the starter, the no-volt release at once ceases to act as an electro-magnet (as the retardation of the current due to self-induction is almost imperceptible), and the residual magnetism of itself is insufficient to hold the arm, and the latter immediately flies back. From Fig. 4 it can be seen how breaking the field circuit affects the no-volt release.

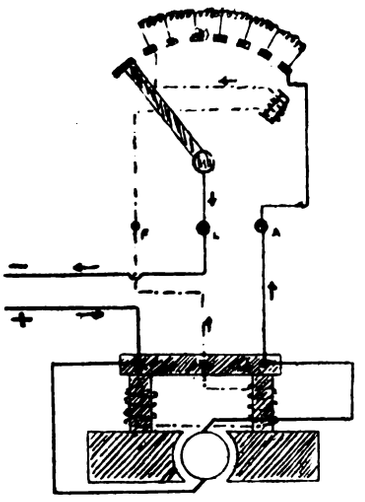

FIG. 4.

Where the field of a motor is weakened, the speed is increased; hence, in this case, there being no field, the speed will be very great, and the motor, owing to its increased momentum, will revolve for a greater length of time.—HYSTERESIS.

Answer to No. 620 (*awarded* 5*s.*).—The reason why the no-volt arm on switch does not release on breaking current to motor is not far to seek, and may be clearly understood, in the first place, by referring to the sketch (Fig. 1) of the

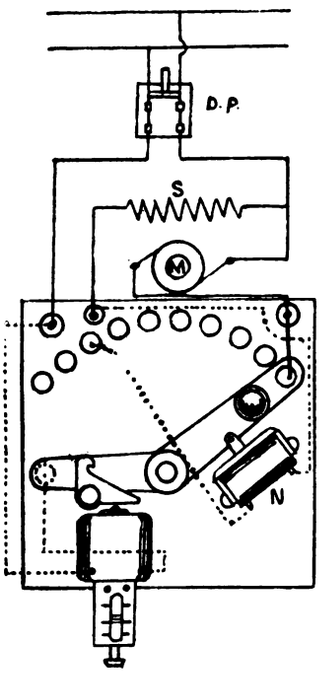

FIG. 1.—D P, double-pole switch; S, shunt; M, motor armature; N, no-volt coil.

starter and motor connections, from which it will be seen that immediately the current is cut off at double-pole switch the armature is still left connected up with the shunt in a complete circuit. The motor keeps on running for an appreciable time, due to its momentum and of machines it is driving, and it is therefore acting as a generator. The no-volt coil has a current flowing through as before, and in the same direction. As mentioned in the question, it will be held on even after the motor has stopped if the current was cut off whilst the motor was heavily loaded. This is undoubtedly due to the lag of the magnetism in the fields setting up a current, the length of time the arm is held on depending upon the design—*i.e.*, the quantity of iron in the fields of the motor.

This may be further verified by the following simple arrangement: Fix a switch in the shunt circuit between the shunt terminal on starter and end of shunt wire connected to former. Now, with motor up to full speed, cut current off at D.P. switch, and when motor has slowed down to, say, half speed, open small temporary switch. The no-volt arm will then immediately release. Try this with heavy load on motor, but open temporary switch between the time of motor having stopped and no-volt arm being released. It will again be released almost immediately. A small flash will be noticed at temporary switch, evidently due to self-induction.

The last part of the question, why the no-volt immediately releases on breaking at shunt connection, is obviously due to current being completely cut off from no-volt coil almost immediately. The effect of self-induction is not so effective as before, there being now no closed circuit. The motor will in this case run for a longer time because there is now no breaking effort due to running as a generator as in the first case, there being also no field and no eddy currents, etc. The momentum of the motor and parts it is driving is now all being wasted in friction only at bearings, and, therefore, runs for a greater length of time.—F. H. R.

FORTHCOMING EVENTS.

FRIDAY, OCT. 16.

Institution of Mechanical Engineers.—At 8 p.m., ordinary meeting. Paper: "The Newcomen Engine," by Mr. Henry Davey.

SATURDAY, OCT. 17.

Junior Institution of Engineers.—At 3 p.m., visit to the New Vauxhall Bridge Works. Assemble at the Westminster entrance.

WEDNESDAY, OCT. 21.

Association of Municipal Corporations.—Annual meeting, Westminster Palace Hotel.

THURSDAY, OCT. 22.

Institution of Electrical Engineers (Leeds Section).—Ordinary meeting. Paper: "Some Notes on Steam Turbo-Electric Generating Plants," by Mr. G. Wilkinson.

FRIDAY, OCT. 23.

Junior Institution of Engineers.—At 8 p.m., annual general meeting, Westminster Palace Hotel.

PERSONAL.

Mr. P. H. Roscoe, son of the sewerage surveyor of the Corporation of Liverpool, and lately cable engineer with the British Insulated and Helsby Cables Company, is leaving to act as assistant tramway engineer at Portsmouth. As a parting gift, the men employed under him at Brighton have presented him with a smoker's cabinet in oak, a meerschaum pipe, cigars, and Phillip Dawson's "Engineering."

Mr. Blake, electrical engineer, has been appointed temporarily to do the work of the borough surveyor of the Monmouth Town Council.

The successful candidate for the post of senior charge engineer at Taunton was Mr. H. E. Sharp, from the Bristol city electricity works.

Mr. Sydney H. Barber was presented last week with a silver cigarette case and match box on the occasion of his relinquishing the chief assistantship at the Shipley electricity works to join the outside staff of W. T. Glover and Co.

On Wednesday a farewell presentation was made by the indoor staff of the South London (London County Council) Tramways to Mr. Alfred Baker on the occasion of his approaching removal to Birmingham. The gifts comprised a drawing-room clock and brass ornaments to match and a tantalus, together with an afternoon tea service and case of silver spoons for Mrs. Baker.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notices of Meetings, Issues of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration.

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140 Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	— 6s. 6d.	— 13s. 0d.
Other Places	5s. 6d.	— 10s. 6d.	— 21s. 0d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Bound Volumes of "THE ELECTRICAL ENGINEER," *containing half-year's copies, bound in Dark-Blue Cloth, Gold Lettered, price 8s. 6d. New Volume, January to July, 1903, now ready.*

FINANCIAL TROUBLES AHEAD.

During the past week the London County Council has made two changes in financial matters which will have a much wider interest than to those immediately under the control of that Council, and the ultimate consequence of which can hardly be seen at the present time. It is well known that the London County Council is practically the central banking establishment for all the local authorities within the metropolitan area. Scarcely a week passes but that the Council advances loans to other authorities. It is now finding that there exists a pinch in the money market, and that money which could a few years ago be obtained at a moderate rate of interest, is not now to be so obtained. Thus, at the last meeting of the Council, the Finance Committee reported that they had been considering the rate of interest under which advances should in the immediate future be granted, and suggested that the present rate of 3½ per cent. could no longer be regarded as sufficient, and that they should increase the rate of interest to 3¾ per cent. per annum. The Council adopted the report of the committee. This increase in the rate of interest has long been foreseen, and under existing circumstances was inevitable. It is in the ordinary nature of business, and may perhaps cause a few of the authorities to think a little more before they enter into big obligations. We doubt, however, whether anything in the shape of interest would be effective in restraining what is termed the progressive policy. In many instances, unfortunately, we are almost bound to believe that other questions than the due spending of money takes precedence in the councils.

The second move of the London County Council, however, may be far more effective than the raising the rate of interest. Loans are obtained for specific purposes, and these loans have to be repaid within a certain number of years, the number of years depending upon the work for which the money is required. Hitherto we believe that in many instances loans have been too easily granted, and the time for which they have run has been too long. The particular case which the Council has decided may not seem very important, or to bear any far-reaching results. It is the case of a certain kind of paving which hitherto has been estimated to last ten years, and the loans granted for it have run during the period. It is suggested that the duration of loan for this particular kind of paving be limited to five years, in that experience has found that within the metropolitan area the paving was worn out before the expiration of a longer time. To us it seems that it is not the particular case that is of so great interest, but the principle involved, which is to ensure that no portion of the loan be outstanding when the work for which it has been obtained is useless. It may be taken for granted that what the London County Council has introduced will be continued by the Local Government Board which has to sanction the loans of municipal authorities required for the various works they undertake. In the near future undoubtedly a far greater examination will be taken in order to determine, not the maximum life of a works, but the average life, and this determines the period during which the loan may be running. We know that there are great differences of opinion as regards electrical undertakings. Many who have carefully studied the question think that the period during which loans are granted is too short, and desire to see the period extended. We doubt if at the present moment we have enough cumulative evidence to determine anything, and we may take it that the policy hitherto pursued is liable to modification. It is somewhat unfortunate that these questions of finance cannot be dealt with without loss

Digitized by Google

of temper, for on the one hand we have many strong statements by interested parties of the manner in which municipal enterprise is conducted, and we are told that when the financial conditions can be thoroughly examined many of these enterprises are in a state of bankruptcy. On the other hand, it is pointed out that the very people who so strongly criticise do not practice what they preach. It is evident by the action of the London County Council that we are on the eve of change, and we think it would be well if all the responsible officials who have charge of central stations would follow the example of Mr. J. Snell, the president of the Municipal Electrical Engineers' Association, and collect all the information and all the figures pertaining to their own installation which bear upon this subject.

QUACKS AND QUACKERY.

On May 22 we made an emphatic protest against the policy of respectable daily papers inserting advertisements about quack remedies. The use of electrical appliances by duly qualified men is to be commended, and every effort should be made to extend their beneficent use; but the quack advertises appliances which are known by qualified men to be remedially useless, and indeed in some cases to be positively harmful. These quacks depend for success upon the ignorance of the general public, and this ignorance is fostered by the criminal negligence of proprietors of papers and periodicals. Anyone who cares to examine the so-called current literature will find that a large part, probably one-half, of its advertisement income is derived from payment by quacks. Some years since, through the action of our contemporary the *Electrical Review*, the value of so-called magnetic and electric belts was thoroughly thrashed out before a legal tribunal; hence it is too late in the day to plead ignorance of the question, yet for months past glaring advertisements have been inserted on the old lines. Fortunately, or unfortunately, the Medical Defence Union have been able in one case to step in, so that probably for a time at least the advertisements will stop. It is too much to hope for finality. Newspaper proprietors will say they are not called upon to discriminate, and why should they refuse good money. Mr. Bodkin, explaining the summonses taken out because of a misdescription, said: "In every one of these advertisements which related to the power of a so-called electric belt to cure every known or unknown disease from which human beings suffered within the shortest possible time." . . . . In reply to a question by the magistrate, Mr. Bodkin said "he had been given to understand that these belts were so absolutely free from electricity that they were just as if a person wrapped a piece of paper round the body." Of course, that was a dogmatic statement, and of no value in evidence. Our quotation in May was, "But a physician can apply the current in a very mild form from the battery." "Yes, but not so mild as it should be to do any good." This question and answer, quoted from an advertisement in the *Standard*, shows conclusively that the writer was very imperfectly acquainted with his subject. Civilisation seems to trend backwards, and the value of modern education cannot be very great when it is seen that the remedies of ignorant quacks are eagerly sought after.

ROTHERHAM.—The Corporation have decided to apply to the Local Government Board for sanction to borrow £14,670 for extension of their electric supply works.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

A SELF-DRIVING MACHINE.

SIR,—I beg to send you the following correspondence, which may be interesting to your readers.—Yours, etc.,
ARTHUR E. GILBERT.

23, King John-terrace, Heaton, Newcastle-on-Tyne,
Oct. 13, 1903.

B. C. Pole, Esq., London.

Dear Sir,—I quite agree in what you say in yours of 8th inst., to the effect that it is possible to construct a machine to work by its own mechanical parts, without any external aid—*i.e.*, mechanically-made power. I have devoted 30 years' study, off and on, to the problem, and am now preparing drawings of "a self-driving machine," which will, I venture to say, be considered one of the greatest inventions of the twentieth century. But being single-handed, and not my own master, the details take some time to work out. When my drawings are completed I should much prefer you to examine them, because your ideas coincide with mine, and in the event of your thinking favourably of the principle of the machine we might come to terms. What do you say? With our two heads together I feel that we could soon produce a working model without costly experiments. *Do I understand that your momentum engine works without boilers, steam, and fuel?*—Faithfully yours,
ARTHUR E. GILBERT,
Oct. 10, 1903. Electrical Engineer.

19-19A, Imperial buildings, Ludgate-circus,
London, E.C., Oct. 12, 1903.

Arthur E. Gilbert, Esq.,
23, King John-terrace, Heaton, Newcastle-on-Tyne.

Dear Sir,—In answer to your letter of the 10th, the momentum engine can be worked without boiler, steam, or fuel by the laws of gravity, also the tides, also the solar motor. I do not wish to see any drawings, as the mechanical development of power is now discovered by me, and I claim all the rewards and statutes which are offered in this country for the discovery.—Yours truly,
(Signed) B. C. POLE.

[This correspondence is *too* good to be lost to the world, and, failing its insertion in *Punch*, we venture to give it room—though it savours too much of "counting chickens before they are hatched."—ED. *E. E.*]

THE RELIABILITY TRIALS OF MOTORCARS.

SIR,—The Automobile Club having now issued their preliminary report upon the above trials, I am glad to note from it that the officials have at last come to recognise the primary importance of the value of non-stop runs. So long ago as 1898, in a letter to the technical journals, I suggested the non-stop idea as applied to the testing of motorcars, but it is only comparatively recently that the Automobile Club and the public have commenced to fully realise what an instructive and a conclusive test a non-stop run really constitutes.

Although the public may have the fullest confidence in the decision of such judges as were appointed to watch the recent trials, yet the formula by which they are supposed to have arrived at their decisions is utterly unintelligible to the ordinary run of interested amateurs, whereas nobody is so dull as to fail to appreciate the meaning of a right-away non-stop run and its immense value in determining the reliability of any particular make of vehicle. There is no doubt about it, reliability is what the British public require before every other quality which a motorcar may possess.

One can tolerate a certain amount of odour, noise, vapour, or vibration, as one does upon a railway, but so long as these objections are confined within the limits of moderation, reliability is the one thing needed, and nothing can demonstrate the possession of this quality so simply, thoroughly, and conclusively as a non-stop absolute run. But such trials as those recently instituted by the club,

Digitized by Google

whilst forming an excellent advertisement to the club itself and constituting some slight basis, perhaps, for its *raison d'être*, are, nevertheless, a terrible drain upon an industry whose object it should be to supply the public with reliable vehicles at a reasonable price. When manufacturers and agents are called upon to pay sums varying from £30 to £100 for the mere permission to participate in these trials (hampered as they appear to me to be by strikingly useless conditions), besides the costs attendant upon the running of the vehicles, it is obvious that such expenses must be piled upon the cost price of the cars, which eventual purchasers must reimburse in the sums they pay for their vehicles. I should like to suggest that the public should in future very carefully note the results demonstrated in all properly authenticated non-stop runs, as these, in my opinion, form a sufficiently conclusive test of the one feature required above all others in the work of a motorcar—reliability. The costs of such a test are infinitesimal compared with the entry-fees exacted for participation in "official" tests, and cannot, therefore, indirectly increase the price of motorcars, which even now, in most cases, is too high to allow the public to derive from them the advantages and enjoyment which they might otherwise legitimately be able to afford.—Yours, etc.,

London, W.C., Oct. 13, 1903. R. MOFFAT FORD.

A FORECAST.

You may talk of any engines
Of reciprocating type
That have ever been constructed
Or have blossomed forth to life:
From the stately-moving triple
To the giddy high-speed thing
Which runs with peace angelic,
Though, like Jehu, travelling;
From the "Eiffel Tower" vertical,
Which necessitates a guy
Rope upon the topmost cylinder
Whene'er the speed is high,
To the horizontal Corliss
Spreading out across the floor
And covering the good half of an acre—sometimes more.
All the beauties and the virtues
Of this ancient, honoured throng
Will be buried and forgotten like the past before so long.
For a rival has arisen,
And i' faith it's going strong,
And the ancient engine builders
Wear their faces very long;
For they don't like to admit it,
But the fact is very plain
That the use of turbine engines
Means a most substantial gain
In floor space, stores, and lubricant.
Besides, they save the pain
Of witnessing the breakdowns
Which again and yet again
Come through heated top and bottom ends,
And other things insane,
Which are attributes of all the brutes
Which reciprocate in vain.
For their day is past and over—
'Tis the turbine come to stop,
For when once you start him running
He'll continue 'till you drop.

—F. T. C.

This is not poetry, but it may be prophetic.—ED. *E. E.*]

Magnetic Survey of the Dutch Archipelago.—According to *Terrestrial Magnetism*, the Dutch Government has granted the means for a new magnetic survey of the Dutch Archipelago during the years 1904-7. During each of these years the field work is to cover two to four months, only a general survey being possible with the present means. A beginning has already been made, observations having been commenced on the "tin island," Billiton, and at some points in the neighbourhood of Batavia.

LOCOMOTIVES OR MOTORCARS?

BY B PONTIFEX.

There are different answers to the above question, which depend on the class of traffic and length of runs, conditions which separate the problem into three headings: (*a*) fast long-distance passenger and goods traffic, (*b*) local passenger traffic, (*c*) slow goods.

For all these, but especially for express traffic, electrical engineers need to be reminded that the track on which the trains run requires to be taken into consideration. Engineers who can—and do—design good working railway motors seem to regard their position on the cars or trains as a matter of secondary importance, and, consequently, put them anywhere solely with a view to convenience and economy of locomotive and carriage design. Even a member of the general public knows that main-line expresses take facing points at a speed of over 30 miles an hour (whether they are supposed to do so is another story); would a train of motorcars, or mixed carriages and motorcars, keep the metals under these conditions? The best answer is that no train on a steam railway would attempt to take facing points except at a crawling pace, if it were being pushed, and what certainty would there be that in a train of motorcars the fastest would invariably lead? Traffic on an important main line would be too complicated if it were carried on by a succession of motorcars running on a very short headway, apart from any difficulty in the way of picking up passengers and their luggage in the limited time that could be allowed for stops. If these assumptions are correct—and they are deduced from the present standard railway practice—long-distance express traffic, which has necessarily to run through junctions at a fairly high speed, will have to be drawn by locomotives. If a train of motorcars were used, the resulting increase in acceleration would be more than outweighed by the danger of jumping the track at crossings, and it is also open to question whether the Board of Trade would sanction extra high voltage on cars that were carrying passengers, since long journeys imply long distances for transmission of power, which in turn require high voltage.

(*b*) For local passenger traffic the conditions are almost reversed Quick acceleration is a matter that directly affects the average speed of the trains,* and a train composed, wholly or largely, of motorcars can always get up speed quicker than a train drawn by a locomotive, while shunting at the termini is reduced 80 per cent. or abolished altogether if the trains start and arrive at the same platform. Added to these advantages is the ease with which a motorcar train can be split up at suburban junctions for serving small branch lines, which is the strong point of any system of multiple control such as that introduced by Mr. Sprague. But even for local traffic some consideration for the track has to be shown to get the best results. A common arrangement is to put a motor on every axle of the leading and trailing bogies, which from my own experience I can say does not give the best results. A train composed of two motorcars, with an idle car between them, was equipped with four motors, two on the leading bogie and two on the trailing bogie; but under the most favourable conditions failed during several trials to quite come up to the contract speed over the whole route, which included 13 stops per journey, while the permanent way was rather knocked about. The motors were then shifted, one to each bogie of the leading and trailing coaches, and fixed on the inner axles of each, so that the leading wheels were always idle, whether the train was moving forwards or backwards. The better distribution of the motors gave increased acceleration, as was expected, but there was also a decided improvement in the condition of the track and in smoothness of running, due to the decrease of hammering at curves and points owing to the removal of the motors from the leading axles.

(*c*) For slow goods traffic locomotives alone meet all requirements, owing to the class of rolling-stock in use and the fact that many goods wagons are owned by private firms. The cost of building and maintaining

*See "Notes on Electric Traction," *Electrical Engineer*, Vol. XXXI., page 150.

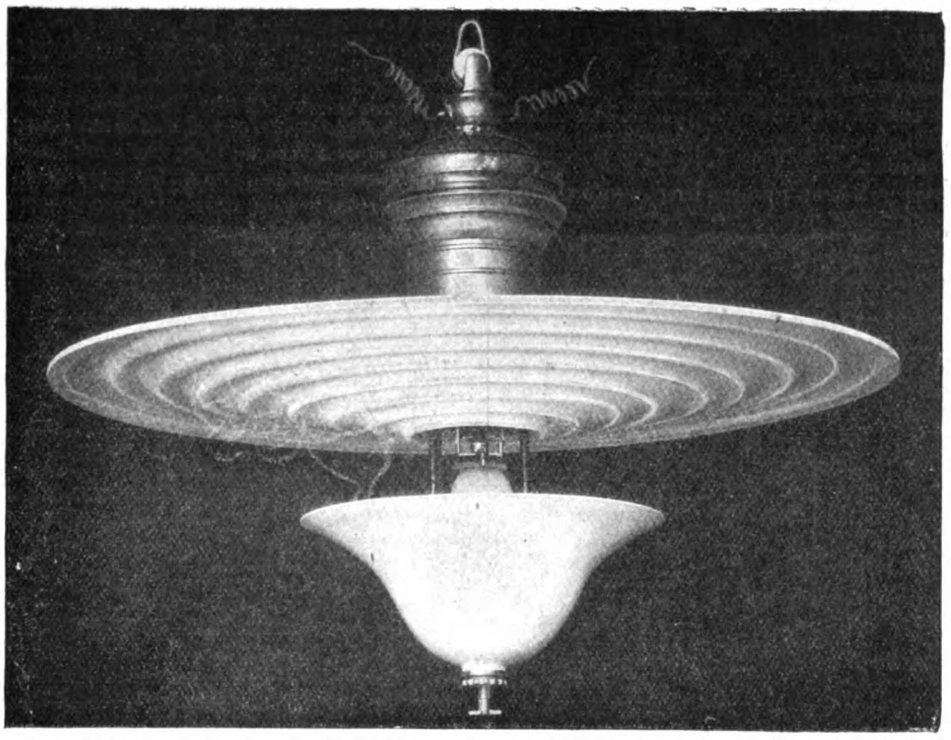
Digitized by Google

motorcars for slow goods traffic would only result in a heavy loss for the railway company that was rash enough to try the experiment.

TRADE NOTICES AND NOVELTIES.

The British Thomson-Houston Company's Concentric Light Diffuser for Enclosed Arc Lamps.

For interior shop-lighting the enclosed arc is generally recognised to possess advantages over the open type. While it does not give such a powerful light as does the open type for the same amount of energy, it possesses other advantages, such as cleanliness, convenience, safety, and requires a very small amount of attention and infrequent trimming. An objection to arc lamps for this kind of lighting, which applies more particularly to the open type, but also to some extent to the enclosed type, is that there is a tendency to concentrate the light in a circle beneath the lamp, and a perfectly even distribution of light is difficult to obtain. In many shops fatigue and subjective colour effects are partly overcome by the use of dense globes. This reduces the efficiency of the light, and there still remain defects in the distribution, due to the arc travelling around the carbon points.



Concentric Light Diffuser for Enclosed Arc Lamps.

In order to further improve the distribution of light with the enclosed arc lamp and adapt it to particularly severe requirements, the British Thomson-Houston Company, Limited, Rugby, after a careful study of this important problem, have introduced the concentric light diffuser, which is shown in the accompanying illustration. This apparatus, it is claimed, while of an exceptionally simple character, not only reduces sharp contrasts and diffuses the light equally in all directions, but the effect of the wandering of the arc has been reduced to a considerable degree, so that the light at any point is, to a great extent, independent of the position of the arc with respect to the carbon ends. The apparatus consists of a suitably-designed metal diffuser attached to the lamp casing in the same manner as an ordinary reflector or shade. In place of the outer globe a screening shade is used which performs the double function of subduing the light directly under the lamp, and reflecting a portion of it on to the diffuser. The light from the diffuser is white, even, well distributed, easy on the eyes, and particularly adapted to the matching of colours, which is of the utmost importance in a very large percentage of shop-lighting. Furthermore, the diffuser makes the illuminating power of the lamp independent of the nature or colour of the ceiling—that is to say, it is immaterial whether the ceiling is light or dark. With the diffuser the light will be about equally effective under all overhead conditions, as there will be practically no light lost by absorption in the ceiling itself. The concentric light diffuser is particularly adapted for use in rooms having low ceilings, and is specially recommended for drawing offices, shops, and in general for any interior lighting work where even distribution and steadiness of light are particularly important. It should never be used without the lower glass shade, and it is not suitable for use with outdoor lamps. The British Thomson-Houston Company, Limited, have devoted a great deal of attention to the proper lighting of interiors with enclosed arc lamps, and as a result of the experience obtained in this line the following useful table has been compiled showing the watts per square foot required to give good lighting for various classes of work. These figures are given merely as suggestions, and a maximum and minimum figure has been given in each case to cover extremely good or particularly bad conditions. The average of the figures given will serve as a general guide. The figures are given in watts per square foot, and are sufficiently accurate for ordinary purposes for both alternating and direct current arc lamps suspended at the usual distance from the floor.

Watts per Square Foot for High-Class Arc Lighting.

Building.	Average conditions.	Variation.
Machine shops, high roofs, electrically-driven machinery, no belts	* ·75	* ·5 to 1
Machine shops, low roofs, belts, and other obstructions	1·	·75 to 1·25

* Energy based on watts at lamp terminals.

Langdon-Davies Motor.

We have received from the Langdon-Davies Electric Motor Company, Limited, 101, Southwark-street, London, S.E., a set of their new lists, dealing with direct-current motors, alternate-current two-phase motors, and single-phase motors. One of the lists includes illustrations of the works in which the motors are manufactured, and of some of the uses to which they have been put. In this latter connection, a separate leaflet containing examples of costs of working, furnished by users of the firm's motors, is worthy of note. In most of these examples the purpose to which the power is applied is given, together with the brake horse-power of the motor or motors, average units consumed per week of a given number of hours, and the cost per week as shown by the bills paid.

Spiral-Filament Incandescent Lamps.

The lamp expert of the Mackey's Electrical Lamp Company, Limited, recently called to show us a new type of lamp which his firm are about to put on the market. The lamp in question had a round bulb, and the filament was in the form of a double spiral. A thin glass rod projecting upwards from the base of the lamp served as a support for the upper looped end of the

Digitized by Google

double spiral filament, and, by holding it, prevented excessive vibration in the same. The advantage of this form of filament is that the distribution of light is much more suitable for all lamps which are hung vertically downwards. With the ordinary form of filament, as shown in Fig. 1, the nominal candle-power is given in a horizontal direction, and the distribution of light at other angles such as is shown in this illustration. Fig. 2 gives the distribution of light from one of these lamps with spiral filaments now being introduced by the Mackey Company. In this case it will be seen that the maximum candle-power is given in the direction of the point of the lamp, and hence on all pendants this lamp will give

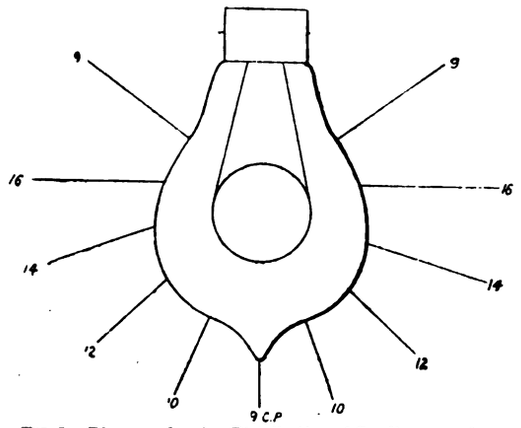

FIG. 1.—Diagram showing Distribution of Candle-power from Ordinary Filament.

more light vertically downwards. This curve (Fig. 2) is taken fom a report by Prof. Silvanus Thompson on a lamp which had a clear glass globe. From this report we gather that the lamp had a mean hemispherical candle-power of 14·62, but, as is seen from the curve, it produced 22·5 c.p. in the axial direction. The mean spherical candle-power of the lamp was 13·31. This independent test clearly shows the marked increase in the light in the axial direction due to the arrangement of the filament. Quite apart from the arrangement of this filament the new lamps will be of high efficiency, as they will be manufactured on lines dictated by long previous experience. It is claimed for these lamps that they largely do away with the need for a reflector. The best proof of this is to compare the light given

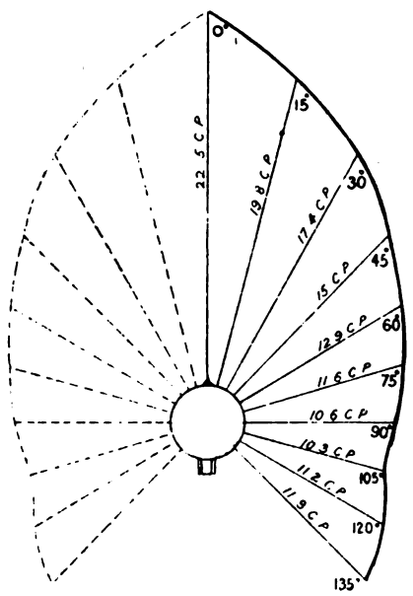

FIG. 2.—Polar Curve of Candle-power from a Spiral Filament Lamp.

on a writing table by one of these lamps without a reflector with that given by an ordinary lamp with a reflector over it.

The Union Electric Company, Limited.

The above company invited a number of electrical engineers to visit their showrooms at 151, Queen Victoria-street, on Wednesday and Thursday last week, in order to inspect a number of new arc lamps, electric motors, and other engineering appliances, which they are placing on the market. Through the courtesy of Mr. Justus Eck we were allowed a private view, which, although it deprived us of meeting the other friends of the company, afforded an opportunity of more close detailed examination. To deal with the electric motors first, the direct-current type are now standardised by the company for four different voltages—*i.e.*, 110, 220, 440, and 500. With this range practically every voltage in use on supply mains within the United Kingdom can be dealt with, and motors supplied from stock. If, however, the delivery is not urgent, it is usually advantageous to have a special winding on the field magnets if the voltage varies much from the above standards. To meet the varying views of consulting engineers, no less than seven different speeds are standardised for each motor frame. This combination in conjunction with the three main types—*i.e.*, open, semi-closed, and completely closed—renders the economical manufacture of electric motors no light matter.

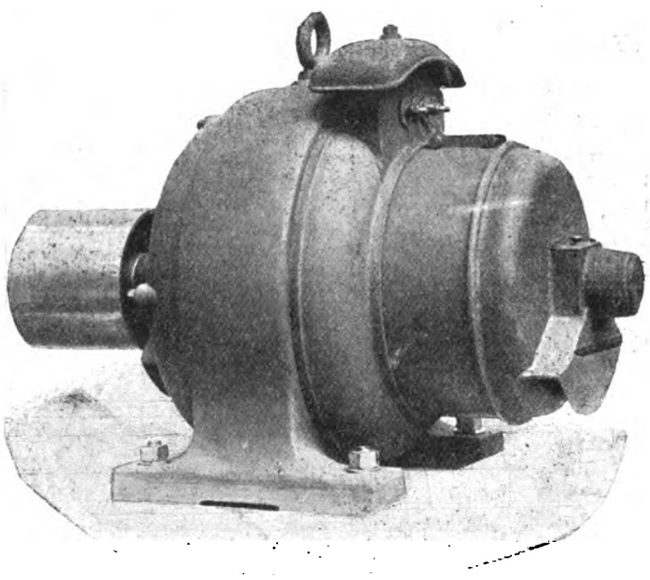

FIG. 1.—View of a Semi-Enclosed Motor by the Union Electric Co.

The difficulty, as far as the last three variants are concerned, is simplified by the Union Electric Company by the ingenious method of ventilating the semi-enclosed motors. This we illustrate in Fig. 1. The air for ventilating the interior of this motor is taken in at openings under the two bearings while the hot air is discharged from an opening under the hood, which is seen in front of the eye-bolt. In this way a good draught of air is ensured both over the commutator and through the armature. The natural inclination of the hot air to rise assists in keeping the armature cool, and it will be seen that the cold air is taken in at the lowest point of the case. The efficiency of cooling is such that the same size of frame, etc., will serve for both the open and semi-enclosed types. In all, except the smallest of these motors, the terminals are completely enclosed. Another feature in the motors is that of the design of the pole shoes. These are of laminated iron, and they are attached to brass rings, which go completely round the armature. In the two-pole machine these shoes are rotated in order to get the correct lead for the fixed brushes. As a rule, these motors are designed to have about 15 per cent. field regulation at normal volts. A new feature in the way of small arc lamps was on view at the same time, and one of these

FIG. 2.—Small-Current Arc Lamp.

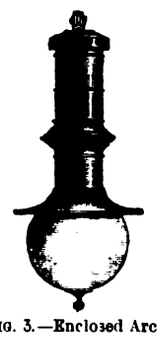

FIG. 3.—Enclosed Arc Lamp.

lamps is illustrated in Fig. 2. It consists of a small lamp, only 15in. over all, which will work most satisfactorily with two amperes. The lamp is of the enclosed type, and works with from 65 to 80 volts across the arc. In this way three lamps can be conveniently connected in series across 240-volt circuit. The white light from these lamps will render them of very great service for certain trades, such as jewellers, drapers, etc., and particularly in those establishments where large units of light cannot be employed. They are designed for both indoor and outdoor working. Fig. 3 is a view of the latest type of enclosed arc lamp manufactured by this firm, but the greatest novelty was their new type of flame lamp, a description of which we must reserve until our next issue. We need only add that anyone who has to design a lighting system for a large workshop or factory, will find the more opportunity of judgment between the relative advantages of the different

Digitized by Google

arc lighting systems at the showrooms of the Union Electric Company than in most other places.

"Permiol."

The above is the name given to a new paint which is being introduced by the Permiol Manufacturing Company, Limited, Croft-street Works, Pendleton, Manchester. It is claimed that this paint does not contain any poison, such as is generally embodied in other paints, compared with which it is also 50 per cent. lighter volume for volume, and therefore any given weight or quantity will cover a much greater surface than ordinary paint. Further, that it possesses extraordinary acid-resisting qualities, and may be used with advantage for the protection of exposed metalwork, including trolley poles, etc.

KEIGHLEY ELECTRICITY UNDERTAKING.

Mr. J. M. Smyth, the borough electrical engineer of Keighley, has presented to his committee his report on the working of the electricity department for the past 12 months ended June 30, together with an abstract of the accounts. The capital account shows receipts amounting to £47,606, as against expenditure to the amount of £47,595. 19s. 10d., leaving a balance in hand of £10. 0s. 2d. There is still an amount of £1,015 for which borrowing powers have been acquired but not exercised. Following we give an abstract of the revenue account for the year under review.

Receipts.	£	s.	d.
Sale of current	1,413	13	7
Public lamps	480	0	0
Meter rents	85	0	3
Rents received from Low Bridge site	87	10	10
Sale of lamps and other apparatus	35	6	2
Sundries	0	11	0
	£2,102	1	10

Expenditure.			
Coal	269	19	2
Oil, waste, water, etc.	23	14	1
Wages at station	346	8	10
Repairs and maintenance (generation)	80	0	7
Repairs and maintenance (distribution)	36	8	5
Attending to public lamps	98	17	9
Interest to gas department for land	275	4	11
Rates and taxes	263	7	11
Salary of engineer	300	0	0
Salary of clerks	95	0	0
Stationery and printing	24	12	11
General establishment charges	83	3	7
Law charges	1	1	1
Insurances	20	0	0
Coronation illuminations	16	0	3
	£1,933	19	6

Thus the gross profit amounts to £168. 2s. 4d.

The net revenue account shows a total of £3,955. 1s. 8d. on the debtor side, and a total on the creditor side of £2,104. 9s., leaving a deficit on June 30, 1903, of £1,850. 12s. 8d. To ascertain the loss for the year the engineer brings down the above total of £3,955. 1s. 8d., and deducting the deficit (which is included) brought from last year's net revenue account of £1,559. 15s. 8d., and also deducting the gross profit from this year's revenue account of £168. 2s. 4d.—total, £1,727. 18s.—makes a loss for the year of £2,227. 3s. 8d. Again, the total loss from commencement of works to June 30, 1903, is £6,285. 6s. 1d. To set against this loss the sum of £4,434. 13s. 5d. has been provided in the general district rate, and the difference, amounting to £1,850. 12s. 8d., will be utilised from the sum of £3,206. 9s. 1d., provided in the present general district rate. This will leave £1,354. 16s. towards meeting the deficit of the current year.

In the following items the figures in brackets are for the year 1901-2: number of 8-c.p. lamps connected at end of year (motors, arc and incandescent lamps, equivalent in 8 c.p.), 9,446 (5,707); number of units sold—private lighting 53,196 (29,177), motors 45.147 (22,017), public lamps 39,378 (39,543), total 137,721 (90,737); maximum load on feeder cables in kilowatts, 120 (113); capacity of dynamos at end of year, 440 kw. (440 kw.); statutory maximum price per unit, 8d. (8d.); prices charged—private lighting 5d. (5d.); power 2½d. to 1¾d. (2½d. to 1¾d.); public lamps £20 per lamp per annum (£20 per lamp per annum); average price obtained per unit—private supply 3·46d. (3·39d.), public lamps 2·92d. (2·91d.); average price obtained on total revenue, 3·66d. (3·18d.); number of consumers on June 30, 133 (92); number of public lamps on June 30, 24 (24); number of motors on June 30, 37=123 h.p. (12=64 h.p.).

With regard to the revenue account, it is noticeable that there is a small gross profit of £168. 2s. 4d. this year instead of a deficit of £2461. 7s. as in 1901-2. The increase in the number of units sold is also noticeable, being equal to 51·8 per cent., and the increase in revenue is equal to 49·5 per cent., but there is only an increase of 4·75 per cent. in the working expenses. By this means a considerable reduction has been made in the works cost per unit sold. The receipts from the sale of electricity, however, are as yet much too small to pay all charges, including interest and sinking fund, and the net result for 1902-3 is a deficit of £2,227. 3s. 7d. There is no doubt, concludes Mr. Smyth, that the starting of the traction supply and an increased day load in the shape of motors will go far towards bringing the undertaking to the self-supporting stage, and it is advisable that every encouragement should be offered to motive power consumers.

SALFORD ELECTRICITY ACCOUNTS.

Below we give a full abstract of the accounts of the Salford Corporation electric lighting undertaking for the year ended March 31 last. The capital expenditure during the year amounted to £102,247.

Revenue Account.

Dr. Expenditure.	£	s.	d.
Generation of electricity—fuel, etc.	5,905	19	8
Oil, engine-room stores, etc.	1,058	7	1
Wages at generating station	2,440	5	1
Repairs and maintenance—buildings	580	10	11
Machinery, etc.	1,365	8	10
Distribution of electricity—salaries and wages	679	1	2
Commission on sales	45	1	1
Repairs of mains, transformers, meters, etc.	2,214	11	11
Change of voltage: lamps, switches, cables, wages, etc.	2,681	6	11
Repairing and trimming of public lamps	697	5	5
Rents	213	14	4
Rates and taxes, etc.	1,391	15	2
Management expenses—salaries	1,587	15	3
Printing, stationery, stamps, and advertising	581	19	6

STATEMENT OF ELECTRICITY GENERATED, SOLD, ETC.

Quantity generated in B.T. units			2,446,475
Quantity sold: Public lamps	439,876		
Quantity sold: By contract	1,580		1,998,307
Quantity sold: Private consumers by meter	1,547,851		
Quantity used on works			150,250
Quantity used for magnetising current			198,791
Quantity used for motor-generators			96,089
Total quantity accounted for			2,434,437
Quantity not accounted for			12,038
Total maximum supply demanded (kw.)			1,862

Number of public lamps: 264 arcs, 107 incandescents.

AYR CORPORATION TRAMWAYS.

Messrs. R. Craig and Fred. Coutts, the convener and manager of the Ayr Corporation tramways respectively, have presented to their committee their first annual report on the working of the tramway for the 12 months ended May 15 last. The following are some particulars of the year's running: cars miles run, 338,049; units used. 335,893; units per car mile, 1; cost per unit, 1·39d.; passengers carried, 3,201,586; average passengers per car mile, 9·52; times population carried, 100; working expenses per car mile, 5·04; total expenses per car mile, 9·01; traffic drawings per car mile, 9·83; total drawings per car mile, 10·11; average fare per passenger, 1·03; average number of miles run per car, 21,003. A large addition has, during the year, been made to the car-shed, accommodation for another eight cars having been provided, and a new store has been built, the old one being turned into a messroom for the men. The workshops have been removed into the new building, where a light overhead crane has been erected, and a large turning lathe suitable for turning the tyred wheels has also been added. During the year six cars and one combined water-car, snow-plough, and track cleaner have been added, so that there are now 16 double-decked cars—10 of the reversed staircase type, seated for 57, and six of the ordinary staircase type seated for 59, and one water-car. The paint work of all the cars was touched up and revarnished during the winter, and the whole equipment has been kept in first-class state of repair, six cars having been re-wheeled with tyred wheels, which have been found more suitable than the chilled wheels supplied with the cars. On May 19, 1902, the Burns Monument section, which measures 1 mile 5 furlongs 5 chains, was opened, giving a total mileage of 5 miles 5 furlongs 5·48 chains, of which 2 miles and 7·71 chains is double line; or in all, 7 miles 6 furlongs 3·19 chains if measured as single track. Up to the present very little has been done to the permanent way, but as several portions of the paving were showing signs of wear, three men have now been put on this work. The overhead construction has been kept in a good state of repair, and undergoes a most thorough and regular inspection, which accounts for the very few breakages in it, none of which have delayed traffic more than a few minutes or caused accident. The earliest workmen's cars to and from Prestwick are very poorly patronised in winter, but those running to the Monument have, on account of the construction of the Dunure and Maidens Light Railway, been bringing in a fair return all the year round.

Following we give an abstract of the accounts.

REVENUE ACCOUNT. Expenditure.	Per car mile.	£	s.	d.
Power expenses—electric energy	1·34	1,884	6	6
Traffic expenses—wages of motormen and conductors	1·42	1,997	4	10
Wages of inspectors	·12	170	17	0
Cleaning and oiling cars	·36	518	0	3
Lighting cars	·06	89	18	2
Cleaning, salting, and sanding track	·05	80	14	11
Fuel, power, light, and water for depôt	·07	102	15	1

LEGAL INTELLIGENCE.

ACETYLENE GAS AND ELECTRIC SMELTING COMPANY.

In the Vacation Court last week before Mr. Justice Bucknill, Mr. Byrne moved, in the matter of the Acetylene Gas and Electric Smelting Company, Limited, on part of certain persons to rectify the register by removing their names.

Counsel said that the names of the persons on the part of whom he moved were inserted without any justification whatever. The company was carrying on business, and the applicants had been put upon the register, and, of course, responsibilities were being incurred. The company, he understood, did not now appear, but his clients had done all they could "to bring them up to the scratch."

His Lordship thought the applicants were entitled to the order.

Judgment accordingly.

THEFT OF ELECTRICITY.

On Saturday, at Marlborough-street, Léon Guerin, 36, and Louise Jones, 55, two French restaurant keepers, of 25, Frith-street, Soho, were charged with stealing electricity from the Metropolitan Electric Supply Company.

Mr. Muir stated that a man named Bonnet, the cook at the restaurant, asserted that Guerin used regularly to disconnect the wires passing through the meter and connect them outside the meter with another piece of wire, so that the electricity passed through the wires outside the meter and was not recorded. Bonnet made an appointment with the men from the prosecuting company, who saw the wire-tapping process by means of the added wire. Guerin had previously told one of their men that he had been an electrician on board a ship.

Andre Bonnet, the cook, corroborated counsel's statement.

Mr. Newton submitted on behalf of Jones that she was an uneducated woman of 55, ignorant of electricity and such modern inventions, and did not know what was being done.

Mr. Muir said there was no wish to press the charge against the woman.

Mr. Plowden thereupon discharged her, and committed the man for trial.

SPEED OF TRAMCARS.

At the West London Police Court on Friday, the third hearing of the adjourned summonses taken out by Mr. Moffat Ford against four drivers of electric tramcars in West London for exceeding the Board of Trade speed limit of 10 miles an hour, came before Mr. Rose. It was stated that the Board of Trade had now consented to nominate an independent expert, and that if the magistrate would adjourn the case until Oct. 31, the speed trials could take place before that date in time for the matter to be finally decided then.

Eventually the Court agreed to an adjournment till Oct. 31.

COMPANIES' MEETINGS AND REPORTS.

ELECTROLYTIC ALKALI.

The annual meeting of the shareholders in this Company was held at Liverpool on the 8th inst., Mr. C. C. Connor presiding.

The **Chairman** said the smallness of profit for the past year was accounted for by the conflict between foreign and English manufacturers of bleaching powder, resulting in a great depression of prices. He regretted that the results shown were not more satisfactory. The results, on the other hand, did not show any loss of capital, and on that circumstance they must be congratulated, considering the state of business. The small profit made was due to causes over which the directors had no control. From the beginning of the current year and probably during the greater part of last December they had very low prices for their bleaching powder in the market. The price which ruled now was probably below the cost of production, and therefore there were very good reasons for anticipating a rise in price. So far as the Company was concerned, the directors were taking every precaution in establishing improvements, pointing to more economy in production, and even if prices should not rise they certainly should not lose any money, and in all probability they would show a better profit next year.

The report was unanimously agreed to.

Mr. T. D. Owen moved that the vacancias on the directorate caused by the retirement of Messrs. J. A. Morice and William Thomson be not filled, and that the number of directors be reduced to six.

After discussion, the proposition was eventually carried by a large majority.

ULSTER ELECTRICAL POWER DISTRIBUTION.

A meeting of the shareholders in this Company was held at the registered office, 1, Lombard-street, when Mr. W. L. Preece, C.E., partner of Sir William Preece, K.C.B., whose firm, in conjunction with Mr. L. L. Macassey, are engineers to the scheme, was in attendance, and explained very fully as to the sites he had visited in Ulster for the proposed power and light stations at the intended distributing centres. As Mr. Preece will be engaged in Ulster on the scheme for the next week, it was decided to hold the next meeting of the Company at 8, Queen Anne's-gate, Westminster, on 21st inst., by which time it was expected Mr. Preece's preliminary survey would be completed. Progress was reported respecting the Bill to be laid before Parliament next session for the carrying out of the scheme.

KALGOORLIE ELECTRIC POWER AND LIGHTING.

The report of the directors for 1902 states that the plant was taken over from J. G. White and Co., Limited, the contractors, on Sept. 22, 1902, and the directors are pleased to state that its operation has been very satisfactory, and the reliability of the supply of power well demonstrated. Although power was supplied to the Kalgoorlie Electric Tramways, Limited, at an earlier date, the transmission lines to the mines were not in use until November, 1902. Despite the fact that only a few consumers were connected prior to Dec. 31, the difference between receipts and expenditure in Western Australia for the whole year is a debit of only £682. The units sold in October, 1902, were 62,000, while in July last 153,745 units were sold, each month between those dates, save one, showing an increase. From the many applications and enquiries received from probable consumers the directors had hoped to be in a position to state that all the power available had been contracted for, but regret that owing to the depression in the West Australian market for the past two or three years having caused many of the smaller mines, which were working at the time of the inauguration of the plant, to cease or curtail operations, and that the larger companies contend the price for power is somewhat high, less than one-half of the power available has so far been definitely sold. Negotiations are going on, and, as new contracts are constantly being made, it is expected the plant will be fully loaded within a few months. To enable an official quotation for the shares to be applied for, the Stock Exchange Committee require certain alterations to be made in the articles of association, and an extraordinary general meeting to follow the ordinary general meeting has been convened to give effect to the requirements. The directors recommend that the items charged to general expenditure during construction to Dec. 31, 1902, be carried to capital account.

NORWICH ELECTRIC TRAMWAYS.

The report of the directors for the year ended June 30 shows that the gross earnings of the Company amounted to £33,833. 8s. 7d., and the working expenses to £24,204. 14s. 1d., leaving a gross profit for the year amounting to £9,628. 14s. 6d. To this have to be added the amount brought forward from last year of £824. 3s. 5d. (after having paid 2 per cent. on Oct. 22, 1902, or £4,840 and placing to reserve account £974. 10s. 9d.) and £1,209. 16s. 7d., interest received from the Corporation in final settlement of account, making a total of £11,642. 14s. 6d. Deducting from this the sum of £2,640, being 4 per cent. interest on the Company's outstanding mortgage debentures to June 30, 1903, there remains a profit of £9,022. 14s. 6d. The directors recommend that a dividend of 2½ per cent. be paid on the Company's shares for the year ended June 30, 1903, which would absorb £6,600, and that a sum of £1,209. 16s. 7d. be placed to reserve account, the balance of £1,212. 17s. 11d. being carried forward. The reserve account will then be increased to £2,184. 7s. 4d. A comparison between the gross receipts for 11 months to June 30 and the receipts for the same period ending June 30, 1902, shows that there was an increase of £497. 15s. 4d., notwithstanding that the first months have shown a falling off of over £1,000. The working expenses for the same period show an increase of £699. 2s. 9d. The average cost per car mile was 5·43d. The average receipts per car mile were 7·76d. The number of car miles run was 1,045,901, and the number of passengers carried 7,173,420. Taking into consideration that the weather was again exceptionally bad during the spring and summer months, it is fairly satisfactory to think that the dividend can be increased, whilst the reserve is substantially increased and the balance to be carried forward is larger than last year. Both the permanent-way material and the track have been maintained in a state of satisfactory efficiency.

NEW COMPANIES REGISTERED.

Cross Electric Engineering and Manufacturing Company, Limited.—Capital, £4,000. Objects: To adopt an agreement with A. H. Sparks and W. F. Carter for the acquisition of the business carried on by them as manufacturing electricians, and to carry on the business of electricians, manufacturers of and dealers in all kinds of electrical machines, engines, instruments, and appliances. Registered office, 106, Murray-street, New North-road, Hoxton.

Hemsworth Electricity Supply Company, Limited (78,733).—Capital, £6,000. Objects: to acquire from the Rev. C. Leteux and G. Hodgson the benefit of a certain contract entered into by them (as trustees for this company) with R. J. Nicholson, and to carry on the business of electrical or mechanical engineers, etc. Registered office: 5, Bank-street, Hemsworth, near Wakefield, Yorkshire.

Blake-Morscher Electrical Ore Separator Syndicate, Limited (78,732).—Capital, £10,000. Objects: to adopt an agreement with H. C. Callahan, to investigate the validity of the patents and the efficiency of the process and mechanism therein referred to. Registered office: 20, Copthall-avenue, E.C.

APPOINTMENTS VACANT.

Cable Jointer, Erith, 45s., Oct. 24.

Shift Engineer, Reading, 36s. per week, Oct. 16.

Arc Lamp Trimmer, 30s. per week. See advertisement.

Switchboard Attendant, Fulham Borough Council, 25s., Oct. 23.

Assistant Electrical Engineer, Oldham Corporation, £100 per annum, Oct. 20.

Digitized by Google

Clerk, Kirkcaldy Corporation Electricity Works, 30s. per week. See advertisement.

Lecturer, South-Western Polytechnic, Manresa-road, Chelsea, S.W., 12s. 6d. per night. See advertisement.

Distributing Assistant for the Poplar Borough Council. Salary, £120 per annum. Applications to Mr. L. Potts, Council's office, 117, High-street, by Oct. 17.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Canterbury.—The Town Council invite tenders for electric cable.

Luton.—The Guardians invite tenders for lighting the new tramp wards by electricity.

Crewe.—The Town Council require tenders for wiring the proposed municipal buildings for electric light.

Nelson.—The Corporation invite tenders for a 400-kw. engine and dynamo, by Oct. 19. See advertisement.

Lisbon.—The Public Works Department require tenders for the public electric lighting of Macao. Tenders by Oct. 21.

Leeds.—The City Council invite tenders for one or two complete sets of steam or electrically-driven surface condensing plant. Tenders by Oct. 17.

Army Contracts.—A notice from the Secretary of State for War referring to tenders for annual supplies will be found in our advertisement columns.

Bray.—The Urban District Council invite tenders for jet condenser with steam-driven pump, to deal with 4,500lb. of exhaust steam per hour. Tender by Oct. 19.

Pietermaritzburg.—Tenders are invited by the Natal Government Railways Electrical Department for additional plant for the power station at Pietermaritzburg.

Dudley.—The Guardians invite tenders for the supply and fixing of the various appliances for the electric installation to the laundry and boiler house. See advertisement.

Swansea.—The Corporation invite tenders for the supply, delivery, fixing, and connecting of ducts, troughs, cables, wires, street boxes, etc. Tenders by Oct. 31. See advertisement.

Transvaal Colony.—The Chairman of the Tender Board, Pretoria, requires tenders for installing and working the electric lighting of Potchefstrom for about five years. Tenders by Oct. 30.

Munera.—The Municipality require tenders for installation and working of electric lighting. Particulars may be obtained from the Secretary of the Ayuntamento of Munera, province of Albacete, Spain. Tenders by Oct. 28.

London.—The Directors of the Metropolitan Railway Company invite tenders for the erection of a repairing shed and shops for electric rolling-stock at Neasden. Specifications, etc., after 5th inst. Tenders by 19th inst.

Kilmarnock.—The Electricity Committee have agreed to extend the time for receiving tenders for the bricklayer and mason's work in connection with the proposed new generating station tramcar shed at Kilmarnock until 21st inst.

Bridgend.—The Guardians invite tenders for wiring the workhouse. Specifications may be seen at the office of Mr. P. J. Thomas, architect, Bridgend. Tenders to Mr. R. Harmar Cox, clerk, Union Offices, Bridgend, before 17th inst.

Wolverhampton.—The Corporation invite tenders for the supply, delivery, and erection of surface condensing plant and oil separators, to deal with 15,000lb. of steam an hour. Tenders to Electrical Engineer, Commercial-road, by Oct. 19.

Kilmarnock.—The Corporation invite tenders for the supply, delivery, and erection of three Lancashire boilers, engines and dynamos, overhead hand travelling crane, storage battery, and switchboard, by Nov. 18. See advertisement.

Blackpool.—The Corporation invite tenders for the supply of arc lamp carbons for the ensuing year. Specification, etc., may be obtained on application to Mr. Charles Furness, borough electrical and tramway engineer, Electricity Works, Blackpool.

London, S.W.—The London County Council invite tenders for the supply, for one year from Jan. 1, of electrical fittings, etc. Forms of tender may be obtained on application to the Clerk of the Council (Stores Branch), 19, Charing Cross-road, W.C. Tenders by 26th inst.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

Devonport.—The Corporation invites tenders for the supply, delivery, and erection of a motor-driven booster. Specification may be obtained from the Borough Electrical Engineer, Newport-street, East Stonehouse, Devon. Tenders before noon on Oct. 24. See advertisement.

Russia.—The Russian Minister of the Interior has sanctioned a plan for the reconstruction of three lines of municipal tramways—namely, those in Newsky, Sadovaïa, and Wassiliostrow districts. Each car is to provide for two classes of travellers, and will accommodate 52 persons.

Todmorden.—The Corporation invite tenders for one Lancashire boiler, two steam dynamos and balancer booster, two feed pumps and one injector, economiser, surface or jet condenser, switchboard and instruments, storage battery, cable work, and overhead hand crane. See advertisement.

West Ham.—The London County Council invite tenders for the supply and erection of (a) engine, dynamo, switchboard, etc., and (b) electrical wiring, mains, and fittings required in connection with the installation of electric light at the Abbey Mills pumping station. Tenders by Nov. 3.

Leicester.—The Tramway Committee invite tenders for erection of two district car-sheds, offices, and all other buildings and works in connection therewith. Specifications, etc., may be obtained at the office of Mr. E. George Mawbey, M.I.C.E., Town Hall, Leicester. Tenders by 23rd inst.

Salford.—The Tramways Committee invite tenders for the installation of electric light at their central car depôt in Frederick-road, Pendleton. Specifications and plans may be obtained from the General Manager, Tramway Offices, 32, Blackfriars-street. Tenders by 5 p.m. on 19th inst.

Halifax.—The Tramways and Electricity Committee invite tenders for (a) 750-kw. continuous-current dynamo, driven direct by horizontal engine; (b) two 9ft. by 30ft. Lancashire boilers; (c) high-tension three-phase cable, etc. Tenders to Mr. Keighley Walton, town clerk, by Oct. 21.

East Barnet.—The Urban District Council will receive proposals for carrying out the provisions of their electric lighting order within the Council's district. Further particulars upon application to Mr. Henry York, the Council's surveyor, Council Offices, Station-road, New Barnet. See advertisement in last issue.

Johannesburg.—The Municipality require tenders for gas generating plant or for steam generating plant and for gas motors or steam motors, with electric generators and accessories. Particulars may be obtained from the Town Clerk, Johannesburg, or from Messrs Mordey and Dawbarn, 82, Victoria-street. Tenders by Oct. 19.

Aberdeen.—The City Parish Council invite tenders for electric light wiring, telephones, bells, etc., of new poorhouse to be built at Oldmill. Plans may be seen and schedule of quantities obtained at the offices of Messrs. Brown and Watt, 17, Union-terrace. Tenders to Mr. C. B. Williams, 20, Union-terrace, Aberdeen, by 12 noon on 19th inst.

Bradford.—The Guardians invite tenders for the electrical engineer's work for the erection of a hospital pavilion at the union workhouse, Horton-lane, Bradford. Specifications, etc., may be seen and bills of quantities obtained on application to Mr. Fred Holland, 11, Parkinson's-chambers, Hustlergate, Bradford. Tenders by 9 a.m. on 26th inst.

Leeds.—The Markets Committee invite tenders for an electric lift to the hotel. Specifications may be seen and bills of quantities obtained upon application to the architects, Messrs. Leeming and Leeming, FF.R.I.B.A., Victoria House, 117, Victoria-street, Westminster, S.W. Tenders to Mr. W. J. Jeeves, town clerk, Town Hall, Leeds, by 12 noon on Oct. 19.

Beckenham.—The Urban District Council invite tenders for the electric wiring of houses in their district under a free wiring scheme. Specifications, etc., may be obtained from the consulting engineer, Mr. Reginald P. Wilson, 66, Victoria-street, Westminster, or Mr. John A. Angell, surveyor, Council Offices, Beckenham. Tenders by 4 p.m. on Nov. 9. See advertisement.

Swansea.—The Corporation invite tenders for (1) laying of permanent way, including rail bonding; (2) rails and fishplates; (3) steel tiebars, bolts, and nuts; (4) points, crossings, cast-steel curved rails, and special work; (A) overhead electrical equipment; (B) ducts, troughs, cables, wires, section and other boxes, etc. Tenders by Oct. 31. See advertisement in previous issue.

Salford.—The Tramways Committee invite tenders for the supply and delivery of planing, turning, boring, drilling, grinding, milling, screwing, punching, and shearing, and wood-working machinery, power hammer, shafting motors, etc., at their central car depôt, Frederick-road, Pendleton. Specifications, etc., can be obtained from the General Manager, 32, Blackfriars-street, Salford. Tenders by Oct. 19.

Harrismith (South Africa).—The Town Council invite tenders for the following electrical machinery and accessories f.o.b. and alternatively erected in Harrismith, Orange River Colony, South Africa: two water-tube boilers and one 25-kw. and two 80-kw. steam alternators, with ejector condensers, switchboards, pipework, and other accessories. Specifications, etc., may be seen and obtained at the offices of Messrs. Mordey and Dawbarn, 82, Victoria-street, Westminster, S.W. Tenders to Messrs. Webster, Steel, and Co., 5, East-India-avenue, Leadenhall-street, London, E.C., by noon on 19th inst.

Great Western Railway.—The Directors invite tenders for the supply of telegraph instruments, telegraph apparatus, copper wire, G.P. wire, etc., telegraph ironwork and tools, telegraph drysalteries, electric light carbons, incandescent electric lamps, iron rivets, bolts and nuts, etc., fishplates, and bolts and nuts for permanent way, and telegraph poles and yellow pines, etc., from Dec. 1 next to Nov. 30, 1904. Samples, etc., may be seen from 6th to 15th inst., at the office of the Stores Superintendent, Swindon. Specifications, etc., may be obtained at the office of the Stores Superintendent. Tenders by 19th inst. to Mr. G. K. Mills, secretary, Paddington Station, London. See advertisement in last issue.

Bolivia.—The Director of Public Works to the Government of Bolivia is prepared to receive from British manufacturers, quotations, prices, catalogues, and printed matter, with discounts, shipping weights, &c., for the following materials: hydraulic power plant, piping, and turbines; alternating and direct current generators and motors; transformers and rotary converters; switchboards and measuring instruments; overhead trolley wire and fittings; third-rail insulators, plastic and copper bonds; hydraulic screw jacks and lifting tackle; contractor's plant and tools. All communications to

Digitized by Google

Mr. T. Clive Sheppard, A.M.I.C.E., director-general of public works, general manager of the Guaqui to La Paz Railway, La Paz, Bolivia, and sent by registered post either via New York or by Royal Mail steamers (West India route) via Panama and Mollendo (Peru).

RESULTS OF TENDERS.

Gravesend.—The Council have accepted the tender of the British Westinghouse Company for a generating set at £994.

Derby.—The tender of Messrs. Newton Bros., at £307. 17s., has been accepted for electric wiring the Reginald-street baths.

Wolverhampton.—The Corporation have accepted the tender of Mr. Herbert Holloway, of Wolverhampton, for the construction of the permanent way for the proposed extensions at £33,964. 11s.

Birkenhead.—The Corporation have accepted the tender of John Parry, 92, Oxton-road, Birkenhead, for cleaning and painting the poles and bracket arms in connection with the Corporation electric tramways.

Manchester.—Royce, Limited, Hulme, Manchester, have received the contract for lighting the premises of Messrs. I. J. and G. Cooper, Limited, Dale-street, Manchester. The installation will consist of 1,139 incandescent lights and 12 arc lamps.

Horsham.—The Urban District Council have accepted the following tenders: Wheeler Condensing Company £1,095, for the erection of a condensing plant and cooling tower at the electricity works; Johnson and Phillips (approximately), £2,800, for cables for the extensions to the electric mains and laying feeders and certain distributors.

Liverpool.—The tender of the Wheeler Condensing and Engineering Company, 179, Queen Victoria-street, London, for the supply of condensing plant required for the first section of the new station at Lister-drive, for the sum of £11 975, has been recommended for acceptance, subject to the approval of final plans and specifications, and to a contract to be prepared by the town clerk.

Rochdale.—The Guardians have accepted the tender of the Henley Telegraph Company for alterations and additions to the existing switchboard and new cables in connection with the electric light at Dearnley Workhouse, subject to the consulting engineers being satisfied as to the sub-contractor for the switchboard work; also that the Local Government Board be asked to sanction a loan to meet the cost of the work.

Fulham.—The Council have accepted the following tenders: Locket and Judkins for a supply of 1,000 tons of Welsh coal (No. 1 Locket steam Navigation nuts) at 14s. 11d. per ton, and Charrington, Sells, Dale, and Co. for the supply of 2,000 tons of Shirebrook double-screened nuts at 13s. 5d. per ton; the Hardy Pick Company for the supply and erection of a clinker crushing and sifting machine for the sum of £675, subject to the work being carried out under the supervision and to the satisfaction of the borough electrical engineer; Windsor and Co. for construction of sub-stations at £520.

Aston Manor.—The Urban District Council have received the following tenders for the complete overhead equipment of about five miles of tramways in the district:

Dick, Kerr, and Co., Limited	£5,155	14	6
Brush Electrical Engineering Company, Limited, (accepted)	4,742	10	7
R. W. Blackwell and Co., Limited	5,225	0	0
G. Law (amended)	6,333	16	0
G. Trentham (amended)	5,819	4	6
F. W. Smith and Co., Limited	5,321	5	7

London, S.W.—The following tenders have been received for the wiring of the new hall of the Royal Horticultural Society in Vincent-square, S.W.:

National Electric Construction Company (accepted)	£777	17	7
G. E. Taylor and Co.	810	0	0
R. Dawson and Co.	810	0	0
Drake and Gorham	854	0	0
Strode and Co.	867	0	0
Buchannan and Curwen	1,080	0	0
D. Watson and Co.	1,106	0	0
Pearson and Co.	1,175	0	0
Marryat and Place	1,337	0	0

Engineer's estimate, £790.

Bootle.—The Corporation have received the following tenders for the extension of the boiler-house at the electric light station, Pinegrove:

Contract No. 1.

J. and G. Chappell	£1,085	16	0
J. Riddock (accepted)	1,033	0	0
W. Musker	1,175	0	0
Hughes and Stirling	1,140	0	0
S. Webster	1,301	0	0
J. Townson and Co.	1,279	7	8
Wellman Bros.	1,165	13	4
P. McKinley	1,306	8	7
P. Tyson	1,149	14	5
G. Woods and Son	1,211	6	11

Contract No. 2.

J. and G. Chappell	1,237	0	0
J. Riddock (accepted)	1,231	0	0
W. Musker	1,225	0	0
Hughes and Stirling	1,220	0	0
S. Webster	1,300	0	0
G. Woods and Son	1,350	0	0
J. Paterson and Son	1,366	0	0
S. Fowler	1,350	0	0
Holme and Green	1,404	0	0

Swindon.—The tender of Mr. A. J. Colborne, at £3,233 17s. has been accepted for the erection of the car depôt stores, shops, etc.; also that of J. G. White and Co., Limited, for the construction of the permanent way for the tramways. Rails of British manufacture are to be supplied at an additional cost of 4s. per ton, making a total additional cost of £138.

BUSINESS NOTES.

TRACTION.

Ayr.—The Corporation are raising a loan of £12,000 for tramway purposes.

Maidstone.—Plans for the proposed light railway have been approved by the Urban District Council.

Sunderland.—Plans have been accepted for the proposed new tramway offices, which are to cost £5,000.

Salford.—The construction of the remaining lines of tramways in the Eccles borough is to proceeded with at once.

Rochdale.—At their last meeting the Town Council sealed the contract for cars with the Brush Electrical Engineering Company.

Dover.—An early meeting of the Town Council is to be called to consider the question of instituting ½d. fares on the tramcars in the evenings.

Thornhill.—The tramways company have informed the District Council that they cannot see their way to institute ½d. fares on the tramcars.

Spen Valley.—The electric cars commenced running on the Gomersal and Birkenshaw section of the Spen Valley tramway system this week.

Devonport.—The Board of Trade have appointed an inspector, but a day has not yet been fixed for the inspection of the tramway extensions.

Scarborough.—The contractors for the laying down of the tramways in the town (Edmundson's Electricity Corporation) have now commenced the work.

Leicester.—The first section of the new electric tramways will be opened for traffic within a week or two. It extends between Victoria Park-road and Queen's-road.

Warrington.—At the next meeting of the Town Council it will be proposed to proceed with the construction of tramway No. 7 from the termination of tramway No. 6.

Perth.—The question of appointing an engineer to advise the Corporation on the question of the tramway reconstruction will be discussed at the next meeting of the Council.

Gosport.—The preparation of the plans for the reconstruction of the existing tramlines is proceeding, and no time will be lost when everything is ready in making a start.

Leeds.—Some 245 electric tramcars are run at present on the Corporation system. It is proposed to purchase more cars in order to meet the growing demands of the traffic.

Blackburn.—The tramway extension from Witton to Cherry Tree has been formally passed by the Board of Trade inspector, Major Druitt, R.E., and opened for public traffic.

Manchester.—The Corporation will promote a Bill in the next parliamentary session for powers to carry out extensions and other works in connection with the tramway system.

Johnstone.—Operations are to be begun next month for the construction of the tramways. Promise is made that the line will be opened about the end of May next or in June.

St. Marylebone.—The Legal and Parliamentary Committee recommend the Borough Council to adhere to their previous decision against the construction of a surface tramway in Edgware-road.

Morley.—Plans of the proposed tramways in the town, promoted by the British Electric Traction Company, are in an advanced state, and will soon be submitted to the Council for their approval.

Lastingham.—The Board of Trade have confirmed the Lastingham and Rosedale Light Railway (Extension of Time) Order, 1903, amending the Lastingham and Rosedale Light Railway Order, 1900.

Cardiff.—Application is to be made to the Board of Trade to allow increased speeds on the tramways. The question of ordering new cars for next summer's traffic has been referred to a sub-committee.

Erith.—The District Council have engaged Messrs. Hawtayne and Zeden to act as consulting electrical engineers in relation to the scheme of tramways for which parliamentary sanction has been obtained.

Walsall.—The Town Council have agreed to spend £2,345 on laying down new junction lines at Pleck Junction in order to facilitate interchange of traffic between the Corporation and the company's lines.

Bere Alston.—The Light Railway Commissioners have submitted to the Board of Trade for confirmation an order made by them amending the Bere Alston and Calstock Light Railway Order, 1900.

Railway Electrification.—The conversion of the Manchester South Junction and Altrincham Railway from steam to electric traction is under the consideration of the directors. An enquiry into the cost of such a scheme is being made.

Belfast.—The City Council have approved the scheme for the purchase and electrification of the tramway system at an expenditure of nearly £1,000,000. At a special meeting on Tuesday arrangements were made for promoting the necessary Bill in the next session.

Dartford.—The Board of Trade have confirmed the Dartford District Light Railways Order, 1903, authorising the construction of light railways in Kent, from the River Thames near Greenhithe to

Digitized by Google

Dartford and Eynsford, with branches to Swanley Junction and to Stansted.

Lowestoft.—Reports on the working of the tramways continue to be eminently satisfactory. The Council have agreed to refer to the Tramway Committee the suggestion that arrangements should be made to enable the children of the borough to travel to school at half fare.

Torquay.—The Town Council have definitely decided in favour of tramways, but have not committed themselves to anything further than to approve in principle the Dolter surface-contact system. The company owning this system intend to apply for parliamentary powers next session.

Kirkcaldy.—In view of the extension of the tramway system, the Tramway and Electric Lighting Committee are purchasing an additional seven cars. The car-shed is to be extended and another 500-h.p. generating set put down at the generating station, costing in all £9,800.

Heckmondwike.—At the last meeting of the Chamber of Commerce a letter, in reply to a request from the last meeting for halfpenny fares, was read from the managing director of the Yorkshire (Woollen District) Tramways stating that for the present they had no intention of making any change.

Crewe.—Heads of agreement have been drawn up between the Town Council and the promoters of the light railway scheme. The ratepayers, however, have decided by an emphatic vote that if a scheme of tramways is to be provided for Crewe, the Council shall undertake it in preference to a private company.

Heywood.—At the monthly meeting of the Town Council the Tramways Committee reported that they had considered the suggested modification of the proposals for leasing the tramways to the Bury Corporation, and had decided that they could not recommend any modification of the terms originally agreed to. Negotiations have been broken off.

Leith.—The Tramways Committee of the Town Council have resolved to inspect the existing tramway system in the burgh and the routes upon which extension is proposed, with the view of incorporating in the provisional order to be promoted by the Corporation next session a clause giving the Council power to work the tramways instead of leasing them to a company.

Penarth.—A joint meeting of the Glamorgan and Cardiff County Councils and the Penarth Urban District Council has been held, at which Mr. Harpur (Cardiff borough engineer), Mr. Ellis (electrical engineer and manager), and Mr. Evans (engineer to the Penarth Council) were asked to prepare an estimate of the cost of the scheme for a tramway between Cardiff and Penarth.

Islington—The Borough Council propose to call a conference of representatives from each borough affected by the proposed reconstruction of the London County Council's northern tramways for electrical traction, together with their respective town clerks and borough engineers, to consider the question of the system of traction to be adopted with a view to united action being taken in the matter.

Worcester.—Complaint having been received of delay in laying down the lines for the electric trams, the Streets Committee have agreed to insist upon a strict observation of the law regarding the construction of the tramways and light railways, and intend to force compliance therewith, The city engineer is to be directed to see that the resolution is complied with, and to report any breaches thereof.

Greenock.—The arbitrator in the dispute between the Corporation and the tramway company with regard to the point of time from which a charge for the supply of electricity for traction purposes should be made, and also to the price to be paid for a supply above 500,000 units, has given his decision. It has not yet been made public, but it is understood to be against the Corporation on nearly every point.

Musselburgh—It was intimated to the Town Council at this week's meeting that the engineers of the electric tramway scheme had nearly completed the details and estimates had been prepared. There was a remote chance of a start being made this month. The promoters were to fix upon a power-station site within a day or two, and there was to be a considerably greater extent of double lines than was proposed under the old agreement.

Plymouth.—Application is to be made for power to construct a light railway to Crownhill, also for a tramway through Garden-street from Ebrington-street to Tavistock-road and a tramway from the Caprera Hotel to the boundary of the borough near North-road Station. An application will soon be made for sanction to borrow £1,300 for the alteration of the tramways in Old Town-street, consequent upon the street improvements.

Derby.—In connection with the electrification of the tramways, the committee have arranged for Messrs. J. and G. White, Limited, to fix bonds of rails at 9d. each instead of the work being done by the Corporation themselves. With reference to the contract which has been placed for foreign rails, it was stated at the last meeting of the Town Council that they would have had to pay £1,200 more for English rails, and the committee felt they would not be justified in doing so.

Aberdeen.—A further extension of the electric tramway system was inaugurated on Saturday with the opening of a line to Torry, which has now become a thickly-populated suburb of the city. The new line passes along South Market-street from Guild-street, and crosses Victoria Bridge, which spans the River Dee. The extension has not yet been passed by the Board of Trade, but the members of the Town Council went over the route on Saturday, and the service of cars was afterwards started.

Yarmouth.—The statement of accounts for the year ended June 30, 1903, shows that the traffic revenue has been £7,584; advertising, £152; total receipts, £7,736; traffic expenses, £2,286; power, £1,244; general, £923; repairs, £607; total working expenses, £5,760; interest and sinking fund, £1,960; total expenditure, £7,720; balance on the year's working, £16. The by-laws are to be so amended as to enable cars to take up additional passengers in wet weather and on exceptional occasions.

Newcastle.—The Tramways Committee recommend the Council to apply to Parliament in the next session for the necessary power to enable them to construct a tramway on Benton Bank-road, and to purchase the land for widening the road, as recommended by the city engineer. The estimated cost of the work is £9,010. On Wednesday a special meeting of the Town Council agreed to apply for powers to extend their tramway service on the outskirts of the city, and also to Blaydon, which is two miles distant. The estimated cost is £296,000.

Ashton.—Lieut.-Colonel von Donop has inspected the tramways in the town. According to the present arrangements the Ashton Corporation cars will not be run for some time on the Manchester-road length, as the city cars will be sufficiently numerous. Ashton will take the receipts within the borough, and pay the working expenses. In connection with the settlement with Stalybridge, the cost per car mile has been worked out at 8d. The length of track from the boundary at Cockbrook to the Stalybridge Town Hall is threequarters of a mile.

Middlesbrough.—Another conference has been held of representatives of the Middlesbrough Corporation, the Urban District Council of Ormesby, and the Urban District Council of Normanby, at which Mr. Robert Hammond attended, and, as requested, reported on a scheme for the authorities concerned undertaking themselves the proposed very considerable tramway extensions. The conference decided that, having fully considered the scheme set forth in the report, it was a practicable one, and recommended the Councils represented to adopt the same.

Carlisle.—The tramways company propose to institute a parcels delivery service in connection with the tramways. The company are prepared to accept the offer of the Corporation to supply electrical energy for traction purposes at a uniform charge of 1·6d. per unit in consideration of the company running a 10 minutes' service of cars throughout the year, provided the Corporation reduce the minimum of units to be taken from 350,000 to 300,000 per annum. The General Purposes Committee, however, will recommend the Council not to amend the terms as suggested.

Additional Traffic Returns.—Anglo-Argentine, £2,564 increase; Barcelona Ensanche y Gracia, £137 increase; Barcelona, unchanged; Brisbane, £74 increase (month of August, £11,736, increase £294); British Columbia Electric (month of March), gross earnings £10,352, net income £2,659; Buenos Ayres and Belgrano Electric, £634 increase (month of September, £13,793, increase £1,317); Calcutta, £428 increase; Cape Town (month of September) receipts £15,174, expenditure £8,503; Isle of Thanet Electric, £25 decrease; Mexico Electric (month of August), receipts £48,600, expenses £27,900; Perth Electric, £169 increase; Port Elizabeth (month of September), receipts £3,730, expenditure £2,767.

Pemberton.—With reference to the tramway reconstruction, the electrical engineer reported at the last meeting of the District Council that during the month good progress had been made with the electrical equipment in Ormskirk-road, the whole of the poles having been planted, all span wires erected, and the trolley run out and finished off as far as the section box at Union Bridge. Fairly good progress has also been made with the track work in Warrington-road, but the wet weather had been very much against this work. The new engines had not yet been under steam, owing to non-delivery of branch pipes from main ring to engines, but as there was no immediate hurry for this he was not pushing the makers.

Edinburgh.—At a meeting of the Tramway Committee of the Town Council last week a report was submitted by Provost Mackie and Mr. James More, C.E., the Council's expert, on the system in operation on the London County Council's tramways at Kennington, by which electrically-equipped cars are taken over the cable lines. This, it was said, would be a feasible arrangement between Edinburgh and Leith. Probably the above report was made out in ignorance of the decision which the London County Council have arrived at to abandon the present practice of taking the electric cars over the cable system for the reasons explained in our last issue. In view of the great trouble and inconvenience the arrangement has resulted in in London, we should not advise Edinburgh to try the experiment.

Jarrow.—At the last meeting of the Town Council the Town Clerk read a letter from Dr. Spence Watson, stating that if the Tyneside Tramways Company failed to come to terms for an exchange of traffic with the Newcastle Corporation, they would be prepared to go to Parliament for running powers. A letter was also read from the Board of Trade, in answer to one from the Council, drawing attention to the danger to the public at level crossings in connection with the electrification of the North-Eastern Railway Company's branch line, to the effect that the responsibility lay with the North-Eastern Railway Company, and they had no doubt that the company would acknowledge its liability. The railway company, in a letter upon the same subject, promised to do all that was necessary to protect the public.

Tramway Contracts.—We are informed that Edgar Allen and Co., Limited, of the Imperial Steelworks and Yorkshire Steel and Engineering Works, Sheffield, have secured, through the contractor (Mr. George Law, of Kidderminster), the contract for the supply of the whole of the cast-steel points and crossings and special work required in the reconstruction of the Gloucester Corporation tramways. They have also secured, through the contractors (Messrs. William Griffiths and Co., Limited), the contract for points and crossings and special work for the Worcester Corporation tramways, and from the British Electric Traction Company, Limited, the contract for points and crossings and special work for the reconstruction of the Birming-

Digitized by Google

ham and Midland Tramways. All the Worcester and Birmingham and Midland points are fitted with Allen's Imperial manganese steel tongues.

Yorkshire Electric Tramways.—The *Financial News* says the prospectus is in private circulation in connection with the arrangements for the placing of the capital of the Yorkshire Electric Tramways Construction Syndicate, Limited, formed to acquire certain orders of the Light Railway Commissioners and tramway orders of the Board of Trade for the construction of light railways and tramways in Yorkshire. The capital of the company is £280,000, consisting of 10,000 ordinary shares of £10 each and 180 preference shares of the rather unusual denomination of £1,000 each. The directors are Mr. H. S. Leon, of 5, Throgmorton-street, and the Stock Exchange, Mr. Albert G. Kitching, and Mr. Ernest Schenk. The bankers are Messrs. Glyn, Mills, Currie, and Co. in London, and Messrs. Beckett and Co. in Yorkshire; and the solicitors are Messrs. Ashurst, Morris, Crisp and Co.

North Wales.—A large gathering of Flintshire gentlemen was held at Chester on Wednesday to confer with regard to the application to Parliament during the coming session for powers to construct an electric tramway connecting the districts of Bagillt, Greenfield, Holywell, Halkyn, Northop, Mold, Buckley, Sandicroft, Queensferry, Shotton, and Connahs Quay The tramways will be worked on the overhead trolley system, and the route, which extends about 30 miles, and serves a district with a population of about 34,000, is circular. The cost of the scheme is estimated at £9,600 per mile. It is proposed to erect a generating station in the area, but not if electrical power can be obtained from a generating station which is to be erected by the North-Western Electricity and Power Gas Company, which was incorporated by Act of Parliament during last session. It was decided to issue a prospectus.

Camberwell.—At this week's meeting of the Borough Council the Works Committee reported that the trenches made by the London County Council during the work of reconstruction of the tramways for electrical traction in Camberwell New-road, Church-street, Peckham-road, High-street, Queen's-road, and Old Kent-road have been repaired in a very unsatisfactory manner, and that the condition of the roadways in many places is a serious source of danger to the traffic. The borough engineer has made several representations to the engineers of the London County Council without effect. Plaster casts of some of the worst portions of the roadways have been prepared and submitted by the borough engineer. The committee, being of opinion that the matter was of an urgent nature, have written to the London County Council requesting that immediate steps be taken to reinstate these roadways to the satisfaction of the borough engineer.

Portsmouth.—At a meeting of the Tramways Committee on Tuesday, the provision of covered cars was again discussed, but no decision was arrived at. It was felt that something should be done to obviate the nuisance caused by the flooding of the lines, and consequent dislocation of the traffic, and the chairman and vice-chairman were appointed to call on the borough surveyor with regard to the matter. The committee had also before it the introduction of automatic points, which would do away with the point boys, but no decision was arrived at. It was felt that the sinking of a well at the power station would effect a considerable saving. The water company's charges last year amounted to £77. The matter was referred to a sub-committee to consider and report. It is stated that the Tramways Committee have refused to arrange through fares with the Horndean Light Railway, and that in consequence an interesting innovation will take place. The joint railway companies are arranging to run motor trains from Portsmouth to Cosham, branching off thence to the Horndean light railway. This will ensure a speedy through service from between Horndean and Portsmouth entirely independent of the borough tramways system.

Motor Omnibuses in London.—Speculation has for some time been rife as to the non-appearance on the London streets of the service of electric omnibuses which was promised by the London General Omnibus Company some time ago. The reason for the delay appears to be a conflict with both the police authorities and the Local Government Board—the former because the new vehicles are said to exceed the prescribed height and width, and the latter on account of the regulation that locomotives on the highways weighing over two tons must not exceed a speed of five miles an hour. The first difficulty could probably have been amicably and satisfactorily settled but for the intervention of the Whitehall authority on the score of weight. To this suggestion the company urge several strong objections, one being that it is impossible to build a motor omnibus of less than two tons that would be remunerative to the shareholders. The vehicle with which experiments have been made weighs nearly five tons. Another obstacle is the speed question. The limitation to five miles an hour is looked upon as altogether unreasonable, and one likely to lead to police interference for obstruction sooner or later. There at present the whole question rests, and we shall be interested to hear the sequel.

Bolton.—At the last meeting of the Tramways Committee applications for the position of assistant general inspector were received and considered, and the following were reserved for further consideration: Messrs. G. M. Atkinson, W. B. Ball, J. Burney, T. Edwards, C. Fowler, J. Hindle, F. Hartshorne, R. Salkeld, Wm. Smith, and W. Smith, all of Bolton. The committee then resolved that the services of Mr. C. C. Howard as traffic manager and otherwise under the department be determined on Nov. 11 next. It was resolved that the report submitted of the special sub-committee as to the general management of the tramways be approved and adopted. This stated that subject to the control and directions from time to time of the Tramways Committee and the Council the chief care and management of the premises, rolling-stock, electrical equipment, etc., should be entrusted to an officer to be termed the general manager, who should have the chief conduct, charge, and responsibility of all arrangements for the proper working of the tramways and traffic and control all officers and servants. For the performance of these duties the general manager is to have, and be subject to, such advice and services as might be reasonably requisite from the electrical engineer and the borough engineer. The commencing salary of the general manager is placed at £500. The borough electrical engineer will act as consulting engineer and general adviser to the tramways department.

Huddersfield.—Below we are able to give some interesting particulars of the revenue from the tramways undertaking for the six months ended Sept. 30 last, compared with the corresponding period of last year. The capital outlay to date amounts to £410,953. The total receipts for the period under review amounted to £34,672, or 9·97d. per car mile, compared with 11·00d. last year. The miles run were 834,160, as against 626,031 in the corresponding six months. In giving the following items of expenditure, the figures in brackets show the cost in pence per car mile last year: Maintenance and repairs—rolling-stock, £3,067. 4s. 4d., or ·88 per car mile (·91); engines and boilers, £302. 8s. 8d., ·09 (·11); overhead equipment, £325. 8s. 9d., ·09 (·09); generation of electricity, £1,598. 19s. 8d., ·46 (·46)—total, £5,294. 1s. 5d., 1·52 (1·57). Traffic—motormen, conductors, etc., £8,096. 3s., 2·33 (2·42); oil, sand, etc., £573. 11s. 9d., ·17 (·16); uniforms, £385. 3s. 1d., ·11 (·06)—total, £9,054. 17s. 10d., 2·61 (2·64). Maintenance of works—total, £88. 19s. 3d., ·02 (·03). Maintenance of ways—total, £1,240. 5s. 9d., ·35 (·25). Management—total, £727. 4s., ·21 (·28). Rents and taxes—total, £950, ·28 (·36). Miscellaneous—£501. 15s. 1d., ·15 (·24); insurance (proportion), £567. 18s. 4d., ·16 (·17)—total working expenditure, £18,425. 1s. 8d., 5·30 (5·54); gross surplus, £16,247. 11s. 4d., 4·67 (5·46). Interest on debt, £7,772. 7s. 6d., 2·24 (2·44); redemption of debt, £5,561, 1·60 (1·71)—total, £13,333. 7s. 6d., 3·84 (4·15); surplus, £2,914. 3s. 10d., ·83 (1·31). Following we give a comparison of the working costs per car mile of the tramways undertakings in several of the large towns: Huddersfield, 5·30d.; Blackpool and Fleetwood Company, 7·34d.; Coventry, 6 53d.; Dublin, 5·45d.; Isle of Thanet Company, 6·85d.; Aberdeen, 6·14d.; Blackpool, 8·94d.; Bolton, 7·06d.; Burnley, 8·72d.; Dundee, 7·00d.; East Ham, 7·20d.; Halifax, 9·68d.; Liverpool, 7·13d.; Nottingham, 6·90d.; Rochdale, 7·67d.; Sheffield, 7·24d.; Southampton, 7·90d.; Southport, 6·44d.; Sunderland, 6·49d.

Paris Metropolitan.—The Paris correspondent of the *Financial Times* says: "According to all reports, the issue of £1,000,000 fresh stock in the Paris Metropolitan Railway Company has not proceeded so satisfactorily as might have been expected. So far as can be gathered, the shareholders have taken full advantage of their privilege to subscribe the new issue, but, on the other hand, there has been no rush on the part of the investing public to purchase 'Metro' shares on the Bourse for the purpose of being able to subscribe to the new issue, which, be it recollected, was entirely reserved for existing shareholders in the company. Now, as the 'Metro' shares are quoted at a considerable premium, it naturally follows that those who have been able to subscribe to the new issue will have made a very profitable deal, seeing that the new shares are offered at par. The absence of any rush to purchase stock on the part of the investing public who are not already shareholders in the company must evidently be a source of considerable disappointment to the promoters of the company, at the head of whom is the well-known Belgian financier, M. Empain. The fact is that the issue, following as it does on the recent disaster, and on the mass of criticism to which the company has been subjected in the Press, could not have taken place at a more unfavourable period. . . . It is fully anticipated that the total cost of the Metropolitan system, when completed, . . . will reach in round figures £20,000,000. The full mileage of the system when complete will be 46¼ miles. Of this mileage about 12 miles were open to traffic in 1902, over which 62,122,000 passengers were carried. Calculating at this rate, the total number of passengers to be carried over the entire system, when complete, would be 328,000,000 per annum. M. Felix Roussel, who was entrusted with the preparation of the municipal report on the Metropolitan Railway scheme, calculated that when complete not less than 352,000,000 passengers would be carried over the system annually. At the lower figure, however, the proportion of the receipts accruing to the city would be £740,000 per annum, or considerably more than sufficient to cover the interest on the loans contracted."

Bournemouth.—The manager has presented to his committee his report on the working of the tramways undertaking for the year ended July 22 last. During the period under review, the total working expenses have amounted to £17,336. 7s. 11d., equivalent to 6·58d. per car mile run. This sum is exclusive of income tax and repayment of loan and interest on same. The receipts from traffic have amounted to £34,232. 0s. 7d., equivalent to 13·00d. per car mile, while receipts from other sources have brought the total up to £35,096. 10s. 11d., equivalent to 13·33d. per car mile. The balance—namely, £17,760. 3s.—equivalent to 6·75d. per car mile, remains to meet income tax, repayment of loan and interest thereon, and to be set aside as reserve and depreciation fund, or for such other purpose as may be decided upon. The above working expenses are equivalent to about 49·39 per cent. of the income. This is a very low figure, which the manager is afraid will not be touched again, since renewals have, in some cases, been carried out at the contractors' expense. The total number of passengers carried has been 5,969,418, the average receipts per passenger being 1·37d., and the total number of car miles run has been 631,885. During the year there has been a freedom from serious accidents. The total number of accidents of all kinds has amounted to 239, being made up of collisions with other vehicles, 145; accidents to persons, 81; miscellaneous, 13. This means that for 2,644 car miles one accident has occurred, while for each 1,000,000 passengers 13 persons have met with accidents, many of which were of a very trifling nature. Following are some of the principal items of income

Digitized by Google

and expenditure: generation—salaries and wages, £1,033. 1s.; coal and other fuel, £2,932. 6s. 8d.; gas and water, £253. 0s. 6d.; running—salaries and wages, £7,004. 1s. 11½d.; cleaning, £964. 17s. 7d.; oiling, £230. 19s. 7d.; gas, £108. 8s. 3d.; stationery, printing, etc., £1,031. 19s. 6d.; rates (not yet proportioned); maintenance and repairs—general, £1,116. 8s. 5d.; overhead system, £365. 11s. 7d.; conduit system, £589. 15s. 1½d. Total traffic receipts, £34,232. 0s. 7d.; miles run, overhead system, 518,319·99; conduit system, 113,565·72—total, 631,885·71; average receipts from traffic per car mile, 13·00d.; passengers carried, 5,969,418; average receipts per passenger carried, 1·37d.; units generated for traction, 760,300; street-lighting, 64 961; station and shed, 12,227—total, 837,488; average units used per car mile run, 1·20.

Darlington.—Prof. A. B. W. Kennedy has presented to the Tramways Committee a report on the alleged defective cement packing in the construction of the tramway track. The report reads as follows: "In company with your sub-committee, my own engineers, and Mr. Connett, the engineer of Messrs. J. G. White and Co., I examined three portions of the work, one which has been laid for 10 weeks, one for five weeks, and one for 10 days. In each case we had a rail moved so that we could examine the material below it and at the side of it. The packing below the rails was in every case satisfactory, and in the 10 weeks' old work it was thoroughly hard. In the five weeks' old work it had fairly begun to set, but was not hard; in the new work it had excellent surface, but was still quite soft. The concrete in the margins, which I also examined, had hardly begun to set in the 10 days' work, and even in the 10 weeks' work it was still very little set, so that large pieces could easily be broken by hand. From various indications which I mentioned to your committee, I have come to the conclusion that the cement used (which I may say had been repeatedly tested, and had been up to the specified quality) was of an exceptionally slow-setting kind, but there is every indication that the setting will be complete before the time when the tramways are opened, and in that case the work will be none the worse for the setting having been slow. At the same time the extreme slowness of setting is a distinct inconvenience, and I have given instructions that another make of cement, which will set more quickly, is to be used, and this is being done. Since I met your committee I have received from the steelworks manager to Messrs. Bolckow, Vaughan, and Co. a letter about Casebourne's cement, which is extensively used at Bolckow, Vaughan, and Co.'s works, which I am glad to say corroborates my view of the matter. Mr. Richards gives various particulars, but the whole matter is summed up in his words, 'Very slow setting, but sets hard enough if given plenty of time.' In any case, as I explained to your committee, the contractors have full responsibility for the nature of the work, and have to maintain it for a year after it is taken over, and if any defects show themselves, either due to the slowness of setting or any other cause, the contractors are responsible and will have to make them good at whatever cost." Current is to be supplied to the tramways at 1½d. per unit.

London County Council.—At Tuesday's meeting of the London County Council the Highways Committee reported that the reconstruction of the New Cross and Greenwich, etc., sections of the London County Council tramways was approaching completion, and so soon as the working of these lines by electrical power was commenced it would be possible to clear the remainder of the site at Greenwich required for the erection of the second portion of the generating station, as the use of the stabling premises now on the site could then be discontinued. The Council on July 20, 1902, approved an estimate to cover the cost of the first portion of the station, and contracts had been let for a part of this work. It was important that the erection of the remainder of the station should not be unnecessarily delayed, as the second portion of the building would be required in connection with the electrical working of some of the tramway extensions in the south as well as of a portion of the Council's (northern) tramways. They suggested, therefore, that they should be authorised to arrange for trial holes to be dug on the site, and for the drawings, specifications, estimates, etc., of the second portion of the station to be prepared. The necessary expenditure for this purpose would not, it was estimated, exceed £2,000. They recommended that the estimate of £2,000 be approved. The same committee presented the following report with reference to the northern trams: "The Council on July 7 last authorised us to prepare plans, specifications, and estimates of cost for the reconstruction for the underground system of electrical traction of various sections of its northern tramways, and the construction of certain authorised lines in connection therewith, the total length of the old and lines referred to being about 52 miles of single track. It appears to us to be desirable that the reconstruction of those sections which can be worked independently with through services of cars should be put in hand with as little delay as possible. We are advised that the following lines can be most conveniently dealt with in the first instance—namely: (*a*) Theobald's-road terminus, *via* Clerkenwell-road, Old-street, Great Eastern-street, Commercial-street, and Leman-street, to near the London Docks; (*b*) Norton Folgate terminus, *via* Shoreditch, Kingsland-road, High street, and Stoke Newington-road, to Stamford Hill; (*c*) Aldgate terminus, *via* Commercial-road, Commercial-road East, and East India Dock-road, to Poplar; (*d*) Moorgate-street terminus, *via* Finsbury-pavement and City-road, to junction with Old-street; (*e*) Holborn terminus, *via* Gray's-inn-road, to junction with Theobald's-road; and (*f*) along Old-street between Great Eastern-street and Shoreditch. The first three of the routes above indicated are of considerable length, and in conjunction with the others form several main tramway routes on which through services can be run. Should our proposal be adopted by the Council, the first effective steps will be taken towards the establishment of through services of electrical cars on the Council's (northern) tramways. The length of the tramways which we propose shall be first dealt with is about 22 miles of single line, and it will be practicable for the whole of these to be worked from the Greenwich electricity generating station. If the reconstruction of these lines be proceeded with at once, it will, probably, be possible to work them by electrical power immediately the generating station is ready, and this is a consideration of great importance in view of the advantage which will accrue from the introduction of electrical in place of horse traction in the crowded thoroughfares affected. We are not yet in a position to present estimates of the cost of the work, as trial holes will have to be made at certain points along the routes, in order to determine the depth available for the tramway conduits over railway and canal bridges, and the position of pipes, wires, and other obstructions under the carriageway; but so soon as the necessary preliminary investigations shall have been completed, we will report fully on the matter. The cost of making the borings referred to is estimated at £600, and we have to ask the Council to sanction this expenditure, for which we have requested the Finance Committee to submit an estimate. We recommend that the estimate of £600, submitted by the Finance Committee be approved; and that expenditure on capital account of that amount be sanctioned for carrying out the necessary preliminary investigations in connection with the reconstruction, for electrical traction, of the first portions of the Council's (northern) tramways." An interesting report was brought up showing the results of recent proceedings taken against drivers of vehicles for wilfully obstructing the tramcars. From June 4 to Sept. 3 no less than 18 proceedings of this character were taken, and it may be judged that the Council are justified in their action from the fact that convictions were obtained in every case but one. The Highways Committee intend to bring up reports on the subject from time to time. In a further report the Highways Committee asked for authority to spend £30,500 on the construction, for the conduit system of electric traction, of the tramway authorised by the 1900 Act, along St. John-street and St. John-street-road, to join the existing tramways in High-street, Islington.

Wolverhampton.—At this week's meeting of the Town Council a long discussion took place on the Tramways Committee's recommendation that the remaining tramway routes in the town should be equipped on the Lorain surface-contact system, and eventually this was agreed to. The committee presented a long report on the subject, from which we take the following extracts: "The committee, as a whole, met and fully considered the question of communication with the outlying districts, with a view to thoroughly and definitely settling the matter. The routes to be dealt with are (*a*) Dudley-road; (*b*) Willenhall-road; (*c*) Wednesfield-road; (*d*) Waterloo-road. . . . With respect to these routes your committee instructed the borough electrical engineer to present figures which would show the comparative costs of equipping the lines, either on the Lorain surface-contact or the overhead system. . . . In addition to these figures, your committee had to consider, when coming to a decision as to which system to recommend to the Council, the following points: (1) the fact that the Council had already decided on the Lorain system for the Tettenhall, New Hampton-road, and Bilston-road lines; (2) the question of a break of communication at the borough boundaries should the Lorain system be generally adopted; (3) the difficulties of operating a dual system within one area; (4) in case the overhead system should be adopted, the necessity of equipping either Piper's-row and Bilston-street with the overhead system, in addition to the existing Lorain system, or else the expense of fitting all overhead cars with skate attachment; and also (5) (though common to both systems) the question of whether single or double track should be laid down along the routes to be constructed. After thoroughly considering all these questions your committee came to the conclusion, with but three dissentients, that the system to be adopted on the routes *a*, *b*, *c*, and *d* must be the Lorain system, and accordingly recommendations to this effect appear later on in this report. But your committee felt that they should also give in this report reasons for the conclusion at which they had arrived, and also make specific recommendations with regard to the question of double or single track and as to the order in which the work of construction should be carried out. The most important objections to the Lorain system hitherto urged have been (1) the cost, and (2) the break in communication at the borough boundaries. First, with regard to the cost, reference should be made to the detailed comparative statement of the borough electrical engineer, which shows the difference in capital cost and annual expenditure between the two systems, but this system, although it received due consideration from the committee, was largely overweighted by the fact that the Council had decided upon the Lorain system upon the Tettenhall, New Hampton-road, and Bilston-road routes, and consequently new factors had been introduced into the situation which would materially affect this monetary difference. [The comparative statement referred to shows the following figures: Dudley-road double line, cost of construction £19,812, or £2,691 in excess of the overhead system, and annual maintenance £1,773, or £296 in excess of overhead; Waterloo-road double, cost £15,378, or £1,684 in excess of overhead, and annual maintenance £1,397, more than overhead £126; Wednesfield-road to Heath Town, single, cost £12,882, or £956 in excess of overhead, and annual maintenance £1,421, or £102 in excess of overhead; Willenhall-road, single, cost £19,214, or £665 in excess of overhead, and annual maintenance £2,062, or £165 more than overhead. The total capital expenditure on the extensions is estimated at £60,000.] The decision of the Council operated adversely to the overhead system being introduced into the borough, inasmuch as the borough electrical engineer advises that should that system be adopted on any route within the town, it would entail the necessity of either equipping Piper's-row and Bilston-street with the overhead system, in addition to the existing Lorain system, or else the expense of fitting overhead cars with skate attachment. For, unless the cars were made interchangeable, additional spare cars would have to be kept in the sheds to meet an emergency, in excess of what would be necessary if the undertaking were worked on one system. Besides this, there would be the many and important objections to the working of a dual system within one area of

Digitized by Google

control, and which are dealt with more fully in the borough tramways manager's report, which is also appended hereto. Again, preferential treatment would be accorded to the better-class roads and streets of the town to the detriment of the inhabitants living in the poorer districts, were the overhead system to be laid down in any part of the borough after the Lorain system had been adopted for the Tettenhall, New Hampton, and Bilston roads. On the other hand, should the Lorain system be adopted throughout, the necessity for the cars carrying two equipments, which would add materially to the amount of electric energy required to drive them, and the unsightliness and danger of the poles in some of the most important and crowded streets in the borough would be disposed of. Taking all these facts into consideration, your committee came to the conclusion that the difference in capital cost and annual expenditure between the two systems would be outweighed by the advantages to be gained by the maintenance of one, and only one, system, and that the only possible policy is to extend the Lorain system throughout the borough. Secondly, with respect to the question of break in communication at the borough boundaries, your committee had to consider whether the inconvenience of changing cars was such a serious drawback as to involve laying down the overhead system, especially considering the fact that the Corporation have no power to run outside the lines specified in the Wolverhampton Corporation Act, 1899. This question could only apply to the Dudley-road and Willenhall-road routes. In settling the point, your committee had to guide them the fact that on the Bilston-road the break in through communication has had no serious effects, as has been practically tested by the traffic returns, which have steadily increased. For instance, the increase of passengers carried during the month of August this year was 26,849 (equivalent to £192. 14s. 7d.), as compared with the same month last year, during the existence of the exhibition, as is shown in the following table:

	Car miles run.	Receipts. £ s. d.	Receipts per car mile.	No. of passengers carried.
August, 1903.....	9,799	485 8 6	11·89	97,096
August, 1902.....	6,487	292 13 11	10 83	70,247
Increase	3,312	192 14 7	1·06	26,849

To this argument should be added the important fact that it lies with the outside districts alone to determine that there shall always be an overhead car to meet a Wolverhampton car at the boundary, so as to minimise to the greatest extent possible the inconvenience consequent upon a change from one car to another. It is equally open to the outlying districts to bring pressure on the British Electric Traction Company to run through cars into Wolverhampton from Dudley, Bilston, and Willenhall. This would be quite possible in view of the fact that the Corporation some time ago made an offer to the company which would permit them to run through cars into Wolverhampton (by affixing skate attachments) upon terms to be agreed upon, and, failing agreement, by reference to the Board of Trade, such terms acknowledging two broad principles—viz., that the Corporation must absolutely control its own traffic; and, secondly, that they should take all earnings within the borough. Any other arrangement, by which a competitive system would exist, would be prejudicial to the financial interests of the undertaking. It may be mentioned that shelters will be provided at the termini of the respective boundaries. Should the Council adopt the resolutions contained in this report, your committee would then be open to receive proposals from the company under the offer before alluded to, and to make such arrangements as might be found practicable and suitable. But, even if the company do not avail themselves of their power in this direction, your committee feel that the inconvenience of changing from car to car is not so great, especially if the two systems run in conjunction with one another, as to involve the adoption of the overhead system, and the consequent extra expense and innumerable difficulties. Therefore, your committee decided that, from this point of view also, they must advise the Council in favour of the Lorain system. There only remains the question of single or double track to be dealt with. Here your committee have deemed it rather a question of engineering possibilities rather than from the point of view of policy. For instance, in the Waterloo-road and Stafford-road, although your committee would rather have recommended that a double line of track should be laid down the whole distance, and although a double line was scheduled in the Wolverhampton Corporation Act, 1899, they were confronted with the initial difficulty that, under part of the route over which a double track was projected, the gas company's 24in. and 16in. mains are laid side by side, and the company's rights are protected under Section 38 of the Tramways Act, 1870. Again, on the Dudley-road and Willenhall-road routes the thoroughfare is so narrow in places that much cost would be involved in buying property for widening, or failing such widening, great risk of danger and inconvenience would be incurred, and more delay would arise on double than on single lines. It should be pointed out that any alterations in track from the plans deposited to the Corporation Act, 1899, require the approval of the Board of Trade, and where there is a less distance than 9ft. 6in. between the kerb of the footway and the edge of the outer rail, the consent of the frontagers. It may be mentioned that when the routes *a*, *b*, *c*, and *d* are ready for traffic the additional cars required to work them can be housed—and this whether they be on the Lorain or overhead system—by building an additional bay, as and when required, on to the existing car-shed at a cost of about £4,000. Your committee, therefore, have to make the following recommendations: (1) That the Lorain surface-contact system be adopted on the following tramway routes—viz., Dudley-road, Willenhall-road, Wednesfield-road, and Waterloo-road. [Memo.: Your committee are very anxious that the Wednesfield-road line should be extended to Wednesfield. It appears, however, that while such extension would only be a mile in extent, it would be necessary to obtain statutory powers. If the Council are of opinion that this step should be taken, your committee are willing to act in that direction. It appears that the Board of Trade do not grant provisional orders to local authorities for the extension of tramways outside their area, but the Corporation would have to proceed by way of a private Bill.] (2) That the tenders of Mr. Herbert Holloway, of Wolverhampton, for the construction of the permanent way on the above routes at the following sums be accepted—viz.: Dudley-road, £11,582. 10s.; Willenhall-road, £8,700; Wednesfield-road, £7,482. 1s.; Waterloo-road, £6,200. (3) That the plans now submitted by the borough engineer showing the above routes, and where it is intended to have single and double tracks respectively, be approved. (4) That the consent of the Board of Trade be obtained where necessary to any alterations made under the authority of Section 28 of the Wolverhampton Corporation Act, 1899, and that the town clerk be empowered to apply for such consent, and to give all necessary notices to frontagers if required, and to obtain their consents if and when necessary. (5) That the routes above mentioned be equipped with the said system in accordance with the prices scheduled, to and the terms contained in the contract between the Corporation and the Lorain Steel Company dated July 26, 1901, subject, however, to such variation and modification as may be agreed upon between the Corporation and the company; and that the said routes be constructed and equipped in the following order—namely, (*a*) Dudley-road, (*b*) Willenhall-road, (*c*) Wednesfield-road, (*d*) Waterloo-road. (6) That the Finance Committee be requested to raise all requisite moneys in such manner as they deem most advisable, and, if necessary, to raise Wolverhampton Corporation stock, for the purpose of defraying the costs, charges, and expenses of the works referred to in the foregoing recommendations. (7) That the town clerk be, and he is hereby, authorised to prepare the necessary contracts with the contractors of the permanent way and electrical equipment respectively, and also with Callender's Cable and Construction Company, Limited (so far as the Waterloo-road track is concerned), and that the corporate seal be affixed as and when required." The following is a report prepared by Mr. W. A. Luntley, the tramways manager. It runs: "In my opinion, the introduction of a dual system of tramways in a town the size of Wolverhampton would lead to many difficulties, as, unless we kept a good number of spare cars for each system, we could not properly cope with the traffic on holidays or special times, such as bank holidays, race meetings, football matches, flower shows, etc. As an example, take a race meeting (of which I understand six, occupying 13 days, are now held annually), when we should require the greatest possible number of cars, we could not take one car (or perhaps two) off all the other roads during the rush in order to deal with the traffic, which could be done if one system only were in operation, and consequently it would mean either robbing one or two roads of nearly all the cars for a time (which would certainly be unwise), or let the traffic go by default. Again, take a bank holiday. It is almost impossible to tell in what direction the majority of the people will travel; consequently, if the cars were not interchangeable, it may be that we could not do justice to the heaviest traffic, on account of the cars we could spare on a certain route not being suited to the system of another road where they would be required. Also, on such days as these, there would be a big through traffic, say from Willenhall-road, or Wednesfield, to Tettenhall, or maybe the racecourse, and, if a dual system is in operation, passengers would have to change cars in town. Of course, in the foregoing remarks I have only taken special days, but it must be remembered that such times will materially assist the tramway receipts here if properly looked after. On ordinary days, when traffic is normal, such inconveniences of working might not occur with a usual allowance of spare cars for each system." A ratepayers' meeting has passed a resolution strongly condemning the extension of the Lorain system to other parts of the town.

LIGHTING AND GENERAL.

Kingswinford.—The electric lighting has been started.

Buckfastleigh.—The electric lighting was started on the 1st inst.

Elland.—It is expected that the electric current will be turned on by Oct. 17.

Sale of Plant.—Particulars of a sale of complete electric lighting plant appear in another column.

Southport.—The Electricity Committee have decided to discontinue the practice of supplying fittings.

Hereford.—The Town Council intend to apply for sanction to borrow £1,000 for electric lighting extensions.

Wolverhampton.—The Council propose to undertake the electric lighting of private houses on the free wiring system.

Pemberton.—The total units generated during the month of August were 15,001, and the total sold 11,250—a percentage of 75.

West Bromwich.—An enquiry is to be held into the Town Council's sanction to borrow £12,217 for electric lighting purposes.

Llandilo.—An enquiry has been held into the District Council's application for sanction to borrow £1,508 for additional electric plant.

Pontypridd.—The Reading Town Council are lending the Urban District Council £2,000 for purposes of electricity and tramway undertakings.

Carrickfergus.—The Urban District Council are in communication with the Belfast and North-East Ireland Electricity and Power Gas Company.

Leeds.—The Corporation electric works have increased their outpu of current during the past 12 months to an extent equivalent to 40,000 8-c.p. lamps.

Grantham.—The Mayor (Mr. William Hornsby, J.P., D.L.), i the presence of a large company, last week formally opened the electricity works.

Digitized by Google

Farnham.—The Sir Hiram Maxim Electrical and Engineering Company have withdrawn their intention to apply for powers to supply the district.

Indo-European Telegraph Co.—The directors have declared an interim dividend for the half-year ended June 30 last at the rate of 5 per cent. per annum.

North Shields.—A failure, now rectified, we understand, of the electric light has caused much inconvenience at North Shields and Tynemouth during the past few days.

Chesterton.—The Cambridge Electric Supply Company have informed the Council that a cable will be laid in a month. The standard pressure had been fixed at 200 volts.

Stourbridge.—The Council on Wednesday decided to adopt Mr. J. B. Clarke's electric lighting scheme. Application is to be made for sanction to borrow £16,000, and Mr. Clarke is to act as engineer.

Weybridge.—The rector and churchwardens have issued a circular letter inviting subscriptions to meet the estimated expenditure of £170 for carrying out a system of electric lighting in the parish church.

Woodhouse.—The Council have decided to apply on or before Dec. 21 for a provisional order to authorise the Council to supply electricity for public and private purposes within the urban district.

Bootle.—With regard to the loan of £40,000 for electric lighting purposes, the Local Government Board have sanctioned the borrowing of £38,750, but have requested further particulars with reference to the balance.

Antony.—The town clerk of Devonport has informed the Parish Council that the Corporation would consider any proposal for the supply of electricity for lighting when they had obtained the necessary power to supply it.

Manchester.—Owing to the failure of the electric power many hotels and other buildings were in darkness in Manchester for about half an hour late on Saturday night, and the tramcar service was temporarily suspended.

East Barnet.—Several special meetings of the Council have been held, at which the subject of electric lighting was discussed. Letters from Finchley District Council are before the Electric Lighting Committee for consideration.

Tonbridge.—The resident engineer in his last report states that 13 applications for light (570 lights) had been received since the last meeting. The total number of applications to date was 85, with a demand of 2,965 8-c.p. lamps.

Bridgend.—The amended specifications of the architect for the lighting of the workhouse with electricity provide for six 32-c.p., 69 16-c.p., and 50 8-c.p. lights, with 112 switches. Tenders for the installation of the light will be advertised for.

Consett.—At the last meeting of the Urban District Council the Chairman said he expected to be able to make a definite statement respecting electric lighting next month, and he fully believed that by next season the district would be lit up by electricity.

Gravesend.—Sanction has been received to borrow £9,102 for electricity works and £53 for dust destructor. These figures include the cost of the new generating set necessary to supply current for the workmen's trams, and for which such trams are waiting.

Kensington.—Notices have been received relative to proposed extension of mains from the Kensington and Knightsbridge Electric Lighting Company, the Notting Hill Electric Lighting Company, and the Brompton and Kensington Electricity Supply Company.

Fulham.—The Council have adopted, on the recommendation of the borough electrical engineer, a scheme for replacing the electrical fittings in the town hall, as follows: large hall, £70; corridors and cloakrooms, £67. 10s.; small hall, £56. 4s. 4d.; offices, £20.

Cardiff.—The instruction given to the electrical engineer to proceed with the electric lighting of Woodville-road and Splott-road as far as Walker-road as soon as possible has been referred back to committee, pending the receipt of the engineer's report on the whole scheme.

Lowestoft.—Sanction has been received to a loan of £2,000 for purposes of electric lighting, repayable, with reference to the £1,000 for the provision of the cables, in 30 years; and with reference to the £1,000 for the provision of meters, indicators, etc., in 10 years.

Cheltenham.—The Lighting Committee are on the first six months £150 below half of the estimated expenditure for the year. Most of the items included in the proposed additional loan of £4,000 for electric lighting extensions have already been approved by the Council.

Sheffield.—The proposed electric street-lighting in the neighbourhood of the Penistone-road destructor is not to be proceeded with. The spare steam from the destructor was to be utilised for this purpose. The superintendent has been instructed to report in what other way the steam should be utilised.

Middlesbrough.—The revenue derived from the Corporation's electrical undertaking during the last month was £645, against £571 in the corresponding month last year, and the cost £369 against £248. The electrical engineer, Mr. Taylor, has been instructed to prepare specifications for extending the plant at the electric lighting station.

Crook.—The Urban District Council have accepted an offer from Messrs. Pease and Partners to provide eight additional lights, with wires, poles, and lamps, all complete, and fix the same in such positions as the Council may direct, and to supply current for lighting at the rate of 35s. per year for each 16-c.p. lamp in operation, and 45s. per year for each 32-c.p. lamp.

Camberwell.—The County of London and Brush Provincial Electric Lighting Company, Limited, are about to commence the execution of the following works: laying electrical conduits along the side of Tyrrell-road from Barry-road to the end of Tyrrell-road, also across Tyrrell-road at end of road, in each case one 2in. low-tension pipe, and construction of a transformer box in Burbage-road.

Barton.—At the last meeting of the Guardians it was stated that, comparing the cost of gas lighting with the cost of the electric light installed a year ago, a saving was effected of about £40 per annum. By extending the electric lighting to the old infirmary a further sum of £30 per annum would be saved. The Electric Lighting Sub-Committee were instructed to report on the matter.

Dublin.—Mr. P. C. Cowan, chief engineering inspector of the Local Government Board, is holding a protracted enquiry into an application of the Corporation for loans of £48,000 and £8,238. 17s. for the purpose of defraying extra expenditure in connection with the electric lighting scheme for the city. This amount includes expenditure for carrying out wood paving, asphalting, and concreting works. There is a further application for £28,500 for electrical works in the Clontarf district.

Stafford.—The electricity output for August shows a decrease of 36·8 per cent., and for September a decrease of 27·9 per cent. But if the supply which one firm took last year, and which has now ceased, is left out of the reckoning, it will be seen that the private consumers show an increase of about 30·17 per cent., which must be considered satisfactory. With regard to the provisional order an enquiry is to be held, after which the advisability of extending the cables will be considered.

Ballymoney.—Messrs. Rowcliffe and Co., Westminster, have informed the Council that it is their intention to apply on behalf of a syndicate for powers to erect electricity and power gas generating stations and lay mains for the supply of electricity and power gas through the manufacturing portions of the counties of Antrim, Down, Armagh, and Londonderry, and asking the help and co-operation of the Council. It was decided not to oppose the syndicate in their undertaking.

Epsom.—The Rural District Council have agreed to favourably consider the application of the Surrey Electrical Power Distribution Company for consent to the granting of a provisional order to supply electrical energy in the parishes of Cheam, Cuddington, and Ewell on the basis of the Wallington order, the company undertaking to make the same terms as regarded the price of electrical energy supplied to private consumers and for public lighting as they had made with the Sutton Council.

Bermondsey.—The Borough Council have resolved to issue a standing order that the electrical engineer make such conversions of gas lamps to electrical lamps in the side streets as the extension of the distributing mains will allow. The following new charges have been adopted for power supply: 2d. per unit up to 10,000 units per annum, 1¾d. per unit between 10,000 and 20,000, 1½d. per unit between 20,000 and 30,000, and for quantities over 30,000 units a special rate would be quoted on application.

Aberdeen Poorhouse.—Mr. J. E. Marr, 29, Union-street, Aberdeen, has been recommended as the consulting engineer in connection with the installation of the electric light at the new poorhouse. It has been decided to place four groups of three 16-c.p. lamps in the main approach to the poorhouse; two of three 16-c.p. lamps in the north entrance; three of three 16-c.p. lamps in the east avenue around the children's block; and three of three 16-c.p. lamps in the avenue leading from the main approach to the hospital.

Spalding.—At the last meeting of the Urban District Council the question of electric lighting was discussed. A private company intend to apply for an electricity supply provisional order, and the Council were advised they could not successfully resist the application unless they applied for a provisional order themselves. The Council, however, as the owner of the gasworks did not wish to do this, and they also objected to a private company installing the electric light. Eventually the whole matter was referred to the Gas Committee.

Malton.—The Urban District Council are in trouble with the Northern Counties Electricity Supply Company, with whom they have practically an agreement for the lighting of the district. The latest grievance is that the company propose to place their generating station outside the area, and the Council object probably because they might later on have difficulty in buying the same. The Council endeavoured to induce the Board of Trade to force the company to place the works within the area, but could get no redress from that quarter.

Stock Exchange Settlements.—The Stock Exchange Committee have appointed Oct. 21 special settling day for Oriental Telephone and Electric Company, Limited, 50,000 6 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1 to 50,000, and have ordered the said securities to be quoted in the official list. Application has been made to the committee to appoint a special settling day in and to grant a quotation to Charing Cross and Strand Electricity Supply Corporation, Limited, 40,000 "City Undertaking" 4½ per cent. cumulative preference shares (1903) of £5 each, fully paid.

Gloucester Electrical Exhibition.—An electrical exhibition will be held on Nov. 16, 17, 18, and 19 in the Guildhall. We learn that the exhibition will include primarily: (1) any device which can be used for the purpose of consuming or carrying current, or any fitting connected with such a device; (2) any other electrical apparatus, such as telephones, etc.; (3) any machine or other apparatus showing some application of electricity. No motor over 8 kw. will be allowed in the building. Motors up to 5 kw. will be supplied at 220 volts, motors over 5 kw. at 440 volts. Current at a pressure of 220 and 440 volts will be supplied to each stall if required. Exhibitors will be charged 1½d. per unit for current, and the amount will be measured by meter, or by arrangement covered by payment of a lump sum.

Newry.—Messrs. Rowcliffe and Co., Westminster, intend to apply on behalf of a syndicate for parliamentary powers to erect electricity and power gas generating stations and laying mains for the supply of electricity and power gas throughout the district, comprising about 1,600 square miles in the manufacturing portions of the counties of

Digitized by Google

Down, Antrim, Armagh, and Londonderry. This is the old electric scheme for Newry revived in another name, which was talked of about a year ago. The matter is before the Gas Committee of the Urban District Council.

Coventry.—An enquiry has been held into the Town Council's application for sanction to borrow £5,000 for the purchase of electric motors to be let out on hire. The sum of £2,000 has already been spent in this way, and the results have proved satisfactory. Consumers of energy for lighting are to be allowed to pay for their energy either 6d. per unit for the first hour, 3d. per unit for the second hour, and 1d. per unit for the third and all subsequent hours, or at a uniform rate of 4½d. per unit, provided that either system be adopted for a period of at least 12 months.

Tiverton.—The Town Council have decided to accept, subject to the Board of Trade and the Local Government Board's approval, the offer of Frank Suter Company, London, to instal electric light for £9,990, and for an additional £500 to work the undertaking for three years, being responsible for the maintenance, sinking fund, and interest, but taking all the receipts earned. The maximum price per unit chargeable to private consumers is to be 6d., and the minimum 4d. The firm have promised to use all materials of British manufacture, except the dynamos, which were to be made by the Helios Company.

Worthing.—At the last meeting of the Town Council it was stated that the electric lighting account was exceedingly satisfactory. For the first time since the electric light was established the committee suggested that there would be no need to apply for a grant in aid. The light was being taken very well, and they found that £186 more had been received this half-year than had been anticipated. The estimated income was put at an exceedingly moderate figure, while on the other side all expenditure had been allowed for, and £300 had been put aside this half-year for interest that did not really become due in this half-year.

Rugby.—The Urban District Council have completed the laying of the electric light cables. An arrangement has been made to erect engines of the Willans type of dynamos on the premises of the British Thomson-Houston Company, who undertake to run them and supply the expert supervision at a certain price per unit. As, however, this machinery is not quite ready, the company have arranged to supply the current from their own generating plant, and it was switched on for the first time last week for a limited time. For the present consumers will be allowed to use the current free of charge. The price will eventually be 5½d. per unit.

Ealing.—The number of electric lamps applied for during the vacation this year amounts to 2,896, and represents 117 new consumers, the number connected during the recess being 112 for 2,497 lamps. These figures, compared with the applications during the recess last year, show a very decided advance, the figures then being 48 new consumers with 1,854 lamps. The number of consumers who made application during this recess was nearly 2½ times as many as last. There are now on the books 1,615 consumers, the number having doubled in a little over two years. The committee have authorised main extensions for connecting 47 houses in various streets.

Battersea.—Mr. S. A. Lovick, of Walsall, has been appointed canvasser to the Lighting Committee at a salary of £2 per week and commission. Messrs. Potter and Co. have been asked to continue the boring of the artesian well at the central electric generating station from 400ft. to 450ft. previous to testing, having regard to the fact that they have only just reached the best water-bearing strata at 379ft. The price is 17s. 6d. per foot inclusive, provided hard chalk is not struck. The charge for the supply of electrical energy for motive purposes is to be altered, after the Christmas quarter's readings of the meters have been taken, from 2d. per Board of Trade unit with rebates to 1½d. per unit without rebates.

Macclesfield.—The Town Council have agreed to the following notice of motion for the quarterly meeting of the Council on Nov. 9: "That a committee be appointed as a standing committee of the Council and be designated the Electricity Committee, and that the duties of such committee to be dealt with (1) all questions respecting the installation of electricity in the borough for lighting and power purposes; (2) applications for the consent of the Council to Bills or provisional orders for the construction of tramways within the borough; (3) applications for the consent of the Council to Bills providing for the distribution of power gas and electricity in the borough, and that the acts and proceedings of such committee be subject to confirmation by the Council."

Erith.—The Electric Lighting and Tramways Committee have instructed the surveyor to erect a temporary structure showing the design and size of the proposed kiosk for a transformer station in Erith-road, Belvedere, and the committee will inspect this temporary structure before deciding upon the erection of a permanent building. The committee have come to the conclusion, with regard to the breakdowns in the transformers supplied to the sub-station at Messrs. Callender's works, that the British Electric Transformer Company were responsible for the delivery of the transformers and for the delay in the completion of the switchgear. They have recommended that the Council to not admit the claim, amounting to £39, made by the British Electric Transformer Company for repairs to the transformers.

Ayr.—The last report by the burgh electrical engineer (Mr. Roland Marshall) states that during the past month the various departments of the works have run satisfactorily. Some Nernst lamps are on order, and they will be erected in different parts of the town immediately on their arrival. The erection of a small sub-station in Blackburn-road is in hand. The maximum load for the year so far was reached on the Friday of the race week between 8 p.m. and 9 p.m., and amounted to 443 kw., as against 373 kw. last year. In connection with this it is interesting to note that the tramway load reached its maximum at the same time—viz., between 8 p.m. and 9 p.m. The units generated during the race week, from 14th to the 20th inclusive, amounted to 22,996 units, as against 22,098 last year, being an increase of 898 units.

Liskeard.—The Rural District Council have referred to their solicitor an application of the St. Neot China Clay Company for permission to erect an electric cable and telephone wire across the highway in the parishes of St. Neot, St. Cleer, and Liskeard, to connect the clay beds at Parson's Park with the works at Moorswater, for which concession they would pay an annual rent of 6s. Permission is asked for a term of 40 years. The General Purposes Committee are considering an application from Messrs. Thompson Bros. and Co., Plymouth, for consent to run overhead wires for the transmission of current for electric lighting in the main streets of Liskeard, and this permission was sought for about three or five years, as the firm are desirous of considering the question of putting down a medium-sized plant for lighting a few of the principal shops.

Bradford.—The special sub-committee of the Finance and General Purposes Committee have reported that it would not be in the interests of the efficient conduct of public business if the Electricity and Tramways Committees were amalgamated, and they have recommended that full reports be exchanged between the committees in future in case of difficulty arising as to methods of working or financial adjustments. The total number of units sold for all purposes during the past 12 months was 9,124,223, an increase of 4,223,051 on the previous year. The total number of consumers for the half-year was 1,740, an increase of 180. The price of electricity for lighting has been reduced from 4½d. per unit to 4d., with a discount of 2½ per cent. and a free supply of incandescent lamps. The total working costs have been reduced during the past year from 1d. to ¾d. per unit.

Poplar.—Some time ago the electrical engineer reported that the Borough Council's plant was being worked to its fullest extent, and brought forward an extensive scheme to cost about £150,000. The Council, however, declined to adopt the scheme. At the last meeting of the Council the Electrical Committee reported that they had again been warned by the engineer that the Council would be running a serious risk during the winter in coupling up new consumers, and having regard to this view the committee were now of opinion that under present circumstances only proposed consumers whose premises were not in the Isle of Dogs area should be accepted, and then only subject to the condition that current is not to be taken between the hours of 4 and 10 p.m. for six weeks on each side of the shortest day of the year. In consequence of this report several large applications for current have been refused.

Kingswear.—Owing to the absence of facilities at Kingswear for shifting the heavy drums the laying of the electric light cables under the River Dart has been somewhat retarded, but early on Saturday morning last it was successfully accomplished. The three drums of cable, weighing about 12 tons, were mounted on specially constructed stands, placed on a lighter, and made fast to the lower side of the floating bridge, at the Kingswear side of the river, at low water. The bridge was brought slowly across, the cables being gradually unwound and dropped to the bottom. The actual time of crossing did not exceed 10 minutes, and was accompanied without a single stop. The cable is of the bitumen submarine type, protected by steel-wire armouring, the sectional sizes being ·125, ·075, ·125 respectively. On either side of the river it will be joined to the feeder cable by means of specially constructed boxes, which allow either section to be disconnected in case of accident.

Colliery Plant.—The British Thomson-Houston Company, Limited, have obtained a contract of the Bolsover Colliery consisting in the supply of two steam generators, each comprising one compound, two-crank, C/16 engine by Belliss and Morcom, complete with usual fittings, and capable of developing 375 b.h.p. with 140lb steam pressure, and working non-condensing at 375 revolutions per minute, direct-coupled to one British Thomson-Houston Company's 250-kw., 375 revolutions per minute, 550-volt, 50-cycle, three-phase, alternating-current generator; the above mounted on combination baseplate. Each set to be also furnished with a direct-coupled exciter and field rheostat for the three-phase generator and exciter. The engines for the above sets will be capable of carrying an overload of 15 per cent. continuously. One switchboard, comprising two generator panels and two feeder panels, with oil-break switches, instruments, etc.

Bury.—From the last report of the engineer, Mr. L. P. Greig, it appears that the new engine and dynamo passed the final test at the works on Sept. 26, and since that date have, with the condensing plant, worked very satisfactorily. The other dynamo has been running fully loaded up every night. During the past month four new services of a total of 54 8-c.p. lamps have been connected. The engineer suggests that five new street lamps be erected there at a capital cost of about £50, and a charge of £8. 15s. per annum. That number would place the lamps 138ft. apart. During the past quarter 17,000 units have been consumed by private consumers alone, as against 10,000 for the same period in the previous year, being an advance of 70 per cent. The Electric Lighting Committee have inspected the works, including the new dynamo and engine and the condensing plant, and were pleased to report "everything to be satisfactory."

London Gazette.—An application for discharge has been made in the estate of Frederick King, electrical engineer, the Stone Bridge, Bristol; day for hearing Nov. 20, at 11 a.m. at the Guildhall, Bristol. A first and final dividend of 2s. 4½d. in the £ has been declared in the estate of William Scholes, residing at 49, Main-street, Failsworth, Lancaster, and carrying on business at 85, Corporation-street, Manchester, and 10, Rochdale-road, Middleton, electrical engineer and contractor; payable Oct. 16 at the Official Receiver's Office, Byrom-street, Manchester. By an order made by Mr. Justice Bucknill dated Sept. 30, 1903, on the petition of William Bratby, of Alton Lodge,

Digitized by Google

Hale, Bowdon, Cheshire, a creditor of the company, it was ordered that the voluntary winding-up of the Electric Tramways Trust, Limited, be continued, but subject to the supervision of the Court. The partnership subsisting between Thomas Richard Carpenter and Ernest Francis Carpenter, carrying on business as chandelier, gas, and electric fittings manufacturers and brassfounders, at 171 to 179, Bishop-street, Birmingham, under the style or firm of Carpenter Bros., was on June 30, 1903, dissolved by effluxion of time. A final meeting of the members of the British Blahnik Arc Light Company, Limited, will be held at 57, Moorgate-street, London, E.C., on Nov. 19, 1903, at 12 noon, for the purpose of having an account laid before them showing the manner in which the winding-up has been conducted.

Hove.—The Town Council have adopted the following report of the Lighting Committee in reference to the application of the Hove Electric Lighting Company, Limited, to compel certain consumers to change the voltage of their supply. The committee detailed the various steps which had led to the company's application to allow a change of voltage from 110 to 220 without the customers' consent, and its refusal by the Board of Trade; and, in conclusion, said the committee had thus succeeded in maintaining, on behalf of the Council and of objecting consumers, the position they took up and so had secured the result for which they contended—viz., that the Hove Electric Lighting Company could not be empowered to compel consumers to change over against their desire, nor without the consent of the Corporation, a consent which the Lighting Committee felt they could not advise the Corporation to give, unless and until the Hove Electric Lighting Company had agreed on their part to give to the consumers a benefit commensurate with that which the company were seeking to obtain for themselves. The agreement between the Brighton Corporation and the Council has now been exchanged, also the working contract between the Corporation and Messrs. Henley and Co. with reference to laying ducts has been approved by both parties. The laying of ducts has been commenced in George-street, and six ducts are to be laid in Church-road.

London County Council.—The Council on Tuesday agreed to lend the Battersea Borough Council £10,500 further on account of the installation of the electric light within the borough on condition that the loan be taken up at once, interest being charged thereon, from the date of the advance, at the rate of £3. 15s. per cent. per annum, payable quarterly, and the principal being repaid by such equal annual instalments on each Aug. 28 as will repay the amount borrowed, as to £6,794 within a period of 50 years, and as to £2,720 within 20 years, in each case from Aug. 28, 1903. This completes the loan of £61,794 to the Council. The following notices under Electric Lighting Acts and Orders of intention to lay mains were agreed to: Blackheath and Greenwich District Electric Light Company, across Burnt Ash-road and along Dorville-road, and to construct a transformer box at the junction of Dorville-road and Cambridge-road; Brompton and Kensington Electricity Supply Company, along a portion of Bolton-gardens South; Metropolitan Electric Supply Company, along a portion of Maida-vale; from County of London and Brush Provincial Electric Lighting Company, along a portion of Cooper's Arms-lane, Putney; Lewisham and District Electric Supply Company, across Silverdale-road and along Bishopsthorpe-road, to lay low-tension mains along Queensthorpe-road, Kingsthorpe-road, Princesthorpe-road, Dukesthorpe-road, Earlsthorpe-road, Mayow-road, and Sydenham-road, and to construct a transformer box at the junction of Bishopsthorpe-road and Mayow-road; and the St. Pancras Borough Council along a portion of South-grove. The receipt of a notice from the Stepney Borough Council under the Limehouse District Order, 1900, of intention to lay mains along London-street was also reported.

Islington.—In our last issue we noted that the Islington Council were recommended by the Electric Lighting Committee to reduce the charge for electrical energy used for motive power between midnight and 6 p.m. We have since had an opportunity of seeing a report presented to the committee by Mr. Albert Gay, in consequence of which the proposed reductions have gone forward to the Council. In this report Mr. Gay, in the first place, gives instances in other towns of the successful use of single-phase motors, of which 1,400 aggregate horse-power are in use at the present time at Sheffield. At Derby these motors aggregate about 1,000 h.p., whereas at Islington they have only connected to the system 61 motors with a total output of 260 h.p. The engineer shows that in order to compete with gas-engines the charge ought not to be higher than 1½d. per unit with gas at 3s. per 1,000 cubic feet. He then gives an analysis of the electric lighting accounts for the last three quarters in 1902 and the first quarter in 1903, in order to ascertain the actual cost per unit for coal and oil. The figures are as follows: for the quarter ending June, 1902, 1·78d.; that ending September, 1902, 1·7d.; that ending December, 1902, 1·47d.; and for the quarter ending March, 1903, 1·29d. This shows that the cost increases in the summer as is to be expected, but the next step taken clearly shows how much extra coal and oil is required for producing the large number of units in the winter quarter. To arrive at this figure Mr. Gay abstracts the number of units and the gross cost of coal and oil respectively for the June quarter from the figures for the March quarter, and arrives at the conclusion that to produce 382,584 extra units in March it requires £1,261 to be expended upon coal and oil, or 0·79d. per unit. Proceeding in the same way for the September quarter the extra cost comes out at 0·85d. These figures are only about half of the average cost per unit of coal and oil for the whole year—*i.e.*, 1·58d. Mr. Gay then gives load curves to show how the present machinery could be used to supply power through the day without overlapping the peak load, at a cost well within the limit mentioned above. Such a motor load is looked for in the Belle Isle district, where there are a number of factories. Assuming that some 300 h.p. or 400 h.p. of motors could be obtained there, the output from the station could be increased nearly 1,000,000 units, or about 40 per cent. Mr. Gay concludes that it would appear desirable (*a*) that the rate per unit should be 1½d., on the condition that not less than 2,000 units were taken annually (equal to, say, a 1-h.p. motor running eight or nine hours daily for five or six days weekly, and 50 weeks yearly); (*b*) that for smaller consumption the rate be as at present, 2d. per unit; (*c*) that any less than 2d. per unit apply only to the period midnight to 6 p.m. (or sunset if this be later than 6 p.m.), and that motors so supplied be then entirely disconnected from the supply; (*d*) that a rebate of $\frac{1}{12}$d. be allowed on each 10,000 units taken over the first 10,000 per annum to a minimum price of 1¼d. per unit; (*e*) that motors driving machinery only (not motor-generators) be supplied at reduced rates; (*f*) that the present day light rate for lighting purposes be not extended unless the consumption at 2d. be guaranteed to equal at least 1,000 units per annum (or 30 units per 30 watts of demand, if less than 1,000 units); (*g*) that all cooking and heating appliances be supplied at a uniform rate of 2d. per unit (this also to apply to motors of less than 1 h.p., or consuming under 2,000 units per annum). It will be seen that these recommendations are practically contained in a report of the Lighting Committee now before the Council—*i.e.*, that to encourage an increased day load the uniform flat rate of 2d. per unit be modified for all electricity for power purposes consumed between the hours of midnight and 6 p.m. by the following sliding scale: for all units up to 2,000 per annum, 2d. per unit; from 2,000 to 20,000 units per annum, 1½d. per unit; from 20,000 and over per annum, 1¼d. per unit.

PROVISIONAL PATENTS, 1903.

Oct. 5.

21315. Improvements in steps for electric and other tramway cars, vehicles, and the like. William Edward Cable, 18, Ebor-street, Heaton, Newcastle-on-Tyne.

21318. Improvements in or relating to electric switch holders or key switches. Charles Henry Davies, 104, Colmore-row, Birmingham.

21320. Improvements in apparatus for electric signalling. Carl Fridolf Brodin and Hermann Axel Schepeler, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

21324. Improvements in magnetic separators for ores or the like. John Thomas Dawes, 4, Clayton-square, Liverpool.

21344. Improvements in and connected with storage batteries. Edward John Wade, "Perugia," Sidney-road, Staines.

21359. Improvements in arc lamps for dark lanterns, cinematographs and similar apparatuses. Nikolaus Köhler, 81, High Holborn, London.

21363. Improvements in electric accumulators. Jean Emmanuel Georges Méran, 11, Southampton-buildings, Chancery-lane, London.

21386. Improvements in or connected with electric fuses or cut-outs. Julien Henri Mercadier, 4, South-street, Finsbury, London.

21404. Electricity meter for alternating currents. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Actien-Gesellschaft, Germany.) (Complete specification.)

21405. Improvements in electricity meters for motors. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Actien-Gesellschaft, Germany.) (Complete specification.)

Oct. 6.

21466. Improvements relating to electric arc lamps. Felix Jeannot and François de Zea Bermudez, 45, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Sept. 12, 1903, being date of application in France.) (Complete specification.)

21491. Improvements in electromotors of the induction type. Frank Michael Lewis, Norfolk House, Norfolk-street, Strand, London.

21493. Apparatus for perforating the type bands for automatic telegraph transmitting apparatus and the like. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Aktien-Gesellschaft, Germany.) (Complete specification.)

21504. Improvements in electric meters. Société Anonyme des Ateliers de Mécanique de Précision de Territet, 45, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Oct. 15, 1902, being date of application in Switzerland.) (Complete specification.)

Oct. 7.

21511. Improved means of temporary holding electric light lamps by magnet. Loftus Brook Mollan and Adam Millin, 59, Victoria-street, Belfast.

21529. Improvements in telegraphic apparatus for transmitting cable messages. Thomas D. Taylor, Dalton Dene, Minnaye-road, Penzance.

21551. Improvements in switches for use for electric lighting and power. Kyran Quaney and William Cecil Kirwan, 11, Brookfield-terrace, Anglesea-road, Donnybrook, co. Dublin.

21582. Improvements in primary electric batteries. George Schauli, 47, Lincoln's-inn-fields, London.

Digitized by Google

21592. Improved electromagnetic signalling apparatus. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Aktien-Gesellschaft, Germany.) (Complete specification.)

Oct. 8.

21598. Improvements in self-replacement intercommunication telephones. Franz Petmeky, 4, Vernon-street, Camp-street, Broughton, Manchester.

21623. Improvements in accident-preventing or life-saving apparatus for electric tramcars and like vehicles. William Henry Taylor, 3, Brown-street, Market-street, Manchester.

21632. Improvements for electric igniting devices for petards. Friedrich Hülsmann, 112, Potsdamerstrasse, Berlin.

21636. Improvements in electric safety and alarm devices for doors. Kilian Josef Lender and Franz Brod, 112, Potsdamerstrasse, Berlin.

21637. Improved electrical alarm-clock. Heinrich Peters, 112, Potsdamerstrasse, Berlin. (Complete specification.)

21652. An improved form of electric accumulator or secondary battery. Jacques Marie de la Croix, 52, Chancery-lane, London.

21653. Improvements in coherers for wireless signalling. Thomas Edward Clark and the Thos. E. Clark Wireless Telegraph-Telephone Company, 52, Chancery-lane, London. (Complete specification.)

21700. Improvements in electrical measuring instruments. Carl Beez, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Complete specification.)

Oct. 9.

21717. Improvements in apparatus to be used in connection with trolley lines for electric traction. John Isaac Hall, 82, Durlston-road, Kingston-on-Thames.

21728. Improvements in magnetic separators for ores or like materials. Joseph Mansell Moss, 4, Clayton-square, Liverpool.

21759. Improvements in telephones, metallic circuit automatic secret intercommunication instruments. Ernest George Bradnam, 139, Antill-road, South Tottenham, London.

21779. Improvements in and relating to electric cells. Thomas Heffernam, 18, Southampton-buildings, Chancery-lane, London.

21791. Improvements in the manufacture of filaments for incandescing electric lamps. Jack Randall Crawford, Clun House, Surrey-street, Strand, London.

21793. Improvements in valve and brake controlling mechanism for steam or electric winding or hoisting engines. Thomas Campbell Futers, 18, Buckingham-street, Strand, London.

21801. Improvements in simultaneous telegraphy and telephony. Josiah Sayers and Frank Bartholomew Holt, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

Oct. 10.

21830. Improvements in or relating to electric ignition apparatus for internal-combustion motors and the like. Edmund Woodward Lewis, 18, Hertford-street, Coventry.

21846. Improvements in trolleys for electric tramways. James Newall Dauncey, 24, Southampton-buildings, Chancery-lane, London.

21851. Improvements in telephone attachments. William Stanley Haddock, 45, Southampton-buildings, Chancery-lane, London.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published Oct. 29, 1903.

1902.

15218. Electric safety apparatus for controlling the traffic upon railways. Prochaska.

21706. Telegraphic recording apparatus. Armstrong and Orling.

22032. Mariner's compass. Baron Kelvin, Clark, and Kelvin, and James White, Limited.

22106. Safety fuses for electric leads. Siemens Bros. and Co., Limited. (Siemens und Halske Aktien-Gesellschaft.)

22107. Sockets for safety fuses for electric leads, partly applicable also to sockets for glow lamps. Siemens Bros. and Co., Limited. (Siemens und Halske Aktien-Gesellschaft.)

22108. Electrical safety fuses. Siemens Bros. and Co., Limited. Siemens und Halske Aktien-Gesellschaft.)

22346. Apparatus for indicating the presence of leaks on electric circuits. Bott.

23797. Apparatus for composite systems of simultaneous telegraphy and telephony. Fell.

24710. Electrical measuring instruments. Carolan. (General Electric Company.)

25578. Electric frequency and speed indicators. Heap.

25658. Apparatus used for wireless telegraphy. Marconi's Wireless Telegraph Company, Limited, and Franklin.

26048. Electric transformers. Carolan. (General Electric Company.)

26050. Magnetic clutches. Carolan. (General Electric Company.)

26331. Electric controllers. Carolan. (General Electric Company.)

26448. Secondary or storage electric batteries. McKinnon.

26414. Regulation of electric motors. Vickers, Sons, and Maxim, Limited, and Williamson.

26943. Electrical measuring instruments. Appleyard.

1903.

162. Electric railway system. Mismahl.

2483. Electrically controlled lifts. Richmond and Carey.

6116. Electric safety fuses. Salmony.

16258. Rotors for dynamo-electric machines. Brooks. (Elektricitäts-Gesellschaft Alioth.)

16456. Manufacture of incandescence electric lamps. Hogge and Barrollier. (Date applied for under International Convention, April 8, 1903.)

16939. Trolleys for electric traction. Lake. (Trolley Supply Company.)

17057. Steering gear for motor road vehicles, electric or steam launches, and the like. Mathewson and Fielding.

17184. Clamps or couplings for wires, especially applicable for use in overhead electric conductors. Krückl.

18453. Dynamo-electric machines. Macku.

18485. Secondary or storage batteries. Wade. (Rodman.)

18953. Check or indicator applicable to the electric controllers of electrically-driven vehicles. Wille.

NOTES.

Birmingham Local Section.—This local section of the Institution of Electrical Engineers will open its winter session on Nov. 18, when the chairman, Mr. J. C. Vaudrey, will deliver an address. Subsequent meetings will be held on Dec. 9, Jan. 20, Feb. 17, March 16, and April 27. The annual general meeting is fixed for May 18.

I.M.E.A.—The official report of the eighth annual convention of the Incorporated Municipal Electrical Association, which was held at Sunderland in July last, is now to hand. It forms a bulky and valuable record of the proceedings at that meeting, and includes, besides the presidential address of Mr. J. F. C. Snell, all the individual papers, together with the discussions thereon.

Wireless Telegraphy in China. — The Italian Legation at Pekin has just established a radio-telegraphic station, enabling it to maintain communication with the Italian ships stationed at Taku, Tien-Tsin, and on the coast. A correspondent says the first messages were transmitted from the Legation at Pekin to the admiral's vessel, "Vettor Pisani," in the Gulf of Pe-chili, 130 miles distant.

The Nobel Prizes.—The prophets are already at work assigning the Nobel prizes which are to be distributed by the committee at Copenhagen in a short time. According to their prophecies, Signor Marconi is to receive the prize for scientific inventions, while the chances for the medical prize are said to be divided between the Danish professor Finsen, whose name is associated with the treatment of lupus by light rays, and a foreign medical man. The English competitor for the literary prize is Swinburne.

London Traffic Enquiry.—The members of the Royal Commission appointed to enquire into the conditions of locomotion in London generally have now been in the States nearly three weeks. Besides making personal inspection of the various methods of transport adopted in the American cities, the Commission are hearing evidence by leading experts, and while in New York Messrs. H. H. Vreeland, Wm. Barclay Parsons, and B. J. Arnold, whose names are so well known both in the States and on this side, were among those whose testimony was presented. The Commission has also been in Boston, and will probably visit Philadelphia, and possibly Chicago, before returning to this country.

Proposed Moving Platform.—It is stated that the Rapid Transit Commission of New York has decided to construct a moving platform in tunnel between Brooklyn and the Manhattan borough, at a cost approaching a million and a half sterling. If, it is added, the moving platform scheme should be found impracticable or inadequate, an electric railway will be built. We remember the scheme being mooted some months ago, but apparently the commission has only now arrived at a definite decision. The platform will be after the style of those which proved so successful at the Paris and Chicago Exhibitions. A company is to carry out the work, and the bidding for the contract will be open.

Trafford Park Development.—The Trafford Park Estates, Limited, have issued a new plan showing the development which has taken place in Trafford Park under their administration. The plan indicates the locality of the numerous large engineering and other works on the estate, including those of the British Westinghouse Company, W. T. Glover and Co., the Lancashire Dynamo and Motor Company, etc. One attraction to manufacturers to establish works on the estate undoubtedly is that electric power and light, also fuel gas, are available at cheap rates, as well as an electric car service and full telegraph and telephone facilities. Apart from this, the transport facilities on the estate are exceptional.

Natural Gas Supply.—A discovery of a source of a natural gas supply in the Sussex village of Heathfield is now being turned to account by the Natural Gas Fields of England Company. It was during boring operations for water that the discovery was made, and it is said that its development in the near future may reveal a gas field larger in area than any known to exist in America. The company has one borehole at present, reaching to a depth of 400ft., where there is a pressure of 200lb. to the square inch, and a possible output of 15,000,000 cubic feet a day. This is about one-eighth of the total daily sale of gas in the Metropolis. The gas comes from the Kimmeridge clays, and it is calculated that with 10 boreholes 50 million thousands of cubic feet of gas could be produced a year. Perhaps this natural gas will resuscitate the old iron industry of Sussex.

Canadian Patent Law.—A further amendment is announced of the Canadian patent laws which is expected to result in immense benefit to patentees. A large number of Canadian patents were invalidated a short time ago by legal decisions, which stated that patents which had not been practically worked within the specified time, or of which a corresponding foreign patent had lapsed, were void. A new Act has just been passed revalidating these patents under certain conditions, and providing for the future that a Canadian patent shall not expire merely on account of the lapsing of a foreign patent, and also giving an alternative to working by rendering the patent subject to a compulsory granting of licenses. Both these alterations are calculated to greatly encourage patentees in the Dominion, for whom the former arrangement formed a grievance. Other alterations in the Canadian patent laws were dealt with in a recent issue of this journal.

Platinum in Incandescent Lamps.—A French company claims to have got over the necessity for using platinum in the manufacture of incandescent lamps. The reasons for the use of platinum are that its coefficient of expansion is the same as that of glass, and, therefore, changes of temperature do not cause cracking. A further reason is that when platinum is fused into the glass, the latter adheres to the platinum as though cemented. While other metals, particularly some alloys, such as nickel steel, have been found which have a coefficient of expansion equal to that of glass, none of them has the property of forming a tight joint when fused in. To get over this difficulty a French company, which manufactures incandescent lamps, has discovered a cement which enables it to secure a tight joint around the leading-in wires without it being necessary to use platinum. This cement is said to be unaffected by air or ordinary temperatures.

Guttapercha Supply.—There is always a fear in the electrical as well as other trades that there may one day be a shortage of guttapercha, and it is therefore a matter of general importance to find a substitute or an addition to the sources of supply. This, the Colonial Economic Committee of Berlin announces, is now in propect of being discovered. The utility of the guttapercha discovered by the expedition which was undertaken to New Guinea under the leadership of Herr Schlechter has so far been established that it may be regarded as suitable for cable purposes as an admixture, and, if carefully obtained, to be suited for cables in a pure condition. Large quantities of guttapercha have been obtained from New Guinea, and are at present being tested. The Secretary of State for the German Post Office, it is further stated, has identified

Digitized by Google

himself with this movement, and has granted a large sum of money to cover the preliminary expenses.

Post Office Telephone Extension.—Everything considered, the extension of the Post Office telephone system in the Metropolis is going on very satisfactorily. Considerable delay has occurred in the completion of the Mayfair exchange, for which, however, the Post Office were in no way responsible, and Tuesday this week saw the successful inauguration of the exchange. It is situate in Bird-street, off Oxford-street, and is intended to serve an area bounded by Regents Park on the north, Knightsbridge and Pall Mall on the south, Regent-street on the east, and Bayswater on the west. The district is only second in importance to that covered by the Central exchange, including as it does Oxford-street, Regent street, Piccadilly, and the residential district of Mayfair. The new exchange has more subscribers connected up at the start than any exchange that has yet been opened by the Post Office in London, and when the switch was released on Tuesday 500 instruments were brought into use.

Subways for Service Pipes.—Our readers will remember that some time ago we announced a competition which was instituted by the Paviors' Company for the best essays sent in on the subject of "Subways or other Means of Placing and Maintaining, without Interference with the Surface, the Main Pipes and Services of Gas, Water, and other Undertakings below the Carriageways or Footways of Cities, Boroughs, and Towns." We understand that essays, drawings, and models were submitted by 26 competitors, and were considered by the judges—the Master of the Company (Major L. H. Isaacs) and Messrs. D. J. Ross, J. W. Bradley, and W. Weaver, the engineers of the city of London, city of Westminster, and borough of Kensington respectively. The awards which have now been made public are as follows: first premium (£105) to Mr. R. M. Parkinson, Peterborough; second premium (£31. 10s.) to a competitor whose name has not yet been ascertained; and third premium (£21) to Mr. F. N. Royle, of Nottingham.

Lead Salts by Electrolysis.—A German contemporary gives the results of the work of Messrs. Elbo and Nuebling on the production of various lead salts by electrolysis. They succeeded best in obtaining lead tetrachloride. The vessel used for this purpose consisted of a receptacle of glass with a porous cell arranged therein. In the cell there was suspended a lead plate, serving as cathode; on both sides of the cell strips of lead were fixed which served as anodes, and on the bottom of the glass vessel there rested a carbon plate, serving as auxiliary anode. The liquid in the cathode cell was dilute hydrochloric acid of about 1·1 specific gravity, while a 1·8 specific gravity acid was used in the anode compartment. The temperature must be below 10deg. C. The idea of using different anodes is that dichloride of lead is formed at the regular anodes, while free chlorine is generated at the carbon anode, which chlorine then effects the conversion of the dichloride of lead into the tetrachloride. The authors isolated various double salts of this substance. They also worked with hydrobromic, hydroiodic, chromic, phosphoric, and hydrofluosilic acid as electrolytes.

Loss of Light due to Globes.—Some figures have been published showing the loss of illuminating power of lamps due to globes. The results given below relate to a series of trials made with a Nernst lamp, which was first placed, by way of comparison, in a thin frosted glass globe. The illuminating power was determined by a Weber photometer. The lamp unenclosed by any globe or chimney gave the light of 81·8 English candles, and the loss resulting from surrounding it with different materials will be seen from the following figures: Concerning globes first, the illuminating power measured horizontally with "Holophane" was 70·30, a loss of light equal to 14·1 per cent.; with prismatic glass the figures were 65·80 and 19·6 respectively; with rose "Holophane," 64·30, 20·8; white opal, 38·30, 53·2; yellow opal, 33·00, 59·7; ruby opal, 28·50, 65·2; rose opal (grooved), 22·90, 72 2; rose opal (light), 19·90, 75·6; and with green opal (light), 18·30 and 77·8. For coloured chimneys the figures given are as follows: with amber glass the illuminating power is 71·30, the loss being 12·8 per cent.; with white opal, 51·80, 36 7; and with light blue the figures are 37·50 and 54·2 respectively.

Rural Telephony.—We note that in America a scheme has been proposed by means of which mail delivery in the rural districts will be considerably expedited through the intervention of the telephone. The experiment is proposed to be carried out on an extensive network of rural telephones, which incidentally calls attention to the large development that rural telephony has enjoyed in the States of late years. It would appear that the general idea underlying the plan is to organise such a system that when the envelope is properly designated and adequately stamped, the postmaster at any rural mail centre may utilise the telephone circuits to call up the person out in the country to whom the letter is addressed and communicate the contents. It is conceivable that much time and labour would be saved in this way, and an extension of the scheme can be imagined by which the person receiving the contents of a letter could dictate to the postmaster a telephonic reply if necessary, of course paying a small fee for the privilege. In the aggregate no doubt a great deal of time might be saved and much new business created corresponding to the express delivery of letters already existing in many English and foreign cities.

Electrolytic Estimation of Metals—In order to avoid the irregularities due to the evolution of hydrogen in the electrolytic deposition of metals, the use of a rotating cathode has been tried by Messrs. F. A. Gooch and H. E. Medway, and found to be satisfactory. According to the *Journal* of the Chemical Society, as cathode, a platinum crucible is used, and it is fixed to the vertical spindle of a motor. The solution to be electrolysed is contained in a glass vessel on a rising table. A strip of platinum is used as anode. At first, the cathode is immersed in the solution to only about two-thirds of its depth, and it is rotated (600-800 revolutions per minute) until most of the metal is deposited. Water is then added, so that the whole crucible becomes immersed, and the electrolysis is carried to completion. The deposit is washed and dried in the ordinary way. Results are given in the paper showing that the method is satisfactory for the deposition of copper (from copper sulphate solution containing free sulphuric acid or even nitric acid), silver (from potassium cyanide solution), and nickel (from an ammoniacal solution). As a comparatively high current strength may be used, the electrolysis can be carried out much more quickly than by the ordinary process.

South African Telephones.—In contra-distinction to this country, the Government of British South Africa holds a monopoly of the telephone, and is particularly busy providing telephone facilities in some of the more important South African towns. This is especially true in the case of Johannesburg. There exists in that town what is known as a "domestic" telephone service, and the Government is taking every precaution to see that in this connection its rights are not infringed. A "domestic" service means a system of communication from room to room within a building, and the Cape Postmaster-General has found it

Digitized by Google

necessary to issue a warning against work of this kind being carried out privately. Owners of buildings are cautioned against entering into contracts with private firms for wiring their buildings for telephonic purposes without reference to the Postmaster-General, who, it seems, is anxious to carry out such work departmentally. Apart from the legal aspect of the question, it is obvious that serious inconvenience would be caused to the owners and occupiers of buildings if, after the installation of a "domestic" service, it were found that it could not be connected with the public telephone service owing to a different system having been provided.

Efficiency of the Nickel-Plating Tank.—Prof. Oliver W. Brown presented a paper before the Niagara Falls meeting of the American Electro-Chemical Society last month, in which he discussed the efficiency of the nickel-plating tank. To study the problem the author has determined the signal potentials of anode and cathode separately by means of a standard electrode. His results show that electrolytic nickel anodes corrode very poorly as compared with cast nickel anodes; pure rolled anodes are no better than electrolytic. The cathode efficiency is affected to a marked degree by the anode efficiency. The satisfactory operation of a nickel-plating solution depends to a large extent on the character of the anode employed. The purest anode material is not the best; presence of copper is advantageous to a certain extent, and it is quite likely that certain other impurities which are usually present in cast nickel may be equally advantageous. The reason that cast nickel anodes show a superiority may be due to the impurities or to a different physical structure which gives rise to a great porosity and roughness of the surface, and thereby a greater actual surface area. The electroplater can obtain an efficiency of 90 per cent. or more if cast anodes are used, with an anode density of about five amperes per square foot.

Yorkshire College Engineering Society.—On the occasion of the opening meeting of the above society last week Mr. E. J. Silcock, the president, delivered an address which was devoted to the subject of municipal engineering. He pointed out the numerous and responsible duties of the municipal engineer, and commented on the fact that it was only of late years that the corporations of this country had realised that in order to secure the services of first-class engineers, they must appoint men who had been specially trained, and must pay them adequate salaries. Only men who possessed a thorough knowledge of engineering principles, coupled with some judgment and the capacity to take a broad view of the development of a city, could be trusted to deal with interests of the magnitude which every day confronted the municipal engineer. As an example of municipal progress Mr. Silcock referred to electric tramway development in this country under the corporations, and particularly to the Leeds tramways and waterworks, both of which gigantic undertakings were designed and executed by the municipal engineer. All things considered, he was of opinion that, in spite of drawbacks in connection with the periodical changing of public bodies, municipal engineering offered good openings to those well up in their profession.

Wireless Telegraph Experiments.—Prof. Alexandro Artom, of the Royal Industrial Museum of Turin, is reported to have been successful in carrying on a wireless telegraphic communication simultaneously between two pairs of stations in the same locality. The experiments were made over a distance of 35 miles near Rome, and the intervening country was of a woody undulating nature. Messages intended for one station are stated to have been received without interception, although communication was going on at the same time between another pair of stations practically over the same ground. Prof. Artom is said to have employed a special instrument of his own invention in the experiments. It will be remembered that Signor Marconi has achieved a similar success in this country, when he demonstrated that it is possible under certain conditions to carry on communication between two stations without being intercepted by other stations working in the same vicinity and at the same time. Mr. Marconi has accepted an invitation from the Admiralty to give on board one of his Majesty's battleships an illustration of the results of his experiments in the transmission of messages to ships by wireless telegraphy over long distances. For this purpose he has arranged to embark on H.M.S. "Duncan," which sails from Portsmouth for Gibraltar in the course of a day or two.

Contact Potentials.—Mr. Heschus has contributed to *L'Eclairage Electrique* an article giving the results of an investigation into the influence which the degree of polish and the superficial density of bodies have on the difference of electric potential produced by their contact. The author arrived at the following conclusions: In all cases, that one of the two surfaces of a particular metal which is most polished, becomes positive. If two different dielectrics are brought into contact, the hardest one ordinarily becomes positive; the contrary takes place with the metals; the numerous exceptions can be easily explained. A body of hard material, but which presents on account of its structure few points where contact is possible, behaves like a soft substance. Glass wool, for instance, becomes negative in contact with cloth, ordinary absorbent cotton, porcelain, and glass. Hygroscopic surfaces, poorly dried, become positive like the water itself. A body which easily crumbles into dust, or a glue-like body, which leaves traces on the surface with which it was in contact, always becomes negative. This fact explains numerous variations in the sense of electrification of the same pair of bodies, through contact or by rubbing them against each other. Ebonite, for instance, becomes negative when in contact with emery paper, but it is positively electrified when it is rubbed with the paper in order to polish it. Two pieces of quartz, of sugar or of pyrite, which give a phosphorescent light when knocked against each other, are both positively electrified. The particles produced by the knocking, however, if allowed to fall on an electrometer, charge the latter negatively.

Wind-Driven Electric Plants.—Before the recent Copenhagen Technical Congress Prof. P. La Tour read a paper in which he gave the results of his investigations on this subject. The professor has for many years been engaged on behalf of the Danish Government in experiments on the use of wind-motors in connection with the operation of electric generating plants, and the results are stated to be fairly satisfactory. The main drawback has been the difficulty in obtaining approximately constant speeds, irrespective of the strength of the wind. It is reported that this difficulty has been overcome by the use of an intermediate shaft placed on a sort of balance, the transmission belt from the windmill leading horizontally down to the pulley of this shaft, and the pressure of the belt against it being regulated by means of the balance provided with convenient counterweights. From the intermediate shaft another belt leads to the dynamo, it being found practicable by this arrangement to make the transmission belt from the mill slip on the pulley as soon as the load exceeds a given value, enabling the mill to run at any speed without carrying the speed of the dynamo

Digitized by Google

above a certain limit. By means of this arrangement in connection with a maximum and minimum interrupter, inserting the machine automatically as soon as conditions are favourable, and switching it off again as the wind becomes too weak, the author claims to have obtained excellent results, the plant having proven satisfactory even during the strongest storms. As a matter of course, storage batteries are always used in connection with such plants. A small station equipped according to this plan is said to have been in operation at Askoo, Denmark, ever since October, 1902, about 450 incandescent lamps being lighted with excellent results; a petroleum motor is provided as a reserve in case of several days' calm weather.

Spark Discharges through Gases.—The chemical effects due to spark discharges through gases are gaining steadily greater importance, and while ozonising apparatus is already in commercial use in Europe for the sterilisation of water, the best-known process of this type in America is that of Bradley and Lovejoy for the fixation of atmospheric nitrogen. The mechanical problem to be solved in all such processes is to bring every particle of gas into the most intimate contact with the spark. The *Electrical World* describes two patents granted to Mr. H. Pauling, of Brandau, Austria, for two different devices for this purpose. In the one the positive electrode is of pointed shape, and the negative is of disc shape, whereby the discharge sparks are conical with the base directed towards the disc and its apex at the discharge point. The blowing-in of the gas is effected through this point in the direction of the spark cone in such a manner that the greater part of the gas current coincides with the spark path. The outlet of the gases after treatment preferably takes place through openings in the disc electrode. In the other device the sparking surface is drawn out in band shape, and the gases are blown or sucked through the spark-gap so formed. A band-shaped sparking surface can be produced, for instance, by allowing the points between which the spark has to pass to make a rapid lateral displacement. Around a cylinder of insulating material a conducting wire is wound in form of a helix, the ends of this wire being connected to the shaft. At a suitable distance from the cylinder a metal strip is arranged parallel to the shaft. This metal strip is connected to one pole of an induction coil, while the other pole is connected with the shaft of the cylinder. A set of nozzles, supplied by a common pipe, is arranged between the metal strip and the cylinder. By revolving the cylinder at a sufficiently high speed a continuous spark band between the metal strip and cylinder is produced, so that every part of the gas passing from the nozzles comes into contact with the sparks.

Magnetic Manganese Alloys. — The German Physical Society recently considered an interesting communication from Mr. F. Hensler on magnetic manganese alloys. Both pure manganese and copper-manganese are known to be quite non-magnetic, but the author has found certain other alloys of the metal to exhibit strong magnetic properties. The following metals and metalloids will thus give more or less magnetisable manganese alloys free from iron: tin, aluminium, arsenic, antimonium, bismuth, and boron. The most interesting results are derived from a thorough investigation into the behaviour of manganese-copper-aluminium alloys. As commercial copper-manganese always includes small quantities of iron, it was first ascertained that even a copper-manganese to which material amounts of iron were added was not magnetisable. It was next shown that, with equal percentages of manganese, the susceptibility will increase for increasing percentages of aluminium up to a maximum corresponding to equal atomic amounts of both metals. This fact is the more noteworthy as the researches of Wiedemann, Quisicke, Du Bois, and others have shown aqueous manganese salt solutions to possess a magnetic susceptibility somewhat higher than the corresponding ferric salt solutions. There is a striking analogy in both the salts and certain alloys of the non-magnetic manganese metal showing strongly ferro-magnetic properties. This suggests a possible comparison of the manganese-aluminium bronzes with a salt solution where the copper would play the part of solvent; the above combination of equal atomic amounts of manganese and aluminium having to be considered as solved salt. Keeping manganese-aluminium-copper alloys for some time at a temperature of 110deg. C. will reduce them to a state of stable equilibrium, corresponding with a maximum susceptibility. The transition points beyond which these alloys become non-magnetic are relatively low, a gradual rise being, however, noted with increasing amounts of either manganese or aluminium.

Water Power from Glaciers.—A unique case of water-power development in the States is illustrated in the Chicago *Western Electrician*, from which we are able to give some interesting details. The chief feature of the scheme is the fact that the water power is to be obtained from mountain glaciers which yield a continuous flow the year round. The plant is now in course of construction at Electron, and the water is to be taken from a stream 35 miles from Tacoma, and 1,900ft. above sea-level, and within nine miles of the first glacier. In all five glaciers feed the stream. A large dam will be constructed and the water will be diverted through an 8ft. square flume, cut through solid rock, and suspended across canyons, a distance of more than 10 miles, to an elevated and precipitous bank of the stream, where a large reservoir is to be constructed. The water will be conducted at a decline of 7ft. to the mile, and at the end will be dropped at an angle of 45deg. through steel pipes 1,700ft. in length down the slope to the river bank, a fall of 888ft. and a pressure of 400lb. to the square inch being secured. The reservoir is to be provided in order to cope with fluctuations in the stream, and as a reserve power in case of accidents to the flume. With a fall of 888ft. the water will rush down through penstocks of steel and strike the buckets of the waterwheels, of which there will be nine, at a velocity of 240ft. a second. From 3,000 h.p. to 4,000 h.p. will be developed. The work is being hurried on as much as possible, and a temporary electric lighting plant has been installed, so that operations may be continued night and day. A great part of the electric power developed will be used in the operation of about 70 miles of electric tramways, but the company will have a surplus of from 10,000 h.p to 20,000 h.p. above the requirements of its own lines, which will be sold for industrial purposes. Experience with harnessing glacier-fed rivers on the continent has proved that there is want of water during hard winters.

Electricity and Shade Trees —A most interesting report has been issued by the Hatch Experiment Station of the Massachusetts Agricultural College in America on the injury to shade trees from electricity. We do not know that the subject has been specially enquired into before, and the report is, therefore, all the more acceptable. The document discusses the subject from various aspects, and illustrates damage due to current from tramway and lighting circuits. Summarising the results, the adverse conditions with which shade trees have to contend in cities and towns constitute a serious drawback to their development. A considerable amount of damage occurs to shade trees by wires, causing abrasions, destruction of limbs and leaders, burnings, and necessitating much injudicious pruning. The greatest amount of damage caused to trees

Digitized by Google

by alternating and direct currents is by local burnings. The higher the E.M.F., the more injury is likely to occur to trees. There is practically little or no leakage from wires during dry weather. In wet weather, however, when a film of water is formed on the bark, more or less leakage is likely to occur, and if the insulation is insufficient and contact with the tree exists, grounding takes place, and burning due to arcing results. The high resistance offered by trees and plants in general serves as a protection against death from an electrical contact. The least resistance in trees occurs in the vital layer (cambium), and those tissues adjacent to it. Electric currents of whatever nature, when applied to plants of a certain intensity, act as stimulus. The physiological effect of the direct current on vegetable life differs from that of the alternating: the latter current acts more as a stimulus to the plant than the former. There is evidence to support the idea that a current, of not sufficient strength to cause burning, may over-stimulate the plant and cause a retardation of its activities which will subsequently result in death.

Train-Lighting by Electricity.—It will be generally conceded that electricity has many advantages for train-lighting, but much discussion has arisen over the best method of securing the current, whether from storage batteries, axle-driven dynamos, dynamos driven by engines supplied with steam from the locomotive boiler, or from various combinations of these systems. The last issue of the *Journal* of the Institute of American Engineers we have received contains several papers which have an interesting bearing on the subject. Many plans have been tried in Europe as well as in the United States, but the authors seem to agree that the most feasible method is to make the system on each car a unit in itself. We quote a practical example. In Austria a Viennese electrical company has fitted up a number of railway coaches with what is known as the Dick system of lighting. The apparatus of this system includes a dynamo, storage battery, and circuit wires. Each car is supplied with a small dynamo, which is attached to the axle of the car wheels by a journaled bearing carrying projecting arms on which the dynamo is mounted, it being held in a horizontal position by a spring attached to the truck. A belt drives the dynamo from a wheel on the car axle. The dynamo produces the current for lighting the lamps while the train is in motion, and simultaneously a small battery is charged from the same dynamo. This battery serves the purpose of keeping up the current while the train is at rest at stations. Generally speaking, however, the lamps should be fed as long as possible directly from the dynamo in order that the battery may be spared. The weight of the dynamo is about 440lb., and an output of 45 amperes is obtained when running at normal speed. There are two batteries which will supply 22 8-c.p. lamps during a period of five hours without being recharged. The batteries are protected by safes, which may be placed in any convenient part of a railway carriage. On the door of each safe are posted exact instructions for the benefit of the attendants whose duty is to look after the apparatus.

Electrical Enterprise in New Zealand.—We have had occasion lately to call attention to the great many electrical schemes which are going forward in New Zealand at the present time, and the interesting progress which the colony is making in all matters electrical, including the development of water power and transmission over long distances, electric tramways, and supply of electricity both for lighting and power purposes. It would be difficult to say which is the most go-ahead city in this development, although there are two or three which stand out from the others as the pioneer cities in the introduction of electricity into the colony. This may be truly said in the case of Christchurch, which has recently inaugurated a combined dust destructor and electric lighting works—the only example of its kind in the Australasian Colonies. The electrical plant has been installed by Messrs. Noyes Bros., who are the New Zealand agents for the British Westinghouse Company. The destructor, as originally erected, was fitted with two Babcock and Wilcox water-tube boilers, of a total steam-raising capacity of 500 h.p., and a working pressure of 150lb. In the new plant which has been laid down the engines are of the high-speed enclosed pattern, running at 450 revolutions per minute, with an 8in. stroke; they are of the triple-tandem, compound type, and were supplied by Davey, Paxman, and Co. Coupled direct to each engine is a British Westinghouse 100-kw. multipolar dynamo generating current at 220 volts. In order to provide power for the all-night load, a storage battery has been installed. This battery is the largest in the Colonies, having a capacity of 1,000 ampere-hours. It is equivalent in output to one of the dynamos running at about half-load for five hours. The construction of the battery is unique, as all the plates are assembled on the work and burned up by oxyhydrogen blow-pipe. Each cell is insulated separately, and the whole battery is insulated by glass from the floor. There are 124 cells in the battery, 14 of which are used as regulating cells. Each cell contains 13 positive plates, 12 negative plates, and 22 gallons of acid. Specially-distilled sulphuric acid has to be made for this battery, as the manufacturers, the Accumulatoren Fabrik Actiengesellschaft, of Hagen, insist on pure acid and distilled water. The charging of this battery requires 20 hours continuous running of one dynamo at nearly full load, and a test of its capacity, made after charging, showed that the results were much better even than the guarantee. The regulating cells and battery are controlled by a switch and minimum cut-out, mounted on the partition separating the battery-room from the engine-room. In order to charge the battery without interfering with the supply to consumers, two motor-boosters are provided. These are of Westinghouse manufacture, and each consists of a 50-h.p. motor, working at 220 volts, coupled to a 37½-kw. generator at 125 volts, both mounted on the same bedplate. The motor is controlled by a starting switch and resistance fixed near it, and also by switches on the main switchboard. The main switchboard consists of five panels of white marble, and is about 7ft. 6in. high. Each dynamo has a controlling panel fitted with necessary switches, circuit breaker, ammeter, and field rheostat. The battery and booster dynamo are controlled by switches and instruments on a separate panel, and also the booster motors. Provision has been made in the power-house for a third engine, and everything has been carried out with a view to extension at an early date. As regards the commercial side of the scheme, it is expected it will prove a success, and a clear profit of just on £1,000 is hoped to be realised the first year. This is allowing 15 per cent. for interest, depreciation, wages, and maintenance, and a sum of £1,122 for operating costs. In the first instance, electricity for lighting is being supplied at an average price of 6d. a unit, and the estimated revenue is based on this figure. It will be interesting to see, when the plant has been long enough at work, how successful the combination of the dust destructor and electric lighting works will prove. The estimate places the average supply of steam from the destructor at 2,000lb. per hour from a ton of refuse with a consumption of 25 tons of refuse per day. It is on this basis that the capacity of the electric plant now installed has been gauged, and it is hoped it will return a fair revenue.

ELECTRIC POWER IN TEXTILE MILLS.

The limited adoption of electric motors for textile machinery is probably due rather to the conservatism of British millowners than to any fault of the power agent. Undoubtedly trade depression has also done much to retard progress in this direction. Were the electrical engineer asked to specify the most suitable time for putting in an electric plant, he would choose a moment when the mill was working at low output and numerous machines were idle, so that any delays incident to the change would be of little importance. But, on the other hand, when business is poor, the management are seldom inclined to incur the considerable expense entailed. Further, the insufficiency of antiquated methods of power distribution is less keenly felt than when the plant is working at its maximum capacity, when a brief cessation of the power supply would greatly disorganise the work. With orders pouring in and the plant working day and night, the owners feel justified in greater outlay on improvements, and in consequence this time is generally chosen for the electrification of a mill. The wisdom of the policy is open to doubt, but the facts are obvious. Much credit is due to the engineer for the ingenious manner in which delays in changing over have been avoided; in numerous cases the electrical plant has been put in without in the slightest degree affecting the continuous operation of the mill. But probably the advantages of electric power would have been better exemplified had it been possible in these cases to modify the transmission system further than by simply substituting motors for the various steam-engines employed to drive the shafting. While the driving of the majority of machines by individual electric motors is not considered the best practice from either a technical or an economical point of view, the grouping of machines driven from one source of power can often be improved upon to a great extent in changing over, resulting in improved working conditions and decreased expenses.

The plant illustrated is an example of an electrical installation grafted on to an existing mechanical system. The twisting shed, shown in Fig. 1, forms part of Sir Titus Salt's extensive works at Saltaire. These mills are for the most part driven by small steam plants laid down at several different points. The twisting shed is, however, located about 500 yards from any part of the main shafting, and it was therefore decided to drive it by electric power, rather than incur the great friction loss of mechanical transmission over such a distance. Fig. 2 shows the Westinghouse alternator put in to generate the electric power. This machine is of 100 h.p., on the three-phase system, and runs at 440 volts and 720 revolutions per minute. It is driven by eight cotton ropes from a pulley 4ft. in diameter on the main shaft, running at 340 revolutions per minute. The other small dynamo shown is auxiliary to the larger machine, supplying the current required for excitation. The electric plant has been running regularly for 18 months 10 hours a day, and has required practically no attention. Starting and stopping are very simple, and no skilled supervision is required at any time.

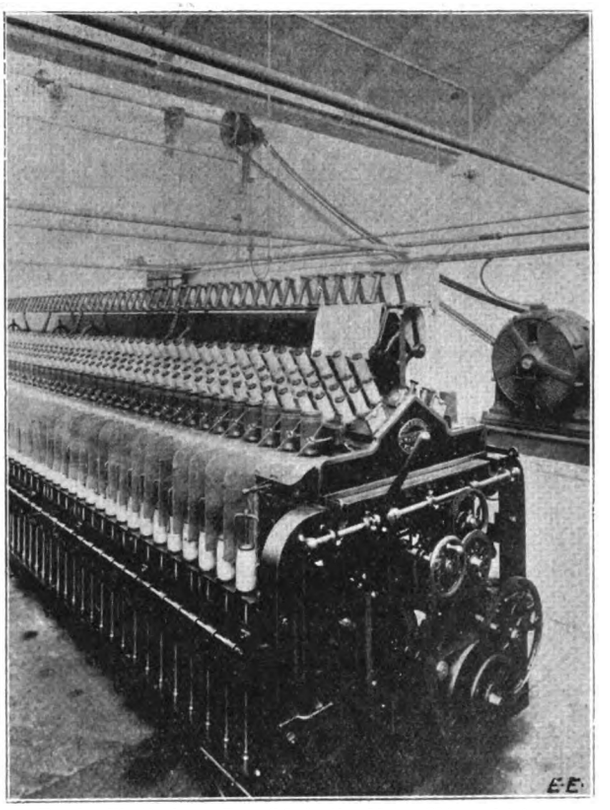

FIG. 1.—Westinghouse Type C Induction Motor, 75 h.p., driving Twenty Twisting Frames.

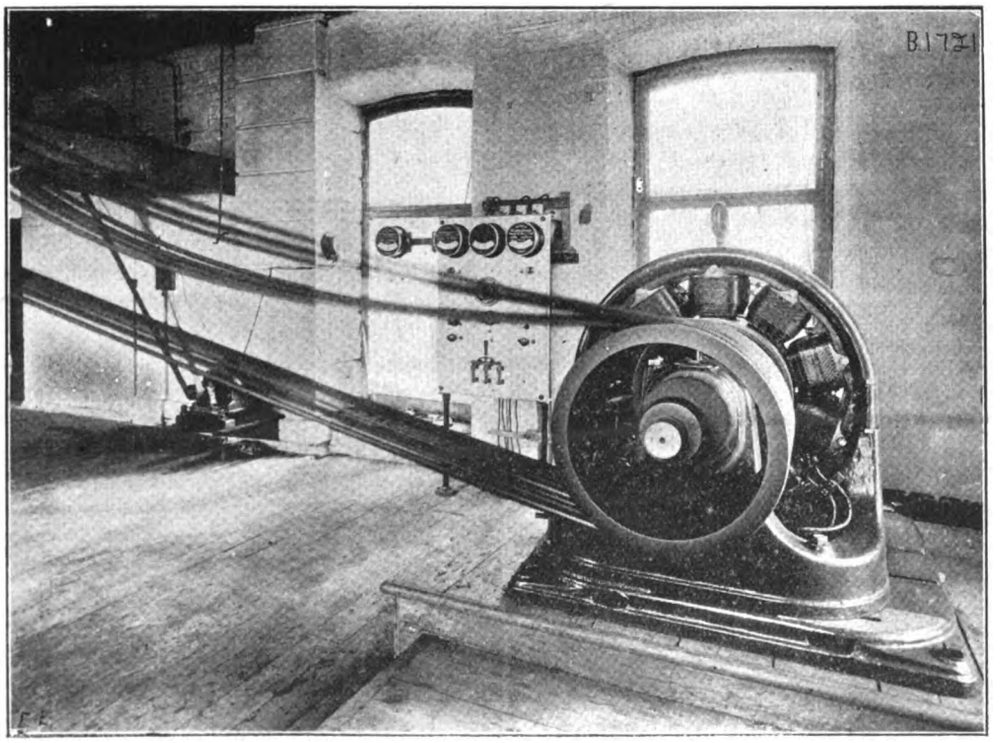

FIG. 2.—The Electric Power Plant, Westinghouse 75-kw. Alternator, with Switchboard and Exciter in background.

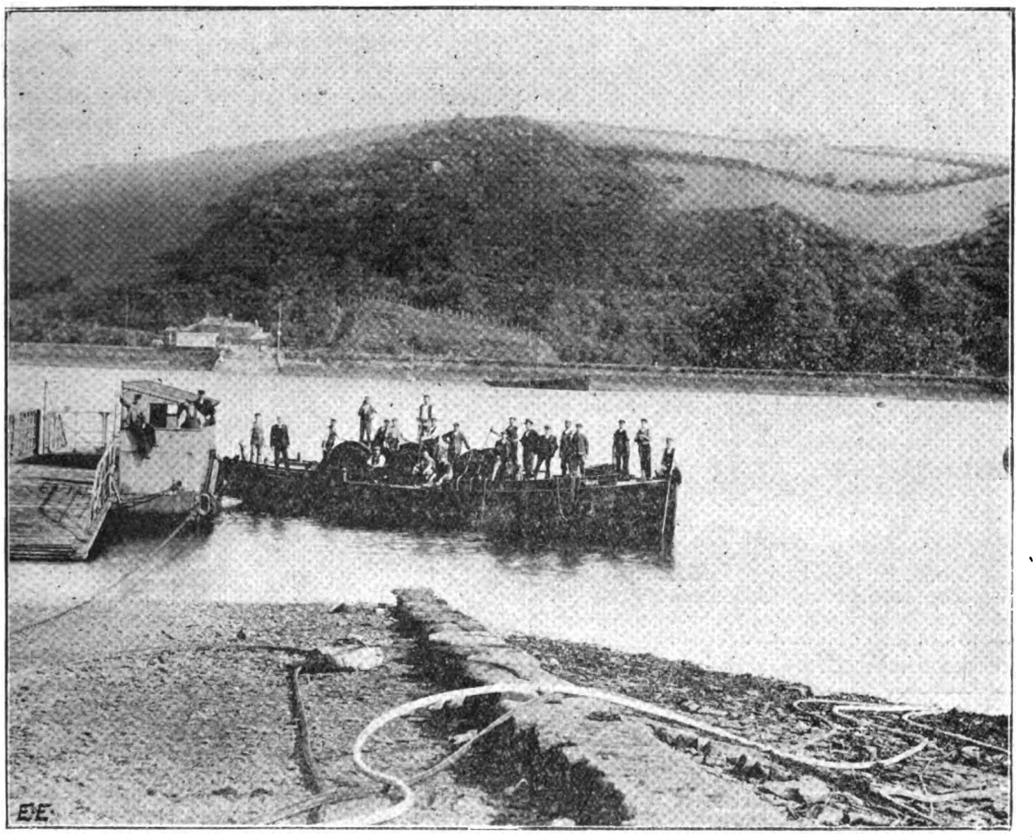
The Westinghouse induction motor, located at one end of the twisting shed, is of 75 h.p., and drives the line

Digitized by Google

shafting by six cotton ropes running on grooved pulleys. Twenty twisting frames are at present driven by the motor, each having 180 spindles running at 2,500 revolutions per minute. The frames are driven by belts from the line shafting, and any of them can be isolated when required by the use of loose pulleys.

The polyphase induction type of motor, as here exemplified, is without a doubt superior to any other electrical machine for such work. It is simple and efficient, it can stand treatment that would inevitably ruin a direct-current machine, and it abolishes the bugbear of sparking. The rotating member, or armature, of this motor contrasts strongly with the equivalent part of the more familiar direct-current motor, consisting simply of solid copper bars laid in slots in a laminated core, these bars being bolted at their extremities to heavy copper end rings. There is no insulation, no small conductors liable to injury, no thin "band wires," and no commutator. These advantages are unquestionable, and demonstrate clearly the superiority of the alternating-current system for electric power distribution in cotton mills.



Laying Callender Cables across the River Dart to Light Kingswear.

The above plant, though but of small size, is interesting not only as an example of the polyphase transmission system, but little known in this country, but also on account of its complete success, having given every satisfaction from the start. The general neatness and compactness of arrangement made possible by the motor drive are well shown in the illustration.

DARTMOUTH AND KINGSWEAR ELECTRIC LIGHTING.

Through the courtesy of Mr. G. E. Smith, the engineer of the Dartmouth electricity works, we are able to reproduce the accompanying interesting photograph of the laying of electric lighting cables across the estuary of the River Dart. The Kingswear Council have entered into an agreement with the Urban Electric Supply Company, of Dartmouth, by which the company agrees to lay mains both for street and house lighting in the district. In order that this might be done, connections had to be made across the river. For this purpose three Callender single-core cables were used, insulated with vulcanised bitumen, and heavily armoured. These were laid in the bed of the river at a point close to where the floating bridge crosses from Dartmouth to Kingswear. The actual distance is about 550 yards, and we are pleased to state that the work was successfully carried out by the electric lighting company's own staff, under the superintendence of Mr. G. E. Smith.

INDEPENDENT TELEPHONY IN GREAT BRITAIN.

BY GARDNER AND HOLME.

(Continued from page 575.)

The method of renting telephones in England until recent years was by an annual payment to cover an unlimited number of local calls, this system now being known as the flat rate. When subscribers, however, have an unlimited use of the telephone, it tends to burden the traffic with a large number of useless calls which would be eliminated on the introduction of a toll. On the other hand, the flat rate is an exceedingly popular one in England, and large firms would oppose a compulsory toll system; at the same time it must be admitted that the toll system theoretically is the correct one, in so far as the more use a firm makes of the telephone on the toll system, the more he pays.

In practice the toll system involves a large amount of account keeping, which increases the office charges nearly in the ratio of decrease in operating. Taking all these facts into consideration, it would seem that a low flat rate combined with a toll rate should be adapted for an exchange system. It is also the practice in England to give free service to flat-rate subscribers all over the local area, although in some cases long expensive junction lines have to be erected to connect the various exchanges together. Thus in the Portsmouth local area some of the junction lines are 18 miles long. Of course, it may be argued that unless the villages were telephoned the central exchange would not be so large or important, as the shops in the villages are placed in communication with the supply stores in the town; yet theoretically a charge should be made for the use of a junction to another town or village.

The trunk lines joining the various telephone areas into which Great Britain is divided are under the direct control of the Postmaster-General, and a charge of about 3d. for

Digitized by Google

every 25 miles for a three-minute conversation is made. Under the licenses granted by the Postmaster-General for the establishment of exchanges a toll system is obligatory, and we will now consider the method of working same from a financial point of view. One method is to demand a deposit from the subscribers in prepayment of calls, and forward the account whenever the deposit is exhausted, and refuse further calls until another deposit is made. This, however, leads to considerable friction with subscribers, and, therefore, should not be adopted by progressive exchanges; and it would not have been mentioned at all had it not been an adopted system.

Another method is to fix recording meters which automatically register the calls from the switchboard at the exchange. Although these meters work well and have been adopted in the large Post Office London central exchange, a subscriber needs convincing that the meter will not register calls which he does not have, and this is the great drawback of the meter being at the exchange end.

Another, and the last method we shall consider, is for the operator to book the calls on a pad at the switchboard, these entries afterwards being transferred to accounts which can be rendered periodically to the subscriber. This system, we believe, is adopted in the Post Office London branch exchanges and also the various Corporation exchanges. From these accounts the subscriber can see the various subscribers he has rung up during the quarter, and is satisfied that the account is in order. A sample of the form in use at Portsmouth, which automatically adds itself up, is given in Fig. 7. This last method proves very satisfactory to subscribers, and although it is an increase in clerical labour compared with the deposit or meter systems, the fact must not be lost sight of that to please subscribers is of more importance than a slight reduction in maintenance charges.

Another method of popularising the toll system is to charge the rental half-yearly or quarterly instead of yearly, forwarding the account at the same time as the preceding quarter's tolls.

FIG. 7.

To arrive at the amount to charge for the rental of a toll telephone in addition to the fees for the calls is a very difficult problem, as it is affected by the proportion of flat-rate to toll-rate subscribers. The first fact necessary to base an estimate on is the maintenance charge of a direct exchange line. In the chapter on maintenance it was found that the upkeep per station, including interest, sinking fund, and special reserve account, amounts to approximately £4. 3s. 6d., and consequently the tariffs should be arranged to give an average income per station of £4. 3s. 6d. But this includes inside extension lines. It is therefore necessary to eliminate these inside extensions so as to arrive at the cost of maintaining direct exchange lines and outside extensions, as obviously an inside extension should not cost as much to maintain as an outside one, or a direct line. From actual practice it is found that the cost of maintaining exchange lines and outside extensions is £2. 7s. 1d. at Portsmouth, and £2. 9s. 2d. at Glasgow. Adding to this the interest, sinking, and reserve fund charges on the cost of £25 per line, we get £4. 8s. 8d. as the full maintenance charge on direct lines. Consequently £4. 8s. to £4. 9s. should be the average receipt per direct line in order to ensure the commercial success of the exchange, or, in other words, about 20 per cent. on the capital cost should invariably be charged in telephone practice.

A safe tariff would, of course, be £4 per annum with a toll of 1d. per call, but as the more important firms prefer a flat rate it would be necessary to introduce one. This, of course, is a concession to the large firms, and the toll rate should be reduced accordingly as a concession to the small users. A flat rate of £6 combined with a toll rate of £3 and 1d. per call are very good rates to commence with, as the tolls may be counted upon to yield at least 15s. per toll subscriber per annum. It will thus be seen that 80 per cent. of the subscribers would have to be toll subscribers before the average receipt would fall below £4. 8s.:

20 per cent. flat-rate lines at £6	=	£120
80 per cent. toll-rate lines at £3	=	240
Tolls, 80 at 15s.	=	60
		£420

Or an average receipt per direct line of £4. 4s. If the cost of the direct lines works out at £20, as at Portsmouth, instead of £25, the maintenance per direct line will, of course, fall by 8⅓ per cent. on £5, or 8s. 1⅓d., and the average receipt necessary would fall to £4. It would then be possible to reduce one, or both tariffs. The best practice would be to reduce the flat rate, as this would slightly diminish maintenance charges, and the more important toll subscribers would transfer to the flat rate, as it is the most popular one.

A reduction of the tariffs could be made as follows:

20 per cent. flat-rate lines at £5	=	£100
80 " " " £3	=	240
Tolls, 80 at 15s.	=	60
		£400

Or an average receipt of £4 per direct line. Even this would be improved on, as with a low flat rate of £5, 60 per cent. would adopt it, but the above figures are given as being an absolutely safe basis of working. Tariffs for inside extensions can now be deduced, being 20 per cent. of the capital cost. The average cost works out about £5, and £1 per annum, being 20 per cent. of £5, is the usual rental charged. Similarly with outside extensions, the tariffs should be fixed to give an average receipt of £4 to £4. 4s. The usual method of charging is if the line is under one mile in extent, but over three-quarters mile, £5; under three-quarters, but over half mile, £4. 10s.; under half mile, but over quarter mile, £3. 15s.; under quarter mile, £3.

It is often thought that call offices stem the growth of a system, but the contrary is found in practice, a good call office system being the means of inducing firms to adopt the telephone. Call offices should yield 7s. per month, otherwise they are not bringing in 20 per cent. on the capital expenditure.

Another method of catering to the small users is by establishing party lines, whereby from two to ten, or even twenty, instruments are bridged across the one line. This, however, does not meet with success in England, owing to conversations not being private and the liability of faults. A two-party line costs the extra spur into the subscriber's office, and the instrument, in addition to the first subscriber's line, so that the combined rentals should equal the

Digitized by Google

average receipt plus 20 per cent. on the cost of the spur and instrument. The average cost of a spur and instrument is £6, and if the average receipt was £4. 8s., the combined rentals should total to £5. 12s., or a two-party line rate of £3 per annum, but as the maintenance becomes greater, owing to the complications for selective ringing, the rental should be £3. 10s. per annum to prove remunerative.

In carrying out private installations a quotation at 20 per cent. on the cost price should be given on a five years' agreement, so that even if the firm does not rent the installation at the end of the five years, little or no loss will occur. In the opening of small exchanges the 20 per cent. rule cannot be rigidly observed. For instance, if a village is one mile from an existing route, and five subscribers are obtained, an exchange could be established for £150, but the rental of the exchange would be comparatively large to the income, and so on opening small exchanges it is necessary to make up a careful estimate of capital cost, revenue, and expenditure to see that it will be commercially successful before commencing the work. To summarise, the tariffs are governed by the cost per line, and the proportion of toll subscribers to flat-rate ones. It will be found, however, that as a general rule a flat rate of £6, and a toll rate of £3 and 1d. per outward call, will prove very successful.

(To be continued.)

A METHOD OF MILKING FAULTY CELLS.

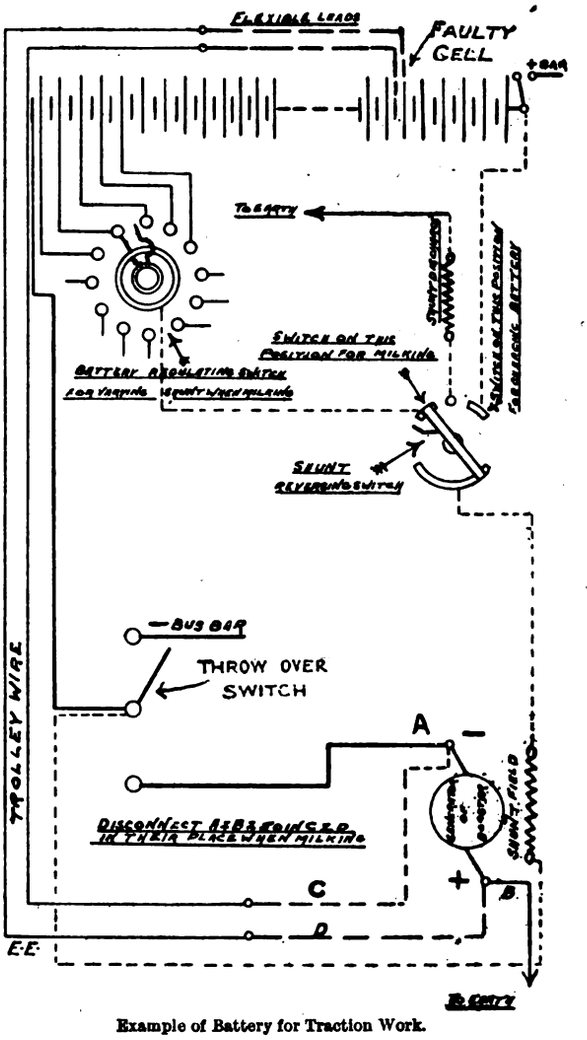
BY W. DALTON.

As a battery is at the best a very inefficient part of a station equipment and, moreover, its maintenance is also a heavy item to contend with, the following method of milking faulty cells without having to resort to the expense of a special machine may commend itself to those who have batteries under their care. It is very often found that sooner or later certain cells in a battery persistently go dead after a normal discharge, and an extra charge is invariably a cure, providing the fault is not caused by shorts between the plates.

It is assumed that an ordinary booster is used in connection with the station equipment, arranged in series with the battery when charging, connected either on the positive or negative side. Assuming there are, say, two adjacent cells which are faulty and require milking, the question to solve is how to adapt the booster (which is probably designed to give about 100 volts normally) to charge the two cells with, say, 150 amperes at a voltage only sufficient to force this current through the low resistance of the cells. The voltage required to do this may only be about six or seven volts. To get this the excitation must be brought down very low, and it is done by exciting the booster field from a few of the good cells in the battery. It may only require, say, 10 or 15 cells in series, and if there is a battery regulating switch fitted up these can be varied to suit circumstances. The ordinary connections at the booster terminals are temporarily disconnected and a pair of flexible leads joined up in their place, the other two ends being clamped across the faulty cell, care being taken to see that they are connected up with their polarity right. A switch is put in the circuit, the booster motor is run up to speed, and the generator field switched on. The main switch is now closed, but before doing so the volts of the generator should be tried, otherwise if the generator was giving no back E.M.F., the cell would be short-circuited through the armature. The battery regulating switch is now regulated until the right amount of current is passing into the faulty cell. If the battery is situated any great distance from the booster, a good method of connecting up the faulty cell is to erect two lengths of trolley wire on porcelain insulators between the booster and battery, and then at the end of this line flexible leads can be clamped on the trolley wire and taken to the faulty cell.

The advantages of the above method are: (1) no expense incurred for a special milking booster; (2) it is not necessary to break the joints and cut the faulty cell out of circuit.

Another point worth noting is that the extra amount of work put upon those cells which are used for excitation purposes is infinitesimal, therefore negligible. This is obvious when taking into account that the shunt of the machine may be some hundreds of ohms, and this divided by the voltage of the cells results in a very small fraction of an ampere. When this method was first tried, it was expected that the machine would spark, due to it giving out a heavy current in a very weak field, but it has been used on more than one make of booster with perfectly satisfactory results. The accompanying diagram shows the connections.



Example of Battery for Traction Work.

THE NEW GAIETY.

The sacred lamp of burlesque lies smouldering at the foot of pedestal, as depicted on the curtain raiser, and the figure representing the new Gaiety raises aloft an electric light. This characterises the modernising of John Hollingshead's house which has just been carried out by George Edwardes. The decorations and fittings and the architectural features do not lie within our sphere: an idea of the comfort obtained may be gathered from the single fact that each chair in the stalls and dress circle did actually cost £4.

The electrical installation is most complete, and has cost close on £7,000, £1,500 of which is represented in the switchroom. It provides for 3,500 lights or an equivalent of 9,406 8-c.p. lamps, 30 arcs, and several motors. All these lights are on the two-circuit system, the supply coming from two stations of the Charing Cross and Strand and from two stations of the Metropolitan Supply Companies. The latter company provide the main supply from their Willesden station, and their stand-by from Sardinia-street. There are 14 sets of mains coming in, divided over three different points of entry. The boards at the various points of supply are, of course, all arranged so as to change any circuit over from one station to the other of the same company. A separate switchboard and service is

Digitized by Google

installed for arc lamps. This is on the three-wire system, with a two-way change-over switch; as there is no separate 100-volt supply, the Metropolitan Company will use for this purpose a motor-transformer to reduce the supply voltage. A separate supply board controls the "police" lights. These are on a separate main from the Charing Cross and Strand Company, so that if all the regular lights on the two separate supplies in the theatre should give out, there will remain alight 136 16-c.p. lamps connected with this third independent supply, enough to provide a slight illumination to all parts of the house, and especially the exits. Another board controls the supply to the motors. There is a 12½-h.p. for the 7ft. ventilating fan on the roof, two of 3½-h.p. for the fan on the stage and the vacuum cleaner respectively, and a 5-h.p. motor for the Waygood's lift on the ladies' side for the dressing-rooms. A separate service supplies the offices and the dressing-rooms on the Aldwych side, another those on the Strand side, and so forth.

The whole of the lamps in the auditorium, passages, etc., are controlled from two points only, the two large switch-boards, having a total of about 70 switches, being fitted in fireproof chambers with metal sliding doors near the stalls saloon, where they will be under the control of a responsible official. All the lamps in the auditorium in view from the stage will be controlled from switchboards by the fire-resisting pass door to the stage. These are fitted with arrangements for lowering the illuminating power of the lamps whilst the play is in progress, and are under the control of the electrician in charge of the stage. Most of the lights are 32-c.p. incandescent lamps. There are 74 25-c.p. lamps on the centre chandelier, an inverted 30-ampere arc lamp under the dome, and 24 12 to 15 ampere projectors on the stage, and six other arc lamps in other parts of the building.

Seven miles of steel tubing and 25 miles of wire were used on the job. The switchboard was made by Messrs. E. F. Moy and Co. In connection with it a new mechanical 57-lever regulator is used for the three-colour gamut. About one-third of these levers are connected with 21 Lyon's liquid resistances in the basement, to be used for slowly varying the lights. In other circuits metal resistances which work on sliding contacts are used, and are placed overhead. The regulator, which is of a type in common use on the Continent, is entirely new in England, and was supplied by the Electrical Company. It cost between £500 and £600, and is an ingenious contrivance for coupling up the different circuits as may be desired for simultaneous control. One regulator shaft is used for each colour, and the circuits can be coupled to the shafting or independently controlled as desired. The wiring to this switch and fuse board has been most neatly carried out, and the usual bunching of conductors near it has been avoided. Each wire can hence be got at easily if required.

The switchboard is bolted to the proscenium wall, and the regulating gear is fixed on the up-stage edge of the platform, thus enabling the person manipulating it to face the stage, instead of having his back to the lamps he is regulating. The resistances themselves are fixed in fire-resisting chambers built above the stage switchboard, extending to the underside of the fly floor, the multiple switches, which are bolted to the resistance frames, being connected to the regulating gear by means of steel-wire ropes. A complete system of electric lamp signalling has been installed to the principal points in the stage cellar, on the stage, and to the flies, the whole being placed under the control of the stage-manager in the prompt corner. As already inferred, the wiring is arranged so that in the event of any portion of the light supply breaking down the whole of the lighting of that system can be changed over to another supply, thus making the chance of a breakdown for more than a few moments impossible at any time.

The whole of the work has been carried out by Roger Dawson, Limited, Berners-street, to the specification of the consulting engineer, Mr. Thomas J. Digby. Every objection of the most exacting London County Council inspector has been anticipated, and the contractors have evidently not stinted money or pains to carry out to a successful issue what must be regarded as the most modern electrical theatre installation in the way of safety, comfort, and stage improvement. Mr. G. Poynton Applebee has been for some years the electrical engineer of the theatre, and upon him will now devolve the care and working of this complete installation.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

629. Describe what you consider to be the best lifeguard for electric tramcars at present on the market.—MICA.

630. Describe the action of the sight-feed lubricator for cylinder lubrication. Give sketch.—C. W. S.

ANSWERS.

Question No. 621.—Resonance occurs when the natural period of discharge of a circuit is equal to the generator frequency, and is complete when the self-induction and capacity of the line exactly neutralise each other. Explain this clearly.

Best Answer to No. 621 (*awarded* 10*s.*).—It can be shown that the period of oscillation of a circuit consisting of an inductance and capacity connected in series is expressed by the equation $t = \pi \sqrt{L K}$ when the resistance is low, and t = time of complete cycle in seconds; L = inductance in henrys; K = capacity in farads.

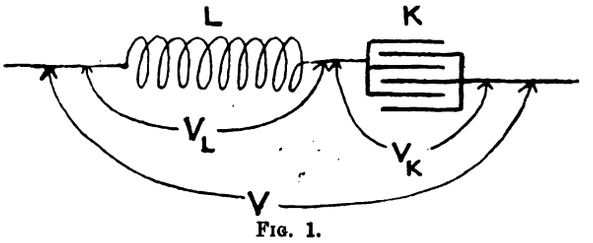


FIG. 1.

Now, if an alternating voltage be applied to such a circuit (Fig. 1), the current which flows produces between the ends of the inductance a counter E.M.F. = $V_L = 2 \pi n L C$, where n = frequency in cycles per second, and C = current in amperes. The same current flows into the capacity, and produces a counter E.M.F. $= V_K = \frac{C}{2 \pi n K}$. Now V_L lags 99deg. in phase behind C, while V_K leads C by 90deg. Hence these two counter E.M.F.'s tend to cancel one another, and if $2 \pi n L = \frac{1}{2 \pi n K}$, they exactly neutralise, leaving only the counter E.M.F. due to the resistance. The current is then limited only by the resistance, and the equation of the current is given by Ohm's law, or $C = \frac{V}{R}$. This is the condition of so-called "resonance." When R is very small, C becomes very large, causing V_L and V_K to become also very large, resulting often in the breakdown of K, whether a cable or other condenser. As stated above, we have

$$2 \pi n L = \frac{1}{2 \pi n K}$$

or,

$$4 \pi^2 n^2 = \frac{1}{L K}$$

Digitized by Google

or, $$n = \frac{1}{2\pi}\sqrt{\frac{1}{L\,K}}$$

Let t = time of one cycle $= \frac{1}{n}$,

then $$t = 2\pi\sqrt{L\,K}.$$

But, as seen above, this equation also expresses the natural time of oscillation of L and K, so that it is clear that resonance occurs when the period of the generator equals the natural period of the circuit.

The above formula only holds for the case where the resistance is small. With resistance in circuit, the neutralisation of L and K gives the maximum current for a given voltage, the current being $\frac{V}{R}$. When L and K are in parallel across the mains, a different case is presented (Fig. 2). If the resistance is vanishingly small, the con-

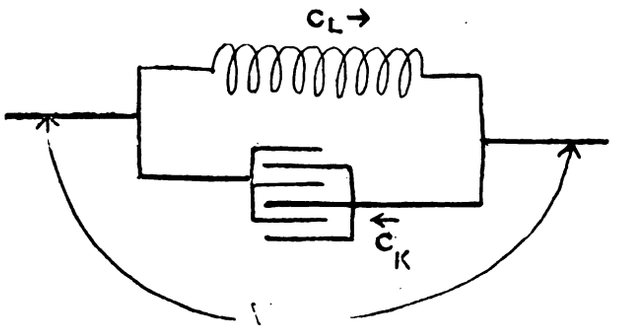

FIG. 2.

denser current, C_K, leads the voltage, V, by 90deg., while C_L lags by 90deg. Hence, if $C_L = C_K$ (the resonant condition), the resultant current flowing from the mains is zero, and no current will flow, however large V may be. But as the circuit must possess some resistance, the two currents, C_K and C_L, are not exactly 180deg. apart, and a resultant current flows from the mains and in phase with V. This may be seen more clearly by the clock diagram of Fig. 3. O V is the applied voltage, O C_L is the current in L, lagging behind O V by a little less than 90deg. (depending upon the relative values of L and R), O C_K is the capacity current. The resultant is a small current, O C_R, which, if L and K neutralise, is in phase with O V.

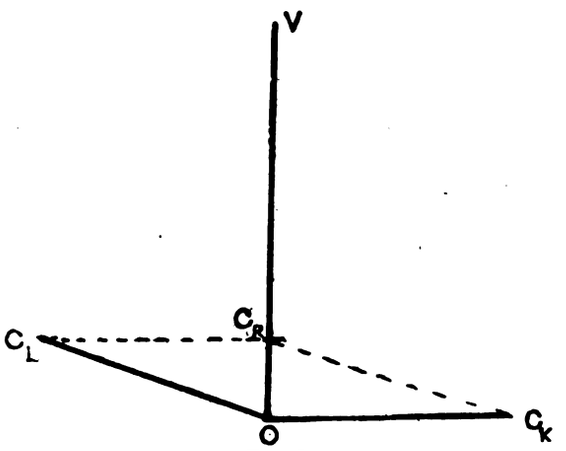

FIG. 3.

Summing up, we may say that when capacity and inductance neutralise, we have: (1) with a *series* arrangement, a large current and abnormal voltages across capacity and inductance; (2) with a *parallel* arrangement, a small current taken from supply and normal voltages across capacity and inductance.—R. C.

Answer to No. 621 (*awarded 7s. 6d.*).—In answering this question, it will be well to briefly consider the effects of an inductance and a capacity in an alternate-current circuit, when the impressed E.M.F. on the circuit follows a simple harmonic law. When an inductance exists in the circuit the current is $\frac{\pi}{2}$, or a quarter period behind the E.M F. as regards its phase. In the case of capacity in the circuit, the current is $\frac{\pi}{2}$, or a quarter period in advance of the E.M.F. In the first case the current varies inversely as the product of the inductance and the frequency, and in the second case current varies directly as the product of capacity and frequency. It will therefore be seen that the effects produced by inductance are the reverse of those produced by capacity, consequently a capacity may be used to neutralise the effects of an inductance in a circuit.

The phenomenon of the neutralisation of an inductance by a capacity is termed electrical resonance, and the advantage of this phenomenon is that it increases the current in an inductive circuit when the impressed voltage is insufficient to give the required current. When the effect of inductance is completely neutralised by capacity, the equation $Lp = \frac{1}{Cp}$ is satisfied, the current being in phase with the impressed E.M.F. Here L = inductance in henrys, $p = 2\pi n$ ($n = \sim$), and C = capacity. Perhaps an example might simplify the above remarks. Suppose it is required to neutralise an inductance of ·1 henry, the $\sim$ being 100, in a circuit having a resistance of 20 ohms and an impressed E.M.F. of 100 volts. Let C = required capacity.

Now, $Lp = \cdot1 \times 2\pi \times 100 = 62\cdot8$; also $Cp = \frac{1}{Lp}$

$\therefore Cp = \frac{1}{62\,8} = \cdot0159$ $\therefore C = \frac{\cdot0159}{2\pi n} = \frac{\cdot0159}{628\cdot32} = 25$ microfarads

Current $= \frac{100}{20} = 5$ amperes; also potential difference at terminals of condenser $= \frac{5}{Cp} = \frac{5}{\cdot015} = 333$ volts. Potential difference across the inductive resistance = current × impedance $= 5\sqrt{r^2 + p^2L^2} = 5\sqrt{20^2 + 62\cdot8^2} = 5 \times 65\cdot9 = 329\cdot5$ volts. This example shows how a small impressed E.M.F. may give rise to very high potential differences between certain points in the circuit, which may result in a breakdown unless suitable precautions are taken. Electrical resonance takes place in a circuit when capacity is placed in series with an inductance, and it will be well to consider the effect of shunting an inductance by a capacity. Under these conditions the total current is divided into two components—*i.e.*, the load current in phase with the impressed voltage, and the idle current which is in quadrature with it. As this idle current is $\frac{\pi}{2}$ behind the E.M.F., and the condenser current is $\frac{\pi}{2}$ in advance of it, these two currents always oppose one another. If the capacity is so adjusted that its current equals the idle current of the inductive resistance, then the only current in the main circuit is the load current. This effect is made use of in a method first introduced by Mr. W. Mordey for getting rid of the power factor in alternate-current distribution. As is well known, before an alternating current can do useful work in a circuit it has to (1) charge the condenser formed by the cable, (2) set up a magnetic field around every conductor forming the circuit. The charge for the magnetic field acts at an angle of 90deg, and the condenser charge at an angle of 270deg. behind the current. Hence the two charges are opposed to each, and if the capacity of the condenser is such that its current equals the idle current which is responsible for the power factor the latter disappears. In practice this is brought about by bridging a choking coil (giving the same current as the condenser formed by the cable) across the circuit. When there is a motor load on the service, the choking coil would only have to make up what the motors do not provide for. Mr. Mordey has found from actual measurements on a cable about six miles in length that it is possible to reduce the idle current from 6·5 to 1·3 amperes. From the above remarks it will be seen that a condenser of suitable capacity connected in series with an inductive resistance, will produce a rise in the potential difference across its terminals, and if the frequency of the supply current, Cp, is so related to the inductance and capacity that the equation $Lp = \frac{1}{Cp}$ is satisfied, then the

Digitized by Google

current will be in phase with the impressed voltage, and electrical resonance is said to exist in the circuit. On the other hand, when a condenser shunts an inductive resistance, it supplies the idle current required by that resistance if the condenser is of suitable capacity.—J. W. R., SWANSEA.

Answer to No. 621 (*awarded* 7*s.* 6*d.*).—The statement that "T. G." asks for an explanation of is not quite right. Resonance does not occur only when the natural period of discharge of a circuit is equal to the generator frequency. It may and does occur when these two frequencies differ, when there is a certain relation between the frequency, capacity, and self-induction. Resonance is best explained by means of a mechanical analogue—the one usually employed is that of the spiral spring. If such a spring is set vibrating, its oscillations have a certain frequency and amplitude. If, now, a periodic force acts on this spring, giving it an impulse at definite intervals, under certain conditions resonance takes place on the spring's oscillations—*e.g.*, if the force gives an impact in the direction of motion of the spring, every time the spring passes through its point of rest in a certain direction the amplitude of the spring's oscillations is gradually increased until it becomes very large. This phenomenon is resonance. If the same force acts as above every second, third, fourth, etc., time the spring passes in a certain direction, resonance still takes place, but the amplitude increases more slowly, inversely as the interval between successive impacts.

Now, just as a spring has a certain period, if it is set oscillating freely, so every electric circuit containing resistance and self-induction and capacity has a certain natural period of vibration, only what vibrates is the current in the circuit. If the corresponding equations for the electrical and mechanical phenomena are examined (they can be found in many books—*e.g.*, Perry's "Calculus for Engineers," Rhodes's "Elementary Treatise on Alternating Currents"), they are found to be of exactly the same form—the mass, friction coefficient, want of stiffness, and displacement of spring in the mechanical case corresponding to the coefficient of inductance, resistance, capacity, and voltage respectively in the electrical case. The equations are:

$$\frac{W}{g}\frac{d^2x}{dt^2}+b\frac{dx}{dt}+\frac{x}{h}=\frac{y}{h}\ \text{(mechanical)}.$$

$$L\frac{d^2v}{dt^2}+R\frac{dv}{dt}+\frac{v}{K}=\frac{l}{K}\ \text{(electrical)}.$$

The usual notation is used, the equations being those for forced vibrations—*i.e.*, the case of a periodic force acting on the vibrating spring. The solutions of these equations are well known (Rhodes, pp. 31 and 201), and it is found that if the applied vibration has a sine function equation—*i.e.*, the E.M.F. of the alternator connected to the circuit under consideration is a sine function of the time—the magnitude of the current in the circuit depends on the value of the expression

$$\frac{pL-\frac{1}{pK}}{R}\ \text{(called the reactance)};$$

where $p=2\pi f$ and $f=$ frequency of alternator. This expression is in the denominator, hence the voltage and current are largest when it is zero—*i.e.*, when $pL=\frac{1}{pK}$; or $p^2LK=1$.

When the reactance is zero—*i.e.*, the effects of capacity and inductance equally balance—we have *electrical resonance*. The above equation, $p^2LK=1$, gives the condition for obtaining a completely resonating circuit. Of course, if the reactance is very small, though not equal to zero, partial resonance is obtained, but the occurrence of resonance depends essentially on the relationship of p, L, and K. If the inductance and capacity be suitably arranged, resonance can be obtained at any frequency. If an alternator have a wave containing the fundamental and higher harmonics, by suitably arranging the capacity and self-induction, resonance may be obtained with any desired harmonic. Thus it is not exactly true that the period of the circuit must be equal to the generator frequency to obtain resonance; if it is equal to the frequency of one of the harmonics, resonance may be obtained, and it is because of this that care must be taken with alternating circuits in which the wave is not approximately a sine wave.—A. C. G. I.

Question No. 622.—Explain how to find the efficiency of an alternating-current motor of 6 h.p., the speed being 1,500 revolutions per minute.

Best Answer to No. 622 (*awarded* 10*s.*).—The efficiency of any motor is the ratio of the electrical power supplied to the mechanical power given out at the shaft. Consequently there will be two quantities to be measured—(*a*) the input watts, (*b*) the output horse-power. Now, the input watts on an induction motor cannot be measured on ordinary voltmeters and ammeters, as the product of the readings so obtained would give the apparent watts, which would have to be multiplied by the power factor of the motor to give the true watts; and without knowing the details of the internal design of the motor, the power factor cannot be obtained except by means of a special instrument, but this would necessitate extra expense, which can be easily avoided by the use of two wattmeters, as is shown later. As "W. F. F." does not state what type of induction motor he wishes to test, it is proposed to show the arrangement of the wattmeters for single-phase, two-phase, and three-phase circuits.

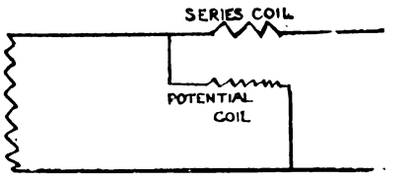

FIG. 1.

Fig. 1 shows diagrammatically the wattmeter connections for a single-phase circuit, the series coil being connected in series with one of the feeders, and the potential coil across the two. On a two-phase circuit with four feeders two wattmeters are required, each connected in a similar manner to the above (see Fig. 2). With only three feeders the wattmeters are connected with the series coils in series with the outside feeders, and the potential coils

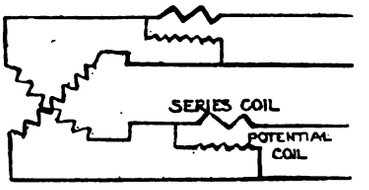

FIG. 2.

across the outside and the middle on each side. Fig. 3 shows the arrangement on a three-phase circuit with two wattmeters. A single wattmeter could be used (with a change-over switch for putting the potential coil first across the outer and middle and then across the two outers), provided that the three phases are balanced, which is unusual on motor circuits. Special meters are made for three-phase circuits which are not in balance, of which the British Thomson Houston Company's meter is an example.

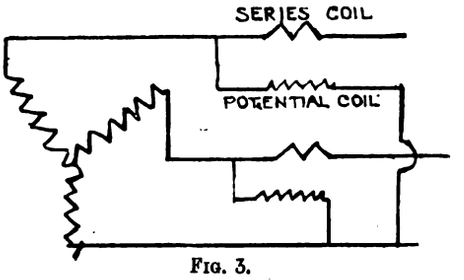

FIG. 3.

But the two-wattmeter method is the simplest and most accurate. In the above figures the sum of the readings on the two wattmeters in the two-phase and three-phase circuits give the true watts input to the motor. The most suitable type of wattmeter is the Thomson meter, and the meter should be well "damped" to avoid fluctuations in the readings.

Now with regard to the measurement of the horse-power

Digitized by Google

output at the motor shaft, the cheapest and best arrangement is to use a brake on the pulley (as shown in Fig. 4). The pulley should be made with flanges each side to allow water to circulate inside round the pulley as it rotates to keep the surface cool, as the friction of the brake on the pulley will cause considerable heading. The brake band is fitted with wood blocks on the inside to form a better rubbing surface on the pulley than would be the case if the steel band was directly on it. The spring below the spring balance, S B, is used to obtain steady readings on the spring balance. With such an apparatus the brake horse-power given out at the shaft is obtained from the following formula:

$$\frac{x \times 2\pi \times \text{revs. per minute} \times \text{lbs. pull on S.B.}}{33{,}000 \times 12} = \text{B.H.P.}$$

It should be noted that with a single-phase induction motor the brake band cannot be put on until the motor has been run up to full speed, as it cannot start up under load, whereas two-phase and three-phase motors can do so. If the induction motor referred to is coupled to a continuous-current dynamo, the horse-power output of the motor can be easily obtained, as it will be the kilowatt output + internal losses of the dynamo divided by 746.

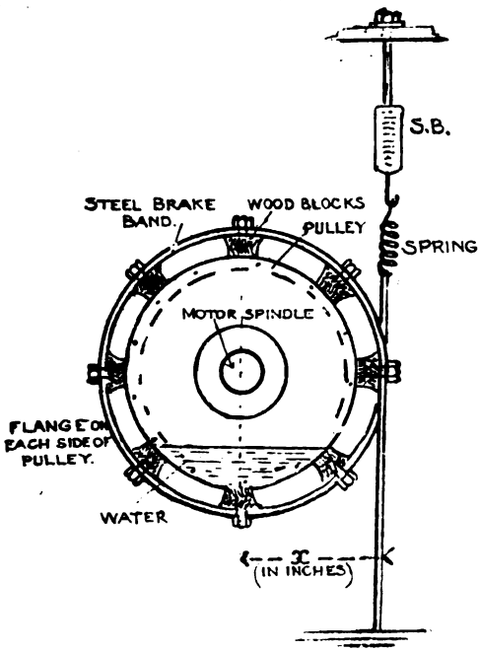

Fig. 4.

The kilowatt output can be measured on ordinary voltmeters and ammeters, and the C^2R losses can be obtained by measuring the resistances of the armature and field and multiplying them by the (current)^2. The other losses due to friction and core loss can be obtained by taking readings on the induction motor to find the input watts: (1) uncoupled from the dynamo and running light; (2) coupled to the dynamo fully excited but not loaded. Then the difference between the two readings will give the generator losses due to core loss and friction in the bearings, etc.—P.

Answer to No. 622 (*awarded* 10*s.*).—No mention is made of the type or class of the motor, or whether it is a three-phase or single-phase machine, but as the methods for determining the output will be the same in each case, we will first consider this point. In determining the efficiency, we have to find the relation between the output and input, and for this purpose the output of the motor must be measured in horse-power produced on a brake. This can be readily reduced to the output in watts, while the input can be measured directly in watts, thus giving the efficiency. There are numerous forms and types of "absorption" or "brake" dynamometers now in use. A well-known type is the Prony brake, which is shown diagrammatically in Fig. 4. The lever is fitted with a knife-edge, which moves in a suitable slot in the lower portion of H. The upper portion is threaded and provided with a handwheel, the latter being fixed in a tripod head. The handwheel cannot move up or down, but is free to turn round. A keyway is cut lengthwise in H, while a feather key in the tripod heads prevents H rotating when the handwheel is turned. A belt laps round the pulley, and the two ends are secured to the lever, J. When it is desired to take a test, the tripod is erected, and the counterweight, K, adjusted so that the lever, J, is horizontal. The knife-edge must be in a vertical line above the centre of the shaft, and the portions of the belt, T_1 T_2, must be parallel. When the pulley runs in the direction of the arrow and the strap tightened, by screwing up H, the scale pan will be moved upwards, and weights must be added to bring the lever again to its horizontal position. Under these conditions the horse-power can be calculated by applying a formula given later.

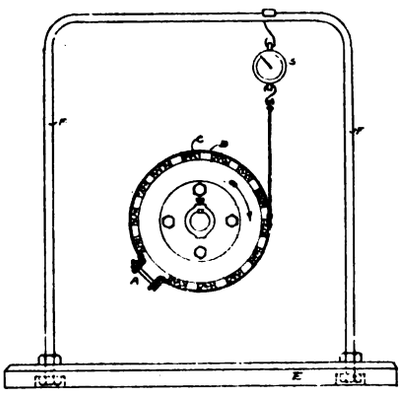

Fig. 1.

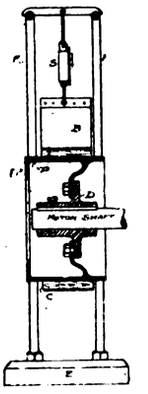

Fig. 2.

The writer, however, prefers the type of brake or dynamometer shown in Figs. 1 and 2; Fig. 1 being a front elevation and Fig. 2 a sectional side elevation. The brake consists of a rigid framing, F, secured to a base, E. This framing can be conveniently made up from pipes and strengthened by cross ties. A strip of thin sheet iron, B, having blocks of wood, C, secured to the inner side, is arranged round the pulley, P, as shown. A is a device, consisting of a bolt and nut, for increasing the pressure of the blocks on the pulley. The latter is of special construction, and should consist of a brass casting, P, secured to a boss, D, by four tap bolts. By this arrangement one pulley will suit for various sizes of shafts—a boss only being required for the particular size of shaft. At the outer edge of the pulley will be seen an annular projection, *f*, at right angles to the face of the former. The object of this is to keep the pulley cool when running, water being poured in the space thus formed before starting up. Centrifugal force keeps this water from coming out when the machine is running. By this means the writer has found that the friction can be kept constant for a complete test without the necessity for applying a lubricant to the face of the pulley.

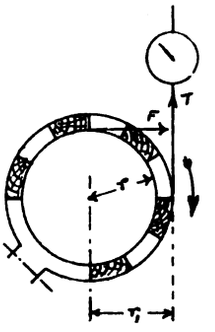

Fig. 3.

The method for calculating the horse-power when using this form of brake will be followed on reference to Fig. 3, which shows the brake in diagram form. In this figure

r represents the radius of the pulley (in feet);
r_1, radius of the sheet iron strip (in feet);
T, the reading (in pounds) on the spring balance, *s*, (Fig. 1); and
F_1 the force of friction at the face of the pulley.

Digitized by Google

It is important to note that T should act tangential to r_1. By the principle of moments we have

$$F r = T r_1 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

The work done per minute is

$$2 \pi r n F \text{ foot-pounds} \quad . \quad . \quad . \quad . \quad (2)$$

where n is the number of revolutions of the pulley per minute, and $\pi = 3{\cdot}1416$.

Hence from (1) and (2)

$$\text{Brake horse-power (B.H.P.)} = \frac{2 \pi r n T r_1}{r \times 33{,}000} = \frac{2 \pi n T r_1}{33{,}000}$$
$$= {\cdot}000019 \, T r_1 \, n.$$

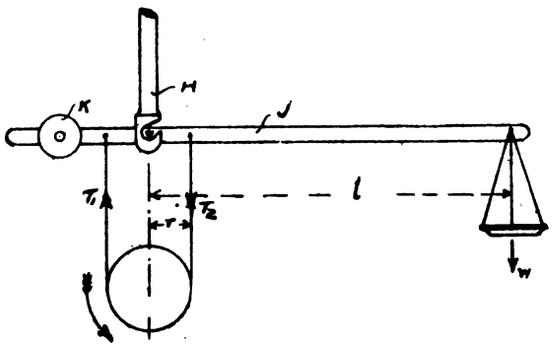

Fig. 4.

The corresponding equations for determining the brake horse-power when using the Prony brake (Fig. 4) are

$$(T_1 - T_2) r = W l \quad . \quad . \quad . \quad . \quad . \quad (3)$$

where T_1 and T_2 are the tensions in the tight and slack sides of the strap;

W, the weight (in pounds) needed to bring the lever, J, to its original position;

r, the radius of the pulley (in feet); and

l, the length of the lever (in feet) through which W acts.

The work done per minute is

$$2 \pi r n (T_1 - T_2) \text{ foot-pounds} \quad . \quad . \quad . \quad (4)$$

whence from (3) and (4)

$$\text{B.H.P.} = \frac{2 \pi r n W l}{r \times 33{,}000} = \frac{2 \pi n W l}{33{,}000}$$
$$= {\cdot}000019 \, W l n.$$

The direction of rotation should in all cases be that shown by the arrow in the figures.

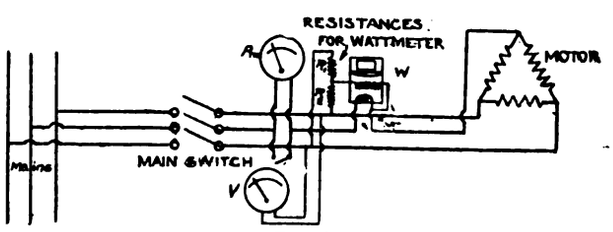

Fig. 5.

The connections for a three-phase induction motor test are shown in Fig. 5. A_m is the ammeter in series with one phase, as are also the series or main coil of the *indicating* wattmeter, W, while V is a voltmeter joined across the other two phases. The connections are for a symmetrically balanced three-phase circuit, which would occur in the motor under consideration. A little explanation is needed about the connection of the wattmeter, W. It will be seen from Fig. 5 that the series (or main) coils are in series with one phase, while the shunt (or pressure) coil is joined from the centre point of two resistances, R_1 R_2. These resistances should be equal, and both should be large in comparison with the resistance of the pressure coil. By means of these connections the total input can be measured directly on one wattmeter. When the test is being run, the following readings should be taken: amperes, volts, watts, speed of motor, and reading on spring balance of brake. The wattmeter is inserted in order to determine the "power factor"—*i.e.*, ratio between "true watts" and "apparent watts"—as if there be any phase difference between the current and voltage, the volt-ammeter reading, or "apparent watts," will be in excess of the true watts, as given by a wattmeter reading. If C be the reading on the ammeter, V that on the voltmeter, and W that on the wattmeter, then power factor $= \frac{W}{3 C V}$. If the number of poles of the motor be known, then the slip can be calculated, for the "synchronism" speed of the motor is

$$\text{revolutions per minute} = \frac{\text{frequency (cycles per second)}}{\text{pairs of stator poles}} \times 60$$

whence the slip is this number minus the actual number of revolutions per minute. The voltage is not given in the question, and if this exceeds 500, potential and current transformers should be used for the instruments.

With a single-phase motor, the readings and methods will be similar to the above, only that the voltmeter and ammeter readings will not have to be multiplied by 3 to give the apparent watts. Readings should be taken at various loads and curves plotted showing the relation between brake horse-power and efficiency, brake horse-power and power factor, brake horse-power and slip, and brake horse-power and amperes input per phase.—MONOPHASE.

Answer to No. 622 (*awarded* 7*s.* 6*d.*).—The above question would have been much more satisfactory, from an answering point of view, had "W. F. F." stated whether the motor was single or multiphase, also synchronous or

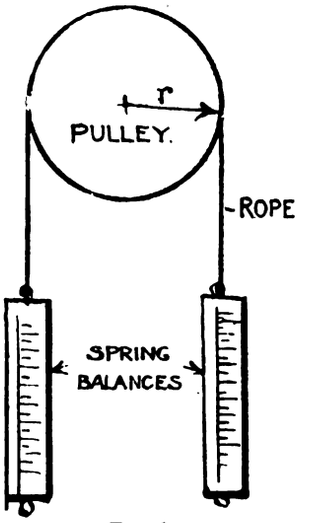

Fig. 1.

asynchronous. The probability being that it is a multiphase one, we will consider it so. The output of the motor will be tested on the brake. Place a rope over the pulley, and to each end attach a spring balance as in Fig. 1, so that each balance shows a small reading. Run the motor, and take simultaneous readings of spring balances and speed of motor. The output of motor in brake horse-power is

$$\frac{P \times r \times 2 \pi n}{33{,}000},$$

where P is difference of readings on spring balances;

r = rod of pulley; and

n = speed in revolutions per minute.

The above will hold good both for synchronous and asynchronous machines. Now consider the motor to be of the asynchronous three-phase type. Fig. 2 shows the diagram of connections necessary. The sum of the wattmeter readings gives the actual power supplied to the motor. If only one wattmeter is available, Fig. 3 shows diagram of connections, the wattmeter connection, which is dotted in the figure, being first connected to one main and the reading taken, and then to the other main as indicated, and the reading taken, the sum of the readings again gives the actual power supplied to motor. The two latter readings should be taken as quickly as possible, and at the same time as the readings of the spring balances and speed. The product of the readings of the voltmeter and ammeter $\times \sqrt{3}$ gives the apparent power supplied to motor. The power measured by the watt-

Digitized by Google

meters, volt and ammeters must be divided by 746: this gives us the input to motor in horse-power. The actual efficiency of the machine is obtained by dividing the

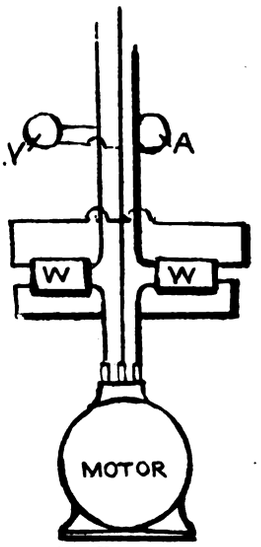

FIG. 2.—A, ammeter; V, voltmeter; W, wattmeter.

output as measured by the brake by the actual input (both values being in horse-power) and multiplying the answer by 100: this gives the actual efficiency as a percentage.

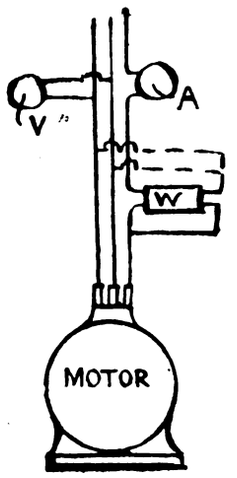

FIG. 3.—A, ammeter; V, voltmeter; W, wattmeter.

The apparent efficiency is got by dividing output by apparent input, and multiplying result by 100. The actual input divided by the apparent output gives us the power factor of the motor at that load. Take several

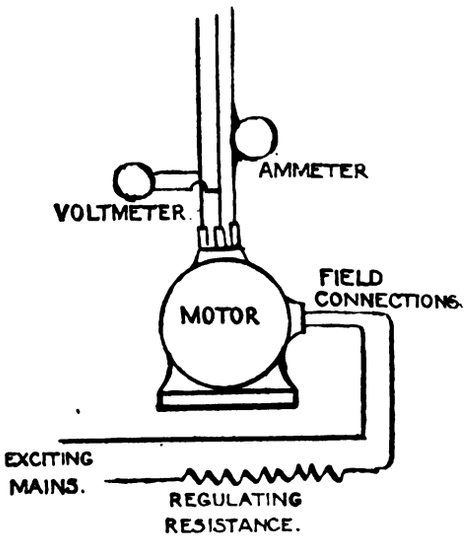

FIG. 4.

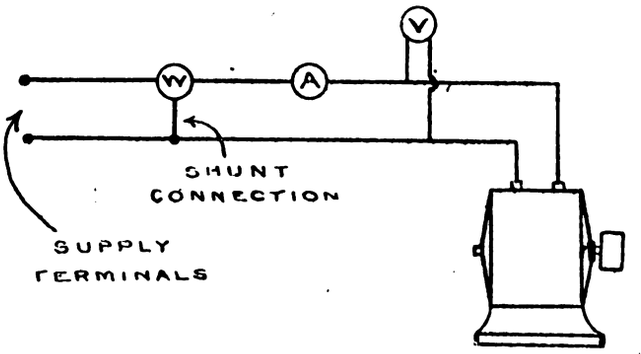
fresh sets of readings, after altering the initial readings of the balances before starting, by shortening the rope a little, and we obtain the efficiencies and power factors of the motor at different loads.

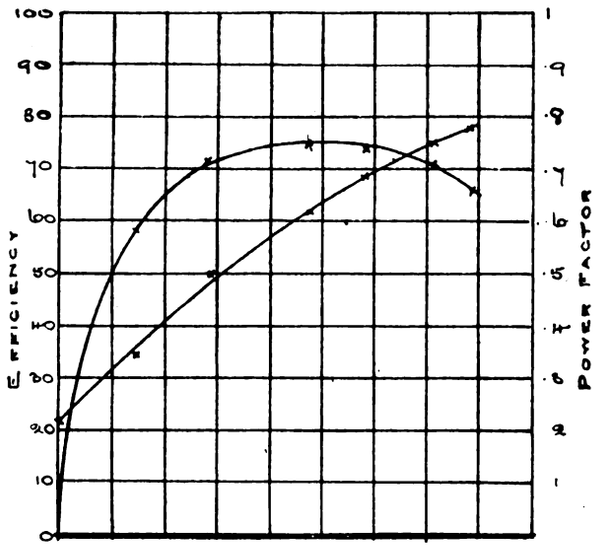
Now consider the motor of the synchronous type. The brake test is exactly the same as the previous case, but the only instruments *necessary* for the input are a voltmeter and ammeter. Fig. 4 shows the diagram of connections. When the motor has been started, it will be found that, by increasing and diminishing the exciting current, the armature current will also increase and decrease although the load is kept constant. Adjust the exciting current of the motor until the current taken by armature of motor is a minimum, and then take simultaneous readings of volts, amperes, and also the brake readings as before. The power given to motor is product of voltmeter and ammeter reading $\times \sqrt{3}$ and divided by 746. Divide output of motor by input, and we obtain the efficiency. If desired, the wattmeter can be inserted instead of the volt and ammeter.—ERG.

Answer to No. 622 (*awarded* 5*s.*).—To measure the efficiency of a single-phase motor the following instruments are required: a voltmeter suitable for measuring the voltage across the terminals of the motor, an ammeter or ampere-balance to measure the total current taken by



the motor, a wattmeter to measure the true watts, a brake of some kind to measure the power at the motor pulley, and a speed indicator. If a wattmeter is not available, a Siemens dynamometer can be utilised by inserting a non-inductive resistance in series with the movable coil and connecting it across the supply mains. It is a simple matter to calculate the number of watts represented by each degree of the dynamometer scale from the constant of the instrument and the amount of resistance inserted. The Soames absorption dynamometer is a good brake for small motors, but it is not a difficult matter to extemporise a brake. A tachometer, if reliable, is much to be preferred to a speed counter, but the latter will do quite well. The instruments should be connected up as shown in the sketch.

Readings of all the instruments should be taken at no



load, full load, and as many points between as is desired, the load being adjusted by the brake. The speed should also be taken at each load. From these readings the efficiency at each load can be calculated, and an efficiency

Digitized by Google

curve can be plotted. The accuracy of these results will depend on the accuracy of the instruments employed and the care taken in making observations. The accompanying

Load.	Volts.	Apparent watts.	True watts.	E.H.P.	B.H.P.	Efficiency per cent.	Power factor.	Speed.
Starting light	214	6,492	4,194	5·62	0	—	·62	—

table and curve give the results of a series of tests made on a 4-b.h.p. motor in the manner described above. In this case a Siemens dynamometer was used as a wattmeter, and an ordinary voltmeter and ammeter were used.—E. I.

FULHAM ELECTRICITY WORKS.

REPORT ON PARALLEL RUNNING.

It will be remembered that in the early part of this year the Fulham Council instructed Mr. James Swinburne to report on the working of the electricity works. This report was to cover the following grounds: (1) the adaptability, efficiency, and suitability of the whole of the plant at or in connection with the Fulham electricity works; and (2) the design and construction of the station. Messrs. Swinburne, Cooper, and Baillie's report, dated Oct. 9, 1903, reads as follows:

"In pursuance of instructions we received, we have made numerous visits to the Fulham electricity works, and have carefully examined the working of the plant, and in this we have given especial attention to the point specifically mentioned—namely, the parallel running of the alternators. As regards the design and arrangement of the station, it would probably be of little use for us to discuss such questions as whether it would have been better to have adopted direct current or alternating current in place of the existing two-phase system, or other broad questions of design. These are very largely matters of opinion, and it would be as useless as it is easy to criticise what has been done, and, in the light of later experience, to point out where changes in the design would have led to greater convenience in working. We consider that the original design of the station is, broadly, good and quite satisfactory, and reflects credit on those concerned with it. Our report deals essentially with details of improvements that can be carried out in extending with present knowledge and experience. Certain portions of the plant do, we consider, require alteration, either immediately or when the increasing load calls for the erection of additional plant, and what we have mainly considered in this report is, to what extent additional plant should be laid down on the lines of the existing plant, and to what extent the present arrangement should be modified.

"*Alternate-Current Generators.*—One of the first questions we considered was the behaviour of the alternators, complaints having been received from consumers of unsteadiness in the light in the early evening. When the load is light enough for one machine to do the whole work, there is no difficulty; but when a second machine is put in parallel, the running is far from perfect. There is what is technically known as 'hunting,' and this gives rise to unsteadiness in the lights of a kind that may be very annoying to consumers. As the load increases as more light comes on, this hunting and the consequent flicker of the lights goes down, and finally practically disappears. Though it was not within the reference, we have carried out a good deal of experimenting with your machines, in which work we received all assistance from your engineers. We naturally could only take the machines as they are, and examined them to find if the hunting is due to faulty governors, or other cause that could be easily remedied. It is not caused by the governors, and we have so far found no means of stopping it. We could suggest several methods which might reduce the evil. Running the engines at a higher speed has been found by your engineers to be beneficial, and we have no doubt that the speed could be increased sufficiently to entirely stop hunting. We could not, however, advise this course, owing to the danger attendant in running engines at much above their normal speed. Another method would be to modify the weight of the flywheel rim. This would probably remedy the evil, but here, again, we do not recommend this form of experiment. A third method would be to fit what are known as 'amortisseurs' on the pole-pieces of the alternator. This would certainly diminish the hunting, but might not be sufficient to stop it altogether. We shall be happy to go on with these experiments if desired, but we do not think it necessary, as the matter will soon be of little importance. In the first place, your engineers have studied the regulation of these engines, and work the paralleling with such care that the hunting is reduced to a minimum, and only lasts a short time each evening. In addition to this you have now a Belliss set which is practically ready for running; and your customers are rapidly increasing in number. The day load can then be run by one of the small engines until it is full up. This will be pretty early, that is to say, before it is very dark. Then the Belliss set will be started, and will take the whole load, until it is fully loaded. Then the smaller engines will be added one by one as needed. We think this will overcome the difficulty and prevent any further complaint. In any case we would advise that the working of the station with the Belliss set be tried before entering on any costly alterations to the alternators, which after all might not quite eliminate flickering in the lights.

"As to extensions of the engine-room, at present you are putting in a Belliss set, which is practically finished. At the rate you are developing you will soon have to consider further extensions. As a station increases in size the size of its engines should increase too, and it is quite possible it may pay you better rather to replace one of the smaller horizontal steam dynamos with a large vertical set which takes the same or less room, than to go to the expense of enlarging the buildings and making more foundations. This suggestion, which is due to your engineer, Mr. Fuller, will demand a careful estimate, which can only be made at the time when you have settled what extension to make. We do not think any blame can be attached to the engine or dynamo makers, or to anyone else, as regards the trouble; in the present state of knowledge, 'hunting' is rather a misfortune than an avoidable evil, and certainly credit is due to your staff for the care with which they have minimised the evil.

"*Dust Destructors.*—We have nothing to say against the dust destructors; quite the reverse. We are putting in the same type elsewhere, and consider your plant thoroughly efficient, but we do not think the arrangement of the destructors in the boiler-house good. While the station is young the destructors are especially economical, but the station will increase far faster than the refuse to be burned. The boiler-house should not therefore be sacrificed for the destructors in any way. The present state of affairs in the boiler-house is far from satisfactory, the intolerable atmosphere of dust and smoke from the destructors being injurious both to health and to machinery in the boiler-house. The best arrangement would be to have the destructors walled off from the boiler-house and to be as open as possible, and, in making extensions in the boiler plant, it will have to be carefully considered whether the advantage of such an arrangement would not warrant the expense either of shifting some of the boilers and destructor cells, or of discarding some of the present boilers. If this be not done, we would suggest the less drastic but less perfect remedy of furnishing the cell doors with hoods leading into a flue with up-draught produced either naturally by connection with the main flue or by a fan. The system is used by Messrs. Horsfall in connection with their destructors, and gives satisfactory results. The expense of fitting would be, of course, far less than that of shifting the position of boilers and cells.

"*Economisers.*—The economisers have given rise to trouble from a rapid deterioration of their tubes. This is probably due to the action of the gases from the dust destructors, and is, we think, unavoidable. We gather that the cost of renewal of the tubes would be so great as to annul the advantages of the economisers. Under these conditions we think it would be best to cease using economisers in the flues from the destructors. The economisers need not be idle, however, as before long the increasing load will require the use of boilers which are purely coal-fed, and they can then be fixed in the flues from these boilers.

"*Feed Pumps.*—These we consider require attention in the immediate future. There are at present only two steam-pumps, which are used simultaneously. If one were under repair or broke down, the other would be hard pressed, and might in turn break down and cause a complete stoppage of the station. Further, the pumps are located in an inconvenient position, being too far from the boilers, the attendants of which have to regulate them. On the other hand, we fear that pumps in the boiler-house with its present atmosphere of dust might give trouble. We would recommend replacing the existing pumps by others of a more suitable type, rather than adding to those now installed. The new pumps should be fixed in the boiler-house if the dust question be dealt with in time, and if not in the most convenient position available which is free from dust.

"*Circulating Pumps.*—There are at present four small centrifugal pumps, and in view of their consumption of energy we think they might be with advantage replaced with one large pump and a spare.

"*Well Pump.*—We believe it would lead to more economical running if this were replaced by a steam-pump, more suited to the work. There is, however, no immediate need to alter this or the circulating pumps.

"*Condensers.*—These appear to be most satisfactory, with the one trouble that the water taken from the river carries with it a considerable quantity of fine sand, which entails continual work for its removal from the tanks. This trouble could be avoided by replacing the present Korting condensers by a surface condenser in the river, which could be of comparatively small size. We think it very questionable, however, whether this would be worth doing. It would be a matter of calculation between the cost of labour in cleaning out the sand and the capital cost of the new condenser. As to the engines, we would recommend the adoption of safety governors. The present governors have dashpots, which have had to be regulated to secure as good parallel running as possible. This made the engine system unstable at very light loads, and the safety or runaway gear has had to be detached, as it was apt to act without occasion. The result is that an engine might, under certain circumstances, run away and burst its flywheel—a most serious matter. This should be attended to at once. It is not that it is in the least likely an accident will occur, but that it is possible, and such an accident would probably be a very serious affair if it did occur.

"*Superheaters.*—At present there are no superheaters in your station, and the steam is sometimes rather wet. As the load is small,

Digitized by Google

and the dust destructors provide a large part of it, there was no reason why superheaters should have been included in the original design. In the near future, however, we would recommend the adoption of superheaters in connection with purely coal-fed boilers."

We trust that the above report will end the lamentable disputes which have done much to hinder the progress of the Fulham undertaking. The details given in the report respecting parallel running are most interesting, and it recalls the paper read by Mr. H. Görges before the Verband Deutscher Elektrotechniker this year* on the same subject. In it he shows the bearing of the natural period of oscillation of the alternation on the success or otherwise of parallel running. A concrete example taken by the author shows that trouble was likely to occur at 90 revolutions per minute—*i.e.*, the speed of the Fulham engines. This conclusion is, of course, not a general one, but in this instance it applies.

EDINBURGH ELECTRIC LIGHTING ACCOUNTS.

Attached we give an abstract of the above accounts for the year ended May 15 last. The total expenditure on capital account on that date amounted to £800,710.

Dr. Revenue Account.	£	s.	d.
Generation—Coal and other fuel	10,561	10	4
Oil, engine-room stores, etc.	1,630	18	3

Bound Volumes of "THE ELECTRICAL ENGINEER," *containing half-years copies, bound in Dark-Blue Cloth, Gold Lettered, price 8s. 6d. New Volume, January to July, 1903, now ready.*

PIONEERING BUSINESS.

The discussions between our leading statesmen which are now taking place on the fiscal policy of this country and her colonies, will be closely followed by our manufacturers. The questions involved are of vital importance to the electrical industry and to the thousands of employés connected with the same. Under the strong light which has been brought to bear on the state of our various industries, it has been unfortunately shown that certain of these are on the down grade, due, as we believe, to the fiscal policy of foreign countries. The figures published clearly show that our markets for manufactured goods are being restricted, and that without we undertake some pioneering work to develop new markets or to improve old ones, other industries will follow those which have already begun to decay. The figures, in fact, show the relative importance of the business and the technical side of a manufacturer's undertaking, and at the same time refute the too frequent argument that technical education is all that is required to enable us to hold our supremacy as a manufacturing nation. In other words, we may educate the rising generation up to the highest pitch and secure, as is now being tried, a closer relationship between our technical education and the manufacturers. All this will be quite useless unless the manufacturer, assisted though he may be with the highest technical skill, has a market for the goods he produces. It is for this reason that the business staff of a firm command higher remuneration than the purely technical man, who, in spite of a good college education, is not able to influence the sales directly. It is interesting in this respect to review the steps by which foreign firms have proceeded when pioneering for electrical business in this country. In the first instance all the firms who have been at all successful in this respect have found it necessary to spend large sums in order to get their goods on our market. The mode of expending these sums is exceedingly simple in view of the fact that the bulk of electrical work in this country is put up to public tender. The foreign manufacturer selects a contract which will enable him to show what he can do, and then offers to carry out the work below cost price. The loss on the contract is put down to pioneering expenses, and he looks to recoup himself for this loss by extra profit on other orders to be obtained. Unfortunately for him, and still more unfortunately for our home manufacturers, the number of firms from abroad wishing to build up business on these lines in our free market in Great Britain is by no means limited. The result has been that first American, and latterly German and Belgian, firms have taken these pioneering orders at low and unremunerative prices, with the result that the home market has been more or less spoiled for all concerned. An interesting incident has recently been brought to our notice which shows how far this temporary interference with our home business might be reduced under a new fiscal policy. A Continental firm, whose country we need not specify, recently determined to try for its share of the business to be had in this country. It had selected its engineer and manager, and resigned itself to accepting a certain amount of pioneering business at a loss in order to gain some advertising orders. The whole scheme was abandoned, however, after the members of the firm had read Mr. Chamberlain's Glasgow speech. The expenses which these various foreign firms have borne in order to build up new markets for their goods in this country and elsewhere are quite legitimate in business, and in certain instances have been quite warranted by subsequent events. It is noteworthy, however, that both the British Thomson-Houston

Digitized by Google

Company and the British Westinghouse Company have found it advantageous to start as home manufacturers, so that they may now be looked upon more in the light of English undertakings. By so doing they become directly interested in the progress of electrical industries in this country, and share in the cost of maintaining our markets both at home and abroad. It is interesting to compare the above progress of electrical undertakings with the progress of the British Empire as a whole. In the eighteenth and nineteenth centuries England spent large capital sums on the building up of her Colonies, which sums were free gifts to the same, almost comparable with the pioneering expenses referred to above. They were, however, taxes on the inhabitants of England, which have since been remunerative in sentiment, if not in cash. They may be looked upon also as the prime cost of establishing markets, which has been entirely borne by us, although we have left these markets equally open to other manufacturing nations. Viewed in this light, Mr. Chamberlain's proposals by giving preferential trade throughout the Empire will only make a fair return for pioneering expenses borne in the past. These proposals, if adopted, will also stimulate Colonial development, and by so doing render these markets which we have developed even more valuable to us than they are at present.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

PRIORITY IN OIL-BREAK SWITCHES.

SIR,—Reverting to Mr. Woodhouse's letter in your issue of Oct. 2, the oil-break switches designed by Mr. Partridge in 1891 were used for service in street boxes, whereas I read Messrs. Ferranti Limited letter of the previous issue to refer to central-station switchgears of importance. I am open to correction, but I do not think Mr. Partridge intended to apply the idea in its initial stages to large central-station switches, otherwise he would have done so on the important extra high-tension switchboard work which he designed for the London Electric Supply Company, and also for the Metropolitan Company, about the period in question.

However, whilst agreeing that considerable credit is due to Mr. Partridge, it will be remembered that others have experimented with the idea. For example, it was used some 25 years ago in connection with Prof. Pepper's induction coil at the old Polytechnic in Regent-street.

Messrs. Ferranti Limited were, I believe, the first to apply the idea for the purpose of central-station switchboards of moment. In any case, it would appear that this great feature in switchgear design emanated from British, and not from Continental designers.—Yours, etc.,

H. W. CLOTHIER.

INDEPENDENT TELEPHONY.

SIR,—Referring to the interesting article on "Independent Telephony in Great Britain," by Messrs. Gardner and Home, which appeared in your issue of the 2nd inst., I would like to point out that, as put by the writers, the increase in the cost of a multiple switchboard as the subscribers increase does not appear a very considerable item, but the case has hardly been put fairly.

I give below the number of multiple jacks required for increases from 800 to 6,000, from which it will be seen that the amount concerned, if only estimated at 2s. per jack, is a very serious item. For 800 subscribers only three multiple jacks per line are required, but this figure continually increases as subscribers are added, and for an exchange of 3,000 to 3,300 subscribers the number required is 11 per line; for an exchange of 6,000 subscribers, 120,000 multiple jacks would be required, or 20 per line, and the same rate of increase would, of course, go on continually. But the multiple jack itself is not by any means the only or the chief cost; every jack involves additional cabling, which, apart from the material, necessitates very considerable labour. I think it only fair that this should be pointed out.

Subscribers.	Multiple jacks.	Multiple jacks per line.
800	2,400	3
1,200	4,800	4
1,600	9,600	6
2,000	1,400	7
2,400	1,920	8
2,800	28,000	10
3,200	35,200	11
6,000	12,000	20

So that the jacks alone at 2s. each would cost 34s. *per line* more for 6,000 subscribers than for 800!—Yours, etc.,

R. M.

REVIEWS.

Practical Notes on Electric Mains.* By B. L. R. LEE. Biggs and Co.

FROM AN EXPERT CORRESPONDENT.

This is a most unpretentious-looking pamphlet, and it has evidently been written in a hurry during the odd moments snatched from a busy life. Nevertheless, it is a book that will be welcomed by the ever-increasing army of town distributing engineers, cable men, and by contractors generally who aim at a broader sphere of action than fixing wood casing and gas barrel.

The text of the book is that a higher factor of safety should be allowed for underground work than is at present in general vogue. This is not actually mentioned in the text, but one can draw conclusions from such items as the following:

Page 17: "Wood for troughing should be at least 1¼in. thick," whereas in practice ¾in. to 1in. are the most usual thicknesses.

Page 16: "Junction pieces should be at least 1ft. long." Six inches is really ample, and it is seldom that any are used at all, as the compound successfully joints the ends of the abutting troughs together unless very carelessly poured in.

Page 17: "Each two lengths of (earthenware) troughing ought to fit together by self-locking socketed joints." There is no self-locking joint on the market, however, and the precaution would be usually considered unnecessary, for, as before mentioned, the compound makes a binding joint almost equal to cement, irrespective of the socket itself.

Page 26: "Cable ends buried in the ground should be in wooden boxes 14in. long." This measurement seems exact enough to have been worked out by slide rule, but the round figure of 6in. is generally used if an old tomato can is not available.

Page 26: "Cables (ends) should be lapped over not less than 2ft. 6in. to allow for testing and jointing." A 1ft. lap is to be considered ample for most work, and the cost of the 5ft. cut off on ·5, ·25, ·5 square inch main, for instance, would be quite £1.

Page 27: "For mechanical reasons no cable should be laid that has an insulation wall less than $\frac{3}{16}$in. thickness." This equals 187 mils, and, further than stating that the C.M.A. sanction from 80 mils for ·025 square inch, to 130 mils for 1 square inch for 500 volts, comment is needless. All the same, Mr. Lee errs on the right side.

Page 29: "Wiped joints should not be used under any circumstances," will be a shock to a lot of people who have used wiped joints for a considerable time with reasonable success, and to whom a simple arrangement for lead continuity, and small diameter of joint, appeal. There is

[* This review is from an expert correspondent, and as our desire is to obtain the best practical information, we have no hesitation in givin expression to what may prove controversial points.—ED., *E.E.*]

Digitized by Google

no doubt that a lot of trouble has been caused by plumbed joints being made by "hatters," but given an experienced, careful man and a solid system of laying, wiped joints are not appreciably inferior to cast-iron boxes.

The author is evidently a man with opinions of his own, and is not afraid to tilt against the fetishes of standard practice. Thus:

Page 8: His recommendation that "no attempt to earth the lead of any continuous-current cables should be made" is testimony enough to his heterodoxy, although his further remark (page 9) that "lead covering is better left without a serving of braid or yarn" seems to contradict this statement, and certainly omits to take into account the mechanical protection afforded by such serving.

He further stands up (page 10) for drawn-in distributors on the ground that withdrawal is "so easily done, even after it has been tapped in many places with service joints."

The methods described (page 10) of jointing cast-iron pipes with neat cement, of (page 11) building brick boxes opposite every other party wall during the mainlaying, and (page 12) of earthing the iron frames of manholes preferably to the nearest water-mains, are all examples of unusualities. Cast-iron pipes should follow the standard practice of lead jointing, if only for the sake of electrical conductivity. The second item is not much used because of the generally useless expense incurred, and reminds one of Prof. Fleming's suggestion made in a Cantor lecture in 1896, that each house or shop that the mains run past should have a service connected and laid up to a terminal box placed inside at the time of main-laying, on the chance of them becoming consumers in the course of time. The third item as to earthing manhole covers does not seem to take into account the handiness of using the lead sheathing, where used, of the cables, themselves earthed, for the Board of Trade connection.

In stating that (page 12) "cast iron cannot be recommended for conduits, as there seems always to be a deleterious action going on between the cast iron and the cable," the author is directly opposed to the standard practice of a large company interested in electric traction, who have laid this cast-iron pipe system in dozens of towns as the one most likely to preserve the cables (at, perhaps, the pipe's own expense) from electrolysis, and galvanic action is evidently an inappreciable quantity. His criticism of a generally used method of building watertight (?) manholes by means of two walls with a meagre frilling of bitumen poured in between is, however, to be commended as practical.

Other matters of opinion, concerning which there are other methods of operation than the one the author describes, may be cited as a further instance of the difficulty of writing a sufficiently complete practical treatise, even upon such a specialism as electrical distribution construction. The class of lubricant recommended (page 14) for drawing in cable is pure tallow worked up with powdered blacklead, but this makes positively too filthy a mess for a conscientious cable-hand to care to deal with, and is expensive. There are petroleum residues to be obtained which are innocuous, clean, and much cheaper. Also the method described (page 14) of fastening the draw rope to the cable end means wasting time and material for moderate runs with medium size cables, compared with the well-tried device of lashing the rope alongside the cable for about 18in. For long runs and heavy cable, a wrought-iron half-sleeve about 9in. long (with an eye at the end) can be used to partly encircle the cable end. Steel pins are driven through holes in this right through the cable, and piano wire is used to lash the whole thing together to keep the pins in place, this being a quickly made solid attachment, with only 9in. of waste cable.

Further, the statement (page 14), that "20 men will be sufficient for the whole work of drawing in a 200-yard length of $^{37}/_{15}$ concentric cable," evidently applies to the old-fashioned "Yo-heave-ho" method. No mention is made of the various means of hauling in by crabs, with the saving of labour occasioned. In this instance six men and a foreman would do the work, two of them being amply sufficient to ease the cable off the drum. And the shrill whistle mentioned (page 15) as a signal for stopping the hauling-in gang, should be supplemented by a red flag fastened to a drain rod, so that, should the noise of traffic interfere, the flag can be displayed at any required height by screwing other drain rods on.

The swab of spun yarn recommended (page 15) to be pulled in advance of the draw rope "to clear the duct of any dirty water that may be there" will certainly absorb its capacity, but nothing further, and, in any case, the rope itself will do this work much more completely. It should be remembered that water inside conduits helps the progress of the cables through, and having once got there (through broken or faulty joints) it will certainly get there again, so that any special swabbing, except for actual obstacles, is a mere formality.

"Service cables should always be concentric in form" (page 65) is a maxim based upon the risk of burning holes in domestic gas-pipes, and is supported by three "ifs" and a "probably." For continuous current and convenience, however, two singles take a lot of beating.

There are a considerable number of fairly palpable slips in this work, and it is to be hoped that the author will have more leisure for proof correction when the second edition is called for, as it surely will be in a short time. Some of the slips are as follows:

Page 8: Fibre and paper insulated cables are mentioned as a class apart from rubber, bitumen, and lead-covered cables, but, of course, these classes of insulation require to be either rubber, bitumen, or lead sheathed for drawing into conduits.

Page 13: Duct stoppers are said to prevent the "accumulation" of gas, but surely "circulation through the manholes" is meant; as the gas gets in, as a general thing, through defective places in the conduits, and duct stoppers are meant to keep it there in comparative safety.

On page 16 wood troughing and bitumen filling are decried as insulators, but these they have no need to be (except in the very rare cases where bare copper is used). This fact is, however, properly appreciated on page 20, where it is stated "if the wood soon rots it does not matter, as the bitumen is still left to protect the cable." In fact, the comparatively ephemeral wood trough may be looked on merely as a former for the comparatively everlasting bitumen which envelopes the cable.

A somewhat singular suggestion (page 17) is that to iron trough makers regarding the advisability of their keeping in stock "bends and angle pieces for several different angles and radii. The bends and angle pieces should be made in both planes (vertical and horizontal), also right and left handed. The engineer would then be able to order a percentage of these bends over the total length of trough required." It should be remembered that there can be used over 50 different sizes and types of troughing between the standard measurements of 2in. by 2in. and 12in. by 4in. (which is about the maximum likely to be made) without even going into fractions of an inch, also that cast-iron troughs are very seldom used on account of their high cost; and as the bends, etc., could be as easily ordered at the same time as the troughing (which would almost certainly require to be specially made), there would be no advantage gained by the engineer or by the maker in keeping such a very risky and expensive stock.

"Earthenware" troughing is generally mentioned throughout the book, but no distinction is drawn between it and the widely different glazed stoneware, the latter of which is most certainly meant in several instances by reason of its special qualities.

Page 17: Lead-covered cable is stated as allowable on alternating supply, without any warning about single cables being tabu.

Page 20: The following statement (referring to a semi-solid system) is too loosely worded to be of much use to anyone: "A gang of about 25 men can easily lay and cover up a trench 200 yards long into which four cables have been drawn in one day if the trench is on the footway." What one wants to know is, Do these men dig the trench as well as cover it up? or is "trench" a misprint for "trough"? Also, have the cables been drawn into the trench (or trough) beforehand? It would appear so.

Digitized by Google

In any case the price of 6d. per yard thus shown for labour is too low for the entire job of excavating, laying trough and cable, pitching in, covering with trough top, and temporary reinstatement of this length of trench; but which part of this work is referred to is not clear.

Ventilation by manhole covers is mentioned on page 21, without any suggestion as to the proper method. The ordinary ventilated manhole frame and cover is a delusion and a snare.

The author's ingenious suggestion on page 27 for the neutral of a triple-concentric cable to be made up of a braided armouring of iron wire is spoilt by his seeming assumption of perfect balancing on three-wire networks, which even a professor knows is impracticable.

"Armouring" is mentioned (pages 28 and 35) in connection with disc cutters and pressure testing, when evidently "lead sheathing" is meant.

Rubber solution (page 33) is debarred from most joints by the author, as it should be, but why is it recommended for vulcanised jointing, where there is already the heat and pressure that are alone necessary for rubber joints?

The manhole covers fitted with wood blocks (page 53) are surely not "wrought," but "cast," iron.

In a work of this nature, where practical experience counts for so much, there are likely to be some statements that are open to considerable question, and among them: Rubber cables are decried by the author (page 18) for solid systems on account of having given trouble, but this trouble surely has only occurred upon drawn-in systems, for which (despite the counter-recommendation on page 8) they are not fitted without special precautions being taken. Rubber cables laid solid, though expensive, are generally considered to make the most reliable system of main-laying.

On page 8 it is stated to be unsafe to draw lead-covered continuous-current cables into conduits, but surely the amount of this type installed giving satisfaction is abundant evidence to the contrary. It may be that this statement is founded on an experience of the further ordinance on page 8 that the lead of continuous-current cables should be insulated from earth.

The fairy tale about copper-strip mains swaying into contact when heavily loaded is repeated (page 21) in this otherwise practical work. A surplus of current will certainly cause a sag in the conductors, but it is likely that this and the succeeding arcing to earth has caused effects which surely could only be explained by science and art teachers as electromagnetic swingation.

There should be no doubt as to the position of a switch contained in a switchbox (page 31) if a brass indicator is attached to the turning plug outside the box. This points to "On" or "Off" exactly as the concealed switch has been left.

Mr. Lee is not an adept at damning with faint praise. He goes straight to the point. Cable and switchboard makers will writhe beneath his vitriolic pen on studying pp. 27, 34, and 61, where longitudinal rubber covering is derided, professional joint-box designers are scoffed at, and switchboard experts held up to ridicule. Contrariwise, certain makers of insulating tapes (page 34), transformers (page 56), petrifying paint (page 60), meters (page 66), arc lamps (page 72), trimming ladders (page 73) will chortle in their joy on seeing their goods mentioned approvingly.

As before stated, much remains to be said in this book on the subject of distribution, construction, and maintenance that has only been fringed upon, and its concluding lines show that the author appreciates this. It should be understood that although there seems to be abundant material for criticism, yet this proportion is really small compared with the amount of useful practical matter contained in the 70 odd pages under review. The subject of what is best practice for mains is not one that can be settled in an armchair, or even in a cable works laboratory, and the men who really know by bitter experience what should be used and how things should be done, are the ones who have little leisure to write about these things. This book would have been a still more useful one if the author had been confined to his room with a broken leg while writing it, and when the second edition comes off may we suggest a preliminary course of motorcar riding.

PERSONAL.

Mr. A. Mitchell, R.N.R., has been engaged about 18 months at Durban as chief engineer for Messrs. Dick, Kerr, and Co. for that firm's contract for the Corporation tramways, and completed his work in September. Prior to his departure for England, his late staff presented him, at a farewell dinner, with a handsome solid silver flask and cigar case, suitably engraved, as a mark of their esteem for him. The presentation was made on behalf of the staff by Mr. G. A. Webb, A.I.E.E., who has been responsible for the electrical portion of this plant, and who has acted as assistant engineer to Mr. Mitchell throughout the work. The Council of the Durban Corporation have voted Mr. Mitchell £100 as a mark of their appreciation for his expeditious work, enabling them to start their tramways on May 1, 1902, 11 weeks after his arrival from Camps Bay, Cape Colony, where he also was responsible for the erection of the Camps Bay tramway plant.

Mr. G. F. Metzger has resigned the office of chief engineer to the Manchester Corporation electricity department. (This paragraph was inadvertently left over last week.)

Mr. L. H. Euler, A.M.I.E.E., has been appointed teacher of electric lighting and power at the Walthamstow Technical Institute.

The salary of Mr. Weston, assistant engineer at Watford, has been increased from £100 to £120 per annum.

We regret to announce the death of Mr. W. C. Hart, an engineer of the Plymouth Corporation tramways, which occurred last week from the effects of an accident referred to in a previous issue.

The Burslem Town Council have appointed Mr. Ashton Bremner, of Oswestry, borough electrical engineer at a salary of £200 per annum.

Three candidates have been selected for the position of tramway manager to the London County Council—viz., Mr. Hamilton, manager Leeds tramways; Mr. Fell, manager Sheffield tramways; and Mr. Nicholson, who is connected with the management of a railway in Lancashire. The Highways Committee's last report states that in consequence of the retirement of Mr. W. Scott, the traffic manager of the London County Council's tramways, and since the resignation by Mr. Alfred Baker of the position of chief officer of tramways, Mr. Bruce has been in charge of the general work of the tramways department when Mr. Baker has been absent in Birmingham, and that he had discharged in a very satisfactory manner the important duties which had in consequence devolved on him. The committee recommend that Mr. J. K. Bruce be appointed, as from and including Oct. 20, 1903, traffic manager in the Council's tramways department, on the same conditions as those on which he has held the position of veterinary surgeon; that his appointment as veterinary surgeon be terminated as from the above-mentioned date; and that Mr. Bruce's salary be at once increased from £550 to £700 a year, rising by annual increments of £50 to £800. Mr. H. B. Taite, general assistant at the tramways head office, has resigned.

Mr. Frederick S. Grogan, A.M.I.E.E., who has been with the British Thomson-Houston Company for the past three years, has been appointed chief assistant engineer to the British Electric Equipment Company in London. Mr. Grogan, during his association with the British Thomson-Houston Company, has been chiefly engaged in tramway construction work, among other places at Huddersfield and Croydon, but latterly has been attached to the company's construction department at their Rugby works. Previously he was for five years an assistant engineer in the Corporation electric lighting works at Belfast.

The Penang Municipality are about to establish a system of electric lighting in the town, and Messrs. Lux Bros., electrical contractors, have sent out Mr. P. Pinker Evans to take charge of the work.

Mr. J. B. Clarke has been appointed as electrical engineer at Stourbridge at a salary of £200 per annum.

Mr. Yeaman, of Islington, who had been appointed electrical engineer at Morecambe, having declined the position Mr. Hall, of Bootle, has been selected.

APPOINTMENTS VACANT.

Cable Jointer, Erith, 45s., Oct. 24. See advertisement in last issue.

Switchboard Attendant, Fulham Borough Council, 25s., Oct. 23. See advertisement in last issue.

Lecturer, South-Western Polytechnic, Manresa-road, Chelsea, S.W., 12s. 6d. per night. See advertisement in last issue.

Clerk of Works, Shoreditch Borough Council's Electricity Department. Salary, £3. 3s. per week (working hours same as contractor), Oct. 31. Also King's Norton and Northfield Urban District Council, Nov. 2.

Engineering Assistant in a borough engineer's office in the vicinity of London, with experience in the construction and maintenance of electrical tramways. Salary, £160 per annum, with annual increments of £10 to a maximum of £200. Applications to be addressed to Box W 14, *Contract Journal* Office, 139-140, Salisbury-court, Fleet-street, E.C.

Correspondence Clerk, Woolwich Borough Council, £90 per annum, Nov. 2.

Improvers at high-tension alternating station, London. See advertisement.

TRADE NOTICES AND NOVELTIES.

The Excello Flame Arc Lamp.

As mentioned in our last week's issue, the Union Electric Company, Limited, of 151, Queen Victoria-street, are putting on the market a new type of flame arc lamp. In view of the novel features of the same, we have, through the kindness of the company, been allowed to take photographs of the mechanism of this lamp in order to illustrate the advances made in its construction. This new lamp, to which the firm have given the trade name of "Excello," will burn for 18 hours at 10 amperes with one pair of carbons. In order to get these hours of burning with one trimming the carbons have to be lengthened, and the first feature of the lamp to which we wish to draw attention is that of the carbons used. With the

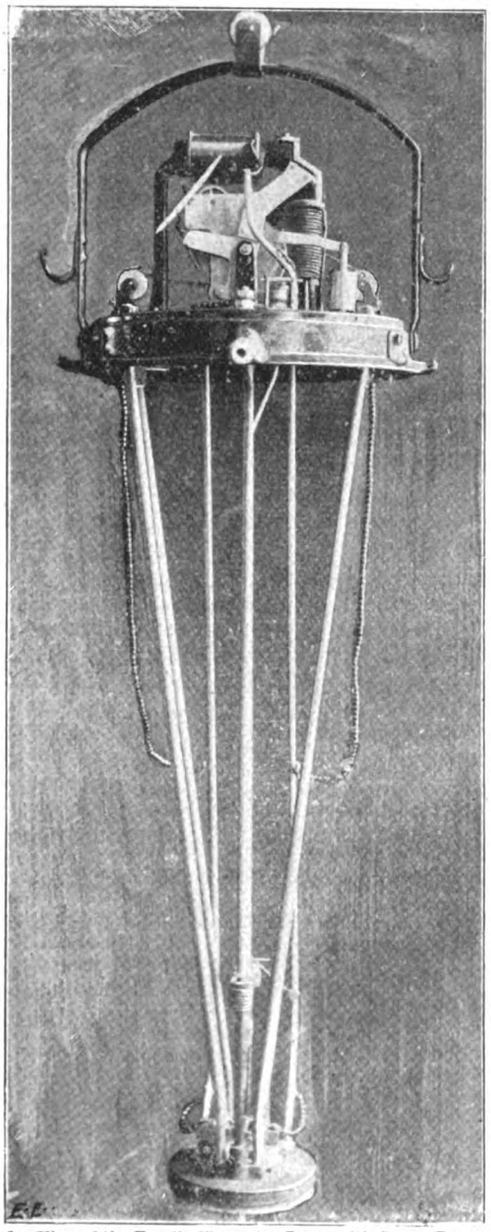

FIG. 1.—View of the Excello Flame Arc Lamp with Covers Removed.

increased length of carbon the drop in voltage in the same when the lamp is first trimmed is considerable, and it would interfere with the regulation. At first an attempt was made to ensure contact between the carbon and the clutches which hold the same in the lower part of the lamp, but it was found that after the lamp had been worked under commercial conditions, a connection at this point could not be relied upon. The difficulty has been ingeniously got over by using a thin metallic core in the carbon. For this purpose a hole is made through the length of the carbon and a metal wire is passed through the same. In order to get a good connection throughout the length, the wire is first passed through the hole in the carbon, and a length equal to the length of the carbon is then bent into a slightly zigzag form so that when it is drawn back the spring action at each of the bends secures a good pressure at the contacts between the wire and the carbon surrounding it. The hole for the metallic core is eccentrically placed in the carbon, leaving the middle free for the usual core, which is employed to carry the salts which give the characteristic colour to the arc. Fig. 1 shows a complete view of the mechanism of one of these arc lamps, which mechanism is, of course, encased when the lamp is in use. Fig. 2 is a larger view of the feeding mechanism, while Fig. 3 shows in more detail the lower part of the lamp. In it the two carbons can be seen projecting

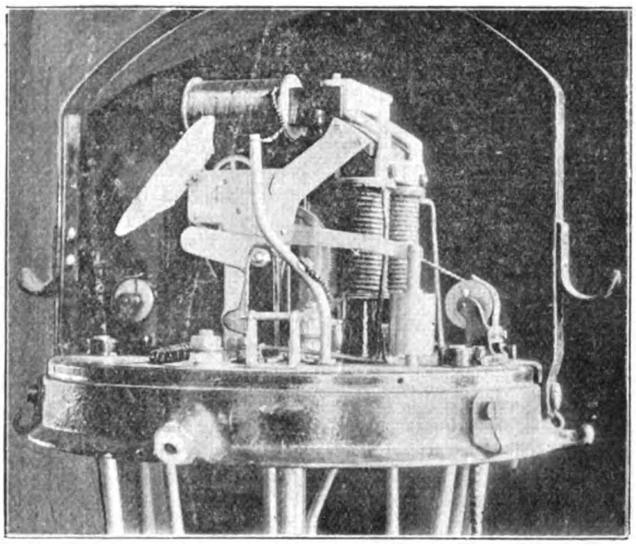

FIG. 2.—The Feed Mechanism.

through the fireproof material which forms a reflector to throw the light downwards. The two magnetic poles which blow the arc downwards can also be seen in the illustration, as can also the two small coils which excite this electromagnet. As will be seen from Fig. 2, these lamps are differentially wound. The arc is struck by the series coils, which operate on a long rod in

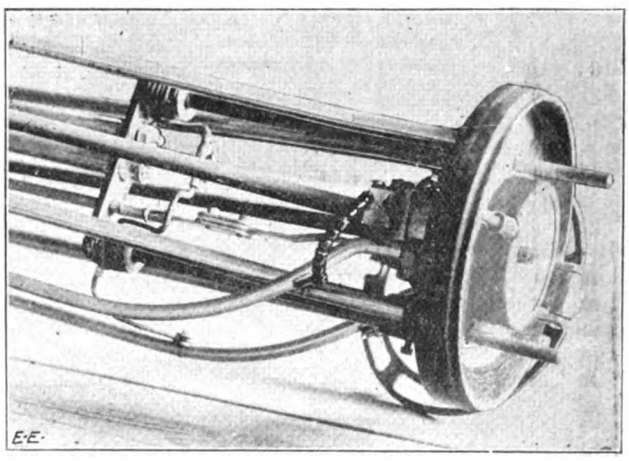

FIG. 3.—The Bottom of Lamp, showing Magnet for Deflecting the Arc down.

such a way as to draw the ends of the carbons apart horizontally. As the voltage across the arc increases, the shunt coils, which are seen in the horizontal position in Fig. 2, overpower the series coils, and by drawing over the common keeper, release the feeding gear and allow the carbons to descend. An ingenious arrangement is used to prevent the lamp being

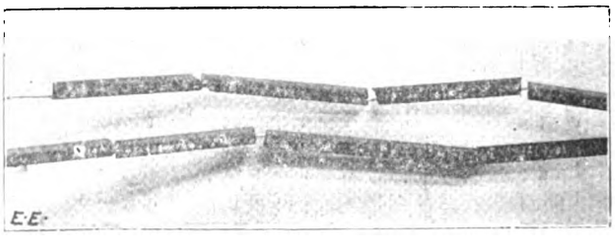

FIG. 4.—Carbon Broken to show the Metal Wire Core.

damaged when the carbons are nearly finished. Owing to the slight inclination between the carbons, there would be a tendency for the arc to travel up the same on to the carbon-holders if an ordinary stop-feed apparatus was used for this purpose. Instead of this, a catch on one of the rods is made to interrupt the shunt circuit of the lamp, whereupon the series magnets jerk the carbons apart and break the arc. The

Digitized by Google

whole of the details of this lamp show careful design, and the workmanship leaves nothing to be desired. The characteristic colour of the lamp, combined with its long hours of burning with one trimming, make it extremely useful for street and railway lighting, while the large dock companies would find it of great service for wharves at which work has to be carried on continuously in winter months. The arrangement of the arc with the white reflector immediately over it gives a good distribution of light over the horizontal plane, as will be seen from the curve herewith (Fig. 5), which was taken on a 10-ampere

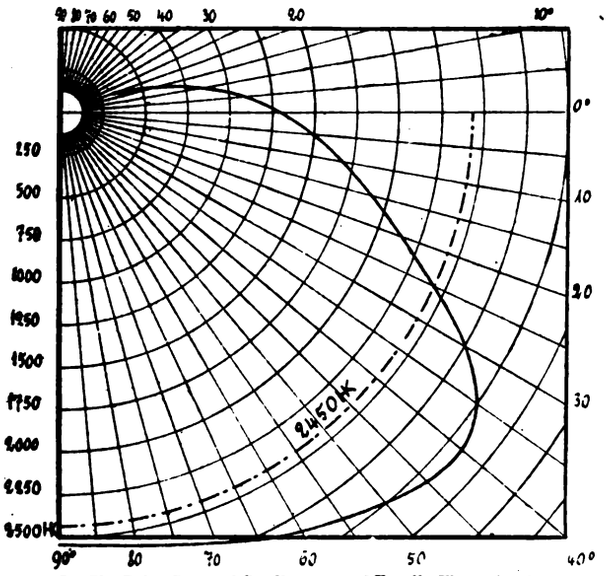

FIG. 5.—The Polar Curve of Candle-power of Excello Flame Arc Lamp.

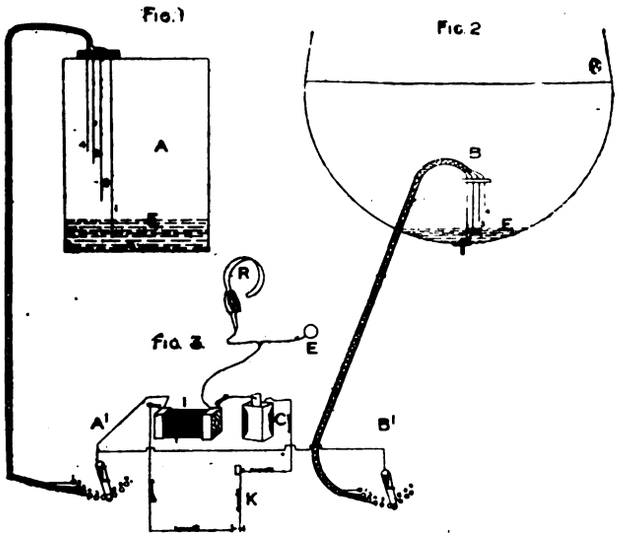
arc with 48 volts between the carbons. The curve is given in Hefner candles.

Water-Level Indicator.

Mr. C. May, a partner in the firm of the May-Oatway Fire Appliances, Limited, of 92 and 94, Paul-street, Finsbury, is putting on the market an apparatus for ascertaining electrically the level of liquids from a distance. The apparatus is designed primarily for use on board ship, where a record is required of the amount of water in the ballast tanks, bilges, etc. The apparatus for carrying out the tests is illustrated in Figs. 1, 2, and 3, and will be readily understood by electrical engineers.



In each tank or compartment there is fixed a number of conductors of various lengths with their ends only exposed to the liquid. At the end of these rods a lead electrode is fixed in order to give more surface than would be obtained with the bared end of the insulated wire. These conducting wires are then led to a number of consecutive contacts, as illustrated in *Fig.* 3, and opposite each contact is marked the height from the bottom of the tank of the electrode connected to it. By means of an induction coil and a telephone, it can then be ascertained which of these electrodes is actually in the water and which are insulated above it. An officer on watch can readily ascertain in this way the depth of water in the various tanks. The testing arrangements for all the tanks could be grouped together at a convenient spot, and in this way much more reliable information can be obtained than is the case at present, when the ship's carpenter has to gauge approximately the water in the bilges, ballast tanks, etc. The apparatus is an exceedingly simple one. It can be viewed at the above-mentioned offices.

Nernst Lamps.

The Electrical Company, Limited, 122-124, Charing Cross-road, London, W.C., have just issued a new edition of their Nernst electric lamp pamphlet. This pamphlet contains a quantity of information, not the least interesting of which are the comparisons made between Nernst lamps of different types and ordinary incandescent lamps. These comparisons are all in favour of the Nernst lamp. True, the great saving effected in current is partly balanced by the extra cost for renewals entailed by the use of Nernst lamps in preference to ordinary incandescents, but even after adding this a substantial gain is shown in favour of the former type of lamp over a working period of 12 months, including 600 lighting hours. Full particulars are given of the "Luna" type, which, it will be remembered, was the subject of a recent notice in our columns. We understand that this type has been exceedingly well received on the market. Hitherto it has been supplied only for direct-current circuits, but alternating-current burners will shortly be introduced. Some useful hints are added concerning the treatment of the lamps, also several illustrations of their actual

Electrolier with B type Nernst Lamps.

application for interior lighting and street illumination. The accompanying illustration proves that the lamp lends itself to artistic embellishment. Several plainer designs of electroliers similarly fitted are shown in the pamphlet under notice, candle and projector Nernst lamps being further dealt with.

Blackwell "I.T.E." Circuit Breakers.

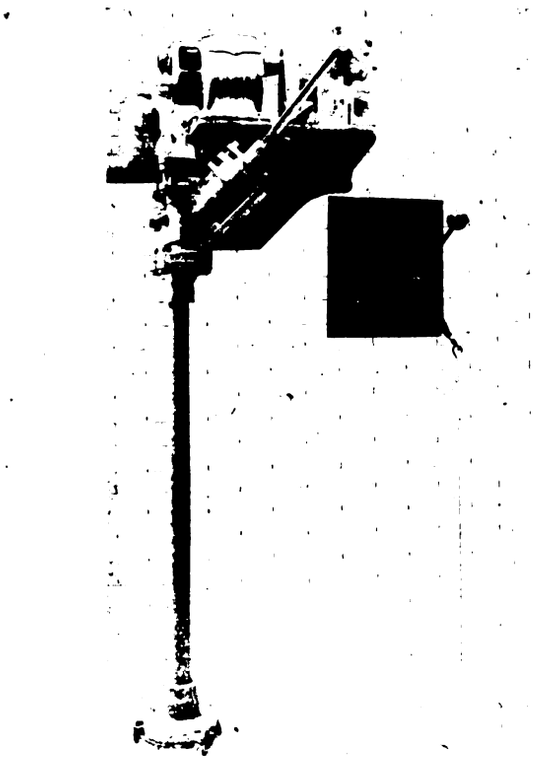
Catalogue No. 59 just issued by Messrs. Robert W. Blackwell and Co., Limited, 59, City-road, London, E.C., deals exclusively with this firm's well-known I.T.E. circuit breakers. Illustrations are given of a very large number of different types of the apparatus, and these bulk the catalogue out to some 130 pages, making it what Messrs. Blackwell believe to be the largest and most complete catalogue devoted to circuit breakers that has ever been issued; nor is this bulk due to superfluous matter. The numerous diagrams showing the manner of connecting the breakers in circuit should be especially useful. We understand that "I.T.E." circuit breakers have now been on the market for over 10 years. For the benefit of those unacquainted with the meaning of "I.T.E." it is explained that these letters stand for inverse time element, which may be defined in several ways—viz., that in inverse proportion to the current so is the time element of action; or, the heavier the current in excess of the normal the quicker the action; or again, the greater the danger the quicker the relief; or, better

Digitized by Google

still, the time employed in opening a circuit is less as the nearer approach to a short-circuit.

Electrically-Driven Draw-Pit Pumps

For the purpose of dealing with the water that may accumulate in cable draw-pits and manholes, and for ordinary domestic use, the British Thomson-Houston Company, Limited, Rugby, have introduced a small combined motor and pump. The pump is of the double-throw, single-acting, plunger type, having a capacity of 7½ gallons per minute, and suitable for heads up to 55ft. The pump barrels are of special close-grained cast iron, with deep stuffing boxes fitted with glands and studs. The plungers, valves and seats, and connecting rods are of special hard and tough gunmetal. The sole-plate consists of a strong casting arranged to bolt on a wall, and is accurately machined to receive the pump barrels, motor, and gear-case. The pump is driven by a ¼-h.p. British Thomson-Houston motor through double-reduction gearing. The first reduction consists of cast-iron machine-cut spur gearing enclosed with a cast-iron guard. The second reduction is obtained by worm and worm-wheel, the worm being of steel and the worm-wheel gunmetal, running in oil and provided with a ball thrust bearing. The motor is controlled automatically by the rise and fall of the water in the pit raising and lowering a copper ball float connected by a rod to a fall-over switch, giving a quick make and break action. The pump is fitted with solid oil lubricators, and the motor with the usual oil-ring lubrication. This combined motor and



Electrically-Driven Draw-pit Pump.

pump requires very little attention, and is recommended for cases where drainage by gravitation is not available.

"Angold" Arc Lamps and Accessories.

We have received from the General Electric Company, Limited, 71, Queen Victoria-street, London, E.C., a copy of their new catalogue of "Angold" arc lamps and accessories. Among the many improvements made in the "Angold" lamp since it was first put on the market, our attention is called to the single-carbon type. It is maintained by the makers that the use of metal brakes and clutches does not ensure such a steady feed as is effected by rubber pads. Having regard to this fact, they have decided to adhere to the principle of the rubber brake, and have patented an arrangement for compensating the wear of the rubber, and at the same time getting an absolutely constant feed. To do this, a brake drum is employed which carries a band with rubber pads, one end of which is attached to a pulley controlled by a spiral spring in tension, and the other hooked on to the rocking frame controlled by the two cores. The tension of the spring takes up any slack of the band, as well as any slack caused by the wear of the rubber pads, and this keeps the brake in action. Owing to the improvement made in the dashpot action, a steady strike is obtained with as little as 7½ per cent. loss in line resistance. The carbon-holders are on the ball-and-socket principle, so that they can be brought into line and afterwards clamped up, when they remain a fixture. This type of lamp can also be supplied for reflection purposes, the only difference in the design being that the poles are reversed, so that the bottom carbon becomes the positive, thus throwing most of the light upwards. Attention is also directed to the small pattern enclosed type lamp listed on p. 742 of the catalogue. These lamps are very much used for shop-lighting purposes, and burn exceedingly well in series, it is claimed. The line resistance, which is supplied fixed inside the lamps, does not require adjusting. On p. 745 an illustration and prices are given of the new pattern "Angold" enclosed type, double-carbon arc lamp. This lamp has been specially designed to meet the demand for a more efficient method of lighting from a single point on 200 to 250 volt circuits. Each lamp has two arcs in the one globe, which burn in series. With this arrangement the same current gives double the amount of light, while no more energy is consumed in the line resistance than is required to keep the lamp steady. Shunt coils are dispensed with by the use of special apparatus for striking and keeping the arcs of even length. This same apparatus also ensures that one carbon cannot be gripped before the other, and when once the carbons are clutched they are moved up and down at the same rate. To meet the demand for a lamp that can be used for the purpose of photo-process work, the General Electric Company have designed a new and improved arc lamp, which, it is claimed, ensures a constant light, thereby enabling the correct exposure of negatives and prints to be exactly determined. To this lamp can be fixed, if desired, a specially-designed stand on which printing frames can be supported. The total capacity of this stand is 16 whole-plate printing frames, and they can be ranged any distance from the arc and at any required height or angle. The supports of the lamps are insulated. The catalogue under notice also contains particulars of the "Angold" automatic suspension gear and contact device. This gear, we understand, has been used with great success by several borough councils and municipal bodies, and is especially constructed for automatically holding the lamps when suspended and taking the strain off the steel wire. The crown of the lamp has an insulated plug mounted on it which is provided with two spring-controlled catches. The normal position is horizontal. When the lamp is drawn up by the winch inside the posts these catches first strike against the bell-mouth of the socket, and are depressed inside the plug until the first increased diameter inside the socket is reached, when they open out and support the weight of the lamp on the ledge. This relieves the suspension wire of all strain. When it is required to lower the lamp, it is first pulled a little higher until the catches reach the second increased diameter of the socket; here they open out horizontally, and when the winch is released the weight of the lamp is thrown on the suspension wire, and it can be wound down to the required position for trimming, etc. Arc lamp carbons of the "Witton" brand, than which the General Electric Company claims there is no better obtainable, are, of course, dealt with among the accessories listed.

Catalogues, Pamphlets, Etc.

BERGTHEIL AND YOUNG, 12, Camomile-street, E.C.—Two illustrated pamphlets, one dealing with special printing-press equipments, and the other with organ blowing by electricity, both mentioning a number of buildings where the firm supplied these appliances.

POCKET DIARY, 1904.—Containing a number of useful engineering notes, rules, and data. 6d. Manchester: Emmott and Co., *Mechanical World* Office, New Bridge-street, and 18, Chancery-lane, W.C.

COCHRAN BOILERS.—A special catalogue giving particulars of patent vertical multitubular boilers (illustrated). Cochran and Co. (Annan), Limited, Annan, Scotland.

CABLE ACCESSORIES AND JOINTING MATERIALS (illustrated).—Siemens Bros. and Co., Limited, Westminster.

MOTORS, DYNAMOS, AND MOTOR STARTERS.—The Keighley Electrical Engineering Company, Limited, Vulcan Works, Keighley.

GREEN'S ECONOMISER for utilising the waste heat from steam-boilers (illustrated).—E. Green and Son, Limited, 2, Exchange-street, Manchester.

"IDEAL" GAS-ENGINES (illustrated).—Southall's Patent "Ideal" gas and oil engines. Hardy and Padmore, Limited, Worcester Foundry, Worcester.

VERITY'S ELECTRIC SUPPLIES (illustrated).—Plant and machinery; motors and motor driving; wires, cables, and wiremen's sundries; switchboards and accessories; bells and telephones; surgical and medical; electric light fittings; dock ship, and arc light fittings; glass and silk shades and reflectors. Verity's, Limited, 31, King-street, Covent Garden, W.C.

Reports and Accounts.—Several reports and accounts of municipal electrical undertakings received this week are unavoidably held over until our next issue.

LEGAL INTELLIGENCE.

STOCKTON TRAMWAYS COLLISION.

At Stockton County Court this week, before his Honour Judge Templer, Charles Turner, auctioneer, sued the Imperial Tramways Company for £50 damages for the loss of a horse which died from injuries received on Feb. 19 last through collision with a tramcar, the accident being caused, it was alleged by plaintiff, through the negligence of the company's driver.

The evidence went to show that plaintiff's employé was driving out of Westbury-street into Mandale-road, Thornaby, and in turning the corner the tramcar struck the horse on the near front foot. It was argued that had the driver stopped the accident could have been avoided.

His Honour did not think a tram driver should be expected to stop whenever he saw a horse. Trams being forced to run on fixed lines could not get out of the way, and, therefore, it became the duty of every driver of a vehicle to steer clear of the cars.

Judgment was given for defendants with costs.

LEEDS TRAMWAYS.

At the Leeds County Court, before his Honour Judge Greenhow, Simeon Copley, of Leeds, brought an action on behalf of his son, Sim Copley, aged 19, against the Lord Mayor and Corporation of Leeds, claiming £50 damages for personal injuries received as alleged through the negligence of the defendants' servant. About a year ago Sim Copley was driving a flat cart in Burley-road, when, nearing the tramway points in the neighbourhood of Cheswick-street and Burley-road, he saw a car approaching him. Turning off the tramlines the wheel of his cart "skidded," and while endeavouring to pull out of the way the car dashed into him, and he was thrown between the car and the cart, sustaining a lacerated scalp wound, which resulted in concussion of the brain and injury to the ribs, necessitating him staying in bed for three weeks.

Mr. Willey, who appeared for the plaintiff, said the question of liability was admitted, and it simply resolved itself into a matter of assessing damages.

The parties agreed to assess the damages at £25, and judgment was given accordingly.

"TUBE" TROUBLES.

At Bow-street Police Court on Tuesday **Mrs. Serling**, of Bernard-street, complained to Mr. Marsham that the "Twopenny Tube" ran under her house, and owing to the noise made, especially at night-time, life was almost unbearable.

Mr. Marsham: Well, I don't think I can stop them.

Applicant: Somebody ought to be able to do something; I have been living at this house 17 years, and I have had no rest for six months.

In reply to the magistrate the applicant said that many of the other residents also complained of the noise.

Mr. Marsham said he was afraid he could not interfere, and advised the applicant to go and see the owners of the estate on which she lived.

COMPANIES' MEETINGS AND REPORTS.

UNDERGROUND ELECTRIC RAILWAYS OF LONDON.

A general meeting of the shareholders in this Company was held at Hamilton House, Victoria-embankment, on the 15th inst., Mr. Charles T. Yerkes presiding.

The **Chairman** said the first report of the Company showed that it had up to June 30 last received out of its resources a total amount of cash of £6,519,672. 7s. 2d., and had spent of that sum £5,600,222. 1s. 1d., leaving a balance of £919,450. 6s. 1d., which was at the London and Westminster Bank, and also on hand and at short call. An amount of £6,999,931. 10s. 4d. of profit-sharing notes had been negotiated, and it was from these notes, and also from the sale of securities from the different companies with whom they had contracts, that they were realising the funds to carry on their work of construction. After these notes were negotiated, the total amount of capital required was then assured, and he congratulated the shareholders on the fact that, even in these hard times, the Company would certainly not want further funds to finish its work. The experiments they had tried in regard to safety devices had been very exhaustive. Owing to certain circumstances which had developed recently, the importance of non-flammable material in their tunnels had been much more intensely demonstrated, and consequently they had decided that nothing inflammable in the way of construction must go into their tunnels or other buildings. The underground work on the Baker-street and Waterloo road between Baker-street and Waterloo was practically finished, and attention was now being turned to the completion of this line, as it was desirable that it should be ready simultaneously with the Metropolitan and District road. They expected to make a connection between these two lines at the Charing Cross Station of the District Railway. The Baker-street and Waterloo Company had also decided to extend their lines from Waterloo Station to Elephant and Castle, and the work was now being pushed forward rapidly, while the extension from Baker-street to Edgware-road was about to be commenced. When this latter was finished the line will be still further carried on to Paddington. The other lines—the Great Northern, Piccadilly, and Brompton, and the Charing Cross, Euston, and Hampstead—were making good progress. The acquiring of the London United tramways had been a great advantage to their system, and they intended to connect directly both the Great Northern, Piccadilly, and Brompton and the District Railways with that line, so that passengers might have an almost uninterrupted passage from Bow, and also from Finsbury Park to Hampton Court.

The report was unanimously adopted, and a vote of thanks to the chairman and directors closed the proceedings.

CUBA SUBMARINE TELEGRAPH.

The ordinary general meeting of the shareholders in this Company was held at 58, Old Broad-street, E.C., on Wednesday, Mr. Charles W. Parish presiding.

The **Chairman**, in moving the adoption of the report, said that the past half-year's working from January to June showed a better result than they had been accustomed to for some time. The actual traffic receipts amounted to £17,244, while for the half-year of 1902 they were £12,784. The latter amount was afterwards increased by the payment received in respect of their claim from the West India and Panama Company, but the comparison could only be taken as a satisfactory indication that the revenue had improved. The island of Cuba had gradually settled down under the new Government, and there was every hope that the ruins of the war and former rebellions would give way to a speedy development of the natural riches of the island, which in time must add to the Company's business. Following the other items of the revenue account, beyond the £17,244 traffic receipts, there was £2,076 interest on investments and cash balances, and £5 for transfer fees, which gave a total of £19,325 to deal with. The working expenses amounted to £6,066, and after placing £5,000 to the reserve fund and providing £3,000 for the preference dividend, the directors recommended a dividend on the ordinary shares at the rate of 5 per cent. per annum, with a further bonus of 2s. per share, which, taken together, were equal to 3½ per cent. for the six months. In distributing that amount they had decreased the carry forward by £340, but they felt they were justified in doing so under the satisfactory conditions of the half-year. Turning to the balance-sheet, the Chairman said they had still to hold up the £8,174 of claim against the United States Government for the damage done to their cables during the Spanish-American war. He hoped they would soon have the matter settled, but he was afraid nothing could be done before it again came before Congress, which could not be for another three or four months. As to the subsidy due to the Company from the Government of Cuba in respect of coast cables, he was very disappointed that they had not yet received it, nor had they received any final explanation from the Cuban Government as to recognising their concessions. The subsidy was about £2,000 a year, and the arrears covered a period from January, 1899, so that altogether there was about £9,000 due to them. The Company's agent was continually negotiating with the Cuban authorities, and his Majesty's representative in Cuba had been instructed by the Foreign Office to assist them in every way. He had good reasons to know that the matter had been laid most carefully before the President himself, and he hoped before long they might receive some satisfactory news.

Mr. George Keith seconded the motion.

A Shareholder asked if there was any likelihood of Marconi's Wireless Telegraph Company competing with them.

The **Chairman** replied that the question was very much in the air at the moment, and he thought they need have no fear of harm from that quarter at present.

The motion was adopted.

KALGOORLIE ELECTRIC POWER AND LIGHTING.

The ordinary general meeting of the shareholders in this Company was held on Tuesday at Winchester House, Mr. Roger W. Wallace, K.C., presiding.

In moving the adoption of the report (which appeared in our last issue), the **Chairman** observed that important negotiations had been going on with regard to the business. It would not be advisable to say anything more on the point that day, but he hoped before long to be in a position to do so. At the date of the last meeting there were unpaid calls amounting to £36,000. During the period under review about £27,400 of this sum had been collected, and since the date of making-up the accounts a further £4,000 had been received. The Board had been enabled to finance the Company by an arrangement with their bankers without making the full issue of debentures. About £24,000 of debentures had been taken up, leaving £26,000 still to be issued. There was no immediate need to deal with the debentures in hand, and they would be reserved for such shareholders as might desire to apply for them. The Board were satisfied respecting the permanency of Kalgoorlie as a gold-producing centre. The output of gold there now was greater than at any previous period. The returns for 1902 aggregated 1,172,405oz., and would show an increase this year. Everything went to prove that the industry would last for many years—far longer, indeed, than the period for which concessions were granted to electric lighting companies in this country. The plant had worked most satisfactorily, and, owing to the improved water supply, it would be possible to sell electricity at a cheaper rate than was at one time anticipated. The directors could have made contracts for the sale of the whole of their available current had they chosen, but not on the most remunerative basis. Their object was to secure a 24 hours' load, or as nearly so as could be obtained. Hoisting and similar machinery gave a load for only a comparatively small number of hours daily, and therefore the Board had declined contracts of that class. New customers were being secured almost from day to day, and he had no doubt that they would succeed in getting their whole supply taken up on the most remunerative basis. He had no doubt that next year they would be in a position to pay dividends. Before

Digitized by Google

that could be done, however, they must write off from revenue, or put to capital account, the sums expended in preliminary work, and the report recommended that the latter course should be adopted. Two of the directors had resigned, and in the future the fees would be reduced to £1,000 per annum.

Mr. Edward Pope seconded the motion, and after discussion and some criticism it was adopted.

Certain alterations in the articles were also agreed to in order to comply with the regulations of the Stock Exchange Committee prior to their granting an official quotation for the Company's shares.

GUILDFORD ELECTRICITY SUPPLY.

A meeting of the holders of founders' shares in this Company was held last week at the County and Borough Hall, Dr. F. R. Russell presiding.

The question before the meeting was a proposal to so modify the regulations under which the founders' shares are held as to convert them into preference shares, bearing a fixed rate of interest. Hitherto the holders of the founders' shares have been entitled to one-fourth of the net profits made in each year after providing for a dividend at 6 per cent. on the capital paid up on the other shares, in addition to which there are various other regulations. The increase of the Company's business has made it necessary to raise further capital, and promises of sufficient support to enable the Company to purchase new plant now required, and to pay for contemplated extension of mains, had been received on condition that the regulations in question were modified as described. A resolution was proposed that the conditions of the founders' shares be altered, and that the rights of cumulative preference shares, bearing interest at the fixed rate of 6 per cent. per annum, be conferred on the said shares.

The **Chairman** explained that it was impossible to exchange for the founders' shares any shares that were not of equal value with them.

After discussion, the motion was carried by the requisite three-fourths majority.

MONTE VIDEO TELEPHONE.

The directors present accounts for the year ended July 31 last, showing a net profit for that period of £12,224, after providing for all working expenses in Monte Video and London. To this amount should be added the sum of £1,064 brought forward from last year, leaving an available balance of £13,288. From this sum the directors propose to transfer £5,000 to reserve fund, and they recommend that, after payment of the full dividend at the rate of 5 per cent. per annum upon the preference share capital, a dividend at the rate of 3 per cent. per annum be paid upon the ordinary share capital, and that the balance of £1,783 be carried forward. The Company has acquired, as from June 12, 1903, the rights, privileges, and properties of the undertaking known as La Hispano Uruguaya, comprising a system of telephone lines and exchanges outside the city and province of Monte Video.

BRITISH COLUMBIA ELECTRIC RAILWAY.

The report of the directors for the year ended June 30 last states that business has largely increased in all departments, and the profits made during the year show a corresponding increase. The gross receipts show an incease over the preceding year of £19,143, and the net earnings, after charging renewals, show an increase of £7,834. The following charges have been made against the revenue account of the year—namely: renewals maintenance, £10,446; bonus to employés, £1,494; written off preliminary and issuing expenses, £1,000; added to capital amortisation fund, £1,595. The net profit for the year, after making the above deductions, amounts to £37,865, and adding the balance brought forward, £533, and deducting debenture interest, the dividend on preferred ordinary stock for nine months to March 31, 1903, and the interim dividend on the deferred ordinary stock for six months to Dec. 31, 1902, there is left available for distribution and reserves £15,779. The directors have decided to provide for the dividend on the cumulative perpetual preference shares to June 30, 1903, to provide for the dividend on the preferred ordinary stock for three months to June 30, 1903, to recommend a dividend on the deferred ordinary stock at the rate of 3 per cent., making 5 per cent. for the year, to transfer to contingency fund £1,000, and to transfer to reserve fund £3,000, leaving to carry forward £1,099. During the year 6,000 5 per cent. cumulative perpetual preference shares of £10 each have been issued by the Company, and a further 1,500 were issued in August last, making a total of £75,000. The construction of the Vancouver power installation by the Vancouver Power Company, Limited, which commenced in July, 1902, has proceeded satisfactorily. The general manager reports that he expects the Power Company will be in a position to deliver 2,000 e.h.p. by the beginning of December next. On the advice of the engineers, the scheme as originally designed has been enlarged so as to provide for the supply of an initial 9,000 h.p., with power of expansion to 30,000 h.p., instead of an initial 6,000 h.p., with expansion to 15,000 h.p. The size of the tunnel has been increased by 25 per cent., and machinery and transmission plant of greater electrical capacity are being provided. This enlargement of the original scheme will involve an additional expenditure of about £60,000, but the directors are satisfied that the importance of being fully prepared to meet the rapid increase in the demands for electrical power in Vancouver and New Westminster justifies the increased expenditure. Funds for carrying on the works of the Vancouver Power Company have been raised by the sale of £175,000 4½ per cent. Vancouver Power debentures, part of a total authorised issue of £220,000, and the Board propose at an early date to offer the remaining £45,000 to the stockholders and debenture holders to provide further funds as required. The directors have for some time past been carrying on negotiations for the purchase of the undertaking of the Vancouver Gas Company, which if brought to a successful issue, should materially add to the value of the company's lighting business.

BRITISH COLUMBIA TELEPHONES.

The report of the directors for the year ended June 30 last states that the expenditure for improvements and extensions during the past year has amounted to £7,334, and the purchase of the plant of the Columbia Telephone and Telegraph Company has involved a further expenditure of £7,668. A new switchboard is being installed in the Victoria exchange on the central energy system. This will necessitate the purchase of new instruments for all subscribers there, involving a total expenditure of at least £15,000. At the last session of the Provincial Legislature, an Act enabling the Company to lay a cable connecting the mainland and Vancouver Island was obtained; the cost of the cable and land lines necessary will be, it is estimated, about £35,000. Owing to the heavy but necessary expenditure before mentioned, and that contemplated, the directors of the subsidiary companies have decided to carry forward the whole of the balance standing to the credit of their respective profit and loss accounts. The directors of this Company, therefore, regret that they are unable to pay any dividend on the ordinary shares. At the meeting a scheme for the reorganisation of the Company, transferring the head office to British Columbia, and increasing the debenture issue will be submitted. The balance from last year's account was £322, and the directors have transferred from reserve fund £4,500, making a total of £4,822. Out of that have been paid expenses of English office, £146; income tax, £376; bank interest and charges, £164; interest on debenture stock to June 30 last, £1,271; and dividend on the preference shares to June 30 last, £1,694—leaving a balance of £1,170 to provide for directors' remuneration and to carry forward.

BRITISH ALUMINIUM.

The secretary writes to the shareholders as follows: "It will be within your recollection that, at a meeting held on Nov. 13 last, the holders of the debenture stock of this Company agreed to postpone the payment of all interest on the debenture stock for one year, and authorised their trustees, in their absolute discretion, to consent to the postponement of the payment of interest for a further period of one year. I am instructed by the Board to inform you that, owing to the improved circumstances of the Company, they have not felt justified in asking the trustees to sanction the additional postponement. The current half-year's interest will be paid on Dec. 31 next, and thereafter the interest will be paid half-yearly, on its due dates. Of the £10,000 authorised at the same meeting to be borrowed in priority to the debenture stock, £7,500 has since been repaid."

NEW COMPANIES REGISTERED.

Municipal Foundry and Engineering Company, Limited.—Capital, £5,000. Objects: to adopt an agreement between C. Hall and J. H. Bardsley, and to carry on the business of ironfounders, mechanical, electrical, chemical, and general engineers and contractors, electricians, etc.

Chichester and District Electric Supply Company, Limited (78,784).—Capital, £20,000. Object: to carry on in the United Kingdom and elsewhere the businesses of suppliers of electricity for light, heat, sound, and power, or otherwise. Registered office: Donington House, Norfolk-street, W.C.

Gent and Co., Limited.—Capital, £50,000. Objects: to acquire and carry on the business of manufacturing electricians, electrical engineers, wire and cable manufacturers, wire coverers, etc., carried on by A. W. Staveley and I. H. Parsons, at Leicester, as Gent and Co. and the Midland Electrical Wire Company, as telephone, water supply, and mechanical engineers, etc.

Hodgson Hartley, Limited.—Capital, £30,000. Objects: to acquire and take over as going concerns the businesses now carried on at Cleckheaton by H. E. Hodgson (trading as H. E. Hodgson and Co.), and at Manchester by James Hartley and Co., of Manchester, Limited, of mechanical, electrical, and hydraulic engineers, plant manufacturers, etc. Registered office: 55, Victoria-buildings, Manchester.

Piscicelli Electric Post Parent Syndicate, Limited.—Registered in Guernsey. Capital, £150,000. Object: to acquire and turn to account an invention of Count Roberto Taeggi Piscicelli, of Naples, for an aerial electric post, with the patent rights for the same, and to carry on any business incidental thereto. The first directors are Count R. T. Piscicelli (permanent), Le Duc de Morny (till 1905), Le Comte de Pradere (till 1905), H. S. Saunders (till 1905), and W. Digby (till 1905). Count R. T. Piscicelli is also technical director and constructional engineer.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Caraminal (Spain).—The Municipality require tenders for installation and working of the village for 20 years. Tenders by Nov. 3.

Windsor.—The Town Council invite tenders for the supply of electricity or gas for the purpose of public lighting throughout the district for a period of five years.

Digitized by Google

Dudley.—The Guardians invite tenders for the supply and fixing of the various appliances for the electric installation to the laundry and boiler house. See advertisement in last issue.

Swansea.—The Corporation invite tenders for the supply, delivery, fixing, and connecting of ducts, troughs, cables, wires, street boxes, etc. Tenders by Oct. 31. See advertisement in last issue.

Transvaal Colony.—The Chairman of the Tender Board, Pretoria, requires tenders for installing and working the electric lighting of Potchefstrom for about five years. Tenders by Oct. 30.

Wakefield.—The City Council invite tenders for the supply and erection of one 400-kw. two-phase generator, comprising engine, alternator, exciter, and accessories. Tenders by Nov. 7. See advertisement.

Brussels.—The Belgian Government Railways invite tenders for material and appliances to be used for lighting passenger trains. Specification No. 996 may be obtained from the above authority. Tenders by Nov. 4.

Munera.—The Municipality require tenders for installation and working of electric lighting. Particulars may be obtained from the Secretary of the Ayuntamento of Munera, province of Albacete, Spain. Tenders by Oct. 28.

Kilmarnock.—The Corporation invite tenders for the supply, delivery, and erection of three Lancashire boilers, engines and dynamos, overhead hand travelling crane, storage battery, and switchboard, by Nov. 18. See advertisement in last issue.

Blackpool.—The Corporation invite tenders for the supply of arc lamp carbons for the ensuing year. Specification, etc., may be obtained on application to Mr. Charles Furness, borough electrical and tramway engineer, Electricity Works, Blackpool.

London, S.W.—The London County Council invite tenders for the supply, for one year from Jan. 1, of electrical fittings, etc. Forms of tender may be obtained on application to the Clerk of the Council (Stores Branch), 19, Charing Cross-road, W.C. Tenders by 26th inst.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

Barrow-in-Furness.—The Corporation invite tenders for the completion of the electric lighting installation at Hawcoat and Walney police stations and the pig slaughtering hall and lairage at the public abattoirs. Further particulars may be obtained from the Borough Engineer.

Portsmouth.—The Tramways Committee invite tenders for the supply of passengers' tickets for one, two, or three years respectively from Jan. 1, 1904. Specifications, etc., may be obtained from the General Manager, Town Hall, Portsmouth. Tenders by 10 a.m. on 30th inst.

Russia.—The Russian Minister of the Interior has sanctioned a plan for the reconstruction of three lines of municipal tramways—namely, those in Newsky, Sadovaïa, and Wassiliostrow districts. Each car is to provide for two classes of travellers, and will accommodate 52 persons.

Todmorden.—The Corporation invite tenders for one Lancashire boiler, two steam dynamos and balancer booster, two feed pumps and one injector, economiser, surface or jet condenser, switchboard and instruments, storage battery, cable work, and overhead hand crane. See advertisement.

West Ham.—The London County Council invite tenders for the supply and erection of (a) engine, dynamo, switchboard, etc., and (b) electrical wiring, mains, and fittings required in connection with the installation of electric light at the Abbey Mills pumping station. Tenders by Nov. 3.

Radcliffe (Lancs.).—The Urban District Council invite tenders for the construction of the switchboard and engine and dynamo galleries at the electricity works. Specification, etc., may be obtained of Mr. W. L. Rothwell, engineer, Council Offices, Radcliffe. Tenders by 12 noon on 26th inst.

Devonport.—The Corporation invite tenders for the supply, delivery, and erection of a motor-driven booster. Specification may be obtained from the Borough Electrical Engineer, Newport-street, East Stonehouse, Devon. Tenders before noon on Oct. 24. See advertisement in last issue.

Halifax.—The Tramways and Electricity Committee invite tenders for (a) 750-kw. continuous-current dynamo, driven direct by horizontal engine; (b) two 9ft. by 30ft. Lancashire boilers; (c) high-tension three-phase cable, etc. Tenders to Mr. Keighley Walton, town clerk, by Oct. 21.

Holyhead.—The Urban District Council invite tenders for erection of a chimney shaft in connection with their proposed destructor and electricity works. Specifications, etc., may be obtained from Mr. Price F. White, Electricity Works, Bangor, North Wales, on and after 23rd inst. Tenders by 10 a.m. on 30th inst.

Manchester.—The Paving, Sewering, and Highways Committee invite tenders for laying underground telephone pipes (Contract 8), with other appurtenant works. Drawings may be seen and specification, etc., obtained on application at the City Surveyor's Office, Town Hall, Manchester. Tenders by 10 a.m. on Nov. 5.

Chichester.—Tenders are invited for the installation of a system of electrical water-level indicators and recorder and telephones. Specifications may be seen and bills of quantities obtained at the office of the city surveyor and waterworks engineer, Mr. I. Pym-Jones, Lion-street, Chichester. Tenders by Nov. 6. See advertisement.

Radcliffe.—The Council invite tenders for the supply and completion of (Contract No. 12) lighting and traction switchboard and accessories; (14) rail bonds. Specifications may be obtained from Messrs. Lacey and Sillar, 2, Queen Anne's-gate, Westminster, and 78, King-street, Manchester. Tenders by Nov. 14. See advertisement.

Blackpool.—The Electricity and Tramways Committee invite tenders for one new 450-kw. traction set (vertical triple-expansion engine and multipolar generator). Specification may be obtained from Mr. Charles Furness, borough electrical and tramways engineer, Electricity Works, Blackpool. Tenders by Nov. 14. See advertisement.

Bradford.—The Guardians invite tenders for the electrical engineer's work for the erection of a hospital pavilion at the union workhouse, Horton-lane, Bradford. Specifications, etc., may be seen and bills of quantities obtained on application to Mr. Fred Holland, 11, Parkinson's-chambers, Hustlergate, Bradford. Tenders by 9 a.m. on 26th inst.

Swansea.—The Corporation invite tenders for (1) laying of permanent way, including rail bonding; (2) rails and fishplates; (3) steel tiebars, bolts, and nuts; (4) points, crossings, cast-steel curved rails, and special work; (A) overhead electrical equipment; (B) ducts, troughs, cables, wires, section and other boxes, etc. Tenders by Oct. 31. See advertisement in previous issue.

Beckenham.—The Urban District Council invite tenders for the electric wiring of houses in their district under a free wiring scheme. Specifications, etc., may be obtained from the consulting engineer, Mr. Reginald P. Wilson, 66, Victoria-street, Westminster, or Mr. John A. Angell, surveyor, Council Offices, Beckenham. Tenders by 4 p.m. on Nov. 9. See advertisement in last issue.

Wednesbury.—The Corporation invite tenders for the electric wiring and fittings for the following public buildings: town hall, municipal offices, art gallery, public baths, public library, and electricity sub-station. Specification, etc., may be obtained between 2 and 5 p.m. on and after the 23rd inst. at the offices of Mr. F. J. Warden-Stevens, A.M.I.M.E., A.M.I.E.E., consulting engineer, 34, Victoria-street, Westminster. Tenders by 12 noon on Nov. 20.

Bolivia.—The Director of Public Works to the Government o Bolivia is prepared to receive from British manufacturers, quotations, prices, catalogues, and printed matter, with discounts, shipping weights, &c., for the following materials: hydraulic power plant, piping, and turbines; alternating and direct current generators and motors; transformers and rotary converters; switchboards and measuring instruments; overhead trolley wire and fittings; third-rail insulators, plastic and copper bonds; hydraulic screw jacks and lifting tackle; contractor's plant and tools. All communications to Mr. T. Olive Sheppard, A.M.I.C.E., director-general of public works, general manager of the Guaqui to La Paz Railway, La Paz, Bolivia, and sent by registered post either via New York or by Royal Mail steamers (West India route) via Panama and Mollendo (Peru).

RESULTS OF TENDERS.

Walsall.—The tender of the Walsall Electrical Company, Limited, for connecting up four new sub-stations with telephones, for the sum of £7. 6s. 6d., has been accepted.

Erith.—Three tenders have been received for electric lighting St. Augustine's-road new schools: Rawlings Bros., Limited, £184; F. A. Glover and Co., £121 (accepted); Ward Bros., £156.

Shoeburyness.—The Hart Accumulator Company, Limited, Marshgate-lane, Stratford, E., report an order from the War Office for the storage battery of 54 cells required at Shoeburyness.

Croydon.—The Electricity Committee have accepted tenders for extensions to the electricity works (buildings) as follows: E. J. Saunders, builder's work; Dorman, Long, and Co., smith and iron-founder's work.

Ashton-under-Lyne.—The Market and Lighting Committee have accepted the following tenders for supply of arc lamp carbons and globes during ensuing year: De Grelle, Houdret, and Co., London, carbons; J. E. Taylor and Co., Ashton-under-Lyne, globes.

Radcliffe District Council.—The Electricity Committee have rescinded acceptance of the tender of Callender's Cable and Construction Company, Limited, for the electricity contract No. 11, for the sum of £5,339. 4s. 4d., in favour of the same firm's amended tender for the sum of £5,350. 2s. 2d.

Harrogate.—The tender of the British Thomson-Houston Company for the supply and erection of a 750-kw. Curtis turbine, with condensers and accessories, for the sum of £6,736, and for the temporary loan of a 305-kw. turbine, to be delivered and erected, and afterwards removed, free of cost to the Corporation until such time as the Curtis turbine can be supplied and erected, has been accepted.

Stoke Newington.—The tender of W. T. Henley's Telegraph Works Company, Limited, for the supply of cables for the High-street and Stoke Newington-road for the maintenance of the cables for one year after completion, free of cost, has been accepted; this includes an undertaking to maintain, if so required by the Council, for a further period of four years for an annual payment of 1 per cent. on the cost of the cables.

Hammersmith.—The Electricity and Lighting Committee have obtained the following tenders for supplying the motor-generators required in connection with certain electrical machinery about to be installed by Messrs. J. and H. Gwynne, Limited, and Messrs. J. Baker and Sons: Witting, Eborall, and Co., £615 or £691; F. A. Glover and Co., £700; Fuller, Wenstrom, and Co., £730; Geipel and Lange, £664 or £750; Lancashire Dynamo and Motor Company, £778, £832, or £971; Johnson and Phillips, £790 or £850; Electric Construction Company, £809; General Electric Company, £870; Bruce Peebles and Co., £890. Messrs. Witting, Eborall, and Co.'s tender of £691 for the two sets has been recommended for acceptance.

Digitized by Google

BUSINESS NOTES.

TRACTION.

Portsmouth.—The Tramways Committee have agreed to try the experiment of covered tops to the cars.

Ince.—The District Council at its monthly meeting ratified the leasing of the tramways in the township to the Wigan Corporation.

Brighton.—The electric cars will commence to run on the London-road and Old-steine routes as soon as the Board of Trade license is received.

Radcliffe.—Application is to be made to the Board of Trade for sanction to an alteration in the plans for the proposed tramways in this district.

Southall-Norwood.—The Board of Trade have extended the time allowed for the completion of the light railway (Southall-to-Uxbridge) to April 9, 1904.

Woolwich.—Steps are being taken to urge the London County Council to proceed with the laying of the tramways from Beresford-square to the Herbert Hospital.

Hanley.—The Town Council are urging upon the Potteries Electric Traction Company the necessity for the construction of light railways to Bucknall and Providence-square.

Nelson.—The Town Council have appointed a sub-committee to visit Liverpool, Leeds, and Bolton, with a view to finding a suitable top cover for use on the Nelson cars.

North-Eastern Railway.—Another experimental electric train has been run on the Riverside branch of the North-Eastern Railway at Newcastle between Percy Main and Carville.

Barrow.—Rapid progress is being made in the reconstruction of the tramways, and there is every prospect that at least one section of the system will be opened in a few months' time.

Guildford.—The promoters of the West Surrey light railways scheme have submitted a modified proposal to the Town Council, which is for a line from Stoughton to the railway station.

Northleach.—The Rural District Council have been informed by the Light Railway Commissioners that the promotors of the proposed light railway are prepared to go on with the scheme.

Elsenham.—The proposed light railway from Elsenham as far as Finchingfield is now almost assured. The amount still required has been reduced to about £600, and the end is felt to be in sight.

Woking.—An amended scheme of tramways for the district came before the Urban District Council at their meeting last week. Eventually the Council gave a qualified approval of the scheme.

Worsley.—Arrangements are being made for an early start in the construction of the tramways in the Worsley and Walkden districts, and the connection of the South Lancashire system with Eccles at Worsley-road.

Croydon.—In the course of discussion at the last meeting of the Town Council it was stated that the British Electric Traction Company made a profit of £10,000 last year on the tramways in the borough which are leased to them.

Leeds.—The question of an improved method of laying tramrails was considered at the last meeting of the Tramways Committee, and was referred to the Works Sub-Committee to be dealt with in conference with the Highways Committee.

Bournemouth.—The Corporation have decided to obtain powers to construct an electric tramway from the present terminus at Pokesdown to Southborne and Christchurch, the estimated cost being £50,000. The scheme is generally approved by the ratepayers.

Mid-Yorkshire.—Arrangements are being made for the transfer of the Mid-Yorkshire branch tramlines running from Nabwood to Thackley, and from the Branch Hotel (Saltaire) to Baildon Bridge, to the contractors, Messrs. J. G. White and Co., of London.

Douglas.—At a meeting of the Town Council the chairman of the Tramways Committee said that the earnings to the end of September, after all expenses had been met, left a credit balance of £8,520, being an increase over the same period of last year of £653.

Batley.—Westinghouse magnetic brakes will be mounted on the new electric tramcars now being built by the British Electric Car Company, the equipments having been recently ordered from the British Westinghouse Electric and Manufacturing Company, Limited.

Hull.—The service of electric cars was opened on Tuesday between the Hull Whitefriargate Bridge and Victoria Pier. The Board of Trade have approved the Tidwell lifeguard for the trams. The patentees have agreed to furnish additional lifeguards for a royalty of £1. 10s. per car.

Derby.—A petition signed by members of the Town Council has been sent to the mayor to reconsider and, if desirable, to rescind a resolution of May 5, authorising the construction of tramways to Littleover. The mayor has accordingly decided to call a special meeting of the Council for Oct. 28.

Newcastle.—Members of the Tramways Committee have made a survey of Benton Bridge with a view to seeing the best arrangements for widening the bridge, or making such other improvement as will enable a double line of rails to be laid over that portion of the Dene so as to complete the tramway circuit.

Prestwich.—The District Council have arrived at a satisfactory arrangement with the Salford Corporation as to the share Prestwich shall receive of the profits made on the tramways in the district. The amount Prestwich will receive will be equal to 1d. in the £ on the Prestwich rates for the next five years.

Perth.—The first meeting of the Tramway Reconstruction Committee was held last week, when various matters of a preliminary character were discussed. The Council on Monday considered the appointment of a consulting engineer, and it was eventually decided to remit the matter to the Council to report.

Cheltenham.—Last week a fire broke out at the stores department of the Cheltenham and District Light Railway depôt, before the reduction of which considerable damage was done. Roughly the damage is placed at about £1,000. The buildings are insured, but not the contents. The origin of the fire is unknown.

Bradford.—The Tramways Committee have decided to increase the wages of drivers and conductors by ½d. an hour. This will mean a minimum wage of 6d. and a maximum of 7d. an hour for drivers, whilst conductors will receive a minimum of 5d. and a maximum of 6d. an hour. The increase will amount in a year to £2,846.

Snowdon Light Railway.—Messrs. Bruce Peebles and Co., Limited, inform us that they have obtained the whole contract for the construction of the proposed Snowdon light railway. By a printer's error in our last issue we erroneously stated that the power to be developed was 60,000 h.p. This should have been 10,000 h.p.

Electric Signalling.—The final Board of Trade inspection is about to take place of the large electric signalling installation which has just been completed at St. Enoch's Station, Glasgow, by the W. R. Sykes Interlocking Signal Company. The subordinate and subsidiary cabins at St. Enoch's have already been inspected and approved by the Board of Trade.

Soothill Nether.—At a special meeting of the District Council the following resolution was unanimously adopted: "That the Council do apply in the next session of Parliament for an Act to enable the Council to construct tramways, and work or lease the same, to purchase land and erect a generating station and refuse destructor thereon," and for other purposes.

Richmond.—A meeting of the Tramways Committee last week considered a series of proposals submitted by the London United Tramways Company for the more effective carrying out of the scheme, to which legislative sanction has already been given, for the introduction of electric tramways into Richmond. The proposals, however, were ultimately rejected.

Llanelly.—The tramways question was again before the District Council at their last meeting. It will be remembered that things have been at a standstill for some months owing to the alleged failure of the Insulated Wire Company to carry out their contract to purchase the tramways undertaking for £5,000. The matter was referred to the Estates Committee for enquiry and report.

Wandsworth.—The Borough Council at their last meeting again adjourned the question of a contribution towards the cost of street improvements proposed to be carried out at Streatham by the London County Council in connection with their proposal to link up their system with the Croydon electric trams at Norbury. The Streatham inhabitants are generally in favour of the scheme.

Glasgow.—We understand that the British Westinghouse Electric and Manufacturing Company have secured a contract for the equipment of all the Glasgow tramcars—numbering nearly 700—with their well-known magnetic brake. Exacting experiments, extending over nearly two years, on 100 cars have been carried out, and the present contract goes to indicate that the brake has proved very efficient in working.

Pietermaritzburg.—The British Westinghouse Company are supplying for the new tramway system at Pietermaritzburg, South Africa, six complete electric tramcar equipments. These will be of standard Westinghouse pattern, each including two No. 90 series-parallel controllers, two No. 200 (35 h.p.) motors, and all the usual auxiliary apparatus, including automatic cut-out, lightning arresters, etc.

Gower Light Railway.—There is now definite prospect of the proposed light railway for Gower being carried out somewhat on the original lines of the scheme. Notices to treat have been served on the owners of the property along the line from Killay Station (London and North-Western) down the peninsula. It is feared that property will not be very easily acquired, and a further difficulty will probably arise as to the Clyde Valley.

Chatham.—Correspondence has taken place between the Town Council and the Chatham and District Light Railways Company on the subject of universal penny fares. Mr. Minshall, the representative of the company, has pointed out that the matter is one for the Corporation and the Board of Trade. At the last meeting of the Town Council the clerk was instructed to write to the Gillingham District Council with a view to a conference on the matter.

Herefordshire.—A light railways scheme for Herefordshire was further considered at last week's meeting of the Ross Rural District Council, when it was said that it would be a good plan to connect Ross and Ledbury and Ross and Bromyard by light railways. As favourable replies have been received from most of the district councils affected by the scheme, the clerk was directed to write to the chairman of the County Council requesting him to convene a conference for the purpose of further considering the proposal.

Moving Staircase.—The directors of the Great Northern and City Railway are considering a proposal for a moving staircase at their Lothbury Station now in course of construction. If the scheme be adopted it will be a complete novelty in London so far as tube railways are concerned; but those who have visited either the Crystal Palace or the Earl's Court Exhibition lately will have noticed the moving staircases which are working at these places for conveying people from a low to a high level. They are operated electrically.

Flintshire.—A large gathering of Flintshire gentlemen have been in conference with regard to the application to Parliament during the

Digitized by Google

coming session for powers to construct an electric tramway connecting the districts of Bagillt, Greenfield, Holywell, Halkyn, Northop, Mold, Buckley, Hawarden, Sandycroft, Queen's Ferry, Shotton, and Connah's Quay. The general tone of the meeting was a unanimous approval of the scheme. The capital of the proposed syndicate is £10,000, to which a number of gentlemen subscribed in the course of the meeting.

Devonport.—Major A. Druitt, R.E., has made an inspection of the new lines from Milehouse to Tor-lane and from St. Budeaux Station to Saltash Passage, which have been constructed by the Corporation and are leased to the Devonport and District Tramways Company, who will work them. Owing to stringent regulations by the Board of Trade, provisional permission could not be granted to open the extensions until the official certificate is issued, and this, it is expected, will be done in a few days. The lines will then be opened for traffic.

Hampstead.—At the last meeting of the Borough Council the Works Committee recommended that, with reference to the letter from the London County Council on the subject of the reconstruction for electrical traction of the County Council's northern tramways, which include the route from Hampstead-road to Hampstead Heath, and asking the views of this Council as to the adoption of the overhead trolley system, they be informed that this Council strongly objects to the overhead system being adopted. The recommendation was adopted.

Lambeth —Consideration was resumed at the last meeting of the Borough Council of the resolution moved at the previous meeting urging the London County Council to run a line of trams to Westow-hill, Upper Norwood. The motion was now adopted; also the following: "That as, in the opinion of this Council, it would be a great advantage to the inhabitants of Lambeth and to the general travelling public if the London County Council acquired and worked the London Southern Tramways, this Council respectfully urge the London County Council to give the statutory notice for the purchase of the undertaking."

Bury.—The Acquisition of Property Sub-Committee report that they have acquired other property for tramway purposes, and that there were only two outstanding bits of property in regard to which there was likely to be arbitration. In order to obviate the cars being in darkness when the trolley arm is being reversed at the termini, the electrical engineer has submitted two schemes, one by which the lamps would be prevented from going out, and the other for the fixing of one lamp inside the cars, which would be lighted when the arm was being reversed. It was decided to adopt the simple lamp scheme, and use it at the Fairfield end only.

South Shields.—The Tramway Sub-Committee have decided to recommend to the Council the adoption of the overhead trolley system for the borough. The routes have been considered by the committee, and it has been decided, instead of continuing the route through Corstorphine Town to Tyne Dock, to recommend that the line be carried as far as the present terminus at Green-street. The dropping of the Corstorphine Town route means a reduction in the total approximate cost of £20,029. It has been decided, in accordance with a resolution of the Council, to advertise for the best terms for leasing the system before considering the question of municipalisation.

Dewsbury. — A special meeting of the Corporation has agreed that application be made to the Board of Trade for a provisional order to empower the Corporation to construct tramways in the borough, (*a*) commencing in Vicarage-road, passing along Vicarage-road, Longcauseway, through the Market-place, and along Wakefield-road to the boundary of the borough with Soothill Nether; (*b*) commencing in the Market-place and passing along Crackenedge-lane to the boundary of the borough with Soothill Upper; and (*c*) commencing at the junction of Wakefield-road with Leeds-road, and passing along Leeds-road to the boundary of the borough with Soothill Upper.

Llandilo-Aberayron Light Railway.—The project of constructing a light railway from Llandilo to Aberayron seems to be proceeding in earnest. Meetings have been arranged to be held at Llandilo, Lampeter, and other places along the proposed route to further the project. Several local authorities through whose districts the proposed railway will run have passed resolutions approving of the scheme, and great interest is taken in the matter throughout the country affected. Guarantees of capital have been obtained for the construction of the line, and it is proposed to ask the County Councils of Carmarthenshire and Cardiganshire to contribute towards the initial expenses. The total length of the line will be 35 miles.

Southend.—At the Board of Trade Sir Herbert Jekyll, assistant secretary to the Railway Department, sat to hear objections to the confirmation of the Southend-on-Sea and district light railways (extension) order. The scheme is one by the Southend-on-Sea Corporation for the extension of their present light railways system, the principal extension being as far as Shoeburyness, so as to give means of communication by the light railway system between Southend and that place. The present system runs between the Southend district and Leigh-on-Sea. Colonel Burges, a large landowner, through whose property it is proposed to construct part of the extension, is the only objector. Sir Herbert Jekyll will report to the Board in due course.

Lowestoft.—The Light Railway Commissioners held an enquiry on Wednesday with reference to the application of the Corporation to amend the East Anglian light railways order. The amendment sought is in the direction of obtaining sanction to carrying out this undertaking—a light railway through the town to Kessingland beach—in conjunction with the tramways undertaking, and the Commissioners announced they were prepared to submit an order on these lines. The tramways manager reports that the total traffic receipts to the 15th inst. amounted to £2,945. 18s. 10d.; passengers carried, 636,650; miles run, 44,819; average receipts per car per day, £4. 16s. 7d.; average receipts per day, £52. 12s. 1d.; average receipts per car mile, 13·7d.

Folkestone.—After many months' delay the Corporation are at length taking steps to carry out the tramway scheme for which they obtained powers some time ago, and an expert is to be retained to advise them in the matter and report upon the tenders received. The borough engineer has prepared a report, in which he gives the cost of the different systems as follows: Surface-contact system—G. B., £11,743 and 10·065d. per car mile; Lorain, £11,881 and 10·185d.; Dolter, £11,370 and 9·746d.; Schuckert, £11,421 and 9·79d. Conduit system—J. G. White and Co., £12 462 and 10·683d.; Dick, Kerr, and Co., £12,618 and 10·815d. The Corporation are not favourable to the overhead trolley system, and either the surface-contact or conduit system will be adopted.

Electric Tramways in Germany.—A recent report from United States Consul H. W. Harris, Mannheim, Baden, deals with the street car lines in Germany. Recently published figures, he says, place the total number of miles of electric car lines in Germany at 2,117. Considering the area and population of the empire, these figures show a comparatively slow development of this branch of railway building—this, too, in spite of the fact that in electric lighting and in other applications of electricity Germany has taken advanced rank. The cause of this backwardness is to be sought mainly in the fact of State ownership of the larger part of the existing steam railways, and the unwillingness on the part of the city and other authorities to grant charters to private companies.

Hackney.—At the last meeting of the Borough Council, a letter was received from the London County Council with reference to their proposals for the reconstruction, for electrical traction, of the northern tramways, which are leased to the North Metropolitan Tramways Company, and the construction of new tramways in connection therewith, and stating for the information of the Borough Council the reasons which have induced the Highways Committee of the County Council to suggest that the overhead trolley system should be adopted for certain of the tramways. The committee recommended that the London County Council be informed that the Council will strenuously oppose any adoption of the overhead trolley system for the working of tramways within the borough.

Birmingham.—Notice of motion has been given for the next meeting of the City Council as follows: "That in the opinion of this Council it is much to be regretted that the Tramways Committee should have considered it necessary to purchase tramrails from abroad at a time when British industry needs encouragement and support." Another resolution runs; "Instructions to committees.—That in asking for tenders for manufactured articles of any description, if the same are made or can be made in Great Britain, they shall be specified to be of British manufacture. This is to apply to all manufactured articles purchased without tender, and to manufactured articles used in buildings, machinery, plant, stores, rolling-stock, etc., in every department of the Corporation."

Additional Traffic Returns.—Anglo-Argentine, £2,227 increase; Barcelona Ensanche y Gracia, £136 increase; Barcelona, £59 decrease, Brisbane, £77 decrease (month of August, £11,736, increase £294); British Columbia Electric (month of March), gross earnings £10,352, net income £2,659; Buenos Ayres and Belgrano Electric, £265 increase (month of September, £13,793, increase £1,317); Calcutta, £393 increase; Cape Town (month of September), receipts £15,174, expenditure £8,503; Isle of Thanet Electric, £33 decrease; Lisbon Electric (month of September), receipts 89,636 milreis, expenses 51,231 milreis; Mexico Electric (month of August), receipts £48,600, expenses £27,900; Perth Electric, £139 increase; Port Elizabeth (month of September), receipts £3,730, expenditure £2,767.

Aberdeen.—At this week's meeting of the Tramways Committee a report was submitted by Mr. Moonie, tramway superintendent, with reference to the possibility of getting suitable car tops to be used during the winter. Mr. Moonie reported that no portable top had yet been invented that was of any practical value, the only thing which he had seen being a double-topped car, which had been constructed with the top upon it. The committee remitted the matter back to Mr. Moonie, in order that he might make further enquiry. Loans and mortgages to the amount of £25,000 were renewed, and authority given to borrow other £25,000 to pay for lines at present being constructed. The convener reported that the newly-opened Torry route was doing very well, £143. 11s. 8d. having been drawn during last week. This was considered very satisfactory for a start.

Finsbury.—A letter was received from the London County Council at the last Borough Council meeting stating that they propose at an early date to proceed with the construction of the tramways in St. John-street and St. John-street road, and asking the consent of the Council to the tramway in Rosebery-avenue being also constructed at the same time, it being a condition imposed by the Act authorising the latter tramway that such consent shall be first obtained, unless and until the tramways in St. John-street and St. John-street-road and certain widenings in Goswell-road shall have been completed. The Clerk said the old Clerkenwell Vestry had opposed this scheme, and had said they were willing to give their consent for trams to run up Rosebery-avenue as soon as certain things were carried out in Goswell-road and St. John-street-road. It was the wish of the London County Council to start the tramway scheme without further delay, and at the same time they were anxious to carry out this work under one contract.

Yarmouth.—The Corporation are in negotiation with the Yarmouth and Gorleston Tramways Company for the purchase of their property. The Tramways Committee at their last meeting further considered the extensions necessary in the tramways at the south end of Gorleston. The borough surveyor stated that, as England's-lane would, under the provisional order of the company, have to be widened before the tramway could be worked by electricity, it would be cheaper to take another route, and he recommended that the line should be taken up

Digitized by Google

Lowestoft-road to Lower Cliff-road, down Lower Cliff-road, and by a bridge over Beach-road to the quay, and then southerly to the eastern end of the Gorleston Shelter Hall. A sub-committee appointed to view the locality reported in favour of a suggestion to continue the present line along Lowestoft-road to Springfield-road, and to take a second line from the tramway terminus, through Baker-street, The Plain, Pier-walk, and the quay, to the Gorleston Shelter Hall, the estimated cost being £11,400. This was agreed.

Chester.—At a recent meeting of the Tramways Committee of the Corporation, a letter was read from Messrs. Robert Blackwell and Co., Limited, the contractors for the tramways, confirming a settlement for the sum of £33,210, stating that they had incurred a large pecuniary loss on the contract, and requesting the committee to add to the sum mentioned the amount of £500, this being a proportion of the extra cost entailed by delays and difficulties which they outlined. The Electrical Engineer said there were a few items still remaining to be adjusted with the contractors, and it was resolved that consideration of the foregoing letter be not entertained until the items in dispute are settled. A statement of accounts were submitted showing that the total cost of construction approximated very closely to the figure mentioned in the report of the engineers of July 21, 1902, and that the total cost of acquisition of the tramways company's undertaking, construction, and equipment will be about £66,270. The manager again submitted a gratifying report as to traffic returns. School children's tickets continued to increase in popularity, and the earnings of the workmen's cars again showed a slight increase.

Londonderry.—Mr. Hinde, C.E., of the Board of Works, has held an enquiry into the Londonderry to Moville proposed electric railway. Mr. A. M'C. Stewart, C.E., explained the plan. The railway, of 3ft. gauge, started from the Rock, came out into the Strand-road beyond the Lough Swilly terminus, crossed the Lough Swilly Railway at Pennyburn, and went on to Moville. There was a small line connecting with the Harbour Commissioners' tramway, for the purposes of goods traffic. The line followed the road, and was on the road level save at two points. One was at Culmore (at the long hill), where a deviation took place, in order to get nearer the village and avoid the hill. The line emerged again at Liberty Bridge, Muff, and passed through Muff. The second deviation was at Quigley's Point, where for three furlongs the line left the road, going nearer the Lough. The generating station would be at Kerrykeel. The line terminated in the grounds of Ark House, Moville. The steepest gradient was 1 in 15, the ruling gradient being 1 in 25. The sharpest curve was three chains. Mr. Edward Rotter, consulting engineer, gave evidence of the absence of engineering difficulties, and the enquiry terminated.

Manchester.—Mr. J. M. M'Elroy, general manager of the Corporation tramways, has prepared a report on the half-year's working ended Sept. 30 last. The report shows that the traffic revenue amounts to £315,970. 17s. 5d., and other revenue to £4,298. 0s. 8d., making a total of £320,268. 18s. 7d. Working expenses (including depreciation, £35,027) were £228,496. 19s. 6d., so that there was a gross profit of £91,771. 18s. 7d. This it is intended to apply as follows: interest, £24,302. 7s. 11d.; sinking fund, £12,605. 10s. 4d.; rent of lines, £10,858. 6s. 7d.; and leaseholds, £600, the net profit being £43,405. 13s. 9d. Mr. M'Elroy points out that the half-year, embracing as it did the whole of the summer traffic, would, of course, show a much better financial result than the coming half-year, and consequently it would be fallacious to estimate the financial results for the year on the basis of the first half-year's profit. A proposal by a private individual for a form of underground electric tramway two and a-half miles in length, with the object of connecting up the five big railway stations in the centre of the city, is being considered by the Parliamentary Sub-Committee of the Corporation. The last horse-car in the city was removed from the tramways last week.

Huddersfield.—At Wednesday's meeting of the Town Council, on the recommendation of the Tramways Committee, it was decided to withdraw the system of merit rewards for employés in consequence of objections raised by them. The financial report showed a surplus of £2,914. 3s. 10d. for the half-year ended Sept. 30, but the statement does not include any provision for depreciation. In the course of discussion a councillor objected to the committee's action in obtaining car gear wheels from an American firm. He was informed that the wheels could have been obtained from the works of a firm at Crosland Moor, It was stated that the wheels came from the Westinghouse Company in Manchester. Mr. Dyson: That company is run with American capital. Mr. T. H. Moore (chairman of the Tramways Committee): It employs British workpeople. Mr. Dyson: And brings many from America. Mr. Moore remarked that the committee were most anxious to keep what work they could at home, but in this case it was thought best to get renewals from the firm which supplied the machinery originally. The problem of fares was a difficult one, and the committee had not been able to follow their consideration of the subject with action. That must be left to a future committee. There was a very substantial depreciation fund. The committee's minutes were then adopted.

Stretford.—The Light Railway Commissioners have issued their decision in regard to the enquiry held by them on Oct. 2 into the applications of the Stretford Urban District Council and the West Manchester Light Railways Company for orders to authorise the construction of light railways, and they are prepared to submit orders to the Board of Trade in respect of the same. The Commissioners have noted the observations made at the enquiry on behalf of the Stretford Urban District Council and of the Lancashire County Council as to the necessity of provision being made for the public safety in respect of the use of the railways within Trafford Park for passenger traffic, and for this and other reasons they are of opinion that these railways should be under some statutory form of authority and control. They therefore propose to insert provisions in any order authorising the new lines of the West Manchester Light Railway Company to ensure that the working of such traffic shall be conducted to the satisfaction, having regard to the public safety and otherwise, of the Board of Trade. In coming to this conclusion the Commissioners were of opinion that any future alteration of the facts and the law as to the roadways in Trafford Park is at present uncertain, and that it was necessary for them to deal with the matter upon circumstances as they now are.

St. Petersburg.—According to our Russian contemporary, *Elektritcheskij Wiestnik*, the Russian branch of the American Westinghouse Electric Company at St. Petersburg recently made an offer to the Municipality in which it proposed to change over all the existing tramway lines in the city now using animal traction to electric railways. The construction work, according to this proposition, is to be carried out entirely with Russian workmen, and no material to be used not exclusively of Russian production, the work to be completed within four years. The change from animal to electric traction is to be carried out on plans which have been already adopted by the Interior Department. The cost of the project has been calculated at 27,000,000 roubles within the city limits and 34,000,000 roubles if the lines are to be extended to Sosnooka in order to connect with the city the new Polytechnic Institute of St. Petersburg. All the rolling-stock was to be supplied by the Westinghouse Company at a special rate, to be established by the Municipality. The amount required for the motor-cars, which are to number 500 at least, will be about 5,000,000 roubles. The requirement is that the work on both the existing tramway systems is not to interfere with the horse car traffic. Should the city department decide to accept the proposition, the Westinghouse Company will deposit 300,000 roubles, but with the right to withdraw that sum in case the city does not sign the contract within three months after the proposal is adopted.

Liverpool.—Mr. Bellamy, the general manager, has reported upon the question of laying double lines in Everton-road from the Necropolis to Fitzclarence-street (a distance of 495 yards). He has prepared plans and a report showing that before double lines can be laid it will be necessary for several gardens to be set back. The work is to be proceeded with. The closing meeting for the municipal year of the Tramways Committee was held last week. Sir Charles Petrie, the chairman, said that the general public ought to feel grateful for the work which the committee had done. As to the progress of the tramway system, he pointed out that while, during the nine months ending September of the year 1897, the passengers carried numbered about 29 millions, the number was now 64 millions, or an increase of 192 per cent. The mileage, too, had increased from 4,489,000 to 8,713,000, and the traffic returns from £219,000 to £393,000. During the present year the abnormal weather had prevented a much higher increase in passengers and receipts. Rain fell on 117 days out of a total of 273 under review, against 102 wet days for the corresponding period of 1902, and 90 during the same period of 1901. In May last an important departure was taken, consisting of an arrangement with the South Lancashire Tramways Company for through running of their cars between St. Helens and the Pierhead. He did not know whether the present arrangement would continue, because only that morning he had had an interview with the chairman of the company, and he was afraid the company felt that the Corporation were perhaps getting too good a bargain. However, the arrangement would probably go on to the end of the year. The question of the extension of the tramways beyond the city boundaries in or two directions had been casually under the notice of the committee, and an inspection of the roads from Wavertree by way of Gateacre and Woolton to Allerton, returning *via* Calderstones-road to Smithdown-road, and also between Garston through Speke and Hale to Widnes, had been made, and this was a matter which would be brought under the further notice of the committee at an early date. Concluding, he alluded to the excellent services of the general manager (Mr. Bellamy) and his staff.

Plymouth.—The borough treasurer has issued his statement of the tramway accounts for the half-year from April 1 to Sept. 30 last. On the credit side the receipts were: Compton section, £6,416. 11s. 9d.; Peverell Park, £3,203. 11s. 3d.; Prince Rock, £4,384. 19s. 4d.; Beaumont-road, £1,689. 14s. 3d.; West Hoe, £525. 18s. 8d.; advertising and sundries, £217. 2s. 7d.—making a total of £16,437. 17s. 10d. The disbursements for the half-year were: salaries and wages, including proportion of town clerk, borough surveyor, and borough treasurer's salaries, £3,528. 14s. 1d.; repair of cars and wages of car-cleaners, £697. 11s. 2d.; electric current, £3,129. 1s. 4d.; repair and maintenance of track, £662. 10s. 11d.; overhead equipment, £54. 2s. 8d.; establishment charges and uniforms, £413. 18s. 11d.; stables, £333. 10s. 9d.; rent, rates, and taxes, £678. 3s. 8d.; miscellaneous, £164. 1s. 3d.—making a total expenditure of £9,670. 19s. 7d., and leaving a gross profit of £6,766. 18s. 3d. To the gross profit carried to the net revenue account was added £591, half-year's contribution from the Plymouth, Stonehouse, and Devonport Tramways Company in respect of the Union-street line, and some smaller items—making altogether £7,570. 13s. 3d. Out of this was paid dividends and interest, £2,127. 15s. 10d.; redemption of stock, £2,193. 2s. 8d.; and special redemption fund, £130. 16s. 8d.—making a total of £4,451. 15s. 2d., and leaving a net profit on the half-year's working of £3,118. 18s. 1d. Compared with the corresponding period of last year, the receipts have increased by £1,907. 17s 1d., while the expenditure has been reduced by £1,855. 4s. 9d., and the net profit has, in consequence, grown from £793 to £3,118. The increase of receipts is almost wholly due to the Compton and Peverell Park lines, which together have brought in £1,612 more than the Compton line did last year, Peverell Park not having then been opened. On the Prince Rock section the receipts increased by £345, but on the Beaumont-road line there has been a reduction of £173. On the debit side the large saving of £1,256 has been effected in the cost of electric current, although more current has been consumed. This saving is due entirely to the reduction in the price of

Digitized by Google

the current of from 3d. to 2d. per unit. Nearly £200 has also been saved in the car-shed by a reduction in the staff. The net profit of over £3,000 will enable the committee to materially reduce the suspense account, consisting of accumulated deficiences, which at Lady Day last stood at £5,000.

London County Council.—From the fact that the County Council have accepted a tender for a new steel cable for the tramway route between Kennington and the Streatham terminus, it would look as if the section will not be electrified just yet. It will be remembered that in the original scheme this was put down as the last route to be converted to electric traction in South London. Among tramway matters touched on at the usual weekly meeting of the Council on Tuesday was a report brought up by the Highways Committee with reference to the northern tramways. The committee stated that in the North Metropolitan Tramway Company's system are several short lengths of tramway within the county, but not forming part of the system included in the lease of the London County Council tramways. The North Metropolitan Company have recently taken steps to reconstruct for electrical traction the portions of tramways referred to, having obtained the consent of the Board of Trade to the system of traction proposed to be used. The work is being carried out under the powers conferred upon the company by the North Metropolitan Tramways Act, 1897. This Act, however, limits the period for the completion of the work to two years from the date of its becoming law, and the company are, the committee are advised, acting illegally in proceeding with the work. It appears to them, they say, that as the tramways affected are purchasable by the Council, and will probably be worked in conjunction with the lines that are the subject of the lease, it is most important that the Council should have a voice in the system of traction to be adopted. Holding this opinion, the committee have given instructions for an action to be instituted to prevent the company proceeding with the works. In a further report the committee recommended the Council not to exercise for the present their powers of purchase in respect of the Highgate-hill tramways and the London, Camberwell, and Dulwich tramways. The Improvements Committee brought up a report as to the cost of local improvements, and Mr. Benn made the following statement with regard to tramways. He said it seemed to be necessary to correct an impression that the Council wanted to push their tramways everywhere, but from the state of the finances it seemed pretty clear that the Council had as much tramway business on hand as they could deal with at present. The matter therefore resolved itself into this—that if the local authorities did not want the tramways they must be prepared to wait for their improvements. He thoroughly believed in the justice of the one-third contribution from the local authorities. The average earnings of the electric trams have so far proved to be 13·47d. per car mile, against 10·42d. with horse traction. This exceeds the estimate, which was 1s. per car mile. On Monday morning this week much inconvenience was caused by a mishap to an electric car at St. George's-circus, Southwark. The rails and footpaths eventually became blocked, and the omnibuses and other vehicles were much impeded by the dense crowd awaiting seats. The accident is stated to have occurred through a Camberwell-green car getting stuck at the points, and a breakdown gang had to be sent for to put matters right. There is an agitation going on just now to endeavour to obtain seats for the use of the motormen on the cars. Three petitions are now being prepared for presentation to the County Council on the subject.

LIGHTING AND GENERAL.

Harrogate.—Some small extensions of mains have been authorised.

Battersea.—Arc lamp standards are being erected along Latchmere-road.

Leek.—The Urban District Council are raising £9,281 on electricity account.

Uxbridge.—The agreement with the electric supply company has been sealed.

Hammersmith.—A number of additional electric lamps are being provided in various streets.

York.—The Town Council have obtained sanction to borrow £10,800 for electric supply extensions.

Leeds.—During the past month electric installations have taken place in 10 places of worship in the city.

Sheffield.—The Council are about to apply for sanction to a loan of £10,000 for the purchase of motor for hiring.

Croydon.—An enquiry has been held into the Council's application to borrow close upon £30,000 for electricity supply purposes.

Globe Telegraph and Trust Co.—An interim dividend of 2s. per share is announced by the directors, payable on the 31st inst.

Doncaster.—The 125 storage cells now at the workhouse, and the standard lamps used for the outside lighting, are to be disposed of.

Prestwich.—Satisfactory arrangements for taking over the Council's electric lighting order have been made with the Salford Corporation.

Panteg.—The electric power company have decided not to proceed with the laying of their cable over the Pontrhydyrun River Bridge.

Sandgate.—Sandgate is to be lighted by electricity, and the Folkestone Electric Company have commenced the work of installation.

Hove.—An enquiry has been held into the Town Council's application for sanction to borrow £5,000 for electric lighting at Aldrington.

Cheshunt.—The proposed agreement with the electric lighting company will come before the next meeting of the Urban District Council.

Change of Address.—Messrs. W. T. Henley's Telegraph Works Company, Limited, have removed to 13 and 14, Blomfield-street, London-wall, E.C.

Bury.—The electrical engineer in his last report states that the number of consumers of current was 366, and the number of 8-c.p. lamps in use was 37,871.

Aberavon.—The Port Talbot Docks Company propose to ligh the road from the borough to the docks by electricity at an actual cos of £500 and annual cost of £109.

Tredegar.—The District Council have decided to light the village of Bedwellty pits with electric light supplied by the Tredegar Iron and Coal Company at 4d. per unit.

Watford.—The following scale has been adopted for charging motorcars: 4d. per cell up to 15 ampere-hours capacity; over that rate, *pro rata*. Minimum charge, 1s.

Saffron Walden.—Application is to be made for a provisiona order enabling the Corporation to supply electrical energy for both public and private purposes within the borough.

Hertford Asylum.—We understand that the County Council have adopted a report recommending a vote of £3,000 for an electric light installation at the county and city asylum.

Worcester.—Mr. Sutherland proposes that eight lamp-pillars be removed and arc lamps placed instead on the tramway poles near by. The cost of the alteration will be about £9 per lamp.

Callender's Cable and Construction Co.—The directors have decided to pay, on Nov. 2, an interim dividend of 5s. per share, being at the rate of 10 per cent. per annum, on the ordinary shares.

Dorchester.—The Town Council have decided to apply for a loan of £16,000 for the purposes of lighting the town with electricity. A ratepayers meeting will be held next Monday with regard to this question.

Poplar.—The Electric Lighting Committee of the borough report that, after meeting the deficiency of £392 at the beginning of the year, there remained a balance of £3,902 to be carried forward to the next account.

Dalkeith.—We understand that the position of 22 arc lamps proposed to be erected in the compulsory area of the burgh has been settled. The lamps will be in two sets of nine in series and one of four in series.

London County Council.—At Tuesday's meeting it was agreed to lend the Hampstead Borough Council £1,273 for street-lighting purposes, and the St. Pancras Borough Council £23,960 for electric light installation.

Limerick.—Mr. Enright, consulting engineer for the electric lighting scheme, has just been testing the works, etc., previous to the charge of the electric lighting being given over to the Gas Committee for the Corporation.

Faversham.—The Town Council have decided upon the erection of five additional arc lamps, making in all 10 such lamps, and they are about to ask the Maidstone Corporation to permit them to visit their electric lighting works.

Fife.—The County Council have decided that the expense of opposing the Fife Electric Power Bill, including the opposition by Kirkcaldy District Committee, and amounting in all to £239, be paid out of the general purposes fund.

South London Electric Supply Co.—This Company reports having sold during the first nine months of the current year 2,788,400 units, as against 645,000 units for the corresponding period of last year, showing a gross revenue of £27,065, as against £13,436.

Southwark.—At the last meeting of the Council the Chairman of the Electric Lighting Committee said that although the electric light station was producing an additional 200,000 units, the working expenses of the undertaking would be even less this year than last.

Stock Exchange Settlements.—Application has been made to the Stock Exchange Committee to appoint a special settling day in and to grant a quotation to Auckland Electric Tramways Company, Limited, £200,000 5 per cent. first mortgage debenture stock.

Aberystwyth.—The electric light company and the gas company are exhibiting test lamps, with the view of securing the order for lighting the promenade extension. The Town Council are asking the electric light company for their terms for lighting the new promenade.

Radcliffe.—The surveyor has been instructed to prepare specifications and quantities for the construction of the switchboard and engine and dynamo galleries. The question of the arrangement for offices, etc., at the electricity works has been referred to the Works Sub-Committee.

Hull.—The electrical engineer's last report states that the following number of units was sold by the Corporation in the past month: traction, 35,632 (an increase of 4,461 as compared with last year); public lighting, 7,016 (an increase of 579); private consumers, 15,982 (an increase of 6,089).

Harrow.—Important developments of the electric lighting company's business at Harrow are under consideration. It is reported that new engineering features are to be introduced with the object of promoting more economical working, and the tariff of charges for electrical energy is to be reduced.

Westminster.—The City Council have made an agreement with the Westminster Electric Company for the supply of electricity for lighting purposes at 3½d. per unit, and propose to make a representation to the Board of Trade with regard to the prices charged by the various companies in Westminster.

Clitheroe.—At the last Town Council meeting the appointment of a sub-committee was confirmed to consult an electrical engineer as to whether it was desirable to proceed with the application for a provisional order for electric lighting, and, if necessary, to engage him to prepare an estimate of the cost of works and land.

Digitized by Google

Suffolk.—In the last report of the Visiting Committee of the county asylum appears a statement from the architect, Mr. A. J. Wood to the effect that the accounts for the electric installation had been adjusted as follows: Messrs. Reavell and Co., Limited, generating plant, £2,287. 2s. 9d.; Messrs. G. N. C. Mann and Co., wiring and fittings, £3,150.

Producer-Gas Engines.—We are informed that Messrs. Mander Bros., of Wolverhampton, have placed with the British Westinghouse Electric and Manufacturing Company, Limited, an order for the supply and erection of a producer-gas engine coupled to a 100-kw. electric generator. The engine will be of the Westinghouse, three-cylinder vertical type.

Oriental Telephone and Electric Co.—The directors have declared an interim dividend of 3 per cent. on the ordinary shares of the Company, free of income tax, payable to those shareholders whose names are on the register at this date. The warrants will be posted 31st inst. The transfer books will be closed from the 22nd to 31st inst., both days inclusive.

Eastbourne.—There has been a very marked diminution in the cost of the electric light at St. Saviour's Church. Recently the churchwardens expended £70 in improving the fittings and ensuring proper control, and they are now reaping their reward. There has been a saving of about £12 during the last nine months, as compared with the same period in 1902.

Penmaenmawr.—The Urban District Council having discussed a recommendation that the offer of Messrs. Lacey and Sillar, Manchester, to prepare a report on the district in connection with the proposed installation of electric light, for an inclusive fee of 25 guineas, be accepted, decided to accept Messrs. Cruse and Handcock's offer to prepare a report as required for 10 guineas.

Leadgate.—Arrangements have been made by the Northern Counties Electricity Supply Company, Limited, by which it is expected that a supply of current for lighting and other purposes will be ready for the district in the early part of the new year. The company then will be in a position to tender for the public lighting of the district, including Crookhall, for the season 1904-5.

Edinburgh.—We refer elsewhere to the Corporation electricity accounts for the year ending May 15, 1903. Since these accounts were printed the charge for electricity for motor power has been reduced to 1½d. per unit, and the charge for arc lamps to £11 per annum. One-hundred and fifteen new arc lamps are now being erected. When these are completed, the total number of public street arc lamps will be 995.

Western Telegraph Co. — The directors, after transferring £35,000 to the general reserve fund and £2,000 to the maintenance ships reserve fund, recommend a final dividend of 3s. per share, making, with previous distributions, a total dividend of 6 per cent. for the year ended June 30, 1903, and also a bonus of 2s. per share, both free of income tax. The balance of the account is carried forward.

Perthshire.—Mr. Duff, S.S.C., and Mr. Vaudrey, both of Edinburgh, last week discussed with a committee the proposal of a water-power electrical scheme for Perthshire, and whether, in the event of such a scheme being carried out, the Corporation of Perth would take a supply of electricity. After an interchange of views, it was arranged that Mr. Lambert, the electrical engineer, should give the engineers certain information as to the lighting.

London Gazette.—At an extraordinary general meeting of the Yorkshire Electric Power Syndicate, Limited, held at the registered office of the syndicate, 4, South-parade, Leeds, on Sept. 29, 1903, the special resolution was passed, and at an extraordinary general meeting of the syndicate held at the same place on Oct. 15, 1903, the special resolution was confirmed: "That the Yorkshire Electric Power Syndicate, Limited, be wound up voluntarily."

Electric Power in Ireland.—The *Sheffield Telegraph* learns that an industrial scheme, which owes its origin to a few Yorkshire capitalists, is being prepared to utilise the vast water supplies of Ireland in the production of electricity and its sale in bulk for manufacturing purposes. There is also another scheme in contemplation to supply electricity and power gas in the North of Ireland. These projects are to come before Parliament next session.

Govan.—The abstract of the burgh accounts for the year ended May 15 last has now been issued. The revenue-producing undertakings include electricity, tramways, baths, and private improvements. The electricity department commenced the year with a credit of £73 and ended with a debit of £168, making a total deficit of nearly £242. However, it should be borne in mind that no less than £1,300 falls to be collected for the summer months from May to September.

Strabane.—Mr. Llewellyn Preece and Mr. R. V. Macrory recently paid a visit to Strabane with a view to locating a site for the proposed electric light and power depôt, which the Ulster Power Company proposes establishing there in connection with their general scheme for the supply of electric light and traction power in the North of Ireland. The idea of the company is to establish electric power stations in Belfast, Portadown, Dungannon, Kilrea, and Strabane.

Walsall.—The last report of the Electric Lighting Committee states that the total number of consumers supplied on Sept. 30 last was 287. During the past month the total units generated at the station was 69,076. The total output from the main generators was 66,458 units. The total units from the transformers was 52,016 (estimated). The total units registered on the meters was 46,040. The machinery was run for 639 hours. The wages paid amounted to £117.

Hampstead.—The Lighting Committee in their last report state that during the three months ended September 8,881 8-c.p. lamps were connected for 136 customers, as against 6,450 lamps for 132 customers in the corresponding period last year. They also reported that a top load of 1,035 amperes was reached last week, against a top load last year of 945 amperes. Complaints are being raised in regard to an alleged nuisance arising from the emission of steam from the works of the Hampstead Electric Supply Company.

Hereford.—Electric light has been installed at the Hereford Constitutional Club, according to specifications prepared by Mr. F. G. Poulton, A.M.I.E.E., city electrical engineer. Messrs. Edwards and Armstrong, of 39, Broad-street, Hereford, were the contractors. The work had been executed in four weeks from the date of its commencement—*i.e.*, within the time specified. The installation consists of 80 16-c.p. lamps and the usual fittings, together with 11-way distribution boards. The light was switched on for the first time on Monday evening.

Finsbury.—At the last Council meeting the Works Committee considered an offer made by the County of London and Brush Provincial Electric Lighting Company to supply electricity in bulk for the purposes of street-lighting by not less than 100 arc lamps at the rate of 2d. per unit. The borough surveyor presented a statement showing that in the event of the borough adopting the suggestion, the cost of the columns, etc., and the electricity would be greatly in excess of the present cost of lighting. It was resolved that no further action be taken in the matter. This was agreed to.

Brighton.—The Council have adopted the following scale of charges for the supply of electricity to the outside authorities: for the first year, 7d. per unit for the first 200 hours' use in each half-year, and 1d. per unit for the balance; for the second and each subsequent year, such price as shall be agreed between the local authorities and the Council, and, failing agreement, as shall be determined by an arbitrator to be appointed by the Board of Trade; except as to price, the conditions of supply, including the right to make a minimum charge, should be those for the time being in force in the borough of Brighton.

Mansfield.—The engineer having obtained sufficient customers in the neighbourhood of Wood-street and Layton-avenue to justify the committee in extending the mains in that direction, it has been resolved that the mains be laid at an estimated cost of £971. 16s. 4d. The engineer has also been authorised to obtain six slot meters with a view to ascertaining as far as possible which in his opinion is the best to adopt in the borough. A letter from the Mansfield Woodhouse Urban District Council with reference to a supply of electrical energy to that Council has been referred to the engineer and consulting engineer for them to report.

Stratford.—The Town Council have received notices of intention to apply for provisional orders from the Empire Electric Light and Power Company, Limited, and the National Provincial Electricity Corporation, Limited. Messrs. Baker, Lees, and Co. have offered to put the Council into communication with a substantial company who would take over the powers granted by the provisional order of 1901 upon terms contained in the heads of agreement enclosed. It has been decided to apply to the Board of Trade for an extension of time for carrying out the undertaking, and at present not to accept Messrs. Baker, Lees, and Co.'s offer.

Hull Telephones.—The Town Council have received sanction to the borrowing of the sum of £43,202 for the establishment of a municipal telephone system. This is the actual amount applied for by the Corporation, as the result of the tenders accepted and other work in connection therewith. All the contracts were let some time ago on the understanding that the contractors were to proceed with the installation of a competitive system in Hull if the Local Government Board sanctioned the application of the Corporation for borrowing powers. The Corporation have already received a large number of applications to become subscribers, and it is expected that the first one will be connected six or nine months hence.

Canterbury.—An enquiry has been held into the Town Council's application for sanction to borrow £4,000 for purposes of electric lighting. The sum applied for was made up of £2,383. 3s. 8d., excess on the loan of June, 1901, and £1,616. 16s. 4d. for new works; £1,016 of the excess was made up of the cost of cable extensions in order to carry a light to persons who wished for a supply. The new works included a further supply of meters, indicators, and further cabling. Mr. Blascheck stated that they had in Canterbury over 20,000 8-c.p. lamps connected at the present time, and the increase was about 20 per cent. per annum. The mains were laid direct in the ground, and were keeping in good condition.

Greenock.—In the five weeks ended Oct. 3 141,590 units of electricity were generated at the Corporation works, as against 94,723 in the corresponding month of last year. A system of free wiring by the Corporation was agreed to at Wednesday's meeting. It was resolved to decline to agree to the proposal of the Parish Council, in relation to Smithston poorhouse and asylum, to forego the guarantee of a minimum payment; but as an alternative to the former offer the engineer was authorised, in the event of the Parish Council deciding that no other artificial light is to be used at Smithston, to offer a supply of electricity, on the understanding that the quantity to be taken would not be less than 20,000 units, which would be charged at the special rate allowed to public institutions.

Aberdeen.—At the last meeting of the Fires and Lighting Committee of the Town Council, the electrical engineer, in regard to complaints as to occasional temporary failures of the street electric lights, stated that he had made alterations and improvements on the cables with the view of preventing the lamps going out in future. He is about to report as to the necessary conditions to be attached to the supply of light from tramway mains where lighting cables are not laid. The Works Committee of the City Parish Council have received five tenders for the electric lighting of Oldmill poorhouse, four from Aberdeen firms and one from a Glasgow firm. That of one of the Aberdeen firms, amounting to £2,001, was the lowest, and it was agreed that it should be accepted, subject to its being in accordance with the schedules on its being extended.

Digitized by Google

Rutherglen.—The Glasgow Corporation have arranged with reference to the application of the Town Council for a supply of electrical energy within the burgh that, if the Town Council of Rutherglen are prepared to apply in December to the Board of Trade and obtain a provisional order containing clauses repealing the powers of the Clyde Valley Electric Power Company, Limited, to supply electrical energy within the burgh in competition with the Town Council or their assignees, and empowering the Town Council, if they think proper, to transfer the order so obtained to the Corporation of Glasgow, the Corporation should agree to take from the Town Council a transfer of the order upon such terms and conditions as may be hereafter mutually agreed upon.

Natal.—From the recent report for the year 1902 of Mr. Charles J. Crofts, harbour engineer of the colony, we learn that various new plant was erected, including a combined set by the General Electric Company. The switchboard was extended, and the laying of the underground mains for arc lighting of the quay side; erection of standards, etc., was put in hand, and made good progress. One mile of cable was laid in pipes, and 13 manholes built; 1,358 lineal feet of cable was laid for lighting, etc., and 12 additional arc light standards were erected on concrete foundations. In November a trial trip was made with an electric launch which had been received from the Thames Valley Launch Company. Most of the members of the Advisory Board were present, and everything worked well.

Cape Town.—During the month of July 166,683 units of electricity were generated at the Cape Town electric lighting works, of which 31,147 were consumed for the purpose of street-lighting, 116,365 by private consumers, 2,000 upon the works, 8,000 units for meters, and 9,171 distribution losses, etc., the net revenue accruing from the supply of current to private consumers being £4,925, as compared with £4,064 for the month of July, 1902, the average price paid during July, 1902, being 10·15d. per unit, and for the year from Jan. 1 to July 31, 1903, 10·9d. The total number of private consumers has been 1,091, and the equivalent number of 8-c.p. lamps 67,000; whilst motors have been employed to the extent of 1,063 h.p., as compared with 810 private consumers, with an equivalent of 54,700 lamps, and motors to the extent of 642 h.p. during July, 1902.—*S. A. Exports.*

Fulham.—The Electric Lighting Committee in their last report comment upon a report from the borough electrical engineer pointing out that the charge of £20 per annum for public arc lamps is far below the actual cost, and that basing the charge upon the Council's present sliding scale, and adding 1d. per unit for labour, repairs, carbons, etc., it would work out at £34. 19s. 4d. per annum. The committee do not consider it advisable to increase the charge to so large an extent, but recommend that in future £25 per annum be credited to the electric lighting account for each public arc lamp. It is proposed that the loan of £13,509, in connection with the Council's electric light and dust-destructor undertaking, be taken up on the terms mentioned by the London County Council, and that the Council undertake to provide out of a sinking fund established for that purpose, or from maintenance account, for all renewals and replacements during the currency of the loan of £1,371 (part of the loan of £13,509) of plant or machinery provided with the proceeds thereof.

Redditch.—A special meeting of the Urban District Council was held on Tuesday. So far about £20,000 has been spent upon the electric works, but the Council have for some time past exhausted all their capital, and a new loan is now contemplated. The Council was induced to try a new gas-engine built by a Rugby firm, but this, after about a year and a half of experimenting and alterations, had to be taken away. The same firm then contracted for the erection of another new 300-h.p. gas-engine, but at the final test a few days ago it was found that the engine would not take anything like the stipulated load, and the committee decided to recommend the Council to call upon the contractors—Messrs. Willans and Robinson, Rugby—to remove the engine. Messrs. Willans and Robinson contended that the failure of the engine at the time of the test was due to the supply of gas being inadequate, and protest against the "harsh and arbitrary" action of the Council, and they were granted a further extension up to Nov. 1. The firm have offered in the meantime to put down a steam set to guard against any possible fear of loss of power until they had put the engine and plant in working order.

New Firm.—Mr. C. H. Wordingham, upon his acceptance of the post of electrical engineer-in-chief to the navy, has disposed of his consulting practice to Mr. Thos. L. Miller, M.I.C.E., who has carried on a similar practice for a number of years from his offices in Liverpool and London. Mr. Miller is arranging to complete a number of works undertaken by Mr. Wordingham, and has taken over the offices of the latter, and is continuing to practice from that address as well as from his own office, 7, Tower-buildings N., Water-street, Liverpool, and at 61, Old Broad-street, London, E.C., under the style of Miller and Collins. He has also arranged to take into partnership Mr. H. W. Wilson, who has for a considerable time been engineer to the Lancashire branch of the British Thomson-Houston Company, Limited, of Rugby and London. Mr. Miller's and Mr. Wordingham's former practice will in future be carried on in the name of T. L. Miller and Wilson at both the Liverpool and Manchester offices. We are informed that Mr. Wilson has had considerable experience in the electrical driving of factories, having devoted special attention to the electrical operation of textile machinery, in which class of work the British Thomson-Houston Company made numerous experiments.

King's Lynn.—The electrical engineer in his last report stated that since the last meeting applications had been received for 232 additional lamps of 8-c.p. or equivalent, making a total of 16,442 from private consumers, the applications including power for two motors, making a total of 425 consumers. He also reported that the outside electrical work in connection with motors, meters, and testing of wiring was getting very heavy, and it would require a competent electrician to deal with it, and that the most economical way of dealing with it would be to appoint two switchboard attendants in place of the third assistant (who resigned last May), which would set the first assistant partly at liberty from the station to attend to outside work. In consequence, Messrs. G. W. Johnson and E. Williamson, who have been trained at the work, were appointed switchboard attendants at 15s. per week each. The engineer submitted the following statement: units generated, August, 1903, 22,977 (1902 16,765); units sold to private consumers—light and power, 11 633 (5,993); units sold at power rates, 4,793 (1,409); cost of fuel, stores, repairs, and wages at station, £93. 11s. 1d. (£88. 15s. 8d.); cost per unit generated, 0·97d. (1 27d.); wages of lamplighters and outside staff, £17. 16s. 5d. (£16. 2s. 7d.).

Hackney.—The following report of the Electric Lighting Committee is under consideration: "We have been negotiating for several months with the Great Eastern Railway Company with a view to persuading them to light their stations in the borough by means of electricity. After discussing various methods of charging for the supply, we find that the only one which would prove satisfactory to both parties would be a charge of 8d. per unit for 100 units per kilowatt of the maximum demand per quarter and 2d. per unit afterwards. On this system the average price to be paid by the company would be as follows: hours use of maximum demand per quarter, 100; average price per unit, 8d.; 200, 5d.; 300, 4d.; 400, 3·5d.; 500, 3·2d.; 1,000, 2·6d. A supply on this basis can be profitably given, and we therefore beg to recommend that the tariff for electric energy used for the purpose of lighting railway companies' premises be at the rate of 8d. per unit for the first 100 units per kilowatt maximum demand per quarter and 2d. per unit afterwards." Current is to be supplied to the Eastern Hospital at a cost of £340, including the provision of a new feeder pillar at Brooksbys-walk, £75; distributor to Eastern Hospital, £265. The Council are obtaining from the London County Council a loan of £906 for electricity supply mains.

Bradford.—A proposal to supply current to the Cartwright Exhibition has been referred back to committee. It was proposed to bear the cost of laying the requisite cables, and to supply the current for lighting purposes at 2½d. per unit and for motive power at 1½d. per unit, these charges to be net, and to include a free supply of incandescent lamps, such lamps to be returned at the close of the exhibition. It was also proposed to grant to the Exhibition Committee the free use of the coloured celluloid lamps (about 900 in number) belonging to the Electricity Committee, on condition that any damage to the lamps should be made good by the Exhibition Committee. The total units of electricity sold for all purposes during the past 12 months have been 9,124,223, as against 4,901,172 for the previous year, being an increase of 4,223,051, whilst the equivalent number of 8-c.p. lamps connected was 239,509, as against 207,176 for the previous year, representing the very large increase of 32,333. The number of motors connected to the supply at June 30 last was 1,018, as compared with 913 at Dec. 31, 1902, showing an increase for the half-year of 105. The Baths and Team Labour Committee have decided to recommend the establishment of medicated and electric baths in connection with the new Morley-street scheme.

Cardiff.—The electrical engineer (Mr. A. Ellis) presented a very satisfactory report for the month of September to the Lighting Committee on Tuesday. He stated that there are 901 consumers of the municipal electric light, equivalent to 89,438 8-c.p lamps, against 58,096 last year—an increase of 54 per cent. The units generated were 220,815, against 116,689 for the corresponding month last year—an increase in output of 88 per cent. The revenue for the month was £2,658. 2s. 11d., compared with £1,600 for September, 1902—an increase of 72 per cent. The committee's reserve fund now amounts to £2,175. As a number of consumers have refused to admit meter-readers because they had nothing to show that they belonged to the department, it has been decided to provide the men with uniforms. A number of residents of Clifton-street attended to ask that the street should be lighted with electricity. The Chairman (Alderman P. W. Carey) said the committee hoped soon to get the consent of the Corporation to erect 13 lamps in this street. Subsequent to the meeting the members visited the central sub-station in the basement of the fish market, and, after inspecting the battery of accumulators, Alderman Carey, the chairman, set in motion for the first time the new electric booster lately supplied to the Corporation by Messrs. T. Parker and Co.

Grimsby.—Mr. Vignoles, electrical engineer, in a report adopted at the last meeting of the Public Lighting Committee, stated that the increases over last year were 4,461 units for traction, 579 for public lighting, and 6,089 for private consumers. The work in connection with the sub-station in Riby-square was well in hand. The laying of the cables was now complete. With reference to the suggestion contained in his last report, that a power consumer should be supplied with current during the daytime at 1d. per unit under certain conditions, the engineer suggested that a rental be charged for the time switch, to cover not only the cost of the switch, but also a portion of the interest on the service connection and office expenses. These charges might be as follows: for motors up to 5 h.p., £2 per annum; above 5 h.p. and up to 10 h.p., £2. 10s.; above 10 h.p. and up to 20 h.p., £3; and above 20 h.p, £4 per annum. In the case under consideration the motor would be larger than 20 h.p., therefore an annual charge of £4 would be made. The total revenue, therefore, would be £120. 10s., and the extra cost to the department £73. 18s., or a net profit of £46. 12s., equal to 38 per cent. on the turnover. His suggestion was to cut off at present from dusk until 10 a m., but he anticipated that after some experience had been obtained it might be found possible to renew the supply at 9.30, or even at nine o'clock, but he did not think it will be possible in Grimsby to renew it earlier than that.

Elland.—Last Saturday saw the inauguration of the Council's refuse destructor and electric lighting installation. The erection of buildings, the laying down of destructor and steam-raising plant, and

Digitized by Google

the installation of electricity, has entailed an expenditure of about £17,000. The destructor consists of two cells, and will destroy one ton of refuse per hour. The electrical equipment consists of two engines and dynamos with a capacity of 280 kw., and there is storage for 700 ampere-hours. Mr. W. H. Eastwood (chairman of the Council) presided at the opening, and on behalf of the members of the Council presented to Mr. Sam Dyson (chairman of the Electricity Committee) a handsome electric reading lamp. Mr. Walter Emmott, the consulting electrical engineer, on behalf of the staff at the works presented Mr. Dyson with a telephone receiver. Mr. Dyson said in the buildings provision had been made for twice the present plant. The extra engine beds had been prepared and a condenser put in to deal with 1,000 h.p., and with the expenditure of another £2,000 they would be able to double the output. At present they were prepared to supply an equivalent of 10,500 8-c.p. lamps, and the battery was capable of storing 700 ampere-hours. There was already a demand for 2,000 8-c.p. lamps and 11 h.p. for driving purposes. Current would be supplied at 4d. per unit. The committee were also prepared for dealing with a tramway load, and if Halifax brought the trams to Elland they would be in a position to supply them with the necessary current.

Bridlington.—An enquiry has been held into the Council's application for sanction to borrow £26,500 for electric lighting purposes. The town clerk (Mr. A. E. Matthewman, B.A., LL.B.) stated that the Corporation had in May accepted provisionally eight tenders, amounting in all to £24,313. 14s. 11d. Engineering fees, costs, and contingencies brought the amount proposed to be borrowed up to £26,500. The proposed station, the freehold property of the Corporation, is situate in the central position. The Council had not yet come to a decision as to the site on which to erect the proposed destructor. The Corporation had obtained electric lighting powers under an order confirmed on June 25, 1900. A house-to-house canvass had shown that a considerable number of persons were desirous of using the electric light, besides which the Corporation would be large consumers, having at present for the Prince's-parade a small installation, and there would be the street lighting, which over the whole of the borough the Corporation proposed should be carried out by electricity. The Board of Trade had on Nov. 14, 1902, given their approval of the system. The plan of the buildings was explained by Mr. E. R. Matthews, C.E., borough surveyor, who stated that although there would be a good supply of water from the Corporation mains, it was proposed to sink a well in order to avoid risks. The buildings were so designed as to be easily capable of extension. In the regrettable absence, through severe illness, of Mr. F. H. Medhurst, B.Sc., M.I.C.E., his partner, Mr. Cyril E. Lloyd, A.M.I.C.E., gave information as the system, machinery, mains, and lamps.

Grantham.—Last week we shortly referred to the official opening of the Urban Electric Supply Company's station, performed, at the invitation of the resident engineer, Mr. W. E. Milns, A.I.E.E., by the mayor of the borough, Mr. William Hornsby, D.L. Three years ago parliamentary powers were obtained by the Corporation under a provisional order for the supply of electricity, and this order was subsequently acquired by the Urban Electric Supply Company. Messrs. Hockley are the contractors for the work, and they are already engaged in taking down part of the buildings in order to provide accommodation for more boilers. At present the boiler-house contains two 90-h.p. Hornsby water-tube boilers, each capable of steaming one engine with a full load. The boilers are fitted with Meldrum's patent stoker in combination with the same firm's forced-draught system. A third boiler is in course of construction. This will be another Hornsby, but of the new upright type. The feed pumps are by J. P. Hall and Co., of Peterborough, and are in duplicate. The water is drawn from a Boby feed-water heater and detartariser, in which the water is heated to nearly boiling point by the exhaust steam from the engines. In connection with this feed-water heater is a softening appliance and a grease extractor. An ample supply of water is obtained from a couple of specially constructed tanks. The steam-pipes have been supplied by Messrs. Stewart and Lloyd, of Glasgow, and the valves by Messrs. Dewrance and Co., of London. The engine-room is spacious, lofty, and well lighted, and contains two Belliss and Morcom engines of 136 h.p. each. They are of the compound, enclosed, quick-revolution, self-oiling type, and are direct-coupled to dynamos by Thomas Parker, of Wolverhampton, capable of supplying 3,000 lamps each. In connection with these is a set of balancer boosters, also by Messrs. Parker. The switchboard is Messrs. Edmundson's own pattern, made by Messrs. Kelvin and White, of Glasgow. The storage batteries are made by the D. P. Battery Company, of Bakewell, Derbyshire, and consist of 130 cells, each of 600 ampere-hours capacity.

PROVISIONAL PATENTS, 1903.

OCT. 12.

21858. Improvements in electrical switches. John Alexander Kennedy-McGregor and Harry Wren, 5, Corporation-street, Birmingham.

21875. Improvements in trolley heads for electrically-driven vehicles. George Varley, Penny Bank-chambers, Halifax.

21882. A new combination of motor and gearing for electric hoists and cranes. William Livingston King, 109, Farringdon-road, London.

21885. Improvements in or connected with the manufacture of electric lamps. Louis Heathcote Walter, 53, Victoria-street, London.

21921. Improvements in and relating to electrical fire-alarms. Wilhelm Kron, 81, High Holborn, London.

21898. Means for operating valves, cocks, taps, electric switches, and the like at predetermined intervals. William Player Miles, 62, Greyhound-lane, Streatham, London.

21909. Improvements in and relating to electric arc lamps. George Monroe Lane and Edgar Hiram Adams, 111, Hatton-garden, London. (Complete specification.)

21930. Improvements in or relating to means for preventing the fusing and flaring of electric wires carrying electric lights. Martin McDermott, 8, Quality-court, Chancery-lane, London.

21939. Improvements in and relating to signalling through submarine and like cables. Oliver Joseph Lodge and Alexander Muirhead, 18, Southampton-buildings, Chancery-lane, London.

21963. Improvements in wireless telegraphy. John Hodgson Lee, 115, Cannon-street, London.

21972. Improvements in dynamo-electric machinery. John Herbert St. Hill Mawdsley, Norfolk House, Norfolk-street, Strand, London.

21980. Improvements in and relating to electric arc lamps. Randolph Hulsart and Edgar Hiram Adams, 40, Chancery-lane, London. (Complete specification.)

OCT. 13.

21983. An improved trolley head for electric traction wires. Jasper James Carter, 1, Anglesea-villas, Ballsbridge, co. Dublin.

21984. Improvements in starting switches for electric motors. Thomas Edgar Weaver, 134, Claremont-road, Moss Side, Manchester.

21987. Improvements in clockwork electrical stopping and starting apparatus. Frank Mitchell, 11, St. Peter's-square, Hammersmith, London.

21996. Improvements in electromotor starters. Charles John Cassé and Harry Herbert Cassé, 2, Market-street, Bradford.

22008. Improvements in multipolar electric generators and motors. Thomas Large Boyden, The Elms, Newbridge, Wolverhampton.

22013. An improved electric heater or radiator. Edward George Rivers, Beverley Lodge, Sheen-road, Richmond.

24016. Electrical circuit breaker. Joseph Bow Tannahill, 65, Chancery-lane, London.

22044. Improvements in dynamo machines. Harold Edenborough, 33, Chancery-lane, London.

22053. Improvements in and relating to dynamo-electric machines. William Crammond Martin, James Lowson, and William Brooks Sayers, 46, Lincoln's-inn-fields, London.

22087. An apparatus for establishing electrical correspondence. Louis Despradels, 37, Chancery-lane, London. (Complete specification.)

22090. Improvements in the manufacture of electrodes and resistances. Giovanni Cornaro, 18, Buckingham-street, Strand, London.

22097. Improvements in or in connection with trolley or like current collectors for electric traction. Artemas Boutelle Upham, 6, Lord-street, Liverpool.

22101. Improvements in circuit breakers. Thomas Edward Daniels, jun., 18, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Jan. 2, 1903, being date of application in United States.) (Complete specification.)

OCT. 14.

22133. A device whereby the trolley pole is automatically controlled and held after leaving the trolley wire. Archibald Johnston and Clifford Alfred Bowen, St. Helen's Depôt, Swansea.

22181. Improved means applicable for use in transforming alternating currents. George Gatton Melhuish Hardingham, Clun House, Surrey-street, Strand, London. (Luigi Magrini, Italy.)

22182. Improvements in electrical switching apparatus. John Reid Dick, Norfolk House, Norfolk-street, Strand, London.

22185. Improvements in the manufacture of insulating material. John Brightwen Alexander, 37, Chancery-lane, London.

22190. Improvements in or connected with alternating-current induction meters. Louis John Hunt and the Sandycroft Foundry Company, 6, Lord-street, Liverpool.

OCT. 15.

22210. Rectifying transformer for alternating currents. Percy Dewhirst, 24, Birley-street, Blackpool.

22216. Improvements in laying electric conductors. Albert Edgar Tanner and Ernest Alexander Claremont, Trafford Park, Manchester.

22265. Improvements in welding metals by electricity. Johann Harmatta, 4, South-street, Finsbury, London.

22269. Improvements in or relating to brushes for electrical machines. Godfrey Marsden Gibson, Westinghouse-building, Norfolk-street, Strand, London.

22287. Improvements in electric arc lamps. William James Davy, 40, Chancery-lane, London.

Digitized by Google

22291. Improvements in electric generating machines and motors for continuous current. John William Percy Scott, James Coghlan, and Eldin Swanzy Moulden, 18, Buckingham-street, Strand, London.

OCT. 16.

22324. A new or improved machine for developing electromotive force. John Henry Cox, 249, West George-street, Glasgow.

22356. Improvements in apparatus for use in the electrodeposition of metals. Sherard Cowper-Coles, 82, Victoria-street, Westminster, London.

22365. Improvements in electromagnets. William Baxter, jun., 55, Chancery-lane, London. (Date applied for under Patents Act, 1901, Nov. 21, 1902, being date of application in United States.) (Complete specification.)

22371. Improvements in overhead trolleys or collectors for electric tramway and railway vehicles. Thomas Blaney, 6, Lord-street, Liverpool.

22374. Improvements connected with electric arc lamps. Louis Carl Henry Mensing, 173, Fleet-street, London.

22388. Improvements in apparatus for enabling telephonic and telegraphic messages to be transmitted over the same line wire. Franklin Wise Howorth, 46, Lincoln's-inn-fields, London. (Carlo Turchi and Edmondo Bruné, Italy.) (Complete specification.)

OCT. 17.

22423. Improvements relating to electric generators and motors. John Henry Hindle, Glebe House, Moorside, Denton, Lancs.

22432. Improvements in electrical ceiling fittings. Charles Mark Dorman and Reginald Arthur Smith, Ordsal Electrical Works, Salford. (Complete specification.)

22439. An improved electrical connection for electro-chemical apparatus. Frederick James Turquand and John Frederick Wakelin, 5, Tottenham-street, Tottenham Court-road, London.

22440. Improvements in telephone systems and apparatus. Wallace Cranston Fairweather, 65, Chancery-lane, London. (The Kellogg Switchboard and Supply Company, United States.) (Complete specification.)

22443. An improved apparatus for winding inductive and non-inductive coils. William Hamilton Wilson, King's College, Strand, London.

22465. Improvements in safety devices for alternating-current electric distribution systems. The British Thomson-Houston Company, Limited, Reginald Charles Clinker, Edmund Basil Wedmore, and James Whitcher, 83, Cannon-street, London.

22470. Improvements in turnover or alternative switches for electric currents especially for lighting purposes. Robert Stuart Pilcher, 6, Lord-street, Liverpool.

22475. An improvement in collecting electric currents from armatures of unipolar dynamo-electric machines. Francis Edward Elmore, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

22486. Improvements in electrical range finders. Harry Shoemaker, 45, Southampton-buildings, Chancery-lane, London. ((Date applied for under Patents Act, 1901, Jan. 10, 1903, being date of application in United States.) (Complete specification.)

COMPLETE SPECIFICATIONS ACCEPTED.

To be published Nov. 5, 1903.

1902.

21901. Electric accumulators. Schmitt and Fabre.

22067. Conduits for electric cables. John Holmes Sutton and Leonard Gregson.

22140. Electrical signalling and indicating apparatus. Chiesa.

22352. Apparatus for locating breaks and grounds in electric circuits, or for comparing the resistance of one circuit with that of another. Myers.

22705. Electric motorcar. Hellmann.

24429. Insulated electrical conductors. Hooper.

24704. Ice scrapers for electric railways and the like. Carolan. (General Electric Company.)

25151. Electrical synchronism and phase indicators. British Thomson-Houston Company, Limited, and Clinker.

26034. Electrical recording instruments. Carolan. (General Electric Company.)

26038. Electric track brakes. Carolan. (General Electric Company.)

26041. Electric arc lamps. Carolan. (General Electric Company.)

26104. Apparatus for automatically moving the points of tramway and railway lines, applicable also to switches on trolley wires for electric tramways. King.

26380. Automatic electric potential regulators. Carolan. (General Electric Company.)

26876. System for the electrical transmission of type recorded messages. Steljes and Typewriting Telegraph Corporation, Limited.

27237. Electrical connection fitting for use in conduit boxes and the like. Byng and Casperd.

27838. Electric lampholders. Smith.

28762. Railway electric signal systems. Boult. (Huff.)

1903.

258. Rail bonds for electric railways, tramways, and the like. Compagnie Générale d'Electricité. (Date applied for under International Convention, Jan. 6, 1902.)

NOTES.

Physical Society.—This society opened its winter session at the Royal College of Science, South Kensington, on Friday evening last. During the session, which extends to June 24, meetings will be held on the second and fourth Fridays in each month, the annual general meeting being fixed for Feb. 12.

Institution of Electrical Engineers.—The parent section of the Institution of Electrical Engineers will inaugurate its winter session on Thursday, Nov. 12. The meeting will be held at the Institution of Civil Engineers at 8 p.m., when the president, Mr. Robert Kaye Gray, will deliver his inaugural address. The premiums awarded for papers read or published during the session 1902-03 will be presented at this meeting.

New York Electrical Society.—A postcard has reached us from New York announcing that the above society would open its twenty-third season on the 19th inst. The attraction of the evening was "an informal talk" by Prof. W. E. Ayrton on "Some Electrical Measuring Instruments and Recent Use of Them." Prof. Ayrton is now visiting the States as a member of the Educational Commission which recently sailed from these shores to enquire into educational methods as practised over there.

Royal Meteorological Society.—The council of this society have designated Hofrath Dr. Julius Hann, of Vienna, as the recipient of the Symons gold medal in recognition of the valuable work which he has done in connection with meteorological science. This medal, which is awarded bienially, was founded in memory of the late Mr. G. J. Symons, F.R.S., the distinguished meteorologist and originator of the British Rainfall Organisation. The medal will be presented at the annual meeting of the society, to be held on Jan. 20 next year.

Junior Institution of Engineers.—A large party of members of the above institution visited the Vauxhall New Bridge works on the 17th inst., Mr. W. C. Copperthwaite, London County Council bridges engineer, explaining all the important features of design and the methods adopted in executing the work so far as it has proceeded. At the conclusion of the visit a vote of thanks was passed by acclamation to Mr. Fitzmaurice, chief engineer, London County Council, and Mr. Copperthwaite for the excellent arrangements made for the reception of the members.

Profits of the Paris Exhibition.—The French Government should be well pleased at having secured the handsome sum of £300,000 out of the International Exhibition at Paris in 1900. This addition to the State's revenues, however, seems to have been accomplished only at the mortification of the private speculator, for whom, we are told, the exhibition has proved a "ghastly fiasco." The previous exhibition in 1889 brought the Government in £42,000, which, however, was not so good as the 1867 exhibition, which resulted in a gain to the State of £100,000. The exhibition of 1878 resulted in a loss.

Marconi's Experiments.—Mr. Marconi on Saturday sailed from Portsmouth on board the battleship "Duncan" for the Mediterranean, where he will carry out further experiments in wireless telegraphy. On the voyage he will endeavour to establish communication with Gibraltar before he loses connection with the "Hector," which is stationed off Portsmouth. The apparatus installed on the "Duncan" is said to differ in many essentials from the standard instruments with which most of the men-of-war are equipped. Captain Jackson, who commands the "Duncan," is an authority on wireless telegraphy, having recently served a commission in the "Vulcan" on the Mediterranean station, a vessel to which he was specially appointed to enable him to pursue his experiments. The "Duncan" took out a large quantity of wireless telegraph apparatus for distribution among the Mediterranean Fleet.

Electric Signalling.—Some successful experiments are reported to have been made on part of the railway belonging to the Societa Veneta, near Padua, of an electric signalling system invented by an engineer named Beer, and especially designed for prevention of collisions. Trains approaching each other on the same line perceived the signals warning them of danger in sufficient time to pull up. The experiments were watched by managers and engineers of different railway companies, and there were also present as interested spectators several foreign consuls from Venice. It is stated that the system is to be adopted by the Societa Venta for use on all its lines.

Electric Speed Trials.—The Siemens electric car with which the high-speed experiments have been carried on on the Berlin-Zossen military railway, has scored yet another triumph. On Friday it succeeded in breaking its previous record of 125 miles per hour, and reached a speed of 128 miles (some reports say 131 miles) over parts of the course traversed. From an experimental point of view, the extremely high speeds attained on this specially-constructed railway are of the first interest, but it is not to be supposed that they would be reached or even attempted on an ordinary electric railway and under normal conditions. They, however, serve to show what electric traction can do, but we are inclined to think that the originators of the trials have this time reached their highest ambition. We understand that some valuable data are being collected which will have an important bearing on high-speed railways in the future.

The Coal Commission.—Prof. W. Boyd Dawkins, F.R.S, was a witness before the Royal Commission on Coal Supplies last week, and gave evidence as to the existence of workable coal in South-East England, referring in particular to the various borings which have taken place at Netherfield, Dover, Ropersall, Ellinge, Brabourne, and the London area. He held that in the district referred to there is a coalfield or series of coalfields ranging from Dover north-westward, but it was impossible for him to define the range of the coalfield or coalfields, or to give any idea of its commercial value, although such coal as existed would probably prove to be within workable depths. He strongly advocated the advisability of further borings, as that was the only method by which the existence or value of the coalfield could be definitely ascertained. Finally, he regarded the finding and exploiting of the buried coalfield as of great national importance.

Radium Exhibits in London.—The exhibits at the Natural History Museum at South Kensington have lately been enriched by the addition of a case containing a few grains of radium bromide, and some pieces of pitchblende and barium platino-cyanide, and visitors to the historic institution may now witness a display of some of the properties of the recently-discovered metal. One of these effects is embodied in Sir Wm. Crookes's spinthariscope, where a small screen of zinc sulphide is placed opposite to a speck of radium bromide. Under the microscope it can be seen that the little screen is continually reflecting the rays which are thrown off by the radium. The effect is also shown of rays penetrating thin sheets of aluminium, and lighting up a platino-cyanide or zinc-sulphide screen beyond. There are yet other rays which will penetrate thick sheets of lead, and still have an effect on the screen beyond. These too are shown, and the exhibition is one which will doubtless attract many visitors.

West Hartlepool Scientific Society.—Mr. J. Elders, the secretary of the above society, has sent us a syllabus of the papers proposed to be read before the society during the coming session, which is the first of its existence. The society has been formed in connection with the West Hartlepool Technical College, and has as its first president Mr. J. Archyll Jones, B.Sc. Altogether eight meetings will be held during the session. The president delivered his address at the inauguratory meeting on Sept. 12, and at a meeting held on the 10th inst. Mr. H. Henderson read a paper on "Arc Lamps and their Uses." Subsequent meetings have been arranged as follows: Nov. 14, "The Absurdities of the Present System of Measures," by Mr. Wm. C. Barrowman; Dec. 12, "Mr. D. B. Morrison's Scheme for the Advancement of Apprentices," by Mr. Wm. Kennedy; Jan. 9, "Boiler Feed Water," by Mr. J. W. Patterton; Feb. 13, "Balancing of Marine Engines," by Mr. J. V. Robinson; March 12, "Three-Wire System," author not stated; and April 9, annual meeting.

London Traffic Commission.—The commissioners delegated to visit the States and examine into the various means of transit and transport practised in the principal American cities arrived back in London on Saturday, after an absence of five weeks. They consisted of the chairman of the Commission (Sir David Barbour), Lord Ribblesdale, Sir John Dickson-Poynder, Sir George Bartley, M.P., Mr. George S. Gibb, and Mr. Lynden Macassey, the secretary. The party confined its investigation to the four cities of New York, Boston, Washington, and Philadelphia, in the order named, in each of which cities the enquiry took the form of an inspection of the systems of urban transit, followed afterwards by a discussion of various questions connected therewith with the traffic experts of the city. Mr. Macassey, in a preliminary journey of enquiry, also visited some other cities, including Chicago, Detroit, Cleveland, and Albany. It is understood that the impressions of the sub-commission on their visit will in due time be placed before the main commission in the form of a report.

Glasgow Scientific Society.—To give it its full title, the Glasgow Technical College Scientific Society, of which Mr. R. D. Munro, M.I.M.E., is the president for the ensuing year, opened its twelfth session at the Science and Arts Buildings, Glasgow, on the night of the 17th inst., when Mr. Munro delivered his presidential address. To-morrow (Saturday) evening the first ordinary meeting of the session will be held, the paper to be read being contributed by Prof. Alexander MacLay, B.Sc., entitled "The Evolution of a Technical College." Subsequent meetings have been arranged as follows: Nov. 14, "Motorcars," by Mr. Alexander Govan; Nov. 28, "Some Remarks on the Willans Engine," by Mr. J. Herbert Pocock; Dec. 5, "Superheat," by Mr. W. H. Booth; Dec. 12, "Steam-Turbine Machinery," by Mr. Arthur A. Wynne; Jan. 9, "The Manufacture of Weldless Chains," by Mr. Alex. G. Strathern; Jan. 23, "Some Observations on Mechanical Training," by Mr. Wm. D. Hamilton; Feb 6, anniversary dinner; Feb. 20, "Modern Conceptions of Matter," by Mr. Angus McLean, B.Sc.; March 5, "British Competition and Manufacture," by Mr. M. Pickstone; March 19, "The Diesel Engine for Marine Purposes," by Mr. A. J. Lawson; March 26, annual general meeting.

Liverpool Engineering Society.—The opening meeting of the thirtieth session of the above society will be held on the evening of Wednesday, Nov. 4, when the president-elect, Mr. Thomas L. Miller, M.I.C.E., etc., will deliver his inaugural address. For the succeeding meetings the following is the present proposed scheme of papers to be read on the dates given: Nov. 18, "Fuel Economy from the Chemical Point of View," by Mr. J. B. C. Kershaw, F.I.C.; Dec. 2, "Recent Telephone Developments in Liverpool," by Mr. E. J. Hidden; Dec. 16, "Polyphase Working," by Mr. H. W. Wilson; Jan. 13, "Motor Vehicles," by Mr. W. Norris; Jan. 20, "Voltage Regulation in Alternating-Current Plants," by Mr. H. S. Meyer; Jan. 27, "Induction Motors," by Prof. E. W. Marchant, D.Sc.; Feb. 10, "Electric Transmission from Water Powers," by Mr. E. Kilburn Scott; Feb. 24, "Conduit and Surface-Contact Tramway Systems," by Mr. George Balfour; March 10, "Steam-Boiler Failures," by Mr. J. R. Smith; March 24, "Notes on Design of Electrical Machinery," by Mr. J. L. Hunt. At this meeting the president and members of the Manchester Section of the Institution of Electrical Engineers hope to be present. April 7, a miscellaneous discussion upon marine subjects; April 28, annual general meeting.

Cooper-Hewitt Mercury Vapour Lamp.—Two patents have recently been granted to Mr. Peter Cooper Hewitt in the States for improvements in his electric vapour lamp, which are briefly described in the *Electrical World*. While the old familiar type of this lamp is held in a vertical position, Mr. Cooper Hewitt has found that operation in a horizontal position has certain advantages, and has now patented details of construction for this purpose. It is stated that a horizontally disposed lamp having a luminous element of considerable length placed in the upper part of a room furnishes a kind of illumination which is agreeable to the eye, and is well adapted to display the special features of architecture, decoration, or furniture, and at the same time the light is said to be agreeable for reading purposes. The other patent relates to details of construction which improve the method of starting the mercury vapour lamp. By adding certain other materials, such, for instance, as red sulphide of mercury, during the manufacture of the lamp, a condition is produced within the lamp which facilitates the starting, a much lower potential being sufficient than if such material is not present. It is also of advantage to provide a band of foil in proximity to the negative electrode and in electrical connection with the positive electrode. To start the lamp, it is connected to a special circuit having a higher potential than that upon which the lamp is intended to run after it has been started, this higher potential being produced by a spark coil.

The Automobile Industry.—Mr. S. F. Edge, the well-known automobilist and maker of motorcars, has been making some remarks on the prospects of the British automobile industry which are worthy of attention. His words should serves as a stimulus to automobile manufacturers in this country to capture the rapidly growing trade in automobiles from our foreign neighbours. Mr. Edge shows that Great Britain is the largest market in the world for automobiles; but, regrettable as it is, the greater part of the manufactures are imported principally from the Continent. Last year 3,500 cars, to the value of £1,046,000, came into this country from abroad, while for the first nine months of the present year this figure had risen to 5,330, valued at £1,600,000. The capture of this immense trade by English manufacturers is all the more desirable, as Mr. Edge pointed out, in that the raw material of motorcars being of inconsiderable value, the greater part of the money goes in wages. Of course, English manufacturers are very considerably handicapped by the fact that, in answer to the popular demand, cheap cars of indifferent quality are sent over here from the Continent; but things look brighter for the future. Many of the initial difficulties in the way of English makers are rapidly disappearing, such as the dearth of competent experts and mechanics; and several

Digitized by Google

large firms in this country are now able to place on the market cars, by no means expensive, of great practical utility and efficiency. It is to be earnestly hoped that instead of the import figures increasing, as they have been up to now, as shown above, they may rapidly decrease, until the greater part of the demand in this country, if not the whole, is supplied by the home manufactories.

Benjamin Franklin.—This was the text of the address delivered by Mr. Choate, the United States Ambassador, as president of the Birmingham and Midland Institute, on Friday night. Benjamin Franklin's whole career, he said, had been summed up by a great French statesman — *Eripuit cœlo fulmen sceptrumque tyrannis.* Franklin enlarged the boundaries of human knowledge by discovering laws and facts of nature unknown before and applying them to the use and service of man, and that entitled him to lasting fame. But his other service to mankind differed from this only in kind, and was quite equal in degree, for he stood second only to Washington in the list of heroic patriots who on both sides of the Atlantic stood for those fundamental principles of English liberty which culminated in the independence of the United States, and had ever since been shared by the English-speaking race the world over. Mr. Choate reviewed at some length the principal characteristics and achievements of Franklin's life, and said his grateful country honoured his memory and cherished his ever-growing fame as one of the noblest treasures, and transmitted from generation to generation the story of his matchless service. His autobiography, written near the end of his wonderful career, was valued by all readers of the English language as one of the most fascinating contributions to its literature, and the lessons of his honesty, temperance, thrift, industry, and economy which he inculcated and practised with such brilliant success in his own person had been of priceless value to his countrymen, and contributed very largely to their social, material, and intellectual well-being. So that taking him for all in all, by general consent they classed him with Washington and Hamilton and Lincoln in the list of illustrious Americans.

Electricity in Mexico.—One of the largest electrical schemes of present times is about to be started in Mexico through the efforts of the Mexican Light and Power Company, Limited, which has its headquarters in the city of Mexico. Some of our readers may be familiar with the name of this company, as we believe that a large part of its capital was raised in this country. Important and liberal concessions have been obtained by the company from the Mexican Government, authorising it to utilise for motive power all the waters and natural falls now existing, and the falls that may hereafter be created between certain limits, which are defined, along the Tenango, Necaxa, and Catepuxtta Rivers, in the Puebla State. The powers vested in the company are full to the extreme. It may alter the course of the rivers; may build deposits or reservoirs; may erect, conserve, and exploit stations for generating, accumulating, and holding electric power; and it may transmit, distribute, and supply electricity to any points which it may be able to reach by means of overhead conductors. On its part the company agrees to establish within a period of four years a plant sufficient to produce 15,000 h.p., and within a period of 10 years a plant with a capacity to generate 30,000 h.p.; also to provide the electric apparatus and transmission lines necessary to convey the electric energy to the city of Mexico and other large centres of population. All the machinery, apparatus, and material of every kind required for the works is to be admitted free of duty for a period of four years for the first plant, and during 10 years for all additional installations. A further concession is that from the date of the charter all the capital invested in the undertaking is to be exempt from taxation, with the single exception of the stamp tax. The construction of the works is to be commenced within three months of the granting of the concessions.

London's New "Tube."—New Year's Day is provisionally fixed for the opening of the Great Northern and City "Tube" Railway between Finsbury Park and Moorgate-street. In many particulars the new "tube" presents features, both in construction and working, which are new to London, and represent the most recent and approved practice. For instance, the tunnels are larger than either those of the Central London Railway or the South London Railway, being 16ft. in diameter throughout, and the tubes themselves are constructed on what is known as the "composite" principle—*i.e.*, the top half of the ring is of cast iron, and the bottom half is of brick, the former resting on the latter by means of a sole-plate. This "composite" construction was introduced by Mr. E. W. Moir, of Messrs. S. Pearson and Son, the contractors. Another important feature of the new railway is the adoption of the third and fourth rail system, in which the track is fitted with insulated positive and insulated negative conductors. Both rails are outside the running track, one on either side, hence the four-foot way is kept quite clear. The multiple-unit control system will be adopted. The cars, which are carried on two four-wheeled bogies, measure 49ft. 6in. in length, and are of the corridor type, with a seating capacity for 60 persons. The motorcars, equipped by the British Thomson-Houston Company, have the motor compartment divided into two, and every protection has been taken against the fire danger. One division contains all the electric control apparatus, confined in a sheet-iron box, which is lined outside with a new non-combustive material known as uralite. Further, the line cables running throughout the train are asbestos-covered, held in non-inflammable cleats and enveloped in steel troughing. All the stations have concrete platforms, and no wood is used anywhere. Automatic signalling will be employed on the new railway.

The Post Office and Wireless Telegraphy.—It is stated in the daily Press that the Post Office has invited Mr. De Forest to give a demonstration of the system of wireless telegraphy which has been exploited in America under his name. The experiments will take place between Holyhead and Howth, which, we believe, was the scene of the earliest attempts in wireless telegraphy with which the Government was associated. Mr. De Forest is now in London, and the trials will probably be commenced within a fortnight. We note that among other claims which this inventor puts forward for his system is that of secrecy. According to the language of the daily Press, this is how he puts it: "While he could receive Marconigrams, Marconi could not receive his messages, owing to the higher speed of transmission." Mr. Cuthbert Hall, the managing director of the Marconi Company, has been telling an interviewer how his company regards the action of the Post Office in the matter. He naturally claims that the Marconi system has alone attained a notable measure of commercial success, but adds that when his company sees a wireless telegraph system which is technically satisfactory, and the owners of which are getting any considerable amount of business, patent proceedings will probably be instituted. It is an old story that the Marconi Company claims to have a fundamental basic patent without the use of which any wireless system is impracticable. In any event, the Post Office is pursuing the right course of

Digitized by Google

not binding itself to any particular system until it has been proved in practice to be the best. An interesting rumour is current in well-informed circles crediting the Government with the intention to introduce legislation next session to deal with wireless telegraphy. It is suggested that owing to the increasing use which Government departments, and particularly the Admiralty, are making of wireless telegraphy, the Government is anxious to establish a monopoly of this means of communication in the United Kingdom.

Junior Institution of Engineers.—The annual general meeting of this institution was held at the Westminster Palace Hotel on the 24th inst, the principal business being the presentation of the council's report and accounts, and the election of officers for the ensuing year. The report stated that the total membership was now 746. Ten meetings for the reading and discussion of papers had been held, the institution premium having been awarded to Mr. R. W. Newman, A.M.I.C.E., for his paper on "The Effect of Design on Methods of Construction from a Contractor's Point of View." Twelve visits to engineering works, etc., had taken place, in addition to those of the summer meeting occupying one week, Sheffield and the Peak district having been the rendezvous. The accounts showed that the sum of £300 had been invested, and that the income had been £156 more than the expenditure. The election of Mr. J. Fletcher Moulton, K.C., M P., as the new president, and some proposed lectures on the theta-phi diagram by Prof. John Perry, were also referred to in the report. The election resulted as follows: chairman, Mr. S. Cutler, jun.; vice-chairman, Mr. Adam Hunter; hon. librarian, Mr. H. T. Gould; hon. auditors, Mr. H. N. Gray and Mr. H. B. Vorley; members of council, Messrs. J. N. Boot, W. H. De Ritter, A. H. Huddart, and J. H. Pearson; provincial members of council, Messrs. V. H. Chabot, T. D. Evans, E King, W. E. Lilly, F. S. Pilling, and E. W. Porter. The programme of papers for the new session was announced: Nov. 20, "Fires on Shipboard," by Mr. G. Canning; Dec. 4, "Gas-Engines," by Prof. D. S. Capper; Jan. 22, Mr. Moulton's presidential address; Feb. 5, "Producer-Gas Power for Ice Factories," by Mr. Hal Williams; March 4, "Electric Storage Batteries," by Mr. G. C. Allingham; April 8, "Heating and Ventilation of Factories," by Mr. K. Gray; May 6, "The Design of a Dry Dock," by Mr. A. W. Young. Engineers desiring particulars of membership of this society should communicate with the secretary, Mr. W. T. Dunn, 39, Victoria-street, Westminster.

Light Telegraphy.—The telegraphic transmission of messages without the use of wires has entered a new phase by the application of Ruhmer's light telephony for telegraphic purposes. It will be remembered that last year Mr. Ernst Ruhmer, in conjunction with the naval construction department of the Siemens-Schuckert Works, made experiments on the Wannsee to transfer by means of a projector certain flash signals to a selenium cell placed at varying distances. In that case the sound waves of the human voice were changed into electrical waves by means of a microphone. These electrical waves corresponded to the sound waves, and effected corresponding changes in the strength of the current and of the light of a continuous-current arc lamp. The rays from the lamp, which varied in strength, were then concentrated upon a selenium cell by means of a parabolic mirror. The current from the selenium cell varied with the light waves and reproduced the speech. Mr. Ruhmer has now perfected an arrangement by means of which this system of telephone may be used in telegraphy. The process is as follows: The arc lamp is acted upon by the induced current of a transformer coil. A mercury interrupter is placed in the secondary circuit, together with a Morse key. When, by means of the Morse key, the secondary circuit, which is frequently interrupted, is closed, an undulating current is set up in the primary lamp circuit, and hence in the light rays. The movement of the key can be followed in a telephone connected across the lamp. The uniform note from the transformer current continues as long as the Morse key in the secondary circuit is closed. It is, therefore, clear that it is possible to signal by means of dots and dashes corresponding to the Morse alphabet, which can be heard in the telephone connected to the selenium cell at the other end. This invention would be particularly valuable for secret military service, as it is not possible to follow the rapid variations of the light intensity either with the naked eye or with the telescope. So far, however, the range of signalling is limited. The apparatus can also be arranged to control the opening and closing of electrical circuits from a distance.

Association of Municipal Corporations. — The autumn meeting of the Association of Municipal Corporations, which was held last week at the Westminster Palace Hotel, was presided over by Sir Albert K. Rollit, M.P., and there was a large attendance, including the mayors and town clerks of many of the metropolitan and provincial boroughs. In his opening speech Sir A. Rollit referred to the fiscal controversy, and incidentally to the question of technical education. He remarked that whatever might be said for or against fiscal changes, there could be no doubt that in relation to the trade of our country we had to deal with a great plurality of causes constantly affecting it, and he did not hesitate to say that neglect by the State for a long period of that public instruction and of that knowledge of the application of science to trade and industry had been one of the causes which made us lament to-day that some other countries possessed that trade and those industries, many of which we once enjoyed, and which, through education, might be enjoyed again, and might be the means of permanently maintaining the commercial pre-eminence of this country. With regard to municipal trading, he observed that so far the association had no reason to be disappointed with what had taken place, and they were not afraid of the light that might be thrown on their proceedings. In the subsequent discussion the Town Clerk of Birmingham made some caustic criticisms of the action of the *Times* in publishing a series of articles on "Municipal Socialism," pointing out that the *Times* itself had gone in for a little trading in connection with the "Century Dictionary" and the "Encylopædia Britannica." Every case of municipal trading in the future would be considered on its merits; and he did not anticipate that capitalists or promoters, or even the *Times* newspaper, would ever be asked to form syndicates to take over the great trading undertakings of their corporations. The Town Clerk of Leeds offered some remarks to the same effect. Sir James Woodhouse, M.P., drew attention to the question of Government audit, remarking that Government audit as at present used was a great force for protecting the ratepayers. In connection with surcharges made by the Local Government Board auditor, and other financial restrictions placed upon metropolitan borough councils, the association agreed to promote legislation in the next session of Parliament to place metropolitan borough councils in an equivalent position to that of the provincial corporations. Before the meeting separated other resolutions were passed referring to local government legislation, trust investment, ground values and corporation loans.

New West Ham Electric Power Station.—At the invitation of the Mayor and the Electric Lighting and

Digitized by Google

Tramways Committee of West Ham, a party of members of the Institute of Marine Engineers was recently shown over the new electric power station that is being erected at Canning Town for supplying the district with electric power for lighting and tramway purposes. The visitors were conducted round the station by the Mayor, the Deputy-Mayor, and Mr. F. James K. Bock, the chief electrical engineer. The new building is now rapidly nearing completion, and it is probable that within six months the machinery will be in full working order. The first installation of plant will consist of two 2,000-h.p., two 1,000-h.p., and two 500-h.p. alternating sets for lighting purposes; while for the tramway load there will be three 750-h.p. engines and dynamos. The boilers are of the water-tube type, supplied by Messrs. Babcock and Wilcox. Of these there are 17, each capable of evaporating 15,000lb. of water per hour. These boilers are all hand-stoked, it having been found in the old station that firing by hand resulted in a considerable saving. There are four condensers, each capable of condensing 40,000lb. of steam per hour, and two capable of condensing 20,000lb. per hour each. To supply the circulating water to the condensers four 15in. centrifugal pumps are installed. There are eight boiler feed pumps and four economisers of 480 tubes each The importance of an adequate supply of clean feed water for the boilers has received very special attention, the plant for softening the water being capable of dealing with 8,000 gallons per hour, whilst the water purifiers for extracting the oil from the condensed steam can operate 15,000 gallons per hour. That the feed water will be passed into the boilers in a clean condition and at a high temperature, was evidenced at the existing station at Abbey Mills, to which the visitors were afterwards taken. Here a sample drawn direct from the condenser was compared with another sample after purifying. It was found that no more than 1 per cent. of the oil remained. At the new station the coal will pass direct from the barges into the coal bunkers by means of a Temperley transporter. The coal bunkers will be fitted above the boilers, and will provide a three weeks' supply, the consumption of coal per week being about 400 to 500 tons. The new station occupies a large area, and in its equipment the comfort of the men employed has not been overlooked, a large messroom and well-arranged baths being noticeable features. As compared with the Abbey Mills station, the new building marks a progressive spirit on the part of the West Ham municipal authorities, and it is interesting to notice how the demand for electric power has increased of recent years. During the year ended March, 1900, 741,435 units were generated, whilst in the year ended March, 1903, the power generated had increased to 2,632,100 units. The existing station at Abbey Mills has generating plant of 4,850 h.p., as compared with 9,100 h.p. of plant at present on order for the new station, which is designed to allow of an increase of power up to 14,000 h p.

Rapid-Cutting Steel.—A joint committee, consisting of members of the council of the Manchester Association of Engineers and of members of the Manchester School of Technology Sub-Committee, together with Dr. J. T. Nicolson, professor of mechanical engineering at the school, have just completed a long series of experiments, the purpose of which was to test the capabilities of some of the high-speed tool steels that have recently been introduced. The report of the committee embodying the results of the tests was presented at the meeting of the Manchester Association on Saturday evening. In carrying out the experiments, the electric power mains of the school were drawn upon for the driving of an electric motor of 100 h.p., from which a large lathe capable of carrying a steel forging of three tons weight was driven through countershafts by 10in. belts. The power was measured by the use of carefully calibrated volt and ampere meters, and the net horse-power used in cutting was ascertained by the aid of a powerful transmission dynamometer and a large Prony brake, designed and constructed in the school. In addition, the actual force exerted upon the tool when cutting was measured by a lathe tool dynamometer having a capacity up to 15 tons, which was constructed in the school workshops and fitted to the lathe. Cuts up to $\frac{3}{8}$in. by $\frac{3}{8}$in. were taken with the tool fixed in this dynamometer, the load being read off in the simplest way by means of a standard pressure gauge. It appeared from the trials that speeds of from 110ft. to 150ft. per minute were possible for soft steel, 80ft. to 110ft. for steel of medium hardness, and 40ft. to 50ft. for hard steel. In the case of cast iron, speeds of 100ft. to 110ft. for soft, 50ft. to 60ft. for medium, and 30ft. to 40ft. for hard were obtained. It was also found that 45 square feet may be machined over in an hour by these rapid-cutting steels when operating upon soft steel with a cut $\frac{3}{16}$in. deep, the figures for medium and hard steel being 30 and 18 respectively. With cast iron a surface of 42, 18, and 15 square feet may be turned off at the same cut in the case of the soft, medium, and hard varieties respectively. But few specially heavy cuts were attempted, but it was found possible (when taking a cut $\frac{3}{8}$in. deep by $\frac{1}{8}$in. traverse) to remove 440lb., 330lb., and 180lb. of cuttings per hour from the soft, medium, and hard steel forgings respectively, and 450lb., 200lb, and 190lb. from the soft, medium, and hard cast-iron specimens. In one instance, with a $\frac{3}{8}$in. by $\frac{3}{8}$in. cut, cuttings were removed at the rate of 510lb. per hour from soft-steel bar. The tests further showed that the forces acting upon the tool point when cutting were over 100 tons per square inch of area of section of cut in steel, and from 50 to 80 tons per square inch for cast iron. One of the most noteworthy facts discovered is that the cutting force does not increase, but appears rather to diminisb, with increasing speeds This is contrary to the opinion generally held by turners and machine tool experts, as instanced by the objections raised by workmen to an increase of the cutting speed on account of the anticipated springing of the work. This objection can no longer be sustained, for although higher speeds of taking a given cut will, of course, require a greater driving power almost in direct proportion to the increased speed, no greater but rather a smaller force will be brought upon the tool, and the load acting on belts and gearing, and the tendency of the lathe and work to spring, will be rather diminished than otherwise. On the other hand, it has been conclusively shown by these trials that heavy cuts at moderately high speeds are much more economical in power than light cuts at the highest possible speeds the tool can stand. For the cutting speed does not increase as fast as the area of the cut diminishes, so that more material can be machined off in a given time with a heavy cut than with a light cut at its corresponding faster speed. Further, the total or gross horse-power required for cutting consists of the sum of that lost by friction of the intermediate gearing and of the lathe, as well as the effective work spent upon cutting. Now, the frictional power does not vary much, whether there is a heavy or a light cut on the machine; it therefore forms a much larger percentage of the whole at light cuts than at heavy cuts. The value of the report is enhanced by the exhaustive tests of the physical and mechanical properties and the chemical constituents of the six different materials operated upon—namely, forged steel and cast iron, each of three grades of hardness.

THREE-PHASE PLANT AT PRESTON.

In January last year we were, through the courtesy of Messrs. Dick, Kerr, and Co., able to give full particulars of two large direct-current dynamos manufactured by the English Electrical Manufacturing Company, at Preston, for the Bolton Corporation. We then gave details (*E.E.*, vol. 29, page 114) of the methods employed in the manufacture of these direct-current machines, which for their excellency in design and in construction may be looked upon as typical examples of the best English practice. At the time of our visit in January last year the firm was just putting into the shops their first three-phase alternator, and since then they have made exceedingly rapid strides in the manufacture of two and three phase plant As have so good a repute. As a matter of general interest, it may be stated that, in addition to having carried out some important developments in alternating-current practice, the works are engaged in manufacturing other special apparatus. High-tension switchgear now ranks among their productions, and motors, direct current and alternating, for power purposes, with the necessary controlling mechanism, have now become part of the standard machinery turned out at Preston. This extension into lighting and power work has necessitated some important additions to the works, a new bay of some 450ft. long and 60ft. wide having been recently completed.

In order to show the progress which the firm have made in the short space of 18 months, we give the following list of orders which they have now in hand, or have just completed. The satisfactory feature in this list is the wide-

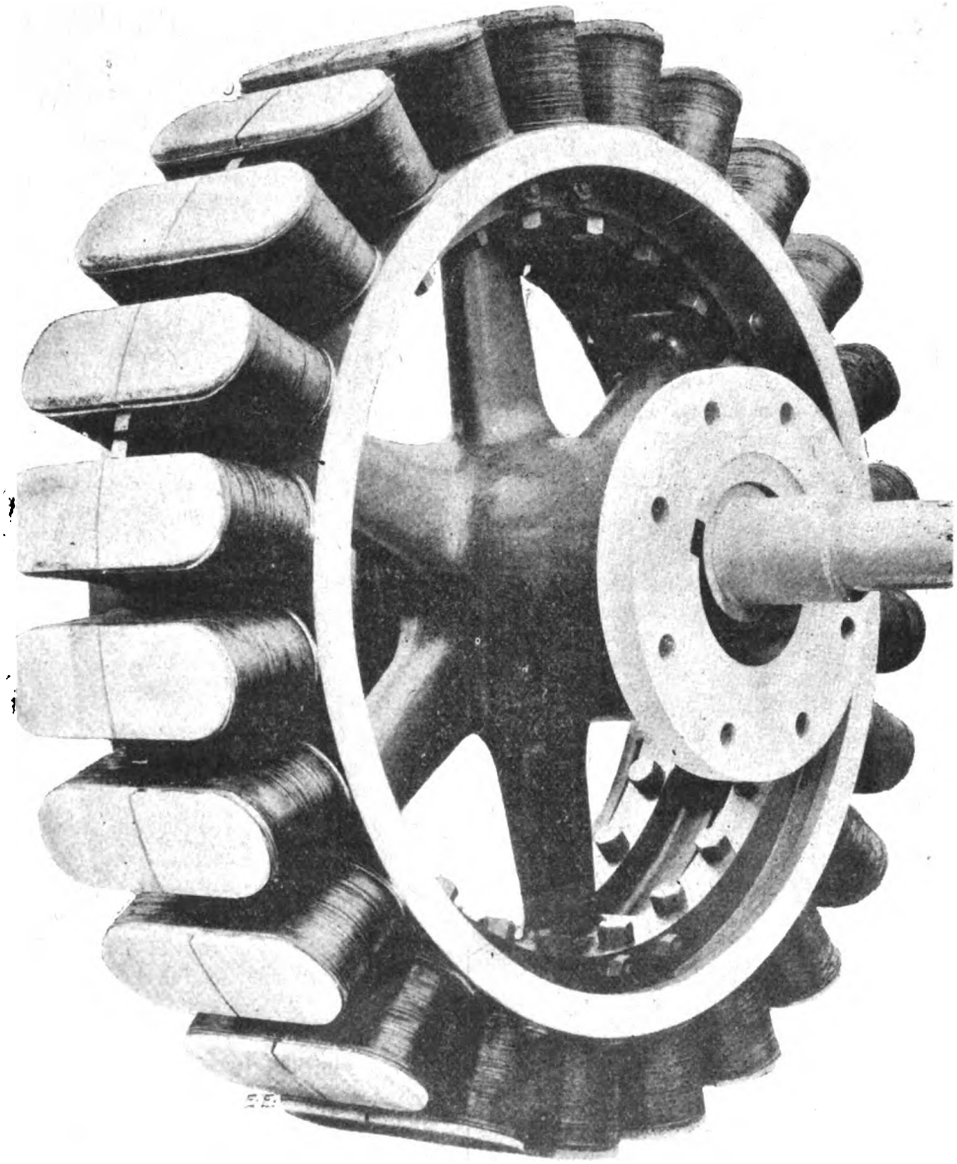

FIG. 1.—The Revolving Field Magnet System of a Dick-Kerr Two-Phase 600-kw. Alternator for Fulham.

was the case in the direct-current machines, the policy was first to establish the general lines on which the construction was to be carried out and then to standardise these details and employ them in all sizes of machines. In this respect they had considerable advantage from the fact that they started the manufacture of three-phase plant somewhat late in the day, as there was at their designer's disposal a vast amount of information from Continental and American firms which could be utilised. This enabled Messrs. Dick, Kerr, and Co., in starting, to avoid faults which had been revealed by practical tests on other machines. In this respect the plant manufactured at Preston will be free from certain objections which have been found in foreign-made machines, and it will compare well, both in mechanical and electrical details, with the direct-current machines for which the firm

spread destinations of the multiphase machines, which will soon be represented in practically all the Colonies. It is worthy of note, also, that Messrs. Dick, Kerr, and Co. have secured large orders for Canada, in spite of the American competition. There is no doubt that in this respect the preferential tariff offered by Canada to the Mother Country is of considerable assistance: London County Council, two 1,500 kw. (alternating), 12 motor-generators, each of 300 kw., and three motor-generators, each of 50 kw.; Horndean tramways, two motor-generators, each of 200 kw.; Portsmouth Corporation, two motor-generators, each of 200 kw.; Sydney, one alternator of 300 kw., two alternators of 600 kw., and six motor-alternators of 300 kw.; Stalybridge, three alternators, each of 500 kw.; Malvern, two alternators, each of 100 kw.; Fulham, one alternator of 600 kw.; Osaka, one alternator of 210 kw.; Durban,

Digitized by Google

one alternator of 500 kw.; Lakefield Portland Cement Company, Ontario, Canada, one alternator of 1,000 kw. and one alternator of 450 kw.; Shawinigan Water and Power Company, Montreal, Canada, one alternator of 3,750 kw.; Metropolitan Electric Supply Corporation, eight motor-alternators, each of 500 kw. And amongst others may be mentioned complete plant, comprising generators and sub-station machinery, for Lancashire and Yorkshire

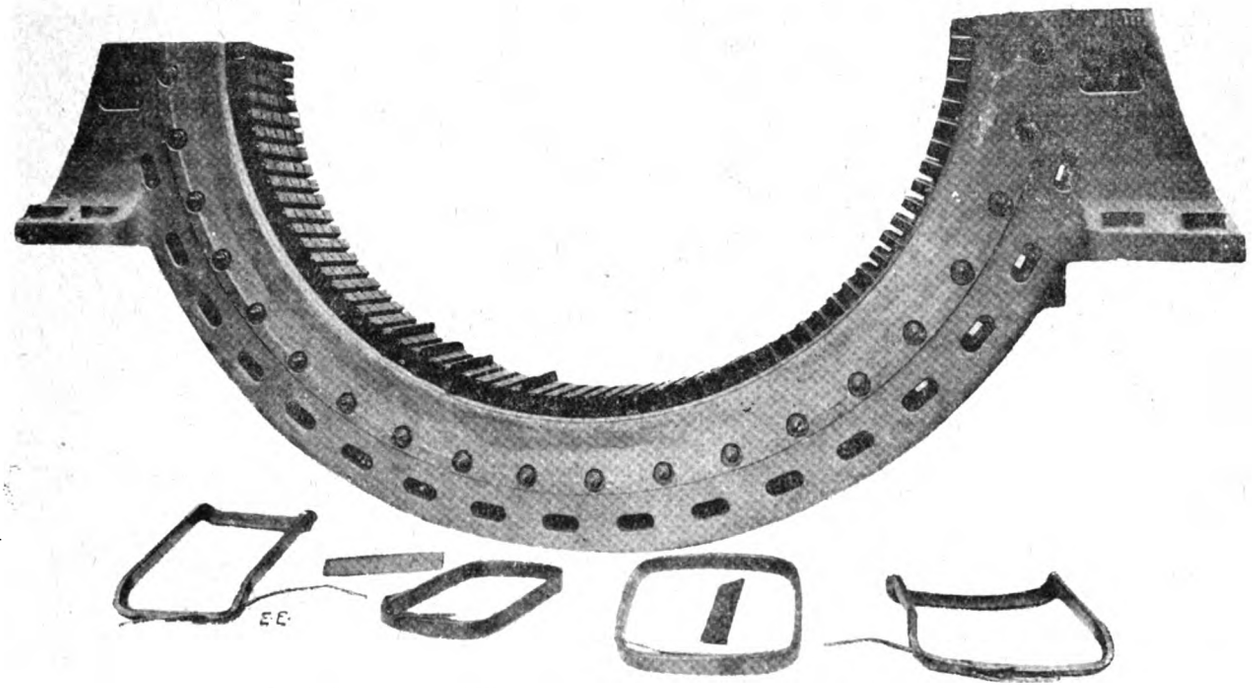

FIG. 2.—The Lower Half of a 1,500-kw. Stator Unwound, with Former-Wound Coils in the Foreground.

Railway, Leeds and Wakefield Light Railway, Tokio Electric Tramways.

The design of the polyphase alternators is necessarily varied somewhat to meet the conditions under which the machines are to be worked, and is also varied with the output of the machines. We propose to commence our description of these Preston alternators with the revolving part, which in every case is the field-magnet system. A typical example of one of these is shown in Fig. 1, which is the rotor for the 600-kw. alternator manufactured to the order of the Fulham Metropolitan Borough Council. In this case the spider is of cast iron, the ends of the spokes being disconnected, so that there are no casting strains in the metal. On each side of these spokes there is secured a ring of the best cast steel. These rings are made in two halves, and are secured together in the first instance by a steel tongue inlet into the T-shaped recess in the ends of the half rings. These tongues are inserted hot and draw the halves close together as they contract in cooling. The cast-steel cores of the field magnets are then secured on to these rings by the bolts shown. It will be seen that the poles are in two halves, which allows of ventilation up through the centre. The pole-pieces are of laminated steel, and when screwed on serve to hold the exciting coils in position. These pole laminations are held together between two cast-steel end plates of strong construction. The firm are making another type of pole in which laminated iron is used throughout, the cores and the pole-pieces being in one. In this case the lower end of the magnet pole is dovetailed into the rim of the rotor. The space between this dovetail and the V-shaped groove in the rotor is then filled in by two steel keys which are slightly tapered. The one key is driven from either side, so that they both secure and centre the pole. In the smaller machines, of which we saw a considerable number in construction during our visit to the works last week, the lamination of the field-magnet system is carried still further. In these machines the cast-steel ring is replaced by iron laminations of a large size, each punched complete out of a steel plate. On the outer periphery of these punchings there are the V grooves mentioned above, into which the laminated poles dovetail, and are secured by keys in the way explained. This construction is exceedingly neat, and allows of the removal of a pole and exciting coil should this be necessary. The laminated centre plates in this case are clamped together on an inner cast-iron

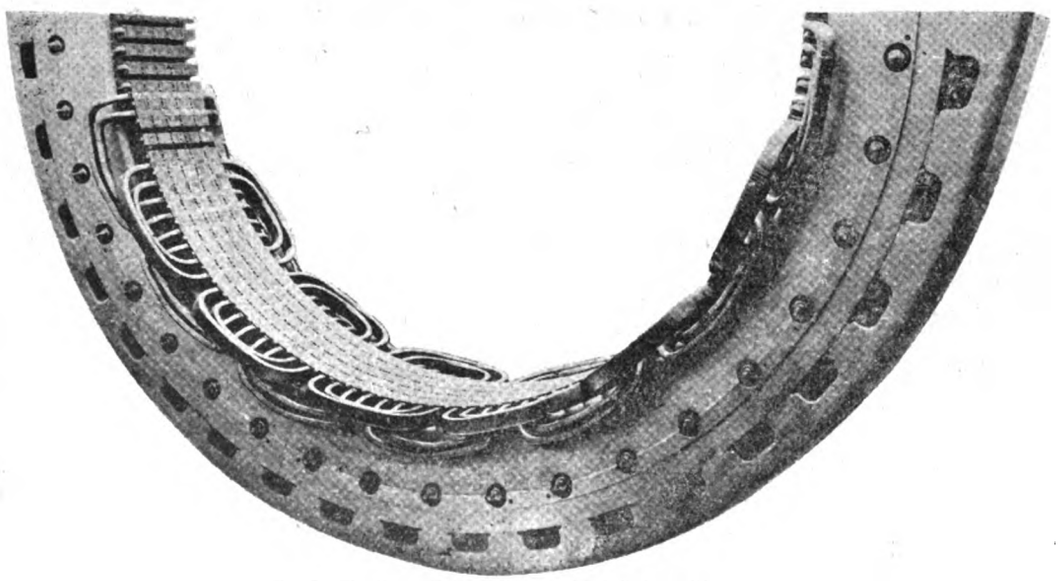

FIG. 3.—The Upper Half of a Stator with Coils in position.

centre. The winding of all the field coils we saw at the works at Preston was being carried out with bare copper strip wound edgewise. Wherever the excitation of the voltage permits, the field coils are wound with a single layer of copper strip wound edgewise, and insulated between the turns by means of specially-prepared fibrous material. The external surface of the windings is left practically bare, being protected merely by insulating varnish, which allows a rapid radiation of heat. This accounts for the somewhat uneven appearance of the windings on the field coil shown in Fig. 1.

up of thoroughly annealed soft iron laminations, the individual laminations being well insulated from each other to minimise eddy-current losses. The laminations are held in position in the frame by means of retaining machined bolts. The coils used are all former-wound, which, after being thoroughly insulated, can be dropped into the slots in the laminated core. These slots are rectangular in section, and have grooves in their upper part into which wooden wedges can be driven to hold the coils in position. In Fig. 2 the lower half of a stator is shown without any windings in position. The three types of coils used in winding are shown

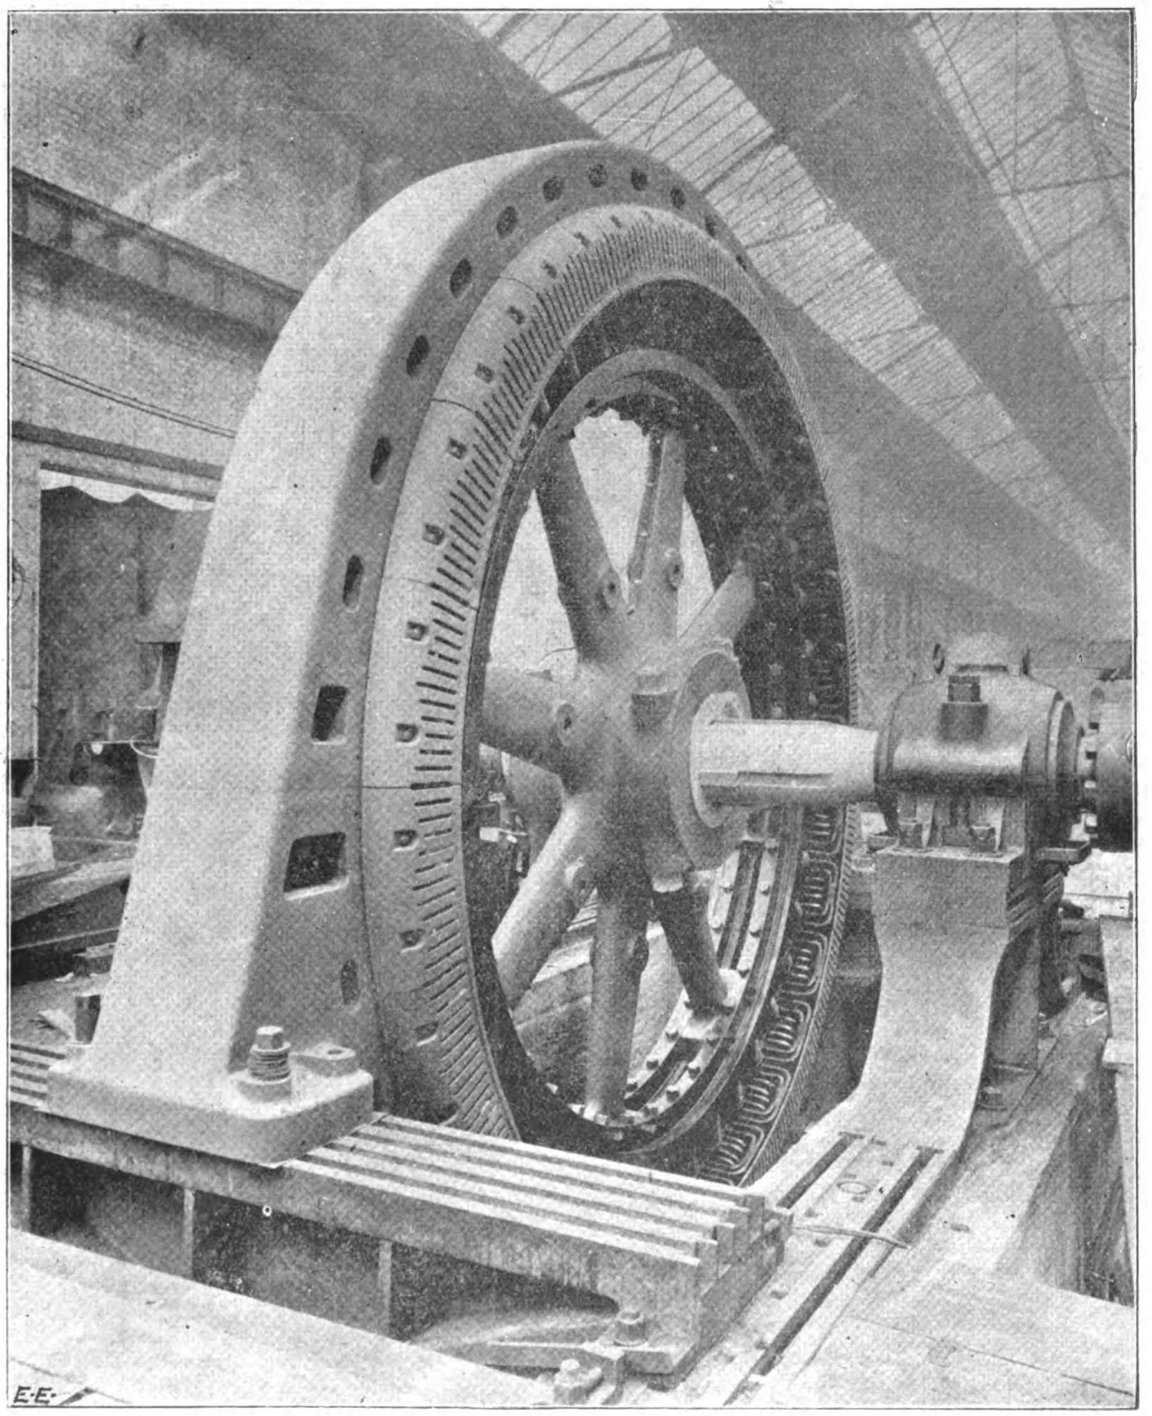

FIG. 4.—A Dick, Kerr, and Co. 1,500-kw. Three Phase Alternator complete.

The stator frame is built in two halves, which are securely bolted together by means of finished bolts The lower half of the frame is provided with feet, which rest upon the foundation bed-plate. In the larger size machines the lower part of the underframe is provided with a special screw for vertical and horizontal centering of the stator relative to the rotating field. The general construction of stator frame is shown in Figs. 2 and 3. The frame is made of high-grade cast iron, and is designed to allow complete ventilation of the laminations, and at the same time to secure rigidity of the frame. The core is made

below. Before the coils are put into the slots there is inserted a trough of insulating material, such as presspahn, as a mechanical protection to the insulation of the coils. In Fig. 3 of the upper half of the rotor the coils are shown in position. Connections between these coils are made by means of highly-insulated cables, and are easy to trace and locate. The coils are protected outside the laminations by means of a cast-iron shield, cast in sections, bolted to the frame and easily removable. This shield is of a perforated design, and does not interfere with the ventilation of the stator winding.

The collector is composed of rings of suitable metal, fixed to the shaft next to the rotor by means of a spider and insulated pins, ample provision being made for free air circulation round the same. The brushes are in duplicate, and are made of carbon of ample surface. They can be set and replaced while the machine is running. The brush-holders are so constructed that the current will not pass through moving joints or tension springs, and will allow for tension adjustment.

The two completed machines which we were invited to see at the works of Messrs. Dick, Kerr, and Co, at Preston, last Friday, were respectively a 1,500-kw. alternator and one of 3,750. As would not be expected at first thought, the smaller machine had the larger output. This is, of course, owing to the fact that it runs at very much higher speed. Fig 4 is an illustration of the 1,500-kw. three-phase alternator, which is to be coupled on to a horizontal engine made by Messrs. Yates and Thom. This machine will give its full output at a voltage of 6,600 and with a frequency of 25. The other alternator (Fig. 5) is a two-phase machine with a capacity of 3,750 kw., and has been constructed for the Shawinigan Falls Power Company, Canada. It is to be coupled to an Escher-Wyss turbine, running at 180 revolutions, the periodicity being 30, and voltage 2,200.

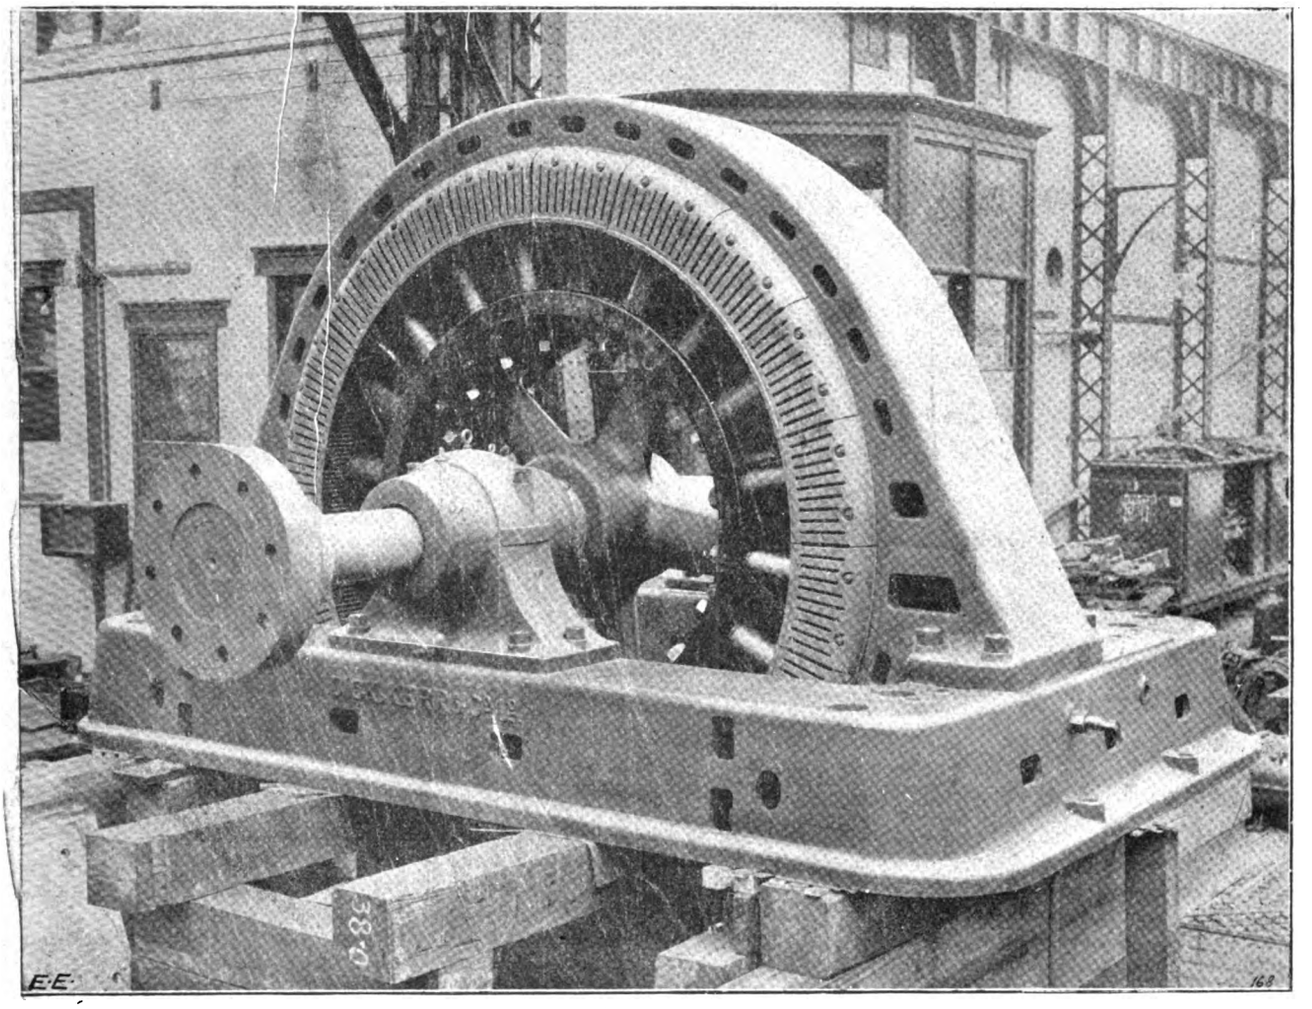

FIG. 5.—A 3,750-kw. Two-Phase Alternator built by Dick, Kerr, and Co. for export to the Shawinigan Falls Power Company of Canada.

It remains to be added that the alternators have been constructed to the designs of Mr. A. P. Zani, who, possessing unique experience in alternator design gained both in the States and on the Continent, has been enabled to improve and modify in the direction of sound mechanical design and efficiency of performance. Mr. Zani, it should be stated, has the co-operation of a very able staff of engineers, who possess exceptional ability and knowledge in polyphase work.

A pleasant feature in the visit last Friday was to see so many big machines and such a large number of motors in the shop at one time. The amount of work in hand is exceedingly creditable both to the designers and to the commercial heads of the firm.

OIL-BREAK SWITCHES AND FUSES.

BY AN A.M.I.E.E.

Oil-break switches are rapidly becoming the standard for alternating currents of high potentials. Indeed, it is doubtful whether any other type of switch is at all practicable for some of the heavier duties that may now be demanded of circuit-breaking devices. Their introduction gives a remarkable accruition to the powers and possibilities of high-tension switchgear, which is especially useful and opportune in view of the practical realisation of great power distribution schemes that is now in progress. Not a little of the successful materialisation of our ideals in this direction—some of them new, but many of them simply resuscitations from the days when the fascinations of alternating-current systems once before held our faith and imagination in thrall—will depend upon the adequacy and efficiency of the switchgear. It is therefore gratifying to note the steady development and perfecting of devices which will give us that absolute, safe, and workable control of which we may stand in need.

As usual, it is in America that the oil-break switch has been put most fully and thoroughly to the proof. Tests with rough apparatus at Niagara, on loads far in excess of any possible before or elsewhere, signally vindicated the soundness of the principles involved; and subsequent investigations have shown that not only is the application possessed of all the elements of practical success, but also that the circuit is broken in a manner which throws no abnormal strain on the insulation thereof. This is a highly satisfactory characteristic in view of the liability of severe resonance effects being originated by the flaring arc produced on the opening of an air-break switch or fuse; for beyond anything else must cable breakdowns be avoided. The mains will be the most costly and critical item of any power distribution scheme; and they must be most assiduously "nursed" and guarded from undue stresses. There is at this time cumulative evidence sufficient to

Digitized by Google

entirely discredit the ordinary air-break switch in this connection, which leaves the field practically clear for some type of switch in which the break takes place under an insulating liquid.

The fault of the air-break switch for high potentials is that it is really dependent upon air convection to produce the final separation of the arc. Speed of break has no appreciable effect; length of break makes too much for cumbrousness to be utilised to any very effective extent. Moreover, as Dr. Garrard has shown, there is good reason to suppose that for every circuit in which there is a break bridged by an arc, there is a particular length of the arc at which high-potential oscillations are likely to occur in the circuit. It is important, therefore, that the arc be broken before it attains to that particular length. Simple air convection cannot ensure this: such mechanical devices as sliding shutters are clumsy and complicated, and surface leakage is apt to make them uncertain in action. The same disability attaches to fixed fenders arranged so that the arc may be broken against them by the up-draught; besides their presence hinders the draught. A forceful blast also involves too much complication to produce and apply, and a magnetic blow-out is not feasible, because of the small magnetic force of the currents dealt with and the impossibility of concentrating a field.

The conclusion becomes inevitable, therefore, that there is no very effective safeguard against these dangerous lengths of arc in air. The remedy must be found in surrounding the arc with a medium of very different properties. Now when submerged in oil it is in a medium of some 700 times the density of air. The buoyancy of the gaseous conducting arc is, therefore, roughly speaking, 700 times as great. The upward displacing force is that much more powerful, and the arc is drawn out and ruptured with corresponding rapidity. Moreover, the cooling influence of the new surroundings is greater than the old in much the same order. It is not surprising, therefore, that striking differences obtain between the arc lengths produced in air and oil respectively on breaking similar electric circuits. Arcs that draw out into feet in free air cannot attain to inches in oil. Definite measurements are not on record, but it has been roughly observed that the arc length in heavy mineral oil, on breaking heavy loads at 15,000 volts, does not appear to exceed ½in. Of course, the time duration is equally short, which is a very important consideration, for the heat generated is naturally in proportion to the time. It is probable that the heat dissipated by the long flaring arc in air would be sufficient to overheat and fire an oil-bath of the content capacity that has proved effective and sufficient in some types of oil-break switches. That the oil remains cool and uninjured in such circumstances is decided evidence of the extent to which arcing is suppressed.

In fact, the arc-quenching capacity of suitably selected oil is so great in comparison with the risk of firing the bath, that the margins of safety in any oil-break switch of good design are of very satisfactory character indeed. In the oil-break fuse the conditions are much more onerous. Here a certain amount of heat has to be generated, even in a mechanically-separated fuse, and one of low fusing temperature. It is impracticable to keep the fuse continuously submerged in the liquid, for heat is being constantly generated, and without some elaborate circulatory apparatus the oil would be dangerously heated under the normal working conditions. In the best of arrangements it is impossible to prevent some of this normal heating from being communicated to the oil. The only feasible designs must be based on the principle of drawing the parted ends under oil on the instant of fusing. The fuse link proper must stand above the surface, but metallic conduction will still convey much of the heat to the oil. It is obvious, therefore, that oil-break fuses of large size cannot be safely set to operate at near limits to the normal load. Thus it is better to treat them as safety circuit-breaking devices for the greater emergencies only.

It is essential that the fuse link be short—*i.e.*, the exposed portion of it—in order to keep down the possible arc length in air. It should have a very definite reduction in section at the desired point of breakage only, so that the heating and fusing will be a minimum, and located only at the immediate point of rupture. For it must be remembered that the whole of the heat of fusion has to be absorbed instantly by the limited mass of oil that comes into contact with the hot metal. And it is very undesirable to have a large arc playing on the surface of a substance like oil: the surface is, of course, the flashing site, and any floating dirt or ash will greatly conduce to such flashing.

Yet after making the very best of the design, it remains that such types of the oil-break fuse labour under great fundamental disadvantages as compared with the switch. In the latter, the work is done in the depths of the oil; in the former, it must be done at the surface. In the last, the constant normal heating effect may be inappreciable; in the first, it must essentially be of some significance, the more so as the fusing limit is set closer to the load. All this points strongly to the advisability of making the switch the only breaking device in the circuit. That is, of making the switch into an automatic circuit breaker by the addition of tripping gear, in the way we shall discuss presently, and so superseding the fuse altogether.

But there is one valuable feature in the fuse which it is a sacrifice to lose. It is an automatic circuit-breaking device with a natural time limit. Not a very controllable limit perhaps, but of great utility in that it discriminates, roughly but fairly, between momentary strong rushes of current and the dangerous prolonged overloads. Time limits on mechanical devices are a troublesome complication, although they bring in advantages of regulation. It is worth enquiring, therefore, whether the oil-break fuse cannot be improved, as no doubt it will be. There is one suggestion that may be made. It is to shunt a main air-break fuse with a separate and entirely submerged oil-break fuse in such a manner that the first quietly fuses and separates, and the other finally breaks the circuit. The air fuse must take the main proportion of the current, and should be of a material with a low temperature coefficient of resistance variation. Its fused ends should be sharply separated by mechanical means beyond the sparking distance before the oil-break fuse, which should have contrary properties, has time to open. By these means we ensure that there shall be little or no normal heating of the oil and no surface arcs on breaking.

It has been suggested that oil-break switches and fuses are lacking in engineering qualities; but why, was not stated. One has remarked that "as an engineer he preferred that switchboards should be dry." Such criticism is arrogant absurdity. Surely the engineer is not debarred from liquids when he can use them to such effect and purpose as is done here. And as for these dry and elegant switchboards, isn't it about time some real engineering were infused into *them*? It ought not to be long now before we complete our emanicipation from the tradition which makes us design our switchgear about some vague ideals of ornamentation, and lay it out in pretty panelled patterns of lacquer and enamel. When that is achieved, engineers who still have preferences for dry and polished elegance had better turn themselves to Maple's to design them something sweet in art furniture, which as an afterthought can be turned into a switchboard. But it is to be feared they won't be able to accommodate either the oil-break switch or the oil-break fuse.

Coming now to the detailed design of the oil-break switch, this works out along a number of divergent lines. In the first place, it should be observed that the normal duty is of little or of no importance in the design of high-tension switchgear in comparison with the emergency duty that it may be called upon to perform. In a central or sub-station the main switches or fuses may have to open emergency loads equal to the full power of the station. Moreover, the total ultimate capacity of the station must be considered in this connection, or the switchgear may prove of insufficient emergency capacity later on. On a short-circuit the switch or fuse must interrupt, with certainty and without damage to itself, a flux of power comparable with the total kilowatt capacity of the plant running, and as the short-circuit current of modern alternating-current generators is about three times their full-load current, a current upwards of three times the total ampere capacity of the running plant may likewise have to be dealt with. Of course, in the latter case the

Digitized by Google

power behind these abnormally heavy currents is very considerably degraded by the great drop of voltage. Hence the maximum power to be broken will about correspond to the station capacity at the working voltage, and this will be the proper criterion on which to define the emergency duty of the switchgear.

The above assumes that the station is run in simple parallel. However, if the plant be arranged to run in independent sections when at full load, then the emergency duty is kept down to smaller and more definite limits. But a human equation comes into this case. If the attendants be neglectful in the matter of opening the interconnector switches, as soon as the additional units of plant are set running on the load, then we may again get emergency calls upon the circuit-breaking devices, which are beyond their capacity to deal with safely or satisfactorily. Still, in spite of this possibility, the arrangement is a valuable method of safeguarding the switchgear; and although it is to some extent less convenient and economical than simple parallel working of the plant, it should always be adopted when the switchgear is of doubtful emergency capacity, or is overcrowded or cut fine in dimensions or centres, or is otherwise at a disadvantage, considering the more abnormal conditions and risks to which it may be subject. For, we repeat, it is the abnormal conditions that are the true test of the efficiency of switchgear. The usual working conditions are in comparison not at all exigent, and they can be easily satisfied. Safety to operators and compactness of lay-out are not the only essentials. The former, of course, is all-important, but the latter is a decided snare. Engineers, knowing that they can get gear packed into a certain space, are strongly tempted to prescribe limits which absolutely cripple the design of the several items of apparatus. The imprudence of it is not discovered till a really serious accident comes along; then it is found that several units of switchgear become involved in the ruin, quite unnecessarily, simply because of their being too contiguous to the unit to which the accident happened. Spaciousness is, for this reason, a quality of good practical worth in a switchboard design, whereas compactness is simply a quality of cheapness and convenience.

Apart from the common considerations of conductor and contact density, and safe breaking distances and the like, there is one in particular which must obviously have some bearing on the capacity of an oil-break switch. This is the content of the oil-bath. The energy of the spark at break is the more effectively absorbed the greater the quantity of oil, not only because of the heat capacity, but more because of the free circulation. The arc is more completely enveloped, and the motions of the liquid are more powerful, so that the arc is swept aside by the rush of the fluid as well as carried upwards by its own buoyancy. It is possible, in fact, to arrange vanes on the contact bars in such a manner that on opening they will set up a strong flow athwart the arc, helping to break it with greater certainty and speed. The efficacy of all these "drowning-out" influences depends directly upon the amount of oil involved. Another point of great consequence to the continued reliability of the switch is the charring effect of the arcs on the oil. Every arc, of course, must burn and carbonise the oil which comes into immediate contact with it. Therefore by degrees the oil becomes foul, and its insulating quality seriously impaired. Before that, however, trouble is found in the deposit of carbon on the insulator surfaces. These circumstances call for periodical cleansings of the switch and renewal of the oil: and here, again, a large content of the oil-bath provides a greater margin of safety, and contributes largely to the permanence of the effective capacity of the switch.

Now, despite all these obvious advantages in favour of a large oil-bath, there is a strong division of design which aims actually at reducing the capacity of this bath to the smallest practicable amount. The reason—or rather, the intention—is to avoid the dangers of firing a large quantity of oil which, once alight, would burn for a considerable period and prove an uncontrollable nucleus of fire. It is considered that a small quantity will burn itself out without doing serious damage. But we are on very questionable ground here. It is very difficult to say, for instance, what is a dangerous amount of burning oil under given circumstances and what is not. On a compactly-built switchboard it would, indeed, seem that any quantity at all adequate for its purpose would prove dangerous when fired. On the other hand, it is very certain that the risk of igniting the bath depends very considerably upon its bulk; and the probability of deterioration follows the same inverse rule. Therefore in limiting the bulk we deliberately cut down the safe breaking capacity of the switch, and increase the risks of firing, for the sake of the possible impunity of the fire when it happens. Clearly, this is not a procedure to be decided upon lightly or without thorough investigation and experiment. The usual device is to break on auxiliary contacts contained in a small oil-bath, but it must not be forgotten that such contacts are extremely liable to become heated, and that they have to deal with the total energy dissipated on breaking the circuit. There is no virtue *per se* in auxiliary contacts, but they save the main contacts from damage and concentrate the arc in a convenient manner. The same conditions exist in breaking at the auxiliary contacts as in breaking at main contacts, so that we may easily get what is a formidable arc for the small auxiliary oil-bath, sufficient to blow out the oil and leave the switch in the dangerous state of an air-break switch with an altogether inadequate length of break.

However, on the other side of the question, we must not scorn the argument against the presence of a large store of combustible oil. The objection is reasonable, although the probability of igniting heavy masses of the description of oil employed is so very remote. It points to the advantage of isolating each switch in a cell or compartment, in situations sufficiently apart from the operating switchboard and each other, to prevent community in disaster. And, after all, this is one of the truest—if, indeed, it is not *the* truest—ideals in switchboard design. A complete catastrophe is the risk we court by following the dictates of space and convenience too far: and great is the gain of eliminating that risk The question is, how far "remote control" is practicable from each point of view—*i.e.*, mechanically and commercially. For the operation of the gear in an economical and feasible manner, demands that although the switchgear be scattered the control of it must be centralised.

Now, American practice has developed this idea, and although the methods followed are not yet ideal, some of them are decided advances in the right direction. In some respects these methods are crude and unrefined, as so usual with American work, which does not receive there the cautious criticism that is meted out to new notions here. Chiefly this in the development of the apparatus due to Yankee haste in standardising constructions on first suggestions without waiting for the best. Still, the main principle is firmly grasped, and, without doubt, most further development in switchboard design will take place along these lines.

The American type of oil-break switch for the usual run of work is contained in an iron tank, which is arranged to bolt under an iron frame carrying the switch mechanism, so that it can be lowered away from the switch contacts without disturbing any of the connections or mechanism. The contact bars or bridges are lifted into the clips by strong toggle joint contrivances above the tank. The contacts are carried in porcelain bushes projecting through the frame covering the tank, and the cable connections are sealed into these bushes. The whole makes a very substantial, if somewhat clumsy and rough arrangement, and it is admirably adapted for the purpose. The tank is lined with wood, and is of liberal dimensions to avoid risks of arcing to the sides. The frame and tank ought, of course, always to be earthed, although this precaution is usually neglected by American designers. These switches are, in general, a strong contrast to the too light constructions of highly finished metal and porcelain which characterise European practice, which somehow can seldom get entirely free from its clinging traditions of ornateness and polish. The latter types are, moreover, usually mounted in full view of the front of the board; the former types are invariably placed behind the panel and operated by hand levers on the front. For the less exacting conditions the oil switch frames are bolted direct to the

Digitized by Google

back of the panel; then going up the scale of duty the principle of remote control is developed, and the switch is fixed on the wall behind, or on floors above or below the switchboard and connected thereto by systems of bell cranks and connecting rods. Following out the idea, the switches may be further isolated by fenders or partitions of brickwork, stone, or concrete slabs, or slate, or marble; or they may be entirely enclosed in cells of brick or other suitable constructions. There is thus scarcely any limit to the degree of isolation and protection attainable by such means, and at no excessive cost. The most onerous conditions are met by pneumatically or electrically operated switches, which can obviously be placed in any conveniently remote and guarded situations; and the lay-outs can be arranged to secure the maximum degree of immunity from wholesale disaster, now that the mechanical difficulties of operation are no longer in the way.

By means of a tripping coil controlling some point in the linkage of the operating mechanism, and designed to release or trip a locking device by which the switch is held closed, it is converted into an automatic circuit breaker. In the case of such a device intended to operate on maximum current, the tripping coil may be actuated by currents transformed from the primary circuit by a current or series transformer. Such secondary circuits can, of course, be earthed on one pole, and the potential differences will be low. Moreover, the secondary current strength can be standardised for a complete range of apparatus at one uniform figure of moderate dimensions, say four or five amperes, which serves all purposes, the variations being obtained on the primary side by varying the ratio and primary current capacity of the series transformer. The secondary current can be employed in the indicating and recording instruments being taken in series through the ammeter, wattmeter, power factor indicator, and such integrating or recording meters as may be employed. As potential transformers will, of necessity almost, be used for the pressure measurements and synchronising gear, it follows that the switchboard proper will be a low-pressure, small-current board pure and simple. Besides, there will be a perfect uniformity of capacity in the instruments, the only variable features in the combination apart from the main switches being the ratios of the transformers and the scaling of the indicating apparatus.

There should be immense advantage and convenience in this, particularly in respect of stock and quick deliveries. Extreme accuracy is, of course, only attainable by calibrating instruments and transformers together, but for all practical purposes sufficient uniformity can be secured in the transformers and instruments that the calibration of any one of the latter will hold good on any one of the transformers having the same ratio. The standardising of switchboard apparatus having such uniform and adaptable qualities is a thing very easy of accomplishment and very desirable.

A considerable further development in the direction of automatic control, becomes possible with the adoption of relays to control the tripping coils. The way is thus paved for more sensitive automatic features. Devices to operate on reverse currents can be introduced; and time limit attachments can be more readily applied. Preferably, the relays should be employed to close independent circuits through the tripping coils: by which method these coils can be made very powerful for their size, since the connection being momentary, very high current densities can be used.

The use of relays for switchgear has been much deprecated, but it is difficult to see fair ground of argument against them. Scarcely anyone at this time of day would quarrel with the use of circuit breakers on switchboards, yet it is a fact that the combination of a relay and a circuit breaker (fitted with a tripping coil, operated by a momentary independent current in place of the usual cumbrous main current coil) is the more reliable and adaptable device. The tripping action is made more sudden and sure, and in power it can be made almost what one will. The primary currents in the relay have so little to do, that the circuit-breaking device becomes far more amenable to treatment and adjustment for various conditions and requirements. In fact, the introduction of relays makes for perfection in automatics; and far from a relay being a superfluous and feeble limb, it forms a very acute and trustworthy brain, able to supplement and assist in a very efficient way the human brain of the switchboard operator.

The writer does not wish to be understood as saying that these relays and automatic devices are to be obtained at once in perfected forms, as it is to be hoped they soon will be. But they are commercially available from several quarters in more or less crude constructions. In fact, they are being rather thrown too carelessly on the market, but with a little solid intelligence put into their design and manufacture they should rapidly improve. Central-station engineers will at least find the subject worth following up, as the main developments in high-tension switchgear will continue along these lines.

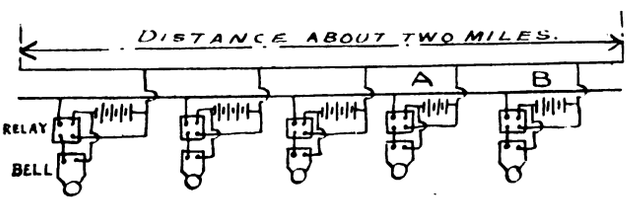
In conclusion, we summarise a few of what seem the best and logical developments of switchboard design, particularly for alternating currents of high potential: The abolition of ornament and the so-called artistic idea, as exemplified in excessive polish and lacquer and enamel; just as much of it as is conducive to cleanliness to be retained, and no more. The isolation of the sections in a sufficiently complete and effective manner to obviate all risks of community in disaster. The use of oil-break switches and circuit breakers with large oil-bath capacity, but arranged remote from the switchboard, each enclosed in a fireproof cell or compartment; the cells to be made with a cement floor, sloping well all round to a centre drain-pipe, made to drain quickly away all splashings of oil. The abolition of combustible insulation and insulated cable connections; the complete isolation of the latter into separate ducts. The reduction of the high-tension switchgear to a switch and a current transformer per single line, with selector or isolating plugs or switches where required. The enclosure of 'bus bars in cells or ducts of brickwork; the connections thereto to be similarly enclosed. It will be seen that there is a considerable amount of builders' work concerned in the lay-out of switchgear on these lines, and it is well for station and consulting engineers who contemplate use of the same to have full cognisance of this characteristic. For it throws the responsibility of the lay-out very much upon them, since the work being so largely structural, it is vain to trust to the building work being allowed for on a sufficiently liberal scale in the usual competitive schemes. It ought to be treated separately as a part of the building contract. It can be carried out more cheaply thus and in a more thorough and effective manner.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

QUESTIONS.

631. The diagram shows an underground signalling circuit with five bells in parallel. The line wires are galvanised iron wires on porcelain insulators. By putting together the two wires anywhere all five bells ring, which is necessary. It is desired to fix a telephone (wall pattern) at stations A and B, and to have a portable (watch pattern) to speak from any part of the line. Can this be



done with the present wires by placing switches at A and B, or, if not, what would be the best and cheapest means of getting the required communication?—PITMAN.

632. Is there any advantage in compounding a motor which is needed to be started up quickly on full load very frequently? The idea is that it can be started up as a series machine, the shunt being thrown in afterwards. The motor would be of 8 h.p., and work at 550 volts.—G. H.

ANSWERS.

Question No. 623.—What is to be said for and against putting wiremen on piecework: (1) on skeleton houses in Simplex conduit; (2) in houses already finished in casing or Simplex

Digitized by Google

Best Answer to No. 623 (*awarded* 10*s.*).—There is a great deal to be said in favour of adopting piecework for outside labour, such as wiremen, but there are also very many difficulties which appear to have hitherto prevented the adoption of this course. The chief advantages may be briefly stated as follows: (1) Each man with his mate, who might be an improver, would be responsible for a definite job, and the weekly pay-sheets would soon show the smartest men. (2) Probably a very considerable amount of idling would be saved. (3) There would be an incentive to the workmen to get the jobs finished as quickly as possible, and this would be very satisfactory to the tenant or builder; the former always objects to having workmen in the house, and the latter generally makes out that the wiremen are delaying the plasterers, etc. (4) Time taken in getting to and from work and from one job to another would be largely saved or not paid for.

The apparent difficulties are many, however, and may be stated as follows: (1) The system could not be applied to large jobs with advantage, as in such cases it is necessary generally to employ a number of wiremen on the same job. (2) There would be a tendency on all jobs for the work to be scamped, and the inspection and test would have to be very thorough. Any time saved by the foreman in supervision would thus probably be expended in extra inspection duties. (3) There might be a difficulty in regard to the time taken in getting to and from the job. The men would probably expect an allowance for this. (4) A very great difficulty would be the delays which always take place before a job can be entirely finished. With skeleton work one cannot count on being able to go straight through the house, although this frequently can be done, but, of course, the fittings, switches, etc., cannot be fixed till later. Then if you pay piecework for the skeleton wiring only the tendency to scamp the work will be accentuated, as the wireman will think he can make good any deficiency when he is working on the time basis fixing fittings. While if you put another man on this work he is unfamiliar with the wiring and takes longer, therefore, to complete same, and you have all the evils and objections incident to divided responsibility. In the case of finished houses this necessity to break the work does not exist, but delays due to the idiosyncrasies of occupiers will be felt

All things considered, the writer does not think it will be found practicable to put wiremen on piecework to any large extent, but very great improvement might result from a properly worked out bonus scheme somewhat on the following lines. A careful record should be kept of the time and material spent on each job, the chargeman and others employed on same, etc., and, before starting any job, an estimate of the cost should be made by the electrician in charge of the work, and the men could be notified that the work would be done on the bonus system, which could provide that, say, 25 per cent. of any saving made on the estimate should be divided between the wiremen employed on the job and the foreman. The figure determined on as the probable cost of the job would not, of course, be the same as the quoted price, but would represent the prime cost, and would take into account *all* the conditions, possibilities of delays, etc., which in general vary considerably with the different jobs. It would probably be best not to let the wiremen know the figure decided on.—E. M.

Answer to No. 623 (*awarded* 5*s.*).—The question of day-work *versus* piecework is one of great interest to many who are engaged in industrial pursuits. An employer wishing to obtain the maximum output from his workmen, and desirous of introducing the piece system, will often find objections raised by the employés. The main reason given by workmen against piecework is that it leads to sweating and the general lowering of wages. It would appear that where great numbers of the same, or similar, articles are manufactured, piecework is advantageous to both employer and employed. In such cases there should be no difficulty in fixing fair prices for the work. It must be remembered, however, that, for piecework to be a success, careful inspection and constant supervision is absolutely necessary. Where, on the other hand, the work consists of varied items—such as repairs, alterations, etc.—and a detailed supervision is impracticable, piecework often leads to dissatisfaction on both sides.

A workman on piecework usually confines his attention solely to the particular operation for which he is paid. To anything beyond this he is completely indifferent. In an occupation such as wiring, where so much depends on good workmanship, the most fruitful cause of fires in electrical installations is generally considered to be faulty work by the wiremen, and, therefore, one would not anticipate the best results when piecework is in vogue. When wiremen are put on piecework a considerable increase in waste material may be looked for, and the scrap heap will probably show an abnormal growth in dimensions. The workman's one idea being to get his part done in the quickest and easist manner possible, he will have little time to give for the utilisation of material to the best advantage. It has already been mentioned that fires are often associated with bad workmanship. Suppose a wireman to be on piecework, would he, for instance, spend the necessary time in properly insulating joints? Joints are, perhaps, the weakest part in an installation, and given a finished joint there is little by which one can tell whether the operations of soldering and insulating have been efficiently performed. It is not all gold that glitters, and an elaborately varnished joint may cause the "insulation" to fall to zero. Generally it appears to be unsatisfactory to put wiremen on piecework except on special jobs, where there is a lot of similar work with constant supervision.

1. In this case so much depends on how the pipes are run, the care with which the "fish" wires are threaded, etc, that the question of piecework should be carefully considered before being introduced. When one set of workmen put the piping up on piecework and another gang draw the wires through on the same method of payment, anyone having had experience with the idiosyncrasies of the British workman will see trouble ahead. If the leads are put in as the pipes are fixed, the work must be carefully overlooked as to connections for fittings, etc.

2. Sending workmen into a finished house to "wire" it rarely gives the best results. Most engineers have experienced the difficulty in gauging the labour under such conditions, awkward corners have to be negotiated, walls to be got through, care taken of existing decorations, etc., so that it sometimes happens that a job is half done before one realises the extent of the work. A wireman put on such a job at what appeared to be a fair price, would no doubt be greatly tempted to scamp the work and rush it through anyhow. In any case, careless and scamped work leads to bad tests, and it may be found that the time and trouble expended in putting a faulty installation in a satisfactory condition for connecting on to the supply mains, will far outweigh any saving due to piecework.—M. M.

Answer to No. 623 (*awarded* 5*s.*). — On principle, in these two cases of wiring, or, indeed, any other, no! do not employ wiremen on piecework. On analysis the objects of piecework divide themselves under two heads—*i.e.*, cheapness of labour or fixed cost of labour. In the first case, the employer expects the workman to complete the job in a quicker time than if employed at a rate per hour; and in the second case, even if the cost of piecework came out the same, he would rest assured that should any unforeseen difficulty arise it would not increase the cost of his labour. In both of these conditions the transaction assumes the form of gamble. In piecework there is a much greater temptation to scamp work, especially if the wireman should be unexpectedly faced with any task which required special manipulation or delicate handling, and which was not allowed for at the time the price was fixed, as it is too much to expect of humanity to give the same attention to any obstruction when that attention means money out of pocket, than should it be paid for at an hourly rate. It should be borne in mind that the application of piecework on a wiring contract differs absolutely from piecework in a factory, as in the latter case a man is turning out much the same work week after week, whereas every fresh wiring contract presents new problems and difficulties, chiefly in connection with the mechanical or constructional portion. Of course, the great preventive of scamped work is proper and careful supervision and inspection, but it is a question

Digitized by Google

whether that does not balance any saving due to piecework in the cost of the job.

Having thus gone into the objects of piecework and its general tendency, let us ascertain how they apply to the two cases in question, and see if either of them present any features to lead us to suppose that they present any exception to the above general rule. The first case appears to present itself as more adaptable to piecework than the second, owing to the fact that the job would be more straightforward, and that being so, there would be considerably less inducement to scamp than if the job was more involved in the execution of it; but, on the other hand, should any bad workmanship occur and escape detection, it would be built in and would cause more trouble eventually to repair. But on the whole, if the work were properly tested and inspected step by step before the builders' men started to cover it in, this case certainly appears more suitable for piecework than the second. Now, taking the case of a finished house, the great objection to piecework would lay in the more complex labour problem which this involves, as it must be remembered that the work would have to be carried out not only to satisfy a purely electrical point of view, but in accordance with that of the householder, and with the least disfigurement of the plaster, ceiling, paper, etc., and it is almost safe to conclude that the wireman would work at a greater rate when on piecework, and, therefore, with more danger to any decoration, etc., that might exist. In this case, though, any bad workmanship would in many cases be more easy to repair at a later date than if the work was done when the house was in a skeleton state.

To sum up, the more simple and straightforward a job is the more suitable it is for piecework, and, therefore, of the two cases mentioned in the question the first appears most applicable, but in reference to what was touched on in the beginning of the answer, it would certainly be better not to execute the work on the piecework system at all, but to employ men at an hourly rate, when there would not be any tendency for them to rush the job through in insufficient style for them to draw the money. Of course, it might be urged that piecework would enable the wiring contractor to give a lower price for the job, and the lower the price the more would electric lighting be utilised, with greater benefit to the whole trade. But no industry has certainly better foundations to recognition, although it may have slightly longer to wait, if the work was done in a manner that did not conduce to extreme cheapness, but rather that did not only lend itself to reproach but kept above suspicion; and a very good, if not conclusive, judgment on the question might be passed by taking the votes of a number of householders and the question put to them as to which they would consider safer or which they would prefer, that their houses had been wired on the piecework system or otherwise. It could be taken for a certainty that they would decide for the latter.—G. A.

Answer to No. 623 (*awarded* 5*s.*).—The employment of wiremen in piecework is no doubt conducive to economy in the cost of wiring, and in these days of competition and price-cutting the system will, no doubt, commend itself to the contractor who wishes to make a fair profit on his contract. The objections to piecework in case (1) are fairly apparent. In the first place, there is the difficulty of checking the work done by a wireman, as well as the manner in which the Simplex or other conduit has been put together. Unless the installation be a large one, it would not pay to keep a foreman or superintendent constantly on each house. The foreman, as a rule, has several other jobs under his charge, and very often when he comes round to check the work of a party of wiremen in an unfinished house, he finds a good deal of the runs already plastered up by the builders during his absence. He has, therefore, to trust to his wiremen for the integrity of the socket joints in the conduit. In many cases these joints would be found in anything but a satisfactory condition, and it would not be surprising if, in places, the conduit were sprung quite free of the sockets altogether, this being due to the undue haste of the piecework wireman to add another "point" to his day's achievements. A break of this nature in the conduit will admit the plaster, which will quickly destroy the rubber insulation of the wires, especially if the "threading" system of wiring be adopted—*i.e.*, threading the wires through each length of tube before the same is fixed. This trouble would not be so great if the work were done on the "draw-in" system, as, of course, in this method of wiring the conduit is first run throughout, and no wires drawn in until the tubing for the circuit is complete and plastered in, thus the plaster has an opportunity of drying before the wires can come in contact with any of it. There is, however, another feature of "jerry wiring" encouraged by the piecework system, and that is the tendency to neglect to file off the sharp "burrs" which are formed inside the tube after cutting it to the required length, and it is by no means uncommon to find the wires bereft of the major part of their insulation after being drawn round some bends armed with sharp edges left in this way. These objections raised against piecework in case (1) apply also in general to case (2), the difficulty being to properly inspect each man's work before passing it. In finished houses new wiring is generally run under floors, in false roofs, down hollow plaster partitions, and, as a rule, in places inaccessible for inspection, and, therefore, where good workmanship is not likely to be put in.

It seems to the writer that wiring is not by any means the class of work that lends itself to piecework, on account of the ease with which bad workmanship may be concealed. Further, in all wiring it is difficult and troublesome to establish a satisfactory system of rating the work done by a man, as it cannot fairly be paid for by any particular dimension, nor, of course, by weight, and not even by the number of "points" wired, inasmuch as all fittings have their own peculiar difficulties, and, therefore, cannot be rated on the same basis. This question of rating would be constantly creating friction between employer and employés, for even with such a standard system as the Simplex it would be very difficult of adjustment. On the other hand, of course, the workman paid by the hour will inevitably relax his energies when the foreman turns his back, and a good deal of time will be wasted. Unfortunately, however, every employer has to expect this sort of thing on outside work unless he can afford to keep a trustworthy foreman on almost every job.—D. J.

Question No. 624.—I wish to construct a transformer, the primary voltage of which is 2 000, and the secondary 25 volts, frequency 60. It is imperative that the secondary circuit consists of *one* turn only. Can this be done? Give particulars of design.

Best Answer to No. 624 (*awarded* 10*s.*).—Transformers have been built for welding purposes having the secondary consisting of but one turn. The output in special cases has been as high as 10,000 to 20,000 amperes, but at a very low voltage of about five volts. Incidentally, it may be mentioned that the Johnson Electric Traction Company, of America, employ special transformers for welding the joints of tramrails in position, the output of the transformer being 25,000 amperes at five to seven volts.

In all these special cases the transformers cannot be designed with anything approaching a fair efficiency, and the "specific" weight—*i.e.*, weight per kilowatt—is also excessive when compared with transformers for ordinary work. Before referring to formulæ, it will be well to consider the relations existing when a transformer is unloaded and when it is loaded. A transformer is analogous to a continuous-current shunt motor in operation. In a shunt motor, when running unloaded, the back E.M.F. generated in the armature is practically equal to the voltage of supply, and the small current taken by the armature can be divided into two portions—viz., one part being absorbed by the friction of the bearings and brushes, and the other part being absorbed in the armature core (called the "core loss" current). The energy absorbed by the core is made up of (1) the "eddy-current loss" and (2) the "hysteresis loss." When the motor is loaded the back E.M.F. falls, on account of the "drop" due to armature resistance, and a current is drawn in corresponding to the load. With a transformer the case is very similar. When the secondary is on open circuit the primary acts as a choking coil, and the back E.M.F. induced is practically equal to the supply volts, the small current taken by the transformer, called the "magnetising" current, under these conditions being required for carrying the iron through the magnetic cycles. This current is

Digitized by Google

90deg. out of phase with the E.M.F., and performs no work, so that it is frequently called a "wattless" current. It will therefore be seen that the magnitude of this current is the function on which the "all-day" efficiency depends.

It will be convenient here to give the general formula connecting the E.M.F. with the flux, turns, and periodicity. A formula which the writer has found to be very convenient is the following:

$$E = 4 . f . T . N . M \times 10^{-8};$$

where E is the effective voltage generated (in volts);
T the number of turns;
N the periodicity in cycles per second;
M the flux simultaneously linked with each of the T turns; and
f a constant, called the "form factor."

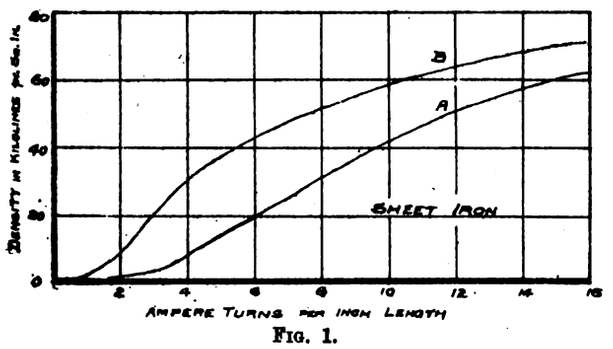


Fig. 1.

In transformers the relation between the voltage and flux is dependent on the wave-form of the applied E.M.F., and this involves the use of the term "form factor."* This may be defined to be the ratio of the square root of the mean of the squares of the equi-spaced ordinates of a curve to the true mean value of the equi-spaced ordinates; or,

$$\text{form factor } (f) = \frac{\text{R.M.S. (root mean square)}}{\text{T.M.}} \quad \frac{}{\text{(true mean)}}.$$

In the case of a rectangular wave the R.M.S. value, the T.M. value, and the maximum value are equal, and the form factor is unity. For a sine wave of E.M.F. the form factor is 1·11, and the value is higher for peaked waves. It will thus be seen that the form of the E.M.F. wave is of importance in transformer work. For practical purposes it is convenient to assume the sine wave for the E.M.F. curve, and the above formula thus becomes

$$E = 4{\cdot}44\ T\ N\ M \times 10^{-8}.$$

Applying this formula, we find that the E.M.F. generated by an alternating flux, M, having a periodicity of

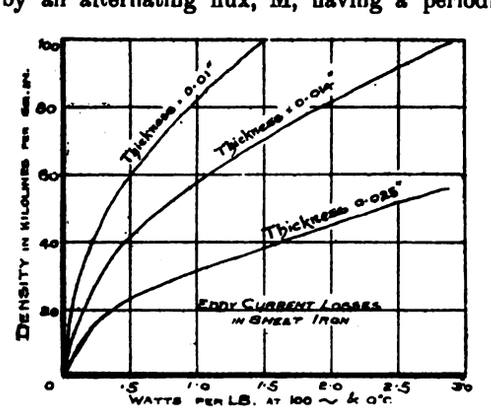

Fig. 2.

N cycles per second will be $E = 4{\cdot}44\ T\ N\ M \times 10^{-8}$ in the primary, and $E_1 = 4{\cdot}44\ T_1\ N\ M \times 10^{-8}$ in the secondary, since the same flux, M, is linked with both the primary and secondary turns (T = primary turns and T_1 = secondary turns). By dividing the former equation by the latter, we have $\frac{E}{E_1} = \frac{T}{T_1}$ = ratio of transformation. Thus the primary voltage is given at 2,000, the secondary at 25, and the secondary turns as 1, and hence the primary turns must equal 80. The flux to be generated in the core can now be determined. Inserting the values for E, T, and N, we have

$$2{,}000 = 4\ 44 \times 80 \times 60 \times M \times 10^{-8},$$

whence $$M = \frac{2{,}000 \times 10^8}{4{\cdot}44 \times 80 \times 60} = 9{\cdot}4 \text{ megalines.}$$

Reference may now be made to the curves given in Figs. 1, 2, 3, and 4. Fig. 1 gives the saturation curve for sheet iron plotted to suit the requirements of transformer calculations. Curve A was obtained after punching, and Curve B after subsequent annealing. In the calculations below Curve B will be used. Fig. 2 gives curves showing the eddy-current loss in sheet iron at different densities,

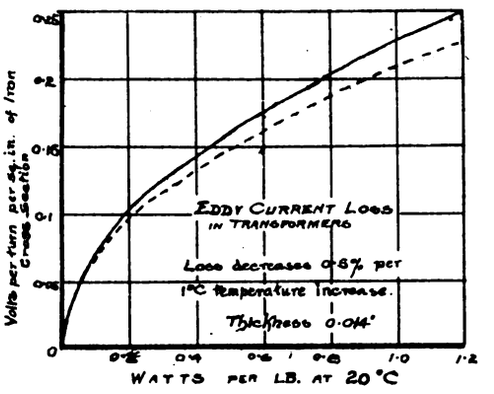

Fig. 3.

and shows clearly the effect of the thickness of the iron A thickness of 0·014in. is generally adopted for transformer work. The eddy-current losses can be calculated from the following formula:*

$$W = 1{\cdot}5 \times t^2 \times N^2 \times B^2 \times 10^{-10};$$

in which W = watts per pound at 0deg. C.;
t = thickness of sheet in inches;
N = periodicity in cycles per second;
B = density in lines per square inch.

The loss decreases ·5 per cent. per degree Centigrade increase of temperature. The formula holds for iron, having a weight of 0·282lb. per cubic inch and a specific resistance of 10 microhms per centimetre cube at 0deg. C. Fig. 3 is, however, to be preferred for transformer calculations, and corresponds to a thickness of 0·014in., such as is used for transformer work. In Fig. 4 is given a curve showing the hysteresis loss in transformer sheet iron at different densities. The curve is plotted for a periodicity of 100 cycles, but the loss at different cycles can easily be obtained, since it is directly proportional to the number of

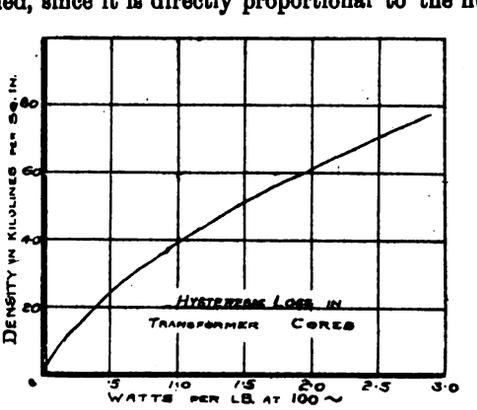

Fig. 4.

cycles per second such as occur in ordinary practice. The arrangement adopted in Fig. 1 of plotting the magnetising force in ampere-turns per inch of magnetic length has been found to be extremely convenient, as the ampere-turns required at a given density can be at once obtained by multiplying the value obtained from the curve by the length of magnetic path in inches. It will be seen from the curve that as the density is increased, not only does the magnetising force rapidly increase, but also the hysteresis and eddy-current losses.

* This term is due to Prof. J. A. Fleming. See "The Alternate-Current Transformer," vol. i., second edition, p. 583.

* For thicknesses greater than 0·025in. magnetic screening affects the result obtained by this formula.

Digitized by Google

In Fig. 5 are given sketches showing a suggested arrangement of the core and coils, the writer preferring this arrangement on account of the better facilities for insulation. No mention is made in the question of the capacity of the transformer, and for an illustration of the methods of calculation given below we will consider a transformer of 20 kw. capacity. As stated above, 9·4 megalines have to be generated in the core. At a density of 30 kilolines per square inch the net section of iron required will be $\frac{9{\cdot}4 \times 10^6}{30 \times 10^3} = 313$ square inches; and at a density of 40 kilolines the net section required $= \frac{9{\cdot}4 \times 10^6}{40 \times 10^3} = 232$ square inches. It will be seen that, on account of the few turns in the primary, the amount of iron required is considerable. We will consider that the core of the present transformer is to be worked at a density of 40 kilolines per square inch, and that the net depth of the stampings is 30in. The gross length, *l*, will be about 10 per cent. in excess of this value—viz., 33in.—allowing for insulation between stampings. The thickness of the latter should be about 0·014in.

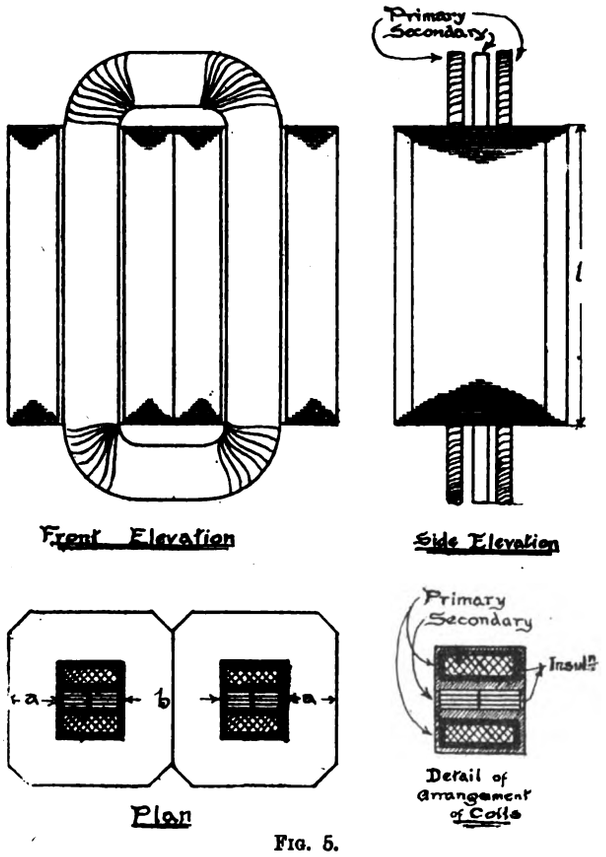

FIG. 5.

The width of iron required beyond the coils (*a*, Fig. 4) will be $\frac{232}{30 \times 2} = 3{\cdot}9$in. The openings for the coils may be 2½in. × 2½in., and the mean length of magnetic path will be $2\{2(2{\cdot}5 + 3{\cdot}9) + 2(2{\cdot}125 + 3{\cdot}9)\} = 49{\cdot}7$in. At a density of 40 kilolines per square inch, 5·5 ampere-turns of magnetomotive force are required per inch length of magnetic path.

$\therefore$ required ampere-turns $= 49{\cdot}7 \times 5{\cdot}5 = 218$.

There are 80 turns, and, therefore, a maximum current of $\frac{218}{80} = 2{\cdot}7$ amperes isrequired. The R.M.S value of this current $= \frac{2{\cdot}7}{\sqrt{2}} = 1{\cdot}93$ amperes. We will next estimate the core loss component of this "magnetising" current.

Weight of sheet iron $= 194 \times 30 \times {\cdot}282 = 1{,}640$lb.

(·282 being the weight in pounds of a cubic inch of sheet iron).

At 60 cycles and 40 kilolines the curve in Fig. 4 shows that there will be a hysteresis loss of $1 \times {\cdot}6 = {\cdot}6$ watts per pound of iron. For estimating the eddy-current loss Fig. 3 may be used. Volts per turn per square inch of iron cross-section $= \frac{2{,}000}{80 \times 232} = 0{\cdot}18$. From Fig. 3 the eddy-current loss corresponding to this value is 0 62 watt per pound. Consequently, hysteresis and eddy-current loss will be 0·6 + 0·62 = 1·22 watts per pound. Total iron loss = 1,640 × 1·22 = 2,000 watts. Core loss component of magnetising current $= \frac{2{,}000}{2{,}000} = {\cdot}71$ R.M.S. amperes. This current is 90deg. out of phase with the current for magnetising, and hence resultant "leakage" current $= \sqrt{(1{\cdot}93)^2 + (0{\cdot}71)^2} = 2{\cdot}05$ amperes. This is the current taken by the primary of the transformer on open circuit, and hence the name leakage current. The current density in the primary may be taken as 1,000 amperes per square inch, thus the section of wire = ·012 square inch, which corresponds to No. 10 S.W.G. The wire should have a triple cotton covering (the external diameter being ·144in.), and should be wound in two coils of 40 turns each, as shown in Fig. 5, being arranged in 10 layers, each of four turns. The wire should be treated with shellac, and at every second layer a strip of shellaced linen should be inserted. Each coil when wound should be served with tape of about ·007in. thick, half overlapped and dipped in varnish and baked, and the operation repeated The current density in the secondary may be 800 amperes per square inch, the section of copper required being about ·8 square inch (the output on the secondary being about 650 amperes at full load). The conductor should consist of copper strip of 1in. × ·1in. section, eight of these being in parallel, forming one turn (as shown in Fig. 5). This arrangement is to minimise the eddy-current loss in the conductors, which would be excessive otherwise. Each strip should be varnished and the whole served with one layer of tape, similar to the primary coils. The insulation between coils and core may consist of $\frac{1}{32}$in. fibre, and this may also be inserted between the primary and secondary coils. The low density in the conductors is to limit the temperature rise to ordinary values.

It will be seen that such a transformer is very weighty compared with ordinary transformers, and, further, the efficiency is also low—only about 75 to 80 per cent at full load. This is on account of the very few turns in the primary, due to the secondary consisting of but one turn. The above example is not intended to be taken as a practical case, but to illustrate the principles embodied in the calculations, and to bring out one great point in transformer work, that the greater the number of turns in the primary the more efficient the transformer can be designed.—A. D.

Answer to No. 624 (*awarded* 7*s.* 6*d.*).—The stipulation that the secondary winding shall consist of one turn only is one that will make the design quite unusual for transformers of small or moderate power, and one that will cause either high first cost or low efficiency or both, but it can be done, and the mere designing part is not at all difficult. We are given the voltage and the frequency, and since one turn of wire must have 25 volts generated in it, we can at once determine the total flux or magnetic induction that must be reached in the iron core from the formula,

$$e = \frac{\sqrt{2}\,\pi\, n\, \mathrm{N\,A}}{10^8}, \text{ or } \mathrm{N\,A} = \frac{e \cdot 10^8}{\sqrt{2}\,\pi\, n}.$$

In this formula a sine-shaped wave is assumed.

N = maximum flux or magnetic induction per square centimetre;

A = cross-section of iron core in square centimetres;

n = frequency;

e = E.M.F. per turn (virtual).

Hence $\mathrm{N\,A} = \frac{25 \cdot 10^8}{\sqrt{2} \cdot \pi \cdot 60} = 936 \times 10^4$.

If N has the normal value in transformer working of 5,000, the cross-section of the iron core must be not less than $\frac{9{,}360{,}000}{5{,}000} = 1{,}870$ square centimetres = 290 square inches, while if the working flux density is raised to the high value 10,000, the iron cross-section would still be 145 square inches.

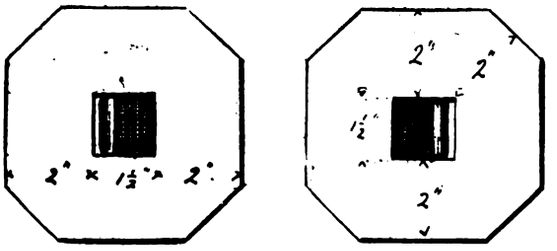
So far we have not needed to consider the power of the transformer at all; the calculation above is quite independent of the power, and it is now seen why the expense and inefficiency are greater the smaller the power of the transformer. For unless the dimensions of the core differ

Digitized by Google

enormously from the ordinary, its weight will be excessive and the hysteresis loss very great. Of course the power for which the transformer is required must be known before proceeding further with the design, and as nothing is said about this in the question, we will assume it to be 10 kw. for our example, but will so consider the reasons for the points in our design as we proceed that they may form directions for the design of a transformer of any other power.

As we are quite in ignorance concerning the purpose for which the transformer is required, we are unable to judge of the relative importance of lowness of first cost and efficiency; we will assume that the efficiency is unimportant, so that a maximum induction value of 10,000 lines per square centimetre will not be too high, the iron cross-section being then 145 square inches, as stated above. The shell type of transformer will be the most suitable, as the iron needs a relatively large radiating surface in comparison with its mass, on account of the high induction and consequent large hysteresis loss. From consideration of the cooling capacity of the transformer, we see that the perimeter of the discs of the core should be large compared with the material in them, but the path of the magnetic lines must also be short, as this will both save iron and iron losses. We must then make the inside dimensions of the disc very small, and then keep down the outside dimensions as low as we can without making the length of the transformer too unwieldy.

Suppose we take wire of gauge 14 for the 200-volt winding, which has to carry five amperes when the input equals 10 kw., the area of cross-section of 80 of these wires is ·4 square inch, and allowing ·6 square inch for its insulation, which must be of good quality, we find that one square inch of space is sufficient for the primary winding. A similar allowance will be ample for the secondary, which will consist of a single turn of strip. A hole, therefore, 1½in. square will give sufficient room for the two windings and their insulation. Let us make the disc 5½in. square with the corners sheared off so as to give a minimum width of magnetic path of 2in.; the length of the transformer will be then $\frac{145}{2 \times 2}$ inches + 25 per cent., or 45in. The allowance of 25 per cent. is for insulation between the discs. The discs should be of the thinnest transformer iron procurable, as otherwise the eddy-current losses will be great



owing to the high induction. A sketch of the cross-section of the transformer is given herewith. If we know the magnetic quality of the iron as regards hysteresis and permeability, we may calculate the iron loss and the magnetising current as below. Area of each disc = 25 25 square inches. The volume of iron in the core equals twice this multiplied by the length (net iron) of the transformer = 50·5 × 36 = 1,820 cubic inches, and the weight in pounds = $\frac{1,820}{3·6} = 505$.

Suppose we know the hysteresis loss in watts per pound is ·5 for B maximum = 4,000, and frequency 100, then, by raising B from 4,000 to 10,000, we increase the hysteresis loss in the ratio of $\left(\frac{10,000}{4,000}\right)^{1·6} = (2·5)^{1·6}$, according to the well-known Steinmetz rule, and the decrease of frequency diminishes the loss in direct proportion, so that the total iron loss is

$$505 \times ·5 \times 2·5^{1·6} \times ·6 = 655 \text{ watts.}$$

To calculate the magnetising current we must know the magnetising force, H, required to produce a flux of B = 10,000. Suppose H must be six C.G.S. units.

Now $H = \frac{4\pi}{10}$ ampere-turns per centimetre.

The mean length of magnetic path is about 12in., or 30cm. Hence turns of primary per centimetre $= \frac{80}{30}$, and magnetising current is

$$H \times \frac{10}{4\pi} \times \frac{30}{80} = 1·8 \text{ amperes.}$$

In conclusion, let us emphasise the point that in a small-power transformer, where the turns are limited, the ratio of copper to iron may be rendered normal by making the copper circuit very long and the path of the magnetic lines very short. The mechanical design suffers, of course, accordingly.—SUPERHEAT.

Answer to No. 624 (*awarded* 5*s.*).—Theoretically a transformer could be constructed to comply with the particulars given in the above question, but in actual practice an excessive sectional area of iron would be required to carry the flux, as is shown later. Fig. 1 shows the general design of a transformer used for electric welding purposes, in which the secondary coil consists of one turn only of copper strip and arranged concentrically with the primary coil. Over the primary and secondary coils is wound a large number of soft iron wires, W, spaces being left at A and B to bring the ends of the coil out to the terminal board. This type of transformer is usually arranged for working on 600 to 1,200 volt mains at 60 to 100 cycles, the secondary giving out about 12,000 amperes and 1 volt, as for welding purposes very large currents are required at a low voltage. Now consider a transformer of this type working on 1,000-volt circuit at 100 cycles, and the secondary giving out 10,000 amperes at one volt. In this case the secondary consists of one turn, and consequently the primary of about

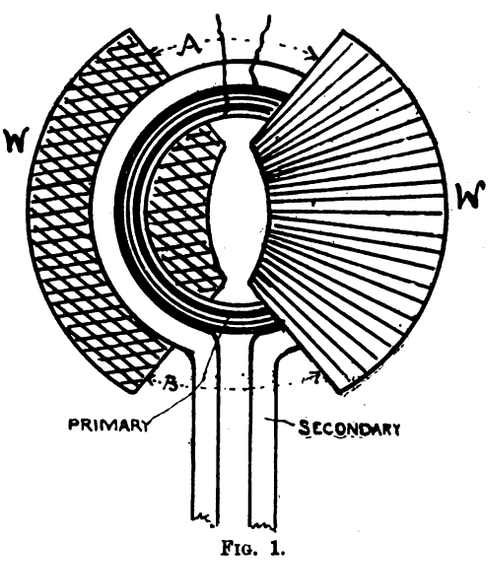


FIG. 1.

1,000 turns. Then the maximum flux can be obtained from the following formula:

$$\frac{\text{E.M.F.} \times 22 \times 10^6}{\text{Turns} \times \text{cycles}} = \text{C.G.S. units.}$$

Therefore, total flux equals 220,000 C.G.S. units, and to carry this flux six square inches sectional area of iron will be required in the core of the transformer (allowing for a density of 36,500 C.G.S. units per square inch).

In the transformer required by "J. G." the secondary consists of one turn only and the primary of 80 turns to suit the required voltages, and with the primary working on 2,000 volts at 60 cycles the flux will be 9,200,000 C.G.S. units by the above formula, and working at the same density in the iron as above, 250 square inches sectional area will be required in the core. From these figures it is quite evident without further proof that it is impossible to build a small transformer to suit the voltages required if only one turn is used for the secondary coil. On very large transformers of 400 kw. and above it would be possible, owing to the large quantity of iron required, as the primary and secondary coils would be of considerable size.—P.

THE ELECTRICAL STANDARDS.

In our leading article for Sept. 4 this year we referred to the work which the electrical section of the Engineering Standards Committee had almost completed in connection with the fixing of definite standards for electric supply voltages and for the frequencies of alternate-current supply systems. In this issue we are able to give the conclusions of this committee, and also a statement of the procedure by which the committee arrived at these conclusions. The procedure is perhaps quite as important as the conclusions, in that it has given every opportunity for those whom the conclusion will affect to express their opinions on the matter. In the first place, the sub-committee of the electrical section dealing with generators, motors, and transformers is composed of fourteen gentlemen who collectively represent the bulk of the interests involved. Thus the War Office, the Admiralty, and the Crown Agents for the Colonies were all represented, and although there was no direct representative from the Incorporated Municipal Electrical Association, Mr. C. H Wordingham could be relied upon to give voice to the views of the central-station engineer. The sub-committee having made up its preliminary conclusions on the points before it, then circulated these throughout the country, so that all the leading manufacturers, consulting engineers, and users of motors had full opportunity of expressing their opinions on the proposed standards. It is gratifying to know that the replies received were unanimously in favour of the recommendation now before us. The full report of the sub-committee is yet to be published, but from the statement published in the present issue we gather that they considered the question before them on the general idea that the standards adopted should conform, as nearly as possible, to present conditions wherever possible, and that they should be selected with a view to enable manufacturers to meet most economically the demand for electrical accessories, such as motors, lamps, etc. In consequence, the conclusions of the committee as far as standard pressures for direct-current supply are concerned, are arrived at by taking approximately the means of the various pressures now in use. Thus we get, as standard pressures, 110, 220, and 440 volts. As the committee point out, electric motor "carcases built for these standard pressures could be utilised for pressures 10 per cent. above or below the suggested standards without any alteration whatever in the castings or mechanical components, by merely altering the windings and excitation.' In fact, it will be found that manufacturers have already gone even beyond the stage which the committee think is possible, and have made the same motors do for 10 per cent. variations of voltage without any alterations in the windings. In consequence, the engineer requiring a motor for, say, 200 or 240 volts, really gets, not the best motor for this voltage, but a 220-volt motor, and he has to put up in consequence with any inefficiencies involved by the change. In many instances the increase in the losses is very considerable, and satisfactory working is prejudiced. We know of one candid manufacturer of electrical motors who had done a considerable business with one supply company, and who received complaints as to the overheating of these motors. His reply to the complaint was that his motors were quite satisfactory for the voltage for which they were wound, and that the heating was due to the supply voltage being an abnormal one. He added that he could not give the very prompt deliveries demanded unless he could wind standard motors for stock. We trust that the standards now fixed will be adopted without exception for all new work undertaken, and that any consulting engineer who wishes to show his extreme care in detail by saving a

Digitized by Google

few hundreds of pounds in his mains by using 240 volts instead of 220 will be restrained by the Board of Trade. In our leader of Sept. 4 we suggested that the Board of Trade had full power to do this, as the declared pressure of supply has under the Electric Lighting Acts to be submitted to them for approval. They hence can assist more largely than any other authority towards securing the adoption of these standard pressures in all new work. It is to be hoped that this will be done, especially as the Board of Trade has been consulted in the matter, and has approved of the standards fixed by the committee. Another point which should restrain engineers and contractors from departing for trivial reasons from these standards, is that they have been determined by an Engineering Standards Committee which is organised conjointly by all the engineering institutions in this country. If for a few years this course of keeping all new work to the standards is pursued, it will then be possible for electric plant manufacturers to assist in the matter. This assistance would come from the fact that they will be able, in consequence of the very large demand, to supply accessories for standard voltages and frequencies at considerably lower prices than they will be compelled to charge for non-standard articles.

CORRESPONDENCE.

"One man's word is no man's word,
Justice needs that both be heard."

REVIEW OF "PRACTICAL NOTES ON ELECTRIC MAINS."

SIR,—As you have opened this matter for discussion, I am probably not out of place in having something to say thereon. Presuming that I am the author of this book reviewed in your last issue (I say "presuming," as I cannot claim the initial "B"), I should first of all like to tender my thanks to my reviewer for the praise he has given me.

Seeing that my reviewer has not stated his name, I cannot attempt to discuss his point technically, and even if he had given his name I would not promise to do so; but I can assure him that about some of the points he has raised there can be no "opinion," an opinion being at the best a very poor thing—merely a belief, and not something that one "knows" absolutely and finally; and that I do "know" that in many cases he is absolutely wrong, and I will leave others, who, perhaps, are not "experts," to tell him so.

Having read through his remarks, two questions came to my mind—viz., "What is an expert?" and "Is my reviewer an expert at electrical distribution or at reviewing?" I consulted a dictionary about the first, but to the second I have obtained no decided answer; yet he has written a good review. My mental remarks on reading his comments were such as: Oh! Indeed! Well, you would not serve my cables so! etc. And having had the aid of the dictionary, and seeing that I bring 18 years' experience to bear, I also will take the title of expert. I make these remarks, because when writing the MS. for this book I had the honest intention of helping those starting, and lest these should think that because my reviewer is an "expert," and says "this is so" and "that is so," his remarks are final and infallible.

My reviewer sums up the whole thing when he says "Mr. Lee is a man with opinions of his own, and is not afraid to tilt against the fetishes of standard practice." I have called myself an expert, but certainly not one to expound the rules of "standard practice." To what does "standard practice" lead us? To all sorts of curious things—for example, shorts, wet cable ends, cables which will not stand pressure tests, low I.R. figures, and, finally, new networks rotten in, say, five years. Allow me to implore young cable engineers to keep away from "standard practice" and "tomato cans"—such things lead England to contemplate "fiscal problems" and the like.

There is just one point on which I will remark, and that is the one bearing on the thickness of insulation wall necessary to withstand mechanical strains. This figure I thought I had given as $\frac{5}{32}$in. (few men outside a cable factory know anything about "mils"), and, of course, does not apply to cables for internal wiring. As far as I am concerned, this figure can remain at $\frac{5}{32}$in., in spite of the C.M.A.—possibly a most useful body—to itself.

In writing a book such as the one reviewed, the statements are apt to be misleading by their very baldness, simply because most readers—as evidently my reviewer—will not have the same attendant convoy of thoughts which the writer had. The reviewer is, however, quite right in his supposition that the book was written in odd moments. I may say it was written under great pressure, and some of it at times when the writer should have been in bed, and the proofs were looked through often while at meals. Thus there are sure to be errors, but I will here remark that if I have made a definite statement that is not an evident error, I have had ocular proof that such is the case, and I have been able to follow the cause through to a legitimate end.

As to my reviewer's suggestion that I should take to motorcar driving, I may tell him that since the M.S. was written I have done many hundreds of miles in motorcars, but even in this I so depart from rules of "general practice" that I do not admit accidents.

However, to conclude, let me again thank my reviewer, and ask the starters in our profession to steer clear of "general practice," but to think and know for themselves, and meanwhile, Sir, to adopt your suggestion to discuss these things.—Yours, etc., L. R. LEE.

Manchester, Oct. 26, 1903.

INDEPENDENT TELEPHONY.

SIR,—In reply to "R. M.'s" letter in your issue of the 23rd inst., we must say at the outset that our articles are being written from a practical point of view. What we cannot understand is why "R. M." did not make his imaginary exchange increase from 800 subscribers to eight millions. There is nothing like doing a thing well. We have never heard or known of an exchange rapidly increasing from 800 to 6,000 lines, and, therefore, from a practical point of view, cannot see the utility of imagining such a thing. "R. M." also points out that it is impossible to extend a board by fitting in multiple jacks unless they are wired, and wiring involves labour, and think it only fair this should be pointed out. To whom is he pointing it out? Surely he does not think that 2s. represents the price of a multiple jack alone, or £2 per strip of 20, or perhaps "R. M." is not acquainted with such practical facts as the price of jacks and cables. In conclusion, we should like to add that, considering the present state of the telephone question, we think genuine correspondents should have the courage to sign their names in full, and also the company they are employed by, so that we may have the pleasure of knowing to whom we are replying. In future we shall not trouble to reply to anonymous effusions.—Yours, etc.,

Southsea, Oct. 23, 1903. GARDNER AND HOLME.

WATER-LEVEL INDICATOR.

SIR,—Permit me to point out that the water-level indicator described and illustrated at p. 623 of your current issue is practically the same as that invented by me in 1878, and in that year submitted to the Admiralty.

The provisional specification, No. 1,748 of 1878, may be seen at the Patent Office Library.—Yours, etc.,

London, S.E., Oct. 28, 1903. C. E. KELWAY.

ELECTRICAL STANDARDS FOR DIRECT-CURRENT PRESSURES AND ALTERNATE-CURRENT FREQUENCIES.

The Engineering Standards Committee, organised jointly by the Institution of Civil Engineers, Institution of

Digitized by Google

Mechanical Engineers, Institution of Naval Architects, Iron and Steel Institute, and Institution of Electrical Engineers, has recently considered a report from the Electrical Standards Sub-Committee on the above question. The importance of the decisions arrived at will depend on the spirit in which they are received by the electrical industry, and we trust that consulting engineers and manufacturers will unite together to make these standards the only ones to which they will work when laying down new installations. The report of the sub-committee reads as follows:

"The standardisation of electrical pressures and frequencies was the first portion of the important work entrusted to the sub-committee on generators, motors, and transformers by the Electrical Plant Committee. The sub-committee consists of the following gentlemen: Colonel R. E. Crompton, C.B., chairman; Colonel H. C. Holden, R.A., and Captain A. H. Dumaresq, R.E., representing the War Office; Commander G. L. Sclater, R.N., and L. J. Steele, Esq., representing the Admiralty; Llewellyn Preece, Esq., representing the Crown Agents for the Colonies; Dr. R. T. Glazebrook, representing the National Physical Laboratory; B. H. Antill, Esq., and W. B. Esson, Esq., nominated by the Electrical Engineers' Plant Manufacturers' Association; A. C. Eborall, Esq., S. Z. de Ferranti, Esq., Robert Hammond, Esq., Captain H. R. Sankey, C. H. Wordingham, Esq., Leslie S. Robertson, Esq., secretary; C. Le Maistre, Esq., electrical assistant secretary.

"At an early stage in their deliberations the sub-committee decided that the most advantageous metod of approaching this problem, beset at it is with so many difficulties, would be from the point of view of those most affected—namely, the users of lamps and of motors for power purposes. It was therefore agreed that the standard pressures to be suggested should be measured at the consumers' terminals as settled by Act of 1899. At the present time there exists many different pressures declared by the various lighting and power authorities. In view of the great desirability of obviating this unsatisfactory state of affairs, it was deemed advisable to suggest the minimum number of standard pressures which would best meet present commercial requirements, and at the same time utilise to the fullest extent the consumers' existing appliances. After careful consideration, it became evident to the sub-committee that the direct-current pressures of 110, 220, 440, and 500 volts would best meet the requirements, because carcases built for these standard pressures could be utilised for pressures 10 per cent. above or below the suggested standards without any alteration whatever in the castings or mechanical components, by merely altering the windings and excitation. It is to be hoped that now these direct-current pressures have been fixed as standards by the committee, they will in future be universally adopted by the engineers advising corporations and others distributing electrical energy. In course of time the benefits to the electrical industry at large, which will certainly follow the adoption of these standard pressures, must become more and more apparent.

"A circular was drafted embodying the suggestions of the sub-committee, and this was submitted, first to the manufacturers for their consideration, and secondly to the leading consulting engineers and users of motors. The information so courteously placed at the disposal of the sub-committee by the consulting engineers and manufacturers was most carefully weighed and considered by the sub-committee, and certain definite conclusions were arrived at, the circular being sent, in the first instance, to the manufacturers, as they were the people most directly interested. Replies were received from all the leading firms, who expressed themselves unanimously in favour of the recommendations of the sub-committee. The consulting engineers similarly gave their adherence to the proposals of the sub-committee. Before coming to their final decision, the sub-committee on generators, motors, and transformers conferred with the sub-committee on electrical tramways, of which A. P. Trotter, Esq., is chairman, and a joint meeting took place, with the result that the pressure of 500 volts, which most concerned the latter sub-committee, was agreed to, and in addition to the pressures already agreed to 600 volts was decided upon as the standard pressure for electrical railways.

"The question of the adoption of standard frequencies, although of equal importance with that of standard pressures, was not surrounded with the same difficulties. It was, however, deemed advisable to fix upon the standard frequencies at the earliest possible stage of the work, as no progress could be made in the standardisation of prime movers for driving alternate-current machinery until such time as the frequencies had been settled upon. On this question there appeared to be a great preponderance in favour of frequencies of 25 and 50. The only point upon which any serious difference of opinion appeared to exist was the advisability of the adoption of a third frequency of 40 or 42, to enable rotary converters to be used to the fullest advantage. All the arguments in favour of this third frequency were fully discussed, but after carefully weighing the *pros* and *cons.* the sub-committee decided not to recommend the adoption of more than two frequencies—namely, 25 and 50. The recommendations of the sub-committee were then submitted to the Electrical Plant Committee, the Publication Committee, the Main Committee, and the Board of Trade for their approval. This having been obtained, it was deemed advisable, in the interests of the electrical industry of the country, that the findings on the questions of direct-current pressures and frequencies should be published at an early date, without waiting for the completion of the entire report to be issued at a later date.

"The following are the resolutions on standard direct-current pressures and standard frequencies:

"1. That the standard direct-current pressures, measured at the consumers' terminals, be 110, 220, 440, 500 volts.

"2. That the standard direct-current pressures, measured at the terminals of the motors, be: for tramways, 500 volts; for railways, 600 volts.

"3. That 25 periods per second be the standard frequency for (*a*) systems involving conversion to direct current by means of rotary converters; (*b*) large power schemes over long distances; (*c*) three-phase railway work, where motor gearing and the inductive drop on the track rail have to be considered.

"4. That 50 periods per second be the standard frequency for (*a*) mixed power and lighting on town supply mains; (*b*) ordinary factory power plant; (*c*) all medium size power plant where rotary converters are not employed."

SOME NOTES ON STEAM TURBO-ELECTRIC GENERATING PLANTS.*

BY GEO. WILKINSON (MEMBER).

Almost since the first power station was established in this country, in 1889, under provisional order for the supply of electricity for lighting and power purposes, turbo-electric generating plants have been employed in the generating station. The share they have taken in the work of public electricity supply has not been large, but it has shown a steady and healthy growth. Until recent times an opinion prevailed in many quarters that generators of this class were to be tolerated only in places and under conditions where no other plant could be employed, that the capacity of steam-turbines in the way of steam consumption was unapproached by any other class of plant, and that with use they went from bad to worse in this respect; grave doubts were also entertained as to the mechanical and electrical stability of electric generators running at the high speeds which are inherent in the steam-turbine. How far these suppositions have been justified by past experience and practice it does not come within the province of this paper to show, but it is becoming generally recognised that where condensing water is available the steam turbo-generator has to-day established a record for reliability, efficiency, and durability, which constitute it a formidable rival to all generating plant in which reciprocating engines are employed, be they slow, medium, or high speed.

On April 23, 1884, the Hon. Charles A. Parsons filed his first applications for letters patent for turbine engines; one of these patents is entitled "Improvements in Rotary Motors actuated by Elastic Fluid Pressure, etc.," and the specification sets forth many of the essentia details to the construction of a successful and economical turbine engine, such as devices for reducing cost of construction, for preventing vibration, for drawing off leaking steam, and for providing efficient lubrication; this attention to details has always been a feature in the Parsons turbine, and has promoted in no small degree the immense success of the present-day turbo-generator. Mr. Parsons's original patent rights having expired, the way has been opened for the manufacture of steam-turbines by other engineers, and already such eminent firms as Messrs. Willans and Robinson, the Brush Engineering Company, the Westinghouse Company, and the British Thomson-Houston

* Paper read before the Leeds Local Section of the Institution of Electrical Engineers.

Digitized by Google

Company, have commenced to manufacture steam turbo-electric generators, while Messrs. Greenwood and Batley, of this city, have for years made and supplied turbo-generators of the De Laval type.

To describe in detail the plants made by these firms is beyond the scope of this paper, and I purpose to note some of their leading characteristics only, devoting the remainder of the paper to remarks and suggestions based on my own experience, in the hope that they may be of service to some members of the Institution and form the basis for a useful and instructive discussion.

The De Laval Turbine.—About 1882 Dr. Gustav de Laval invented a reaction turbine originally constructed for direct driving of milk separators. The driving wheel was a pipe bent in S form, to which steam was admitted through a stuffing box in the centre, where the shaft was also fixed. The steam issued from the open ends of the pipe, thus driving the engine round. Steam-turbine engines of this simple type are, I believe, still working, but they are obviously crude and uneconomical. In the modern construction of the De Laval the steam is blown divergent from stationary nozzles, where expansion takes place, against vanes or buckets fixed in the circumference of a wheel, and the steam thus impinging on the vanes drives the wheel round and causes it to rotate at high velocity. There is only one row of buckets or vanes on the wheel upon which the steam delivers most of its energy, and is afterwards exhausted either to the atmosphere or to a condenser in the ordinary way. The steam-nozzles are placed in very close proximity to the vanes of the turbine wheel, the clearance being only 2mm., and consequently there is practically no loss of velocity between the steam jets leaving the nozzles, and entering the vanes of the turbine wheel. The peripheral velocity of the wheel in the largest De Laval turbines does not exceed 1,380ft. per second, while steam expanded from 150lb. pressure into a 28in. vacuum can attain a velocity of over 4,000ft. per second, thus the wheel falls far short of the theoretical economical speed. The turbine wheel is adapted by an ingenious construction and method of suspension to operate at a very high peripheral velocity, and the speed is reduced and made available for dynamo driving by very perfectly made spiral cut gears, which effect a 10 to 1 speed reduction. The dynamo armature is direct coupled to the gear-wheel shaft of the turbine. The larger sizes of turbine-dynamos have two armatures, so as to obtain a better distribution and balance in the turning effort. Two sets of field magnets are provided, and the armatures can be coupled either parallel or in series, or the machines can work direct on a three-wire system of distribution. The speed is maintained constant by an exceedingly ingenious and compact centrifugal governor mounted on the slower-running gear wheel, which controls a double-seated valve on the steam admission. The following table shows the high efficiency obtained with the De Laval generators. They are, however, made up to 300 h.p. only, which is too small a unit for most public electricity supply stations, and, so far as I am aware, only direct-current generators are supplied with these turbines.

TABLE I.—Results of Tests with De Laval Steam Turbo-Generators at Different Loads.

* To get approximate lbs. of steam per kilowatt-hour multiply by 10 and divide by 6.

The Parsons Turbine.—This turbine, which is by far the most important and extensively used at the present day, is of the parallel-flow type. The turbine motor consists of a cylindrical case with rings of inwardly projecting vanes, within which revolves a concentric shaft carrying rings of outwardly projecting vanes. The rings of vanes on the case nearly touch the shaft, and the rings of vanes on the revolving shaft lie between those on the case, and nearly touch the case. The steam passes first through a ring of fixed guide vanes, and is projected in a rotational direction upon the succeeding ring of moving vanes, imparting to them a rotational force; it is then thrown back upon the succeeding fixed ring of guide vanes, and the reaction upon the next ring of moving vanes increases the rotational force. The same process takes place at each of the successive rings of guide and moving vanes. The energy to give the steam its high rotational velocity each successive ring is supplied by the drop in pressure, and the steam expands gradually by small increments. In the earlier types the steam was taken in at the centre of the fixed cylinder, and operated on successive fixed and moving vanes, both right and left, exhausting at each end of the fixed cylindrical chamber, thus obtaining an approximate balance and little or no end thrust on the bearings; in the later designs the steam flows and operates upon fixed and moving vanes, in one direction only; the diameter of the fixed and revolving vanes are usually increased at least twice, and the three chambers thus formed are generally designated the high-pressure, intermediate, and low-pressure cylinders. To balance the end thrust imparted to the shaft by the steam operating upon the moving vanes, grooved pistons or dummies are used, which rotate within corresponding seatings; the diameters of these pistons correspond with the diameters of the working cylinders, and a passage connects each working cylinder to the back of its corresponding balancing piston, and thus the end thrust is neutralised. The balance pistons also act as a practically steam-tight joint, since the clearance between the grooves can be adjusted longitudinally by a thrust block in the end bearing. In order that the turbine shaft may set itself accurately in the centre of gravity, the bearing are constructed of a number of concentric loose-fitting sleeves immersed in oil in such a manner that any transverse movement of the shaft is resisted by the fluid friction of the thin films of oil which have to be squeezed from the parts where the tubes are pressed against each other; thus the flexibility of the bearings is sufficient to compensate for any slight variation between the centre of the revolving cylinder and its true centre of gravity. The armature of the electric generator is directly coupled to the turbo shaft by means of a steel sleeve; the shaft also carries a worm which drives a worm-wheel, which in turn operates the lubricating oil force pump, and also the steam admission governor, by means of an eccentric or cam. When necessary, the condenser, air, and circulating pumps are driven also from this slow-running worm-wheel. The governing of the machine is as follows: Steam is admitted to the turbine in a series of gusts by the periodic opening and closing of a double-beat valve. This valve is operated by means of a steam relay in mechanical connection with the turbine shaft. The duration of each gust is controlled by an electric solenoid, which is connected as a shunt to the field magnets. The core of the solenoid is hung from the end of a long lever. The fulcrum of this lever is periodically moved up and down by means of a link connecting it with the eccentric, which receives its motion from the worm on the sleeve coupling, the eccentric also serving to work the oil-pump. The short end of the lever controls the valve of the steam relay. Each periodic movement causes a gust of steam to be admitted to the turbine, the duration of the gust depending on the height of the distant end of the long lever. With alternating-current generators an ordinary centrifugal governor takes the place of and fulfils the functions performed by the before-mentioned solenoid; a second centrifugal governor is also provided which comes into action should the generator through any cause obtain an excessive and dangerous speed, when a trip gear is operated thereby and the steam automatically cut off from the plant. One important factor which in the early times prevented the use of the Parsons turbine in alternating-current stations was that the makers were unable to guarantee satisfactory parallel running of the plants. About the year 1894 this difficulty was surmounted by modifying the governing in such a manner that the steam admissions were increased in frequency and shortened in duration, thus obtaining a more even angular velocity. The first single-phase turbo-alternator to be successfully run in parallel with slow-speed generators was one of the radial-flow type of 150 kw. output, installed in the Portsmouth Corporation works in 1894. Mr. Quin shortly afterwards succeeded in operating parallel-flow single-phase plants in phase with slow-speed plant at Blackpool, and to-day the successful operation of the plants in parallel with each other and with plant of other types is common practice. The first Parsons steam-turbine and generator was built in 1884. It developed 10 h.p. at 18,000 revolutions per minute. It ran for several years in Gateshead-on-Tyne, supplying current for the manufacture of incandescent lamps. It is now in the South Kensington Museum. It consisted of two groups of 15 turbines each, the steam entering between them and passing in opposite directions through each group. In 1889 the radial flow type of steam-turbine was introduced, and in 1892 a 100-kw. set running at 4,000 revolutions per minute was tested with a steam pressure of 100lb., slightly superheated, and a vacuum of 28in., when the consumption was found to be 25lb. per kilowatt hour. About two years later the parallel-flow type of turbine was again adopted, in which were introduced the modifications already described. Various improvements were also made in the design and construction of the vanes, which resulted in a considerably greater economy of steam. About this time several turbines of the non-condensing type were put down in the Manchester-square station of the Metropolitan Electric Supply Company, of London, where an injunction had been obtained against the company on account of the vibration caused by the reciprocating engines already installed. These turbo-alternators were of 350-kw. capacity, and gave complete satisfaction. Since that date the size of turbines has gradually increased, units of 500 kw. being put down in Newcastle, Scarborough, Cambridge, London, and other places. In 1900 two alternators, each of 1,250 kw. capacity, were made for the city of Elberfeld, Germany. The turbines were of the tandem type, consisting of high and low pressure cylinders, and ran at 1,500 revolutions per minute. The dynamos were four-pole, and supplied single-phase current at 4,000 volts and 50 periods. The steam consumption with slight superheat was 18·8lb. per kilowatt-hour at full load, or 11·9lb. per indicated horse-power, including the power required to drive the condenser pumps. These dynamos run perfectly in parallel with the 1,500-h.p. Sulzer engines which are coupled to 1,000-kw. Brown-Boveri alternators running at 83 revolutions per minute. In fact, the turbines steady the reciprocating engines, even when the latter are running on traction load. During the last few years new designs have been brought out in which the consumption obtained has been further reduced, giving, especially in the larger

Digitized by Google

sizes, some very remarkable results. A few examples of the amount of steam used by various sizes of turbines are given below.

50-kw. Steam Alternator for the Blackpool Corporation.

Pressure of steam above atmosphere at stop valve.	Superheat at stop valve.	Vacuum in the turbine cylinder bar = 30in.	Revolutions per min.	Load.	Steam used.	Steam used.

A disadvantage in the Parsons plant is its great length, and there appears to be no good reason why it should not be shortened, the discs carrying the vanes being made larger in diameter to compensate. A convenient arrangement would be to place the plant thus shortened vertically, instead of horizontally, and I venture the opinion that the vertical type of turbo-electric generator will eventually displace the horizontal type. Returns published by Messrs. C. A. Parsons and Co. in May, 1903, show that the firm have supplied 50 turbines to corporations, ranging from 50 kw. to 1,800 kw., and aggregating 20,900 kw.; also 73 turbines to electric supply companies, ranging from 50 kw. to 3,500 kw., and amounting to 31 880 kw. in the aggregate.

Westinghouse-Parsons Steam-Turbine.—This steam-turbine built by the Westinghouse Company is practically the same as the Parsons type, with the exception that the governor is placed between the turbo and the electric generator. A fly-ball type of governor is made use of, which has several features conducive to good regulation. The ball levers are swung on knife-edges in lieu of pins. The governor works both ways—that is to say, the mid-position of the levers is admitting a full head of steam to the turbine. A movement from this in either direction is tending to cut off the supply. This serves a useful purpose in the event of a very excessive load coming on the turbine, such as a short-circuit, which has the effect of bringing down the speed more than the percentage variation permitted by the adjustment of the spring, when the steam immediately becomes shut off. Again, in such an event as some of the governor driving mechanism becoming broken, and the governor balls slowing up independently of the turbine, the steam is shut off before any damage could take place. It may be of interest to note that the Westinghouse Company have on order, and are building, about 85,000 b.h.p. nominal capacity of turbines for use in this country. These include, among others, three 3,500-kw. turbo-alternators for the Metropolitan Railway of London, and eight 5,500-kw. turbo-alternators for the Underground Electric Railway Company of London. In addition, large sets are being built for the Corporations of Brighton and Liverpool. The guaranteed maximum steam consumption of the 5,500-kw. plants at 165lb. steam pressure and 27in. vacuum per kilowatt hour is as follows: full load, 20·81b. saturated steam, 17·7lb. with 150deg. F. superheat; half load, 25lb. saturated steam, 21·2lb. with 150deg. F. superheat. The plants are also designed to take an overload of 50 per cent. In these large turbines a departure is made from the regulation practice, inasmuch as steam is admitted at the centre of the casing and exhausts at both ends; a balance is thus obtained upon the duplicate sets of revolving vanes, and no steam balancing dummies are used.

Willans and Robinson Steam-Turbine.—This is practically a Parsons turbine with the following modifications: While efficiency in the Parsons turbine depends upon the small clearances between the outer ends of the turbo vanes and the cylinder casing, and also between the ends of the fixed vanes and the revolving cylinder, in the Willans these peripheral clearances are disregarded and reliance for efficiency is had upon the small clearances on the sides of the vanes at their outer ends. The rotating rings of vanes (and also the fixed ones) are enclosed by a double hoop of thin metal which moves with the vanes; the edge of this ring comes fairly close to the continuous collar which forms the root of the next fixed ring of vanes. The clearance is very small, and it is claimed that if the hoop touches the fixed collar it will do no harm, but will almost immediately wear itself into the proper position. There are other minor details in connection with the governors, bearings, and casing, introduced with a view to simplification, and the makers are prepared to guarantee, with high-pressure superheated steam and a good vacuum, a steam consumption not exceeding 17lb. to 18lb. per kilowatt-hour on a 1,000-kw. turbine coupled to an alternating-current generator.

Brush-Parsons Turbo-Generator.—So far as the steam portion of this plant is concerned, it is built to the Parsons designs with one or two detail modifications in connection with the oil circulation and cooling; the alternator is of the fixed armature type with revolving field magnets. Although the Brush Company have only recently taken up the manufacture of this class of plant, an examination of the various parts during construction convinces me that the Brush Company's production will prove itself to be one of the best and most reliable of turbo-generators.

The Curtis Steam-Turbine.—The shaft in this turbine is vertical, the lower end carrying discs of large diameter within the steam casing on the periphery of which the steam-vanes are carried, the stationary rings or vanes being fixed to the cylinder casing. On the upper end of the shaft the revolving field magnets are mounted, and the stationary single or polyphase armature coils are located in grooves formed in the laminated iron discs surrounding field magnets, the whole being protected by a metal casing in the shape of an inverted basin. At the extreme upper end of the shaft the centrifugal governor is located, which controls the plant in the novel manner described later. The Curtis generator is of recent development, and retains some of the features of both the De Laval and Parsons types; also a number of novel and practical innovations are introduced which make the plant specially interesting at the present time, and which the manufacturers claim make possible a lower speed, less weight, fewer and simpler parts, high economy, less cost in manufacture, and other important advantages. Velocity is imparted to the steam in an expanding nozzle or nozzles, so designed as to efficiently convert into velocity nearly all the expansive force of the steam between the pressure limits used. After leaving the nozzles, the steam passes successively through two or more lines of vanes on the moving element, which are placed alternately with reversed vanes on the stationary element. In passing successively through these moving and stationary elements, the velocity acquired in the nozzle is abstracted, and largely given up to the moving element. Thus the steam is first thrown against the first set of vanes of the moving element, and then rebounds alternately from moving to stationary vanes until it is brought nearly to rest. By this means and by virtue of the large diameter of the discs carrying the vanes a high steam velocity is made to efficiently impart motion to a comparatively slowly moving shaft. The steam inlet area is made up of a number of expanding nozzles adjacent to each other, so that the steam passes to the wheels in a broad belt when all the nozzle sections are in flow. This process of expansion in nozzles and subsequent abstraction of velocity by successive impacts with wheel vanes is repeated two or more times, the devices for each repetition being designated as a stage. The number of stages and the number of lines of vanes in a stage are governed by the degree of expansion, the peripheral velocity which is desirable or practicable, and by various conditions of mechanical expediency. Generally speaking, lower peripheral speeds entail more stages, more lines of vane per stage, or both. The general practice is to so divide up the steam expansion that all stages handle about equal parts of the total power of the steam. The governing is effected by the successive opening or closing of the high-pressure set of steam nozzles and consequent widening or narrowing of the active steam belt. The first expansion nozzle is controlled by a throttling device operated by the governor, and the remaining nozzles are opened or closed electrically by a small electric controller which is moved round by the governor. The downward thrust due to the pressure of steam against the vanes is not balanced by steam pistons or dummies, as in the Parsons type, but the whole revolving mass is floated up on a thin film of oil which is forced up beneath the footstep bearing by an oil force pump. High efficiencies are obtained with this plant, and with 125lb. steam pressure superheat of 100deg. F. and 28in. vacuum, the makers guarantee maximum steam consumption per kilowatt-hour, exclusive of the power required for operating the condenser pumps and driving the exciter, as follows:

Size of plant.	Full load.	Half load.	Quarter load.
kw.	lbs.	lbs.	lbs.
750	19·9	20·9	24·0
1,500	19·3	20·2	23·2

Under the same conditions, but with 140lb. steam pressure and 28½in. vacuum, a 600-kw. Curtis generator at 1,500 revolutions per minute gave on test a consumption of 19½lb. of steam per kilowatt output on full load, 19½lb. on 25 per cent. overload, 20¾lb. on half, and 22½lb. on a quarter load. The following are some of the distinctive features of the Curtis turbo-generator: (*a*) the short vertical height occupied by the steam portion of the plant, as compared with the horizontal length of the steam portion of the Parsons type generator, and the strength and substantial section of the steel turbine vanes; (*b*) the extremely small floor space occupied by reason of the electric generator being built vertically over the turbine; (*c*) the excellent ventilation obtained in the alternator owing to its being built vertically over the turbine; (*d*) the uniform turning movement obtained by the continuous supply of steam to the turbine and speed regulation by varying the volume thereof. Possible disadvantages are that the generator carries no exciter, and the condenser pumps cannot be driven direct from the turbo shaft. It is probable that the reciprocating steam-engine will still maintain its superiority over the steam-turbine for driving direct-current generators of large size, inasmuch as at the high speeds necessary with turbines there is difficulty in constructing a satisfactory direct-current revolving armature; the armature reaction necessitates either a special compensating winding or the shifting of the brushes for changes in load, and the excessive peripheral velocity and vibration of the commutator precludes the use of carbon brushes, which would probably soon become red hot. Hitherto most of the high-tension alternating-current turbo-generators have been constructed with revolving armatures, a practice which is to be condemned, inasmuch as with the excessive centrifugal strains and vibration due to high velocity it is difficult to maintain good insulation of the high-pressure generating coils; also the excessive velocity of the collecting rings causes cutting of both the rings and the collecting brushes. A considerable amount of metal dust is thrown off at the point of contact, and in long continuous runs this metal dust

Digitized by Google

is apt to collect and break down the insulation of the high-pressure collecting rings or brushes. In the writer's experience both these causes have produced breakdowns in turbo-generators with revolving armatures. The ideal arrangement is a fixed armature with the field magnets revolving within same, and this is now becoming standard practice in single and polyphase turbo-generators. The result is an absolutely reliable plant, which in point of first cost, economy of operation, and steam consumption, is in advance of the best practice with slower speed generators driven by reciprocating engines.

Economy of Space and Buildings.—This may be readily set forth by comparing the 3,500-kw. Sulzer-Kolben two-phase generators at the Willesden works of the Metropolitan Electric Supply Company, with turbo-generators of equal output. The Sulzer-Kolben plant weighs, with condensers, approximately 585 tons. The space occupied by the foundations is 60ft. 2in. in length by 21ft. 6in. in width, with a vertical height above the engine-room floor to the top of the piston tail rods of 33ft. 4½in. A Parsons turbo-generator of the same output weighs approximately 148 tons, and the space occupied does not exceed 37ft. 1in. in length by 8ft. in width and 14ft. 6in. in height, plus about an equal depth for the condenser-room beneath. A Curtis turbo-generator of 5,000 kw. output weighs approximately 175 tons, and the space occupied does not exceed 20ft. by 15ft., with a vertical height not exceeding 30ft. In this size the condenser, turbine, and generator are arranged vertically, the condenser forming the base of the plant.

(To be continued.)

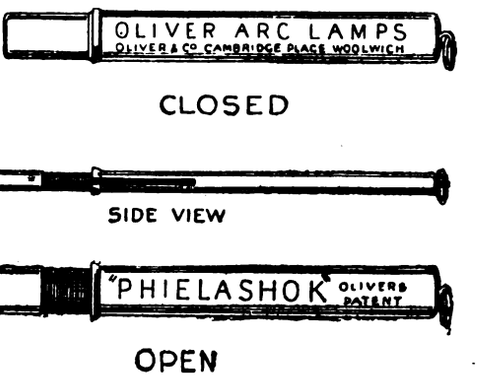
TRADE NOTICES AND NOVELTIES.

Continuous Concrete Conduit.

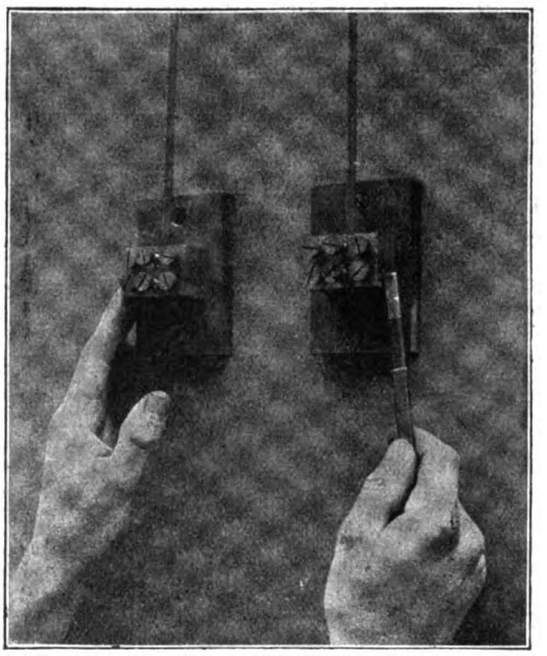
On Wednesday last we were invited by Messrs. Berry, Skinner, and Co., of 78, Upper Thames-street, E.C., to inspect a new system of constructing underground conduits into which cables can be drawn. The system is being used at the Neasden power-house of the Metropolitan Railway for conveying cables from the generating machines to the switchboard. For this purpose 4in. diameter ducts are required, and these are constructed in concrete in the following way. Iron pipes about 3⅞in. in diameter are used as formers. These pipes at Neasden are about 4ft. long, and they are jointed by an internal screwed coupling, so that the outside surface is continuous after the pipes have been screwed together. Each pipe is first dipped several times into a hot composition of paraffin wax and graphite, until the thickness of the same on the pipe is over ⅛in. The pipes are then screwed together, and laid on wood distance pieces, and concrete is packed in all round them. After two or three days have elapsed, in order that the concrete may be firmly set, the iron pipes are withdrawn. In order that this may be done steam is passed through them, which melts the above composition, and hence releases the pipes from the concrete bed. The result is a concrete conduit without joint, the inner surface of which is coated with a thin layer of paraffin and graphite, which acts as a lubricant when the cables are being drawn in. The advantages which are claimed for the system by its inventors and by Messrs. Berry, Skinner, and Co. are the following: (1) absolute continuity, and the seamless nature of the duct between manholes; (2) the whole of the work is constructed on site, so that no stock of troughing is required to be kept at any time; (3) a great saving in cost as compared with any other known draw-in systems. In reply to queries on the question of cost, we were told that 4in. diameter conduits could be made in this way at prices ranging from 1s to 1s. 3d. per yard run of single duct. This price applies to contracts where there are a number of ducts required side by side. It was also stated that 60 yards of pipe could be drawn out, which would allow for 120 yards between the boxes. The chief difficulty which seems likely to be found with the system is that it requires absolutely straight runs between draw boxes, as otherwise the iron formers could not be withdrawn from the concrete. For tramway working this could be obtained, especially in outlying districts. We understand that the system is being used in Germany, both by the Allgemeine Elektricitäts-Gesellschaft and by the Government Post Office Department.

"The Phielashok."

Messrs. Oliver and Co., the arc lamp manufacturers, have introduced a new electrical instrument or appliance in the form of an ordinary flat pocket pencil case, which they appropriately call a "Phielashok" (Oliver's patent). The use of this instrument is for testing electric wires and apparatus to ascertain whether they are alive or have current on them, and it owes its introduction to the general high pressure of electric supply now so generally prevailing in this country. Previous to the introduction of the "Phielashok," a conductor or part of an apparatus could be tested for electrification by placing the body directly across the part in question, and the supposed other pole of the circuit when a shock of either 230 or 460 volts, as the case may be, might be expected. This method is by no means a personally pleasant one even to those who boast that they are quite seasoned in this respect. The alternative is to obtain an incandescent lamp, pole finder, or galvanometer, and to make the test which in any case will involve a loss of time. On account of its compact and small size the "Phielashok" is carried in the pocket, and is at all times at hand to make a test. It consists of two parts—an outer metal case and an inner sliding portion specially prepared of very low electrical conductivity, which is capped with metal.



In making a test it is necessary to hold the metal case in one hand with the slide drawn out a certain distance, to place the other hand to one pole of the circuit, and to touch the supposed other pole with the metallic end of the slider. Thus the body will be placed in series with the low-conductivity slider, probably directly across the supply voltage, and if so, a very slight shock only will be experienced, giving an indication to the user that the wire or part be alive. A greater or less shock may be taken by diminishing or increasing the length of the high-resistance strip in series with the body, which may be drawn out of or passed further into the case. "Phielashok" may be used on any circuits up to 1,000 volts and even higher, but for higher voltages these are specially prepared and made. Standard instruments are, however, for use on ordinary supply pressures from, say, 200 or less up to 500 volts, but even these vary with the individual user. Instruments for alternating current are



marked "A," and those for continuous current "C." The applications in practical use for the "Phielashok" are innumerable.

Catalogues, Pamphlets, etc., Received.

Steam Plant Specialities (Illustrated). Holden and Brooke, Limited, Manchester.—In the preface the firm say that this catalogue, C, of their manufactures will be found to contain all essential particulars together with much new information, including some important modification in prices and preliminary notices of several new specialities for steam-power plants. We understand that any of our readers may obtain a copy upon application, and it would interest steam users to do so.

Lundberg Electric Light Accessories (Illustrated). A. P. Lundberg, Pioneer Electrical Works, 477-487, Liverpool-road, N.—Amongst the specialities mentioned we note "Pivot" and "Century" tumbler types, "Improved Pioneer," "Impulse," "Bowspring" switches, distribution boards, and various fittings

Digitized by Google

suited to high-voltage requirements. The firm have the following agencies: Scotland—Messrs. W. C. Yuille and Co., 17 and 19, West-street, Tradeston, Glasgow; Lancashire—Mr. E. Unsworth, 145, Shrewsbury-street, Manchester.

MOTORS FOR PRINTING MACHINES (the Holmes-Clatworthy system). J. H. Holmes and Co., sole owners of the British patents for the Lundell continuous-current electric motors, Newcastle-on-Tyne, and 17, Soho-square, London, W.—This is a supplementary list to a list of 1,300 motors driving printing machines supplied by the firm, and already referred to by us.

PSYCHILOID (ILLUSTRATED). Psychiloid, Limited, Love-street, Sheffield.—Contains particulars of sheets, tubing, insulating handles, bobbins, formers, commutator rings, rollers, etc., of this insulating material, which has the advantage that it can be tapped and bored, and for which it is claimed that it is absolutely insoluble in all ordinary solvents, that it has been immersed for one month in water and sulphuric acid (3 1) without the slightest effect, and that it is practically non-absorbent. A number of tests made by various electrical engineers, including Mr. Capper, of the University College, Sheffield, are appended. The latter found on trying to pierce a sample at a pressure of 2,500 volts that no effect was produced, although it had been soaked in water for over 24 hours. Another firm found a sample to give an insulation test of 7·5 megohms.

TELEPHONE INSTALLATIONS FOR ELECTRIC TRACTION SYSTEMS (ILLUSTRATED). Western Electric Company, North Woolwich, and 171, Queen Victoria-street, E.C.—The telephone apparatus described in this list has been specially designed to meet the requirements of tramway service. Amongst the advantages claimed for this system are: (1) Simplicity of operation. To call the central station one has only to press the key in a microtelephone connected to a street box; or, in the case of a sub-station, to remove the microtelephone from the hook. (2) Minimum amount of apparatus at the street boxes, there being neither batteries, induction coils, nor any other accessory. (3) Any number of points may be joined up to one line. (4) Small battery power required at the central station; in most cases six or eight cells. The firm recommends users to adhere, if possible, to standard apparatus, thereby ensuring low cost and quick delivery.

APPOINTMENTS VACANT.

Clerk of Works, Shoreditch Borough Council's Electricity Department. Salary, £3. 3s. per week (working hours same as contractor), Oct. 31. Also King's Norton and Northfield Urban District Council, Nov. 2.

Engineering Assistant in a borough engineer's office in the vicinity of London, with experience in the construction and maintenance of electrical tramways. Salary, £160 per annum, with annual increments of £10 to a maximum of £200. Applications to be addressed to Box W 14, *Contract Journal* Office, 139-140, Salisbury-court, Fleet-street, E.C

Correspondence Clerk, Woolwich Borough Council, £90 per annum, Nov. 2.

Improvers at high-tension alternating station, London. See advertisement in last issue.

Advertisement Assistant, London County Council. Applications, by 10 a.m. on Nov. 16, to County Hall, Spring-gardens, S.W.

Engineering Assistants (2), London County Council, with good experience in the design and construction of the permanent way and general arrangement of electric tramways on the conduit system (if possible) and on the overhead system. Salaries up to £7 a week. Applications to Clerk of the Council, County Hall, Spring-gardens, S.W., by 10 a.m. on Nov. 10.

Representative, conversant with municipal authorities, and with practical knowledge of tramway construction, and surveying for first-class firm of tramway engineers and manufacturers. Apply to A 21, *Contract Journal* Office, 139-140, Salisbury-court, Fleet-street, E.C.

Improver, Perth Corporation Electricity Works. Commencing wages, 12s. per week. See advertisement.

Jointer, Erith Corporation, £2. 5s. per week. Also Mr. C. Turnbull, Tynemouth Electricity Works, North Shields. See advertisement.

PERSONAL.

The Scarborough Works Committee have recommended that Mr. Robert Atkinson, of Shipley, should be appointed clerk of works in connection with the laying of the tramways, his salary of £3. 10s. per week being paid by the tramways company.

Mr. Herbert E. Sharp, from the Bristol electrical works, has been appointed assistant electrical engineer at Taunton.

The control of the permanent way of the Reading Corporation tramways has been transferred from the borough engineer to Mr. W. Binns, the engineer and manager of the tramways department.

Mr. R. G. Mercer, A.M.I.E.E., who has been with the British Insulated and Helsby Cables, Limited, Prescot, for the last five years as outdoor superintendent, has been appointed as manager in Messrs. Psychiloid, Limited, Electrical Insulating Works, Sheffield.

FORTHCOMING EVENTS.

SATURDAY, OCT. 31.

Glasgow Scientific Society.—At 7.30 p.m., ordinary meeting. Paper: "The Evolution of a Technical College," by Emeritus Professor Alexander MacLay.

MONDAY, NOV. 2.

Royal Institution.—At 5 p.m., general monthly meeting.

TUESDAY, NOV. 3.

Institution of Civil Engineers.—At 8 p.m., ordinary meeting. Inaugural address of Sir Wm H. White, K.C.B., F.R.S., etc.

London Electrical Contractors' Association.—At 8 p.m., ordinary meeting, Restaurant Frascati, Oxford-street. Paper: "A Model Specification for Contractors' Use," by Mr. W. R. Rawlings.

WEDNESDAY, NOV. 4.

Institution of Electrical Engineers (Glasgow Section).—At 7 p.m., second annual dinner, Grand Hotel, Glasgow.

Liverpool Engineering Society.—At 8 p.m., ordinary meeting. Inaugural address of Mr. Thomas L. Miller.

THURSDAY, NOV. 5.

Chemical Society.—At 8 p.m., ordinary meeting.

Rontgen Society.—At 8 30 p.m., ordinary meeting. Inaugural address of the Right Hon. Lord Blythswood, LL.D., F.R.A.S.

LEGAL INTELLIGENCE.

SOUTH LONDON TRAMWAY RECONSTRUCTION.

Before Mr. Justice Bigham and a special jury in the King's Bench Division on Monday the case of Olley *v.* White and Co., Limited, was heard. It was an action brought by Miss Lila Olley against Messrs. White and Co., Limited, contractors, to recover damages for personal injuries alleged to have been sustained through the negligence of the defendants. The defendants denied negligence or liability.

It appeared that in August of last year the defendants were under contract with the London County Council to electrify their tramway system between Westminster and Tooting, and on the 28th of that month plaintiff entered one of the London County Council's horse cars at Westminster Bridge. While the car was proceeding along Kennington-road, near Kennington Cross, where the defendants had dug a trench, it left the line and partly overturned.

Plaintiff said that she was riding on the top of the car, and that in consequence of its leaving the line, owing to the points not being properly fixed, she was thrown violently against the rail of the car, sustaining injuries to her side and a severe shock to her nervous system. Plaintiff suffered from functional disturbance of the heart, giddiness, and sleeplessness, and she was unable to follow her employment for three or four months. The defendants denied negligence, and contended that if the plaintiff was entitled to recover the London County Council were liable.

Mr. **Justice Bigham** said in this case there seemed to be a fight between the defendants and the London County Council. He did not think the plaintiff ought to suffer in consequence of that dispute, and, therefore, he suggested that the London County Council should be brought in, and that it should be left to him to decide whether the defendants or the London County Council were liable to pay, assuming that there was negligence.

Eventually it was agreed that the London County Council should be brought in as parties to the action.

GEORGE F. MILNES AND CO., LIMITED.

In the Chancery Division of the High Court on Tuesday Mr. Justice Buckley heard the petition of John Lysaght, Limited, for the winding up of the above-named company. The nominal capital was £250,000, of which £122,990 has been paid up.

Mr. W. F. Hamilton, K.C., for the petitioner, a judgment creditor, said there was a voluntary winding up, Mr. Max Meyer being the liquidator. Counsel objected to his acting, on the ground that he was a director of companies in Berlin and a German subject, though temporarily domiciled in England. Counsel asked for a supervision order and that somebody should be appointed liquidator instead of Mr. Meyer.

After hearing Mr. Preston on the same side, Mr. Willis for creditors, Mr. Nepean for the debenture holders, and Mr. Bramwell-Davis, K.C., for the company, his Lordship made a supervision order, and appointed the receiver appointed in the debenture holders' action to act jointly with Mr. Meyer.

A WIRING CONTRACT.

At Croydon County Court, Messrs. Wenham and Waters, electrical engineers, of Croydon, sued Dr. P. F. O'Hagan for £8. 6s. 6d., balance of account for wiring defendant's house and supplying fittings.

Mr. Robinson, for the plaintiffs, stated that the work was done as long ago as December, 1901. The original price of the contract was £11. 2s., but with the addition of several small items this was increased to £20. 6s. 6d. Defendant had paid two sums of £5 and

Digitized by Google

one of £2 on account, and this had reduced the amount to the sum claimed.

Mr. Clark, for the defendant, said that the defence was that the price agreed upon was 15s. per point and that the price was excessive. They were quite willing to have the matter go before an electrical engineer and abide by his decision.

The **Judge** said it was too late for a defence that the price was excessive to be raised. There would be judgment for the plaintiffs.

URBAN ELECTRIC SUPPLY COMPANY.

In the Chancery Division on Monday, **Mr. Maugham** said that in the case of John Pickering and Son *v.* the Urban Electric Supply Company, Limited, an order had been agreed between them which put an end to the action. It was a motion for an injunction in regard to the right to lay a cable. The parties were *sui juris*.

His Lordship sanctioned the arrangement.

CENTRAL LONDON RAILWAY SUED FOR FALSE IMPRISONMENT.

A remarkable action was brought against the Central London Railway Company at the Clerkenwell County Court on Thursday last week by a man named Thomas Hayes, who claimed to recover £10 damages for false imprisonment.

The action arose in this way. According to **Mr. May,** counsel for the plaintiff, his client, on Dec. 22, was travelling home from work on the Central Railway. He got in at Bond-street and was going to the Post Office, but owing to a breakdown all the passengers were ordered to alight at the British Museum Station. On leaving the station each passenger was given a complimentary ticket entitling him or her to travel one journey on a future occasion. On the following morning, at six o'clock, plaintiff, for the purpose of going to his work, proceeded to the Post Office Station, and instead of purchasing a ticket, put his complimentary pass into the box and stepped on to the lift. Almost immediately he was seized by one of the officials, who accused him of not having put a ticket in the box. Plaintiff explained that he had dropped in a complimentary ticket, but the official declined to believe him and dragged him out of the lift, saying, "We must make an example of you men," but adding that if he liked to take a ticket he could go. Refusing to do this, plaintiff was detained for 1½ hours until the station-master arrived. The ticket-box was then searched and the complimentary ticket found, whereupon the station-master apologised to plaintiff for the detention and asked him to say no more about it. Plaintiff replied that he certainly should not let the matter rest there. He proceeded to his work, but was told by the foreman that he could not have men coming there late. A short time afterwards, on the ground that work was falling off, he was discharged.

For the defence, **William Henry White,** conductor on the Central London Railway, said the occurrence took place on Dec. 30, and instead of being six o'clock it was nearer eight, because he was only acting as collector that morning from 7.30 till 8. He saw plaintiff enter the station, but as he passed the box without dropping any ticket in the box he went after him, and told him he must take a ticket before travelling. Plaintiff's reply was that he had dropped a complimentary ticket in the box and declined to take another one, although he (witness) assured him that if the ticket was found he would have his money returned if he gave his name and address. The station-master arrived in a few minutes, and several complimentary tickets being found in the box plaintiff was told he could travel.

The **Judge** said he could not give a verdict in plaintiff's favour in the face of the evidence adduced by the other side. Judgment would be for defendants, with costs.

LARGE TUBE CLAIM.

At the Sheriff's Court in Red Lion-square on Wednesday, Mr. Under-Sheriff Burchell and a special jury heard a claim for £10,282 from the Great Northern Railway Company, on behalf of the trustees of the late Mr. Arnold, of Seven Sisters-road, N.

The claim was in respect of 233, 235, 237, and 239, Seven Sisters-road. The latter three, which are shops, have been taken by the railway company, under parliamentary powers, for purposes in connection with the building of the Great Northern and City Tube. The cowhouse and dairy premises at No. 233 had, said Mr. Freeman for the claimants, suffered depreciation to the extent of 25 per cent. through the action of the company.

After hearing expert evidence on both sides, the jury found for the claimants in the sum of £7,200.

COMPANIES' MEETINGS AND REPORTS.

BRITISH ALUMINIUM.

An extraordinary general meeting of this Company has been called for Nov. 4 to consider and, if thought fit, pass the following resolution—namely: "That the capital be reduced from £400,000, divided into 10,000 A cumulative preference shares of £10 each, 20,000 preference shares of £10 each and 10,000 ordinary shares of £10 each, to £310,000, divided into 10,000 A cumulative preference shares of £10 each, 20,000 preference shares of £10 each, and 10,000 ordinary shares of £1 each, and that such reduction be effected by cancelling capital (which has been lost or is unrepresented by available assets) to the extent of £9 per share upon each of the 10,000 ordinary shares which have been issued and are outstanding." Should the above resolution be passed by the required majority, it will be submitted for confirmation at a second extraordinary meeting which will be convened subsequently.

NORWICH ELECTRIC TRAMWAYS.

The annual general meeting of the shareholders in this Company was held at 20, Bishopsgate-street Within, E.C., on Wednesday. The report stated that the gross earnings of the Company for the year ended June 30, 1903, amounted to £33,833. 8s. 7d., and the working expenses to £24,204. 14s. 1d., leaving a gross profit amounting to £9,628. 14s. 6d. To this have to be added the amount brought forward from last year of £824. 3s 5d., after having paid 1 per cent. on Oct. 22, 1902, or £4,840, and placing to reserve account £974. 10s. 9d., and £1,209. 16s. 7d. interest received from the Corporation in final settlement of account, making a total of £11,662. 14s. 6d. Deducting from this the sum of £2,640, being 4 per cent. interest on the Company's outstanding mortgage debenture to June 30, 1903, there remains a profit of £9,022. 14s. 6d. The directors recommend that a dividend of 2½ per cent. be paid on the Company's shares for the year ended June 30, 1903, which would absorb £6,600, and that a sum of £1,209. 16s. 7d. be placed to reserve account, the balance of £1,212. 17s. 11d. being carried forward. The reserve account will then be increased to £2,184. 7s. 4d. A comparison between the gross receipts for 11 months to June 30, and the receipts for the same period ended June 30, 1902, shows that there was an increase of £497. 15s. 4d. The working expenses for the same period show an increase of £699. 2s. 9d. The average cost per car mile was 5·43d. The average receipts per car mile were 7·76d. The number of car miles was 1,045,901. And the number of passengers carried 7,173,420. The report was adopted.

MAY-OATWAY FIRE APPLIANCES.

The annual general meeting of this Company was held on Friday, when the second annual report of the directors was presented. The figures showed that for the first time the sales have met the expenditure. During the period covered by the report some large installations have been completed, and they are working with satisfaction to their owners and the brigades with which they are in direct connection. Direct connection by the Company's system has now been made, or is authorised, by the headquarters of the fire brigades at Glasgow, Liverpool, Manchester, Birmingham, Leeds, Sheffield, Dundee, Bolton, and a number of other boroughs and towns.

EDISON AND SWAN UNITED ELECTRIC.

The report of the directors for the year ended June 30 last states that the net revenue account shows that £30,835 has been brought forward. Interest on debenture stocks has absorbed £18,761; £5,690 has been set aside as depreciation on freehold and leasehold property, plant, and machinery; £6,174 has been applied in writing down values of stocks; and £1,168 has been reserved on account of bad and doubtful debts. In pursuance of the policy inaugurated last year a sum of £1,000 has been added to the reserve for future stock depreciation. The result, as shown by the balance-sheet, increases the debit balance by £1,959. The cost of establishing the business, goodwill etc., £443,451, has been brought forward at the figures standing in the last balance-sheet. The freehold and leasehold property, plant, machinery, and tools have also been brought forward at the value stated in the last balance-sheet, with the addition of the amount expended to June 30, 1903, less depreciation charged in net revenue account. The shares of the Altrincham Electric Supply, Limited, have been taken at par, as in previous years. The indebtedness of this company has been reduced by £152. There has been expended on capital during the year £2,770. The directors will continue to exercise a strict watchfulness on capital outlay.

WESTERN TELEGRAPH.

The report of the directors for the half-year ended June 30 last states that the revenue for this period amounted to £229,090 and the working expenses to £94,791. After providing £13,578 for debenture stock and debenture interest and sinking fund, and £3,239 for income tax, there remains £117,480; to this is added the £5,331 brought forward, making a total of £122,811. A quarterly interim dividend, amounting to £31,189, has been paid, £35,000 transferred to the general reserve fund, and £2,000 to the maintenance ships' reserve fund. The revenue includes £14,790 dividends upon the Company's investments in other telegraph companies. The directors now recommend the declaration of a final dividend of 3s. per share, making, with the interim dividends, a total dividend of 6 per cent. for the year, and also the payment of a bonus of 2s. per share, which together will amount to £51,982, leaving a balance of £2,639 to be carried forward.

NEW COMPANIES REGISTERED.

West Surrey Light Railway Company, Limited.—Capital, £1,000. Objects: to provide and work a light railway or railways, tramway or tramways, in Surrey. Registered office: 27, Chancery-lane, W.C.

Incandescent Lighting and Electric Fittings Company, Limited.—Capital, £2,000. Objects: to carry on in Glasgow or elsewhere the business of manufacturers of and dealers in gas and electrical fittings and furnishings of all kinds.

Digitized by Google

CONTRACTS FOR ELECTRICAL SUPPLIES.

Bermondsey.—The Borough Council invite tenders for cables, arc lamp standards, and accessories, by Nov. 9.

Caraminal (Spain).—The Municipality require tenders for installation and working of the village for 20 years. Tenders by Nov. 3.

Hornsey.—The District Council invite tenders for one 300-kw. steam dynamo to be delivered in October, 1904, and another in March, 1905.

Dudley.—The Guardians invite tenders for the supply and fixing of the various appliances for the electric installation to the laundry and boiler house.

Windsor.—The Town Council invite tenders for the supply of electricity or gas for the purpose of public lighting throughout the district for a period of five years.

Swansea.—The Corporation invite tenders for the supply, delivery, fixing, and connecting of ducts, troughs, cables, wires, street boxes, etc. Tenders by Oct. 31. See advertisement in last issue.

Rangoon.—The Municipal Committee have decided to call for amended tenders for the electric lighting of the town on a continuous-current system. Five tenders were received for the first call.

Wisby (Sweden).—Tenders are invited for a private and public electricity supply estimated to cost 180,000 kroner. Particulars may be obtained from the Director of the Draetselkammaren at the above place.

Wakefield.—The City Council invite tenders for the supply and erection of one 400-kw. two-phase generator, comprising engine, alternator, exciter, and accessories. Tenders by Nov. 7. See advertisement.

Brussels.—The Belgian Government Railways invite tenders for material and appliances to be used for lighting passenger trains. Specification No. 996 may be obtained from the above authority. Tenders by Nov. 4.

Blackpool.—The Electricity and Tramways Committee invite offers for various plant. Particulars can be obtained from the borough electrical and tramway engineer, Mr. Charles Furness, West Caroline-street, Blackpool. See advertisement.

Glasgow.—The Scottish Office of the May-Oatway Fire Appliances, Limited, invite tenders for the wiring of various installations. Full particulars from the Managing Director, 49, Queen-street, Glasgow. Tenders by Nov. 7. See advertisement.

Kilmarnock.—The Corporation invite tenders for the supply, delivery, and erection of three Lancashire boilers, engines and dynamos, overhead hand travelling crane, storage battery, and switchboard, by Nov. 18. See advertisement in last issue.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

Barrow-in-Furness.—The Corporation invite tenders for the completion of the electric lighting installation at Hawcoat and Walney police stations and the pig slaughtering hall and lairage at the public abattoirs. Further particulars may be obtained from the Borough Engineer.

Russia.—The Russian Minister of the Interior has sanctioned a plan for the reconstruction of three lines of municipal tramways—namely, those in Newsky, Sadovaia, and Wassiliostrow districts. Each car is to provide for two classes of travellers, and will accommodate 52 persons.

West Ham.—The London County Council invite tenders for the supply and erection of (a) engine, dynamo, switchboard, etc., and (b) electrical wiring, mains, and fittings required in connection with the installation of electric light at the Abbey Mills pumping station. Tenders by Nov. 3.

Todmorden.—The Corporation invite tenders for one Lancashire boiler, two steam dynamos and balancer booster, two feed pumps and one injector, economiser, surface or jet condenser, switchboard and instruments, storage battery, cable work, and overhead hand crane. See advertisement in last issue.

Culiacan (Mexico).—Tenders are invited for lighting the town by electricity; 60 arc lamps of 1,200 c.p and 110 incandescents of 50, 30, and 16 c.p. will be required. Propositions will be received by letter until Dec. 31 in the Secretaria del Ayuntamiento, Culiacan, where further information may be obtained.

Manchester.—The Paving, Sewering, and Highways Committee invite tenders for laying underground telephone pipes (Contract 8), with other appurtenant works. Drawings may be seen and specification, etc., obtained on application at the City Surveyor's Office, Town Hall, Manchester. Tenders by 10 a.m. on Nov. 5.

Blackpool.—The Electricity and Tramways Committee invite tenders for one new 450-kw. traction set (vertical triple-expansion engine and multipolar generator). Specification may be obtained from Mr. Charles Furness, borough electrical and tramways engineer, Electricity Works, Blackpool. Tenders by Nov. 14.

Beckenham.—The Urban District Council invite tenders for the electric wiring of houses in their district under a free wiring scheme. Specifications, etc., may be obtained from the consulting engineer, Mr. Reginald P. Wilson, 66, Victoria-street, Westminster, or Mr. John A. Angell, surveyor, Council Offices, Beckenham. Tenders by 4 p.m. on Nov. 9. See advertisement in last issue.

Swindon.—The Corporation invite tenders for the supply, delivery, and erection of steel poles, overhead line section boxes, arc lamps, and accessories. Specifications, etc., may be obtained from Messrs. Lacey and Sillar, 78, King-street, Manchester, and 2, Queen Anne's-gate, Westminster. Tenders by Nov. 16. See advertisement.

Chichester.—Tenders are invited for the installation of a system of electrical water-level indicators and recorder and telephones. Specifications may be seen and bills of quantities obtained at the office of the city surveyor and waterworks engineer, Mr. I. Pym-Jones, Lion-street, Chichester. Tenders by Nov. 6. See advertisement.

Radcliffe.—The Council invite tenders for the supply and completion of (Contract No. 12) lighting and traction switchboard and accessories; (14) rail bonds. Specifications may be obtained from Messrs. Lacey and Sillar, 2, Queen Anne's-gate, Westminster, and 78, King-street, Manchester. Tenders by Nov. 14. See advertisement.

Radcliffe (Lancs.).—The Urban District Council invite tenders for the supply of the pitch and oil required in the construction of the tramways in the district. Specifications, etc., may be obtained on application to Mr. W. L. Rothwell, engineer, at the Council Offices. Tenders to Mr. S. Mills, clerk, Council's Offices, Radcliffe, by Nov. 14.

Sydney (New South Wales).—Tenders will be received at the office of the Deputy Postmaster-General, Sydney, New South Wales, up to 2.30 p.m. on Dec. 30, for the supply and delivery at the departmental stores, Sydney, of telegraph, telephone, and electric light material. Specifications, etc., may be seen and tender forms obtained at the General Post Offices, Sydney, Melbourne, Brisbane, Adelaide, Hobart, and Perth.

Wednesbury.—The Corporation invite tenders for the electric wiring and fittings for the following public buildings: town hall, municipal offices, art gallery, public baths, public library, and electricity sub-station. Specification, etc., may be obtained between 2 and 5 p.m. on and after the 23rd inst. at the offices of Mr. F. J. Warden-Stevens, A.M.I.M.E., A.M.I.E.E., consulting engineer, 34, Victoria-street, Westminster. Tenders by 12 noon on Nov. 20.

Manchester.—The Commissioners of H.M. Works and Public Buildings invite tenders for erection of a telephone exchange and engineer's office and store at Quay-street, Manchester. Specifications, etc., may be seen at H.M. Office of Works, New Bridge-street, Manchester. Forms of tender may be obtained at H M. Office of Works, etc., Storey's-gate, S W. Tenders before 12 noon on Nov. 11 to the Secretary, H.M. Office of Works, etc., Storey's-gate, London, S.W.

Harrismith (South Africa).—The Town Council invite tenders for the supply, f.o.b. British port, of the galvanised iron buildings required for a small electricity generating station. Drawings, specifications, etc., may be seen at the offices of, or obtained from, the Council's consulting engineers, Messrs. Mordey and Dawbarn, 82, Victoria-street, Westminster, S.W. Tenders to Messrs. Webster, Steel, and Co, 5, East India-avenue, Leadenhall-street, E.C., by noon on Nov. 9.

Derby.—The Directors of the Midland Railway Company invite tenders for the supply of stores for 12 months from Jan. 1, 1904, including telegraph instruments, telegraph stay rods, bolts, insulators, etc., telegraph and signal wire. Samples may be seen at the General Stores Department, Derby, on and after Nov. 2, between the hours of 10 a.m. and 4 p.m. (Saturday, 10 a.m. and 1 p.m.) Forms of tender on application to Mr. Alfred Derry, stores superintendent, Derby. Tenders to the General Stores Committee, Midland Railway, Derby, by 9 a.m. on Tuesday, Nov. 10.

RESULTS OF TENDERS.

Bristol.—The tender of Mr. McNaughten for the supply of carbons to the new arc lamps has been provisionally accepted.

Blackpool.—The Corporation have accepted the tender of Crompton and Co., Arc Works, Chelmsford, for the supply of arc lamp carbons for the ensuing year.

St. Olave (Southwark).—The Salisbury Electrical Engineering Company, of Lee, have obtained the contract for providing 370 lights and 188 switches at the workhouse at £365.

Aberdeen.—The Corporation have accepted the tender of Mr. P. Tawse, amounting to £9,798. 14s. 4d. for the extension of the cable subway from Crown-street along Langstane-place, to Holburn-street.

Southend.—The tender of Messrs. Crompton and Co., Limited, Chelmsford, at prices amounting to £163, has been recommended for acceptance for the supply of ten 300 wattmeters, ten 300 ampere brakers, and 120ft. copper strip.

Southampton.—The Corporation have accepted the tender of Pearson, Huggins, and Co., Limited, 51, Scrutton-street, Finsbury, London, E C., for the supply of 20 overcoats for employés of the tramway department, at £25. 17s. 9d.

Preston.—The Tramways Committee have resolved to recommend the Council to accept the tenders of Messrs. Dick, Kerr, and Co., Limited, for the supply of 30 electric cars for the sum of £472 per car, and for permanent-way construction and overhead equipment (with the Lorain Company's special work) for the sum of £80,592.

Swindon.—The Corporation have accepted the following tenders: A. J. Colborne, Newport-street, Swindon, for erection at Swindon, Wilts, of car depot stores, repair shops, etc., £3,233. 17s.; Reason Manufacturing Company, Brighton, for the supply of maximum demand indicators for 12 months; Cable Accessories Company, Birmingham, for the supply of fuse boxes for 12 months.

London.—Messrs. Rowland Carr and Co. report orders as sub-contractors to Messrs. Crompton and Co., Limited, for 40 arc lamp columns and accessories for Hackney. They have also secured the contract for the steel troughing in connection with the electrification of the Underground Railways, and a further order from the New Century Arc Lamp Company for 40 arc lamp columns required for Stepney.

Brighton.—The tender of Messrs. Dick, Kerr, and Co., of Preston, to supply 20 tramcars at £10,200 is recommended for acceptance.

Digitized by Google

The closeness of the tendering is shown by the fact that the tender of the Brush Electrical Engineering Company was only £10 more. The Tramways Committee also propose to accept a tender of £5,962 for the supply of 800 tons of tramrails. This tender varies from £300 to £800 above five other offers. These latter were, however, for Belgian rails, and being advised that the life of British rails was 20 per cent. longer than that of the foreign article, the committee decided to give the contract to the home product at the higher price.

Steam-Turbines.—The British Westinghouse Electric and Manufacturing Company have in hand turbo-generators aggregating 78,300 kw., or nearly 115,000 h.p., at Trafford Park Works. The largest sets, eight of which will furnish current from its Chelsea power station for the Underground Electric Railways of London, will normally develop 5,500 kw., or about 8,000 h.p., but be equal to 11,000 h.p. on overload; they are the largest single-cylinder engines which have yet been constructed. The Brighton and Liverpool Corporations respectively claim 5,400 kw. and 3,200 kw. of the total orders in hand, Clyde Valley Power Company 12,000 kw., and Metropolitan Railway 10,500 kw.

London, N.E.—The Bethnal Green Borough Council have received the following tenders for clearing the site of proposed electricity works: Amount of offer—C. Griffiths, Ben Jonson-road, Stepney, £100 (accepted); S. E. Bonsall, 8, Queen's-road, Peckham, £105. 11s.; Smith, Wilkinson, and Sons, 10, Tottenham-lane, Hornsey, £102; J. Ashton, sen., 8, Stanley-road, Wood Green, N., £100; A. Myer, 180, Morning-lane, Homerton, £96. 10s.; J. M. Hinton, Park House, Alexandra-terrace, East Ham, £95; W. Butler, 61, The Grange, Bermondsey, £75; J. W. Moore, 88 and 90, South-street, Walworth, £55. 10s.; J. C. Base, 131, High-street, Stratford, £35; W. Downton and Co., Neville Yard, West Kilburn, £35. Amount to be paid to contractor—S. Eddiard, 15, Green-lanes, Stoke Newington, £50; J. Ashton, 106, Mare-street, Hackney, £60; W. Marshall, jun., 1, Clifton-square, Peckham, £140.

Paisley.—The British Schuckert Electric Company, Limited, report the following recent orders, among others: For Paisley Corporation, extensions to tramway switchboard, consisting of nine panels, with the necessary instruments and switchgear; also a negative booster set of 27 kw. capacity to work in conjunction with the return-current feeders. For the Dunlop Rubber Company, Limited, Aston, through Messrs. Willians and Robinson, who are supplying the engine, a 275-kw. direct-current generator, 250 volts, 340 r.p.m. This machine will operate in conjunction with the existing plant of the Dunlop Rubber Company, the whole of which, including generators, motors, etc., was installed by the British Schuckert Electric Company, Limited. For the Lurgan Weaving Company, Belfast, a 88½-kw. combined direct-current generator, 220 volts, and Allen steam-engine, together with ejector condensing plant complete.

Wolverhampton.—The Corporation have received the following tenders for the supply, delivery, and erection of surface condensing plant and oil separators, to deal with 15 000lb. of steam an hour:

Allen, Son, and Co., Bedford	£1,339	0	0
Belliss and Morcom, Limited, Birmingham	1,431	0	0
Ditto (alternative tender)	1,402	0	0
Blake, Knowles, and Co., London	1,094	2	0
J. Evans and Sons, Wolverhampton	1,292	17	6
Klein Engineering Company, Manchester	1,492	0	0
Mirrlees, Watson, and Co., Glasgow	1,305	5	0
Ditto (alternative tender)	1,310	5	0
Ditto (alternative tender)	1,320	5	0
Ditto (alternative tender)	1,364	5	0
Thornton and Crebbin, Bradford	1,337	0	0
Ditto (alternative tender)	1,207	0	0
Wheeler Condenser Company, London	1,191	0	0
Worthington Pump Company, London	1,361	0	0

Devonport.—The Corporation have received the following tenders for a negative booster:

Walker and Hodgetts, Limited, (guaranteed efficiency 80 per cent.)	£310
British Electric Plant Company, Limited (70 per cent.)	310
Crompton and Co., Limited (73 per cent.)	313
Brush Electrical Engineering Company (82 per cent., accepted)	327
Siemens Bros. and Co., Limited (72.25 per cent.)	332
Industrial Engineering Company, Limited (72 per cent.)	338
Bruce Peebles and Co., Limited (79 per cent.)	341
Keighley Engineering Company, Limited (80·5 per cent.)	347
Johnson and Phillips (81 per cent.)	375
Rhodes Electrical Company (77 per cent.)	390
Mavor and Coulson, Limited (79 per cent.)	391
Thomas Parker, Limited (77·5 per cent.)	393
British Westinghouse Company, Limited (79 per cent.)	397
Lancashire Dynamo and Motor Company, Limited (78 per cent.)	410
Laurence, Scott, and Co., Limited (75 per cent.)	420
Mather and Platt, Limited (75 per cent.)	425
Lister Electric Manufacturing Company, Limited (76 per cent.)	433
British Schuckert Electric Company, Limited (76 per cent.)	455
Electric Construction Company, Limited (80 per cent.)	465

Wandsworth.—The Borough Council will hold a special meeting to consider whether or not the Council shall agree to make a contribution of £65,000 towards the cost of the widening of Streatham High-road for the extension of the London County Council tramway from the present terminus at the Tate Library, Streatham, to the county boundary at Norbury. The Borough Council has on a previous occasion refused to make any contribution, but it is now proposed that the resolution embodying that refusal shall be rescinded, in view of the advantage that would accrue to ratepayers in the Streatham Ward if the proposed extension was carried out.

BUSINESS NOTES.

TRACTION.

Dover.—The Board of Trade have confirmed the Dover and River light railway order.

Calverley.—A tramways provisional order is to be applied for on behalf of the District Council.

Birkenhead.—It has been resolved that top deck covers be fitted to two of the Corporation's trams.

Burton.—The Burton and Ashby light railway order has been confirmed by the Board of Trade.

Heywood.—Terms have been arranged for the leasing of the tramways to the Rochdale Corporation.

Airdrie.—It is probable that the first sections of the electric tramways will be opened for traffic in February.

Barking.—The Board of Trade's inspection of the new electric tramways to Beckton took place on Tuesday.

Burnley.—It is has been decided to fit two of the Manchester-road cars with mechanical slipper brakes at a cost of £60.

Leicester.—One of the Lancashire boilers for the tramway power-house has been delivered. It was supplied by Messrs. Yates and Thom, Blackburn.

Redruth.—It was stated at this week's meeting of the Council that from Nov. 7, 1902, to Sept. 30 of this year the trams had carried 1,000,000 passengers.

Colchester.—The laying down of a system of electric tramways in the town was formally marked by a fitting ceremonial performed by the Mayor on Thursday last week.

Huddersfield.—Bicycles will in future be carried upon the tramcars at owner's risk in all respects at the same rate as passengers, but not more than two will be carried upon one car at a time.

Brighton.—The tramways engineer has been instructed to prepare specifications and detailed drawing for a public shelter and tramway room at the Old-steine terminus of the tramway system.

South Hams Light Railway.—The Light Railway Commissioners will hold a public enquiry at Kingsbridge on Nov. 3 as to the expediency of granting an order to authorise the South Hams Light Railway.

Twickenham.—With reference to the London United Tramways Bill, 1903, the District Council have decided to agree to the tramway company's amendments in the agreement between them and the Council.

Calne.—The Light Railway Commissioners will hold an enquiry soon in regard to the application of the promoters of the Wilts Central Light Railway to construct a light railway between Calne and Marlborough.

Middlesex.—The County Council are opposing the application of the London United Tramways Company to the Board of Trade for an extension of time for the completion of the extension of their Ealing line to Uxbridge.

Halifax.—The Corporation Tramways Committee have received an offer of £2,000 per annum for the privilege of occupying spaces on the Corporation tramcars with advertisements. This is equivalent to a rate of 1¼d. in the £.

Wolverhampton.—At a special meeting of the Town Council to be held on Friday, the members will be asked to consider the question of promoting a Bill in Parliament for the extension of the tramway system to Wednesfield.

Kirkcaldy.—In connection with the tramway scheme, in respect of which parliamentary powers are to be applied for to double the lines where necessary, and to lay double line to Dysart, it has been decided to divide the existing route into six ½d. stages, or 2½d. for the complete route.

New Zealand.—At a recent meeting of the board of directors of the Waipori Falls Electric Power Company it was intimated that the electrical supervising engineer was expected to arrive this month, and he would at once commence operations on the intended electrical tram service work.

Hastings.—Mr. W. M. Murphy has informed the Town Council that the tramway works will be commenced in February, and he hopes to complete the principal lines before the end of next year. The time for completion authorised by the original Act and order has yet nearly two years to run.

Dublin.—The Judicial Committee of the Privy Council have heard an application on behalf of the Dublin United Tramways Company for an extension of time limited for the completion of certain works in connection with their system. The committee granted an extension of two years from the present time.

Spain.—A proposal has been made by the "Tranvia del Este" Company of Madrid for a new electric tramway line, and until Nov. 13 other proposals on more favourable terms, duly guaranteed, may be made. An application has also been made for the concession for an electric tramway in the Canaries from the port of La Luz to that of Sardina.

Handsworth.—It having been agreed by the District Council to pay the South Staffordshire Tramways Company £5,250 for the purchase of that portion of their undertaking which is in the Council's district, the electrical engineer has been instructed to proceed with the preparation of plans for the conversion of the lines to electrical working.

Scarborough.—The joint committee of the Water Committee and Streets Sub-Committee have met to consider the question with regard to the tramways company and the laying of water-mains. It was decided to appoint a deputation along with the two engineers

Digitized by Google

(Mr. Millhouse and Mr. H. W. Smith) to interview the tramways company.

Swansea.—Over 30 tenders have been received for the proposed tramway extensions. The specified date of completion is 12 months, with the exception of certain portions, which must be completed in six months. The penalty for late completion is 1 per cent. of the total price of each contract for each day's delay. The tenders must be all in by the 31st inst.

Bankfoot.—The Board of Trade have confirmed the Bankfoot Light Railway (Extension of Time) Order, 1903, reviving the powers granted and extending the period limited by the Bankfoot Light Railway Order, 1898, for the compulsory purchase of lands and extending the period limited by that order for the completion of the railway and works by that order authorised.

Norwich.—The gross earnings of the Norwich Electric Tramways Company for the year ended June 30 amounted to £33,833. 8s. 7d., and the working expenses to £24,204. 14s. 1d. The directors recommend a dividend of 2½ per cent., £1,209. 16s. 7d. going to the reserve account, and the balance, £1,212. 17s. 11d., to be carried forward. Seven million passengers were carried during the year.

Paris Underground.—A Reuter's telegram from Paris of Saturday's date says: "In consequence of a short-circuit in the power cable another fire broke out on the Metropolitan Railway at about five o'clock this morning. Dense smoke filled the tunnel between the Champs Elysees and the Etoile Stations. No trains have been running up to the present, but the fire has been got under. No one was injured."

Finchley.—At the last meeting of the Urban District Council the surveyor reported that there was still considerable delay in finishing the portion of the track already laid. He understood, however, from the county engineer and the contractors that the necessary material was now coming to hand, and more dispatch would be possible. High-tension mains had been laid from Barnet boundary to Whetstone.

Altrincham.—The poll taken on the tramways question was declared on Saturday. Voting cards had been sent round to the ratepayers asking the following question: "Are you in favour of the Altrincham Urban District Council applying to obtain a provisional order for the construction of tramways in Altrincham?" 1,311 voted for and 1,098 against the application, giving a majority of 213. Nearly 200 did not vote.

Derby.—On Tuesday, after a long discussion, a special meeting of the Town Council passed the following resolution: "That the portion of the resolution of the Council passed on May 6, 1903, approving of the routes presented by the Tramways Committee be rescinded so far as it refers to the tramways on the Burton-road at a point on the road opposite Vicarage-avenue and the borough boundary adjoining the parish of Littleover."

Greenock.—The decision of the arbitrator in the dispute between the Town Council and the tramways company (referred to in our issue of the 16th inst.) has now been made public. The arbitrator has fixed the price to be paid by the company for electric energy in excess of 500,000 units per annum at ⅛d. per unit, and decided that the company shall pay the Council £125 per annum for the use of the cables as from May 1, 1901.

New York.—The *Electrical World* supplies details of an addition to the subway power-house now building on the Hudson River. This addition will make the plant the largest and most expensive in the world. The total estimated cost of the whole scheme is £1,400,000, and the plant will be capable of generating 132,000 h.p. The boiler plant at first will consist of 72 boilers, each of 500 h.p. The chimneys will reach to a height of 265ft.

Lewisham.—The Borough Council have received a letter from the London County Council stating that if they will consent to contribute one-third of the cost of the necessary street widenings upon the introduction of electric trams, the London County Council will proceed with the application to Parliament. At a previous meeting the Lewisham Council agreed to contribute one-sixth, and they have now promised to reconsider the matter.

Erdington.—A meeting of the Tramways Committee of the Urban District Council has considered and approved the detailed specification and drawings for the construction of the first portion (about six miles in length) of a complete scheme of electric tramways for the district, prepared by Messrs. Robert Green and H. Humphries, the joint engineers, who were instructed to forthwith obtain the approval of the Board of Trade to them and to advertise for tenders.

Quarry Bank.—Last week Sir Herbert Jekyll heard objections to the Quarry Bank, Brierley Hill, and Rowley Regis light railway order. The following clause was inserted in the order: "Nothing in this order shall authorise the Councils to alter or interfere with any of the tramways or light railways of the Dudley, Stourbridge, and District Electric Traction Company, Limited, without the consent, in writing, of the company, or without like consent to construct certain other lines."

Buenos Ayres.—Electric traction is making great headway at this place. All the lines of the Anglo-Argentine Tramway Company have now been converted to electrical working, and La Nueva Tramway Company has obtained permission to convert their line to the same method of traction. The concession is for 55 years, and the company agrees to give free lighting *en route* to 200 16-c.p. lamps per kilometre. Various extensions of the electric lines in Belgrano and Flores are to be carried out by the Buenos Ayres Electric Tramway Company.

Newcastle.—A special meeting of the Tramways Committee has been held to decide which route from Chillingham-road to Heaton-road it would be best to put in the Bill to be brought before Parliament. The committee decided that the trams should go one way by St John's-terrace and Tenth-avenue and return by Ninth-avenue and St. John's-road. The committee's recommendation (entailing an expenditure of £6,800) came up at the Council meeting on Wednesday, but was referred back after a long debate, which was characterised by some unruly scenes.

Sheffield.—The Tramways Committee have recommended to the Corporation that they should cease to insure against claims for compensation by third parties, and undertake themselves to meet these risks, but they suggest, with a view to limit the liability, that notice be given that from Dec. 5 next, as passengers are being carried at less than the maximum authorised charges, they will only be carried on the express condition that the liability of the Corporation is limited to an amount not exceeding £25 for any accident to any one person. The electric cars are about to be equipped with the "National" life-guard.

Southend.—Financial statements with reference to the electric lighting fund and the light railways fund were submitted at the last meeting of the Town Council. With regard to the former, the estimated expenditure for the year was shown as £8,725, and the estimated income as £8,400. The expenditure for the six months ended Sept. 30 was £4,485, and the income £4,459. Under the light railways heading, the year's estimated expenditure was put down as £14,841, and the estimated income as £15,000. The expenditure for the six months ended Sept. 30 was £8,852, and the income £10,394.

Rotherham —Dr. Kennedy has reported on the proposed tramway routes, and the Tramways Committee recommend that clauses be inserted in the Bill to be promoted for the following extensions: (*a*) Effingham-square, Frederick-street, Bridge-street, College-road, to Bradgate; (*b*) Wellgate, Badsley Moor-lane, and Middle-lane; (*c*) Moorgate-road to Whiston; (*d*) Effingham-street, Greasborough-road, to Greasborough boundary; (*e*) Fitzwilliam-road to bottom of Whinney-hill; (*f*) Canklow-road to Whiston Bar; (*g*) Domine Well-lane in Market-place; (*h*) existing extensions at Kimberworth and Canklow.

Llanelly.—A meeting of the Estates Committee of the Borough Council was held on Monday, when the deadlock in connection with the traction and lighting scheme was again considered. Mr. D. Randell, solicitor to the Council, was present, and repeated the advice he had already given, that the Council should go to Parliament to secure a Bill to compel the Insulated Wire Company to carry out their agreement. Mr. Randell said that he was backed up in that view by the opinion of Mr. Vesey Knox, of the Parliamentary Bar, who said that it was the only course that the Council could pursue. The matter was then fully discussed, and by four votes to three it was decided to adopt the advice of the solicitor and take parliamentary proceedings.

Additional Traffic Returns.—Anglo-Argentine, £2,113 increase; Barcelona Ensanche y Gracia, £136 increase; Barcelona, £59 decrease; Brisbane, £123 decrease (month of August, £11,736, increase £294), British Columbia Electric (month of March), gross earnings £10,352, net income £2,659; Buenos Ayres and Belgrano Electric, £129 increase (month of September, £13,793, increase £1,317); Calcutta, £425 increase; Cape Town (month of September), receipts £15,174, expenditure £8,503; Isle of Thanet Electric, £50 decrease; Lisbon Electric (month of September), receipts 89,636 milreis, expenses 51,231 milreis; Mexico Electric (month of August), receipts £48,600, expenses £27,900; Perth Electric, £268 increase; Port Elizabeth (month of September), receipts £3,730, expenditure £2,767.

Islington —At the last meeting of the Borough Council the Works Committee reported consideration of a letter from the London County Council giving at length the reasons (among them being that the conduit system would necessitate the reconstruction of numerous bridges) which had induced them to suggest that the overhead trolley system should be adopted for certain of their northern tramways, and expressing the hope that the Borough Council would, in view of the difficulties, agree to the proposal that certain of the tramways in the borough should be worked on the overhead system of electrical traction. The meeting resolved that representatives from each borough affected by the proposed reconstruction of the London County Council's northern tramways for electrical traction, together with their respective town clerks and borough engineers, be invited to attend a conference to consider the question with a view to united action being taken in the matter.

Speed of Tramcars.—In connection with the prosecution of four motormen of the London United Tramways for driving their cars at a higher speed than the authorised limit, some official trials were made on Wednesday in order to decide whether the contention of the company that their cars were unable to run at a greater speed than 10 miles an hour was correct. The *Times* correspondent, who watched the trials, says the prosecutor, Mr. Moffat Ford, and his expert, Colonel Crompton, C.B., were not admitted. He gives the result of one trial as follows: "Car No. 75 was timed carefully over 220 yards twice. It consumed on one occasion 35⅗ seconds, on another 37 seconds. Since 45 seconds is the time which ought to be consumed in covering a furlong, it is abundantly clear that yesterday car No. 75 exceeded the legal limit twice—that is to say, on the only occasions when it was timed." The official results will probably be made known when the adjourned summonses come before the West London police magistrate.

Cheltenham.—A deadlock has arisen between the Corporation and the light railway company in regard to the proposed extensions of the present light railway along High-street to Charlton Kings, and along Both-road to Leckhampton. The Corporation stipulate that along the High-street jarrah wood blocks should be used on either side of the track, but the company insist that the material shall be creosoted deal blocks. The difference in the life of the two blocks is said to be considerable, but so also is the cost, jarrah wood entailing a larger expenditure by £600 per mile as compared with creosoted deal blocks, and on this basis the extra cost to the company would amount to between £3,000 and £4,000. It is stated that Mr. Nevins, chairman of the company, has sent what practically amounts to an ultimatum

Digitized by Google

to the Corporation—viz., that he adheres to the cheaper material; that he is anxious to proceed with the extension without further delay, but that he will make no further concessions to the Corporation on the point mentioned.

Chatham.—The Chatham and District Light Railways Company have found it impossible to get through their scheme (estimated to cost about £6,000) for doubling the track on Chatham-hill with the celerity they had anticipated, and the work has not yet been commenced. The requirements of the Chatham and Gillingham Councils necessitated prolonged negotiations, but eventually matters were satisfactorily adjusted with the first-named authority. The company, however, declined to agree to carry out all the works stipulated for by the Gillingham Council with regard to the part of the road in that parish, and appealed to the Board of Trade to decide the points of difference between them. Lieut.-Colonel P. G. von Donop, R.E., accordingly held an enquiry into the matter, and met representatives of the company and the Council on Chatham-hill. The Board of Trade have now given their decision. They have determined the matter in accordance with Lieut.-Colonel von Donop's report, which is in favour of the light railways company.

Cardiff.—There was another discussion at the meeting of the Tramways Committee on Friday last with reference to permitting the use of cars for advertising. Mr. Ellis (engineer) expressed the opinion that the prospective revenue was more than counterbalanced by the present sightliness of the cars and their attractiveness to passengers. If the inviting appearance of the trams were altered, he believed there would be a falling off in traffic. The committee were practically unanimous in deciding not to entertain the advertising idea. According to a Cardiff electrical engineer, the illuminated tramcar experiment which has been tried at Cardiff is a costly luxury. Mr. W. S. Crossman informed the committee that the gentleman in question had told him that the cost per hour was no less than £3. Mr. Ellis replied that the actual cost was only 3s. 4d. per hour, and that the tramway receipts on the day on which the car was run went up £50. Mr. Ellis reported that up to the 16th inst. the increased receipts over last year totalled £16,973. There were now 79 cars regularly running, as against 66 at the corresponding date of last year. The committee expressed satisfaction with the increase.

Portsmouth.—The Corporation are recommended to extend the tramways to connect with the proposed Portsmouth-Hayling Island Light Railway at the borough boundary. The estimated cost of the scheme is £10,000. The Light Railway Commissioners will hold an enquiry into the proposed light railway next month. From the tramways accounts for the past 12 months it seems that the sum of £83,563. 12s. 5d. was expended in the year on the capital account, making a total expenditure of £620,239. 8s. 8d. The income was £83,950, against £50,643; whilst the expenditure was £36,961, against £29,871, leaving a gross profit of £46,988. This, after paying off the adverse balance of the previous year, and providing the interest and sinking fund charges, leaves a balance of £6,918. 10s. 8d., which the committee have decided shall form the nucleus of a reserve fund. The total amount redeemed and accumulated in the loans fund in respect of the undertaking now amounts to £31,066. Application is to be made for loans as follows: laying a double junction at Bradford-road, Southsea, £556. 10s. 10d.; laying a cross-over in Commercial-road. £150; and purchase of a motorcar and track sweeper and sprinkler, £655.

Local Authorities and By-Laws.—On Tuesday Sir Herbert Jekyll presided over a conference of local authorities of West Middlesex relative to the adoption of a set of by-laws giving them power to control the service of the London United Electric Tramways. Twickenham, Chiswick, Brentford, Hanwell, Teddington, Hampton, and Hampton Wick districts were represented. The President said that some districts wanted the electric cars to run at speeds above the Board of Trade standard, some below. The Board recognised that the code, as it applied to old horse tramways, was quite inoperative in the altered condition of electric traction, and they were considering the question of speeds; but there would have to be uniformity. With regard to the distance between travelling cars, all the authorities agreed to 50 yards, with the exception of Chiswick, which wanted 150. The Brentford Council asked for a speed indicator to be on each car, but that was quite impracticable, and would have to be dropped. The suggestion of the same Council that every car should be disinfected once a month to the satisfaction of the local authority was *ultra vires*. Mr. Clifton Robinson, for the company, said they would welcome the invention of a reliable speed indicator, and would give a bonus of £500 for one.

Belfast.—An application came before the Judicial Committee of the Privy Council in Dublin on Friday on behalf of the Cavehill and Whitewell Tramway Company, Belfast, for power to increase the capital of the company. Mr. Ronan, K.C., for the company, said the application was not opposed now, although opposition had been threatened by the British Electric Traction Company. The Cavehill and Whitewell Tramway Company in 1881 and at different times had obtained further capital and borrowing powers by amendment orders. The tramway was a little over three miles in length, and ran from Chichester Park, Antrim-road, out to the suburbs of the city. The line was worked by horse power, and it was sought to reconstruct the line and work it by electric power. In the parliamentary session of 1901-2 the company, in conjunction with the British Electric Traction Company, promoted a Bill which authorised the capital to be increased by £33,000, and the borrowing powers by £11,000. The entire capital then amounted to £45,000, which was more than sufficient to have the work carried out according to the estimate, which placed the cost at £40,000. Subsequently, however, the estimate was increased to £57,000, and they wanted power in order to meet this to increase the capital by the issue of 22,500 new ordinary shares, and to increase their borrowing powers by £7,500. The Act of 1901 did not provide for the additional capital, but this was purely an oversight. The Lord Chancellor, in giving the decision of the committee, said they would not remark on the merits of the case, but they could not accede to the application on the question of jurisdiction.

Bradford.—In their annual report for the past 12 months, the Tramways Committee of the Corporation state that the route length of the tramways worked by the Corporation has increased from 39 to 45 miles. The car mileage has increased by 1,719,898 miles, and the receipts show an increase of £68,984. There are 206 cars, fully equipped, 187 of which are now in service. The lowering of certain fares from 3d. to 2d. and the alteration made in regard to workmen's fares have been attended with satisfactory results. The receipts for the year ending Aug. 31 last amounted to £183,648, as compared with £114,664 last year, the average per car mile being 10·12d. The number of accidents for the year ended Aug. 31 last is 1,168. It is with pleasure the committee note that out of this number there have been no fatal accidents. Forty-four million passengers have been carried on the cars during the 12 months. The wages and working conditions of drivers and conductors have not been varied from last year. The "class" system of working and the payment by the hour have been found to work very satisfactorily, and now that the men have been thoroughly trained the committee believe they have an excellent staff of employés, who know their work thoroughly and do it well. The total staff numbers 901, against 826 last year, and 215 in 1901.

Ramsgate.—The Board of Trade has issued Lieutenant-Colonel von Donop's report on the accident which occurred at Ramsgate on Aug. 12. While an electric tramcar travelling from Margate to Ramsgate was descending Bellevue-road the driver lost control of it, and it came into collision with another car travelling in the opposite direction. Over 30 passengers were injured, two seriously. Lieutenant-Colonel von Donop says that the driver, by his account, manipulated his brakes in a most unskilful way, and it was to his want of skill that the accident must be to a great extent attributed. He had had considerable training at the work, but both his action and his evidence showed that he did not understand the working of the rheostatic brake. It was, however, specially with the view of preventing drivers losing control of cars that Major Pringle, in his report of Oct. 12, 1901, recommended the provision of slipper brakes, so that these might be applied before commencing to descend steep gradients. The 40 four-wheel cars belonging to the company had, it was stated, all been equipped with slipper brakes, and since there had been no cases of runaways with those cars. But the brakes fitted to the 20 eight-wheel cars could not be so applied, and it was to this defect that this accident must also be attributed. Until the company fitted these eight-wheel cars with slipper brakes, which could be applied before the car started to descend a steep gradient, he did not consider that Major Pringle's recommendation had been properly carried out. The company pointed out that the provision of such brakes was a matter of great difficulty on account of the arrangement of the wheels on these eight-wheel cars. This might be so, but the problem must be faced or the use of these cars be discontinued.

Electrification of Steam Railways.—In its annual report recently issued the Massachussetts Railroad Commission gives a useful account of the experimental steps which have been taken by various railway companies in America towards the substitution of electricity for steam. While looking favourably upon such movements, the Commission thinks that the steam railroad is not likely to give way to the electric railroads in the immediate future, and says "it is idle to suppose that the end can be hastened by legislation." In dealing with the entire railroad system, the report remarks, there is the frequent and infrequent passenger and the frequent and infrequent freight service, the light and the heavy trainload, the short and the long distance haul, the traffic with many and the traffic with few stops, and the complicated freight and passenger terminals. It is evident that these conditions present serious questions affecting both safety and expense in considering an electric equipment. The use of a single motor, carrying its own fuel, distinguishes steam transportation; while the peculiar feature of the electric system is the fact that the power is generated at one or more central stations and transmitted for considerable distances. The principal economy in the use of electricity is in the opportunity to generate power in large units under the most favourable conditions; its waste is in distribution at expense and loss. The greatest electrical economy is secured when the load upon the line consists of a large number of small units—small trains at short distances apart—equally distributed; the least favourable condition is when the load upon the line consists of a small number of large units at long distances apart. As the development of the passenger business, through increased frequency of the short-distance services, has been in the direction of the greatest electrical economy, while the development of the freight business, through the increase in the weight and decrease in the number of trains, has been in the direction of the least electrical economy, it is clear that the most favourable field for the introduction of electricity is in the passenger traffic. It is almost wholly in this field that the possibilities of an electric service upon railways are exhibited in different places in this and other countries with varying degrees of success. The service is found upon certain branch or suburban lines, where increased facilities for transportation combined with reduction of fare have brought a large increase in the volume of traffic. Whether a given enterprise has proved profitable it is often difficult to determine, but it is safe to lay down the general rule that a field for the development of a very large traffic with frequent train service has been shown to be essential to satisfactory results. Upon every hand it is apparent that agencies are at work to develop the application of electricity so as to permit more and more its substitution for steam in the general operation of railroads. No incitement to pushing forward these undertakings can be more effective than the stimulus of self-interest on the part of those anxious to instal the electric in the place of the steam plant, and on the part of those eager in the handling of transportation

Digitized by Google

to make use of every real advance in methods. It is idle to suppose that the end can be hastened by legislation in the effort to compel capital to follow experiment more closely than business prudence dictates.

New South Wales Tramways.—The report of the Railway and Tramway Commissioners of New South Wales for the year ended June 30 last has just reached us. We gather that on that date there were 124½ miles of tramways open for traffic, the capital expenditure on which amounted to £3,371,587. The earnings during the year amounted to £752,034, being an increase of £120,277 over previous year, and the working expenses, which include over £20,000 to meet the reduction of the working hours of the running staff, to £654,165, being an increase of £112,181. The interest on the capital invested on lines open for traffic, calculated at 3·552 per cent.—the average interest paid on the State debt—calls for £117,265, and the balance, after paying all working expenses, amounts to £97,869, the result being a deficit of £19,396. The permanent way, the Commissioners state, has, as well as the rolling-stock, machinery, electric plant, and buildings, been efficiently maintained during the year. Owing to the conversion from steam to electric traction, a larger amount of relaying has been necessary. Seven miles 23½ chains of 42lb. rails were relaid with 60lb. T-rails, and 1 mile 68 chains with 83lb. girder rails, and the cost has been charged to working expenses. 26,000 tons of metal have been used in maintaining the lines, as compared with 18,816 tons the previous year. During the 12 months 24 electric cars, paid for out of working expenses, replaced 24 steam cars and three steam motors. The total amount of steam stock replaced to June 30 this year by electric cars is 111 cars and 26 motors, at a cost of £82,677. The cost of the old stock was £82,458. 160 electric four-wheel motorcars and five service trucks have been added to the stock during the year and charged to capital. 130,405,402 passengers were carried, as compared with 108,135,111 in the previous year—an increase of 22,270,291. The conversion of eight steam lines to electric traction during the year necessitated a large increase in the amount of electric power generated at the main power-house at Ultimo. An extensive addition to the plant has been completed, and the output has advanced from 1,235,455 to 2,826,126 Board of Trade units. In this connection the three-phase power transmission system, with five sub-stations for distribution of the required electrical energy to the various sections at Sydney, Newtown, Randwick, Waverley, and North Sydney, has been brought into operation. A further extension of the power-house has been put in hand, a considerable portion of the steel structural work having been erected and made ready for the reception of the new plant to be installed. Attached we are able to give a comparison of the figures for the years 1903, 1902, and 1888 respectively. Amount expended on construction and equipment—1903, £3,371,587; 1902, £2,829,363; 1888, £877.244; cost per mile open, including workshops and rolling-stock, £27,090, £27,220, and £22,786 respectively; miles open for traffic, 124½, 104, 38½; average miles open for the year, 116½, 96½, 38; earnings, £752 034, £631,757, £236,519; working expenses, £654,165, £541,984, £219,196; balance (after paying working expenses), £92.869, £89,773, £17,323; percentage of profit to capital invested, 86·99, 85·79, 92·67; earnings per average mile open, £6,455, £6,546, £6 224; working expenses per average mile open, £5,615, £5,616, £5.768; return per average mile open (after paying working expenses), £840, £930, £456; earnings per tram mile, 1s. 1¼d., 1s. 4¼d. 3s. 4¾d.; working expenses per tram mile, 11½d., 1s. 2d., 3s. 1¾d.; return per tram mile (after paying working expenses), 1¾d., 2¼d., 3d.; number of passengers carried, 130.405,402, 108,135,111, not obtainable; tram mileage run, 13,695,630, 9,344,164, and 1,388,786. For the quarter ended Sept. 30 last the revenue amounted to £185,840, as against £166,900 in the corresponding quarter last year; and the expenditure to £159,239, as compared with £143,528.

London County Council.—Since the London County Council have withdrawn the electric cars from the cable section between Kennington and the Streatham terminus, passengers desiring to journey through to the London termini, or *vice versâ*, by tramcar have to change cars at the junction of the electric and cable systems. This, we regret to hear, has given rise to much inconvenience and loss of time to passengers, especially to those who avail themselves of the tram service to reach their places of business in the City. We are informed, and believe it to be quite within the facts of the case, that often passengers coming from the Brixton and Streatham districts have to wait 10, 15, and 20 minutes at the Kennington junction before they are able to proceed on their journey townwards in the electric cars. The reason for this is not that the number of cars running is insufficient, but that the service is most irregular. For instance, it is no uncommon sight to see four, five, or six "Westminster" cars running in succession and leaving Kennington on the return journey comparatively empty, while large numbers are awaiting the arrival of a "Blackfriars" car to carry them to their various destinations lying in that direction. When at length it does come there is an unseemly rush for seats. Sometimes it is the other way about, and passengers wanting to get to Westminster have to wait an equal length of time before their car arrives. Necessarily a change of cars must entail delay, but we think that if the connections were managed better the inconvenience would not be unduly resented by the public. As it is, there is much grumbling, and not without good cause. It is stated that the electric cars will commence to run from the London termini as far as New Cross on Jan. 1. At the usual weekly meeting of the Council on Tuesday the Highways Committee had on the agenda various reports referring to the tramway undertaking. These showed that arrangements are being made for the provision of car-shed accommodation at New Cross and Wandsworth. In the first case the committee asked for authority to spend £850, in addition to the £11,500 already sanctioned, for the acquisition of property for the purposes mentioned, while in the second a Bill is to be promoted next session for the compulsory purchase of certain property in Jews'-row, Wandsworth, with the same object. The following report was presented with reference to the tramway reconstruction in South London: "Certain preliminary expenditure will have to be incurred in making surveys, preparing plans, etc., in connection with the various tramway works which are in immediate contemplation. These include the reconstruction of the Streatham cable tramways, a work which it is imperative, in the interests both of the general and of the tramway traffic, should be carried out with as little delay as possible, and the extension of the tramways from the present terminus in Tooting High-street a short distance along Defoe-road, in order to provide a fresh terminus, which is urgently needed, for the Tooting tramways. Some small expenditure will also be required for making surveys, etc., in connection with tramways south of the Thames which the Council have given notice to purchase, and in prosecuting enquiries with regard to undertakings which they will shortly be in a position to purchase should it be so decided. To cover the expenditure necessary to provide the staff with all that will be required to make the surveys, etc., referred to, and to cover other expenses of a preliminary character, the committee suggest that a vote of £2,500 should be passed. This course was adopted previously to the work of the reconstruction of the New Cross and Greenwich sections of the tramways being put in hand, and was found to be a convenient one. Ultimately the various items of expenditure proposed to be incurred will be charged proportionately to the respective works to which they properly relate." The committee had sent to the Finance Committee an estimate of the amount named, and recommended that the estimate of £2,500 submitted by the Finance Committee be approved, and that the Highways Committee be authorised to incur that expenditure on capital account up to that amount. The committee also brought forward a report with regard to alteration of mains in Tower Bridge-road. It stated that in connection with the construction of the tramway in Tower Bridge-road, authorised by the Council, which is at present being carried out, it will be necessary to arrange for the removal or alteration of certain pipes, wires, etc., under the carriageway. Certain of these mains are those belonging to the Bermondsey Borough Council as part of its electric lighting undertaking, and the Borough Council have received notice from the contractors, Messrs. W. Griffiths and Co., to remove the mains referred to, in order to provide sufficient depth in the carriageway for the construction of the electric conduits for the tramways. The Borough Council suggests that the mains to be removed should be placed as far as possible in the Tower Bridge-road subway and its laterals, but the committee think that the best and least expensive course to adopt would be to carry the mains by the shortest route through the arch of the subway. The cost of the work will have to be borne by the Council as part of the cost of the construction of the tramways. The committee accordingly recommended that permission be given to the Council of the metropolitan borough of Bermondsey to carry out the necessary alteration of the positions of their electric lighting mains in Tower Bridge-road in consequence of the construction by the London County Council of tramways along that thoroughfare, such permission being subject to the mains being laid by the shortest route through the arch of the subway and to the work being carried out in all respects to the satisfaction of the Council's chief engineer.

LIGHTING AND GENERAL.

Falkirk.—The Town Council are about to make a few extensions of electric light mains.

Luton.—The Guardians have decided to substitute electricity for gas at the workhouse.

Hammersmith.—The public lamps in Great Church-lane are to be supplied with electricity in place of gas.

Cardiff.—The Corporation have obtained permission from the Marquis of Bute to lay a cable through his estate.

Hanwell.—The District Council having decided to obtain an electric lighting provisional order, the draft of same has been approved.

Penrith.—A scheme for the electric lighting of the town at a cost of £7,500 is under consideration by the Urban District Council.

Melksham.—An agreement relating to the license of Messrs. Tilke and Smith to lay electric mains in the urban area is under consideration.

Huddersfield.—The Electricity Committee in their last report state that the number of consumers is now 1,835, and lamps connected 127,690.

Tobercurry.—The District Council have granted permission to the Tobercurry Lighting Committee to erect poles and wires necessary for the lighting of the town.

Benfieldside.—An offer from the electric supply company to tender for the lighting of the district for the season 1904 and 1905 is before the Lighting Committee.

Salford.—The Council propose to apply for sanction to borrow £10,000 to cover the cost of the purchase of motors to be hired out to the public, as authorised by the Corporation.

Bradford.—It is expected that the Sunbridge-road dust destructor, now being erected by the Horsfall Destructor Company, will have 500 h.p. available for electric lighting purposes.

East Ham.—From Jan. 1 next current will be supplied to private consumers at 4½d., and to places of public worship at 4d. per unit, which is a reduction of 1d. per unit on each rate.

Lowestoft.—We understand that the next report of the Electric Lighting Committee will deal with the question of free wiring and a flat-rate system of charging as against the present maximum demand method.

Rosario Electric Co.—In their report for the period to June 30 last the directors recommend a dividend on the preference shares at the rate of 6 per cent. per annum, calculated from the due dates of instalments to June 30 last.

Digitized by Google

Ladysmith.—We referred to the opening of the Corporation's electric light works in our issue of Sept. 25, and now learn that already the engineer, Mr. J. Stanley White, is putting down an additional set equal to the two at present running.

Thornbury.—Steps are being taken by a syndicate to secure a Bill for the sole supply of electric power in that part of the Rural District Council's district not already allotted. The Council have, however, decided to obtain these powers themselves.

Gillingham.—The Parish Council have instructed Messrs. Parry, Ross, and Richards to make a preliminary canvass and survey of the parish, and to submit a report with estimates of the cost of electric lighting for the further consideration of the Council.

Wrexham.—On Tuesday the electrical engineer presented a scheme for the extension of the electric light cables, the approximate cost of which will be £4,500. The question of applying for sanction to the borrowing of £4,500 has been referred to the Finance Committee.

Ludlow.—An enquiry has been held into an application of the Town Council for sanction to borrow £8,250 for purposes of electric lighting and the provision of a refuse destructor. The Council were represented by Mr. J. H. Williams (town clerk) and Mr. Parker, C.E., Hereford.

Wisbech.—The Town Council have decided that an expert be consulted with regard to offers from several electric lighting companies to provide an installation for the town. His selection and the fixing of his remuneration in the first instance is to be left to the Electric Lighting Committee.

Sheffield.—The senior students of the technical engineering class of the Owler-lane Evening School on Monday, by the permission of Mr. S. E. Fedden, C.E., visited the electric light and power station. Mr. A. Cuthill (station superintendent) and Mr. F. T. Callis (senior engineer) acted as guides.

Cheetham.—The Urban District Council have asked Mr. A. Slatter to attend a Council meeting on behalf of the electric light company in order to discuss the provision of electric power at the waterworks. The electric light company propose to commence laying the cables as soon as the rain stops, whenever that may be.

Mansfield.—An electrical exhibition was opened on Tuesday afternoon at the town hall by the mayor (Mr. J. Crampton). The exhibition is held in connection with the Corporation electricity department, under the supervision of Mr. W. J. Chadburn (chairman of the committee) and Mr. Hewlett (the engineer).

Calne.—The town clerk has been instructed to reply to the Southern District Electricity Corporation that the Council could not withhold or give their consent to the company's application to supply Calne with electricity, as they were at present considering whether they should not make a similar application to the Board of Trade.

Elland.—During the weeks passed since the opening of the electricity works, the consumption of current in the town has reached for each night an equivalent of 800 8-c.p. lamps We understand that during the week everything has gone satisfactorily at the station. The Council intend to offer current at 3d. per unit for lighting places of public worship.

Pitlochry.—A project for introducing the electric light is again under consideration, and the details of the scheme are said to be now very fully arranged. It is understood that Mr. John Leonard, architect, is one of a number of local gentlemen who have interested themselves in the matter. The motive power will be derived from the River Tummel.

Finchley.—The supply of electricity to North Finchley commenced on the 29th ult., and a supply from dusk to 12.30 a.m. was maintained until the 8th inst. Since that date the supply has been uninterrupted. East Finchley has been permanently supplied since the 9th inst., and Church End since the 12th inst. Sections of the mains in each of the three districts are being connected.

Glengarnock.—At a meeting of the ratepayers last week it was decided to form a lighting district co-extensive with the water district, which will extend from the new railway, Kilbirnie, to Langbar. The Glengarnock Iron and Steel Company are willing to supply electric light at 5d. per unit, and it is estimated that the cost of the installation and lamps will not exceed 2½d. per £1 on owners and the same on occupiers.

Paddington.—The Metropolitan Electric Supply Company are laying electric mains along Maida-vale. At the last Council meeting the Joint Works and Electric, Gas and Water Committee submitted a report on the whole question of the lighting of the borough, and recommended that no action be taken at present with a view to lighting any of the streets of the borough with electricity. This was agreed to without discussion.

Bermondsey.—The Electric Lighting Committee's recommendation that it be an instruction to the Baths Committee to adopt the report of Messrs. Kincaid, Waller, and Manville, in conjunction with the borough treasurer's report thereon, for the heating of the Bermondsey baths by exhaust steam, came before the Council last week. The expense would be £2,020, and the matter will come before the new Baths Committee next month.

Stock Exchange.—The Stock Exchange Committee have appointed Nov. 5 a special settling day for Peebles (Bruce) and Co.'s 20,000 6 per cent. cumulative preference shares of £5 each fully paid, Nos. 20,001 to 40,000. The committee has ordered the said securities to be quoted in the official list. The committee have also been asked to allow Eastern Telegraph Company's further issue of £44,435 3½ per cent. preference stock to be quoted in the official list.

Aston.—The sub-committee appointed by the Council as a deputation to visit and inspect the combined electricity station and dust destructor at Wrexham last week reported that, as the members present could not agree upon a unanimous decision, it resolved to prepare two separate reports. It was decided to take these reports at the same time as the reports of Mr. W. H. Trentham and Messrs. J. and J. S. Enright, adjourned from the special meeting of the Council held in May.

Dundee.—Following the example of the North British Railway Company, the Caledonian authorities have completed arrangements for the introduction of the electric light at Dundee West Station. In addition to the passenger platforms, the goods department and the busier sidings will be equipped with the new illuminant. The arrangement, like that at Tay Bridge, provides for the supply of current from the Corporation works, the installation being carried out by the company's engineers.

Stirling.—The last report of Mr. A. C. Hanson, electrical engineer, shows that for the four weeks ending Oct. 3 15,768 units were generated, as compared with 14,165 for the same period in 1902. The total number of equivalent 8-c.p. lamps connected to date was 11,145 against 9,710 at the same period last year. A new distributing cable has been laid. Several Nernst lamps have been erected in place of gas lamps; others are being converted. A number of new applications for motors and lighting supply were recorded at last week's meeting.

Arbroath.—The special committee of the Council appointed to deal with the proposals from several electric lighting companies, and to ascertain the best terms upon which any one of these would be prepared to take over the order and carry out the work, have agreed to recommend that the proposals of the Empire Electric Light and Power Company, Limited, London, should be accepted. The company will take over the order at a price which will not involve the town in any loss, and will complete the installation within 12 months.

Whitby.—The following interesting particulars have been ascertained by the committee of the Whitby Conservative Club in connection with the respective costs of electricity *v.* gas, the former of which illuminant was recently installed in the club premises on Marine-parade. During the past quarter 146 units—38 of which were charged for at the rate of 8d. per unit and 108 at 2d.—were consumed, making a total charge of £2. 4s. 10d. for the quarter. The cost of gas for the corresponding quarter of last year was £3. 1s. 5d. The introduction of electric light has, therefore, effected a saving of 16s. 7d. on £3, which is considered very good business.

Long-Distance Telephones.—Communication is now practicable between Cardiff and Brussels and neighbourhood, but not with any other town in Belgium. The charge is 8s. for each period of three minutes' communication, and the service is only open to Post Office subscribers making use of the Post Office call offices. Conversations by subscription are allowed by night at half rates for a period of not less than six minutes. Formal sanction by the French Administration having been given to the arrangements, communication will now be practicable between Cardiff and Paris (including the suburbs), Orleans, and Rouen. The charge for communication is the same as that for Belgium.

East Molesey.—Edmundson's Electric Light Corporation have offered to insert the following clauses in the proposed provisional order: (1) to give the Council the right to purchase the undertaking at a valuation as a going concern at the end of 7, 14, or 21 years; (2) to supply electricity to private consumers at the following rates, 7d. per unit for the first hour per day at the maximum demand, or its equivalent, and 3d. per unit for any further quantity. Furthermore, as it cannot be a clause in the order, they would be prepared to enter into an agreement to supply electricity for public lighting at a price not exceeding 2½d. per unit. The Council have abandoned their own proposal for obtaining an order, and have decided to consent to the above clauses.

St. Pancras.—The London County Council have informed the Council, with reference to the application for a loan of £30,000 for electric lighting purposes, subject to the Borough Council agreeing by resolution to provide out of a sinking fund established for that purpose or from maintenance account, for all renewals and replacements during the currency of the loan of any of the plant and machinery provided with the proceeds thereof, they are prepared to advance £23,960 of that sum upon the terms that it is taken up at once and repaid with interest at the rate of £3. 15s. per cent. per annum, calculated quarterly, by equal half-yearly instalments of principal and interest combined, within 42 years from the date of the advance, and that the Borough Council pay the cost of the loan.

Worthing.—The borough surveyor estimates the cost of the proposed refuse destructor, including the engines, boilers, and other plant, tenders for which have already been provisionally accepted, at £5,600, and the Council will apply for sanction to borrow this sum. The destructor building will be sufficient to admit of the destructor being extended to double the capacity of the plant now proposed to be put down. The Council have decided that the fixed charge for lighting purposes to private consumers remain at the present rate of 6d. per unit, but that from and after the commencement of the new year the table of discounts allowed in respect to current supplied for lighting purposes should be as follows: 1,000 up to and including 5,000 units used per annum, 5 per cent.; and over 5,000, 10 per cent.

Camberwell.—At the last meeting of the Council the application of the County of London and Brush Provincial Electric Lighting Company, Limited, to place a transformer box in Burbage-road, near the corner of Half Moon-lane, was granted, subject to any disturbance of the footway or roadway being made good to the satisfaction of the borough engineer, and subject to an undertaking by the company that should the site or any portion thereof or the works connected therewith be required for public purposes, the company will pay the cost of removal or of any alterations. A letter has now been received from the company stating that they cannot possibly accept the condition the Council has made, and that there is no alternative but to submit the matter to the Board of Trade unless the condition be withdrawn.

Digitized by Google

St. Olave (Southwark).—The workhouse is to be lighted by electricity instead of gas. The total cost of gas for the workhouse for the year ending Lady Day last was £483, of which it was assumed one-fourth was required for cooking purposes. Upon an average two-thirds of the lights—370—will burn three hours daily, and consume 45 units of electricity, the cost of which at 3½d. per unit amounts to 13s. 1d. per day, or, say, £240 per annum. The difference between the cost of gas (£365) and electricity (£240) is, therefore, £125. The Salisbury Electrical Engineering Company, of Lee, have obtained a contract for £365—providing 370 lights and 188 switches. The current is to be taken from the Borough Council.

Share Market.—More attention is given to electric lighting shares just now, and many cheap securities are obtainable, yielding from 3¾ to 4¾ per cent. on the money invested at present quotations South London Electric shares have been favoured during the last few days owing to a remarkable increase in the amount of current sold by this company, which in its early days had many troubles to overcome, and still suffers from original over-capitalisation. One reason for the increase in consumption is that the South London Corporation has secured a useful temporary customer in the London County Council. During the time occupied by the building of the Council's own power-house, the South London Company supplies the energy to the London County Council's trams. The arrangement lasts for some 18 months yet.

Dumfries.—Messrs. Frank Suter and Co., Limited, London, acting in co-operation with three other manufacturing firms, have offered to the Town Council to carry out an electric light installation for the town on the following terms: that the Council provide the capital, amounting to £16,300; that the company carry on the undertaking, and pay to the Council the full interest on capital and sinking fund charges, and shall also pay over annually half of the profits, but under reservation of a right to charge a loss incurred at any time against the profits of subsequent years; that the company and the firms associated with them enter into an agreement guaranteeing the Council against any loss; and that the Council be entitled to take over the works at any time without payment of any premium on giving 12 months' notice. It is proposed to employ the Dowson power gas in generating the electricity.

Fulham.—The electrical engineer to the Borough Council has reported that as a result of his investigations he had come to the conclusion that it was necessary to at once put in hand the construction of two new sub-stations, one in West Kensington and the other in Fulham-road at its junction with Munster-road. It was also necessary to add to the present high-tension feeders supplying Jerdan-place. The total cost of these works would be £2,050. It was agreed by the Council to put the work in hand. At the present moment constructional and other works involving capital expenditure are practically suspended owing to the fact that the triennial elections for the borough councils take place next Monday, and also because the County Council have urged upon the local councils the necessity of suspending, as far as possible, further works out of capital expenditure until the money market is in a more satisfactory condition for the Council to borrow.

Erith.—The Electric Lighting Committee recommend the erection of a number of ¼ and ½ ampere lamps, and the necessary extensions of the public lighting cables. With regard to a supply of current to Crossness outfall works the committee have considered a letter from the superintendent, Mr. E. J. Beal, enquiring upon what terms the Council would be willing to supply electricity to those works for the day load, and recommend that the Council agree to supply current for the day load at 5d. per unit, or for both the day and night loads, estimated at 140,000 units per annum, at 4d. per unit, provided in each case that the London County Council will guarantee the payment of the minimum sum of £200 per annum for the period of three years. The committee have directed the resident electrical engineer to obtain badges to be fixed to the coats of the staff engaged in the fixing or examination of wires, fittings, meters, etc., upon the premises of private consumers, also to provide oilskins for the outside workmen.

East Barnet.—Progress is being made with the framing of an electric lighting scheme for the district. The Electric Lighting Committee of the Urban District Council have obtained a report of Mr. Warden-Stevens, in which he agrees with Mr. Adams in advising the Council not to allow the electric lighting order to lapse, but he takes a different view from Mr. Adams as to the best way of carrying out the order. Mr. Adams advised the Council to generate and distribute their own light, and to introduce a dust destructor, while Mr. Stevens advises the Council to obtain a supply in bulk, and undertake distribution through their own mains. He thinks that works established in the district would be successful eventually, but recommends the purchase of energy in bulk in the meantime. He does not believe in confining the mains in the first instance to a few of the best roads, and thinks that the means of supply should be given to all within reasonable limits. If the Council undertook the distribution they would see that the interests of the ratepayers were fully safeguarded. The scheme will involve an expenditure of £14,821.

Birmingham.—The Birmingham Tame and Rea District Drainage Board decided on the 27th inst. to apply for sanction to borrow £14 000 for the purpose of erecting a boiler-house, electric generating station, high-tension power transmission line, motors, pumps, transformer stations, etc. In the last session of Parliament authority was given to the Board to sell two acres of land to the city of Birmingham for the purpose of constructing a refuse destructor thereon. In payment for this land the Birmingham City Council agree to generate steam, day and night, capable of actuating one high-speed engine, calculated to give off 175 b.h.p. With this power the Drainage Board, on the advice of their engineer (Mr. J. D. Watson), resolved to lay down an electrical power transmission plant for the purpose of driving motors for farm purposes at Saltley, Tyburn, and Park Hall; and motors for driving five centrifugal pumps, capable of lifting seven million gallons per day, situated at various places along the line of the 8ft. main sewer in the valley of the Tame. Three motors will also be erected at Tyburn for driving machinery in the mechanics' and joiners' workshops. Provision will also be made to drive four rotary sewage distributors at Minworth Greaves. In addition to this there will be provision for lighting at the Board's more important buildings at Saltley, Tyburn, etc. The contract for the provision of the electrical transmission plant has been secured by the British Thomson-Houston Company, Limited, of Rugby, and amounts to the sum of £7,977. 5s.

Accidents.—The electrical engineer of Swansea (Mr. Prusmann), as reported in the *Daily Post*, said the cause of Sunday's failure of the electric light was due to a short-circuit in one of the boxes near the hospital corner. He found on examination it was impossible to tell what was the cause, as all the fittings in the box were entirely burnt up, and there was nothing left upon which to base a conclusion as to cause. The street arc lamps, which have separate cables, were only out for five or ten minutes. Three churches which use the current were in darkness, together with private consumers, for something like an hour and a half. The Empire though, where a sacred concert was held, was reconnected in sufficient time, so that no inconvenience was caused to the concert. This was due to the fact that one of the feeder cables is connected direct into the basement of the Empire. Shortly after eight o'clock (the lights having been out since 6.35), the private lighting was resumed, with the exception of a short length on which the fault actually happened, affecting two or three consumers. There was no delay in the report of the fault. Directly it happened the automatic circuit breaker operated at the station and threw the whole works into darkness. The engines continued to work, and within half an hour the whole staff were either at the station or at the scene of the fault. There was not the slightest confusion, and each of the staff did exactly the right thing. North Shields was last week plunged into darkness through the electric power station being flooded. Local failures were also reported at Jarrow. The resident engineer of Worthing, in his report on the recent failure of certain arc lamps, states that the chief cause of default was due to the dampness of the atmosphere, the effect being to corrode the brasswork and small moving parts of the lamp mechanism, so that the "feed" of the lamp is impeded. On Saturday evening the electric light supply failed at Leicester owing to a short circuit on the switchboard. The main cable conveying the electric light current fused, the switchboard broke down, and the station had to be shut down. Supply was resumed on the following evening. The cellar containing the switchboard is fireproof, so that there was practically no danger. As soon as the man in charge of the board found the "sparking" in connection with the switchboard he telephoned to the generating station at Aylestone, and the machinery was stopped at once. This station has been running now for over nine years, and the mishaps experienced have been quite insignificant.

Manchester.—A good deal has been published about the resignation of Mr. Metzger at Manchester. We have refrained from details till now, and give herewith the report of the discussion in the Manchester Council respecting the same. Mr. Howarth moved the adoption of the Electricity Committee's minutes, with the deletion of the following words from the clause which announced the resignation of the chief engineer: "On the ground of his inability to work in unison with the deputy chairman." Outlining the incidents leading to the resignation, Mr. Howarth said that in January of this year the Electricity Committee of Halifax wrote to the town clerk asking if he would allow the engineer to advise in connection with certain works in progress in that town. This letter was laid before the committee, who found that Mr. Metzger was appointed subject to a condition that he should devote his whole time to the duties of the position. The town clerk of Halifax was informed that Mr. Metzger could not advise his Corporation. He did not see any need to consult Mr. Metzger on the matter, but he subsequently explained to Mr. Metzger that the Corporation could not allow its officials to do outside work. Then the Burslem Town Council approached the chief engineer personally, without consulting the town clerk, and he undertook the revision of their schemes and received for his work 50 guineas. When Mr. Metzger was asked for an explanation by the committee he said he had received the sanction of the chairman. This, Mr. Howarth said, was not the case. Mr. Metzger did write to him, and the impression left on his mind was that someone merely wished to consult him on a technical point, and he did not feel justified in refusing permission for that. If he had known that Mr. Metzger was seeking to augment his salary by outside work, he should have put his veto on the proposal. It appeared that Mr. Metzger had accepted the task of arbitrating between the Trafford Park Power Supply Company and the Electrical Company of Berlin. As the Electric Company were doing a large amount of work for the Manchester Electricity Committee, this action of the chief engineer placed him and the committee in a very invidious position. The matter was discussed by the committee, and a good deal of personal feeling was manifested. Ultimately Mr. Metzger tendered his resignation. It was accepted by the committee, and the words which he asked to be deleted were inadvertently inserted in the minutes. Mr. Howarth concluded by saying that Mr. Metzger had been in the service of the electricity department for two years and nine months. During that period Mr. Metzger had applied himself to the work very earnestly and very successfully. Mr. Burgon seconded the resolution, which was passed without further discussion.

Dalkeith.—The erection of the generating station in Croft-street has been nearly completed, and the streets are being opened for the purpose of laying the electric cables. The contractors, Messrs. Crompton and Co., are at present also introducing electric light installations into Jedburgh, Melrose, and Dollar. The plant will consist of two Crompton 55-kw. belt-driven shunt-wound dynamos, driven by two 80-h.p. high-speed electric light gas-engines by Crossley. The supply of gas to these engines will be provided by two 80-b.h.p. gas-producers, suitable for using anthracite coal. The battery consists of 360 cells,

Digitized by Google

The switchboard is of black and white marble. A hand-driven travelling crane by Chatteris, capable of lifting 12 tons, is to be put up as a permanent fixture. There will be one motor and two boosters for charging the battery, all direct-coupled together on one bed, and there will also be one balancer. The supply will be a low-pressure continuous current on the three-wire system, the voltage across the outers being 460. The cables are being laid by Messrs. Callender on the solid system. There will be about 22 arc lamps for public lighting. Consumers will have the option of adopting free wiring.

Bristol.—The Electrical Committee have adopted a report of the Wiring Sub-Committee as to the terms on which the Corporation should undertake free wiring, wiring on hire-purchase terms, and as to the hire of motors. The wiring is to be carried out through local contractors. In the case of free wiring, a percentage on the cost of the installation will be charged as rental, but the amount cannot be fixed until the Local Government Board have sanctioned the raising of the necessary loan. In the case of hire purchase, the committee are prepared to extend the payments over any period up to five years. The consumer will be required to pay 10 per cent. of the cost of the work on signing the agreement, and in the case of a three years' term, 12 quarterly payments, each equal to 8½ per cent. of the cost, with interest quarterly at the rate of 4 per cent. per annum on the principal from time to time outstanding. In both cases the hirer will be at liberty to redeem the fittings at any time on equitable terms. The rates for the simple hire of motors will be reduced at the expiration of the current quarter. The sale of motors on the hire-purchase system will not be undertaken by the committee, because there are manufacturers always willing to sell on those terms. Some months ago the Town Council sanctioned considerable extensions of electric street-lighting, the streets to be so illuminated being chiefly the main thoroughfares leading to the city. The scheme involved the erection of about 300 arc lamps. Some sections have been completed and on Tuesday many of the new lamps were given a trial, evidently with perfect success.

Portsmouth.—The auditors in their last report state that there is a considerable improvement in the system of book-keeping of the electric light department. The revenue account shows an increase in the sale of current of £3,250, whilst the rentals have increased by £200. The gross revenue amounted to £35,282, as compared with £32,295. The expenditure under various headings generally showed increase, the profit on the undertaking being £14,079, as compared with £14,695. The form of the balance-sheet of the undertaking the auditors do not approve. They query certain items in the balance-sheet. As to repayment of loans, while the auditors are satisfied that at the present time the annual instalment of loans raised by issue of stock are correctly charged, and will with their accumulations suffice to meet the principal amounts due at the end of the number of years for which the loans were sanctioned, they are not satisfied that the same is the case in regard to the loans from the bank and to the advances by the treasurer through the capital cash account. They do not consider that interest has been fully charged each year against the revenue of the undertaking, and that owing to this omission the balance on the net revenue account is made to appear at a sum of at least £1,200 in excess of the true figure. Dealing with the figure in the accounts for depreciation, the auditors submit a basis for calculation. As they truly point out, the accuracy of the balance-sheet depends on the actual depreciation being provided for in the accounts. They also discuss certain items which have been charged to capital expenditure. To put the accounts of the undertaking upon a really proper basis, the auditors consider that one correction is essential, and a second is very desirable. First, the amount of interest charged since the commencement should be looked into, and to the extent that the undertaking has not been charged with full interest, its so-called reserve fund should be applied to correct the errors that have taken place. Secondly, the figures for a depreciation fund should be submitted to an expert, who should advise the Corporation what alterations, if any, should be made therein, and, if necessary, make a valuation of the machinery and plant. The result of his decision should be thereupon included in the accounts, so that it may be clearly seen what is the true position of the undertaking, and whether it is, in fact, paying its way or otherwise. On the electric lighting account a further sum of £16,384 on capital account was expended during the year, making a total expenditure of £218,446. The total in the loans fund for the extinction of debt now stands at £24,369, and £12,177 has been repaid. The income of the revenue account was £35,282, as against £32,295 The expenditure was £21,203, as against £17,589. Mr. Bone considers this does not compare favourably with the previous working, when the increase of revenue was over 18 per cent., while the expenditure showed a slight decrease. The increase in the expenditure is mainly under the heads of generation of electricity and repairs.

Aberdeen.—The plans of the new subway, the accepted tender for which is mentioned in another column, have been prepared in the burgh surveyor's department under the personal supervision of Mr. Dyack, burgh surveyor, and his assistant, Mr. Conway, both of whom have had practical experience of this work. The *Aberdeen Daily Journal* says: Near the top of Crown-street there will be a spacious distributing chamber, lined with white glazed brick. From this chamber, cables may be taken in any direction required. The subway itself is to be of a horseshoe shape, 6ft. 6in. in height by 4ft. 6in. across, so that it will scarcely be so big as the one from the electricity works up Crown-street. It will be built of concrete, lined with red brick, and protected from damp by means of bitumen sheeting, as in the existing subway. Its total length will be some 700 yards. In the construction of this tunnel several difficulties will have to be contended with, as, for instance, dealing with and diverting sewers, etc., which come in the way, one of them being the main sewer, which will have to be lifted and relaid. On the other hand, the difficulties will be much less formidable than were encountered in laying the Crown-street tunnel, for then part of the new main sewer, which is to have its outfall at Girdleness, had to be constructed at the same time beneath the electric cable subway; and having a comparatively level piece of ground to deal with from Crown-street to Holborn-street, the contractor, Mr. Tawse, should be able to make a very satisfactory job, as he did under more difficult circumstances with the Crown-street subway. Along the route there will be, among several new features, connecting chambers at Bon-Accord-street and Bon-Accord-terrace, provided so that cables may be taken towards Union-street or elsewhere for future extension. Another new feature is that, instead of the subway being entered from the centre of the street, entrances are to be provided from the footpaths so that on having a cover opened there anyone may get into the subway by a short passage. Near the top of Holburn-street there will be another distributing chamber from which cables may be taken either up or down Holburn-street to Albyn-place, etc. This chamber also will be lined with glazed white bricks. Here a ventilating fan, electrically worked, will be erected, so that the tunnel will be kept well ventilated. There will also be plenty of light from the electric lights which will be placed throughout the tunnel in a manner similar to those in the existing subway. The cables will be carried on a cable rack rather different in design from the present one in Crown-street. This rack will be prepared by the Corporation electric department. The subway will hold 52 cables, but will be so arranged that a dozen or more may be added without any difficulty should necessity arise for them. In the subway they will be safe from damp or other damage, while if anything should go wrong, the workmen walking through the subway could give it their attention. The work, which will be commenced almost immediately, will probably be carried on in two or more sections at one time, so that operations may be completed in an expeditious manner.

Barnstaple.—The charge for public lighting is to be 6d. per unit up to the end of the current year. The Council are producing electric current at 2·1d. This does not include interest and sinking fund, but the difference between 2d. and 6d. will be more than ample to provide for it. The Mayor submitted the following address at the last Council meeting: "Gentlemen,—As so many misstatements have been made concerning the financial position of the borough, it is my duty and privilege to place before you and the ratepayers a statement thereon, particularly with regard to the electric lighting undertaking. I find that on April 26, 1901, estimates were prepared by your engineer for lighting what is termed the compulsory area, and such estimates amounted to £21,450, which included contingencies such as engineer's fees, costs of the provisional order, and legal expenses; £21 600 was borrowed. The contracts for the work amounted to £14,657. 7s. 6d.—viz: Bryant and Thorne, for building, £3,789; Babcock and Wilcox, for boilers, £3,012; Newton Electrical Company, for engines and dynamos, £4,235. 6s.; St. Helens Cable Company, for mains, £2,001. 11s. 6d.; Ashmore, Benson, and Co., for accumulators, £1,031. 10s.; Chatteris Engineering Company, for crane £115; Tucker, for laying water-pipes, etc., £448; Johnson and Phillips, in lieu of contract for well, £25—total, £14,657. 7s. 6d. To this there are extras on the various contracts, which I propose dealing with in detail. The first is that on buildings. These extras amounted to £1,574. 16s., and are arrived at thus: increased expenditure on foundations, caused by extra excavation in some parts to a depth of 15ft. at least, £482; substitution of white for red bricks for facing of building, and for increased height of walls, £57. 17s. 9d.; construction of condensing pit, in consequence of the substitution of surface condenser in lieu of ejector condenser provided for, £46. 0s. 5d.; increased strength of roof principals, £53; additional 3ft. on boiler-house, £60; new side walls, owing to dilapidated condition of old walls, £420. 0s. 6d.; sundry work in connection with engineers, £68 4s. 8d.; substitution of brick for stone for walls of boiler-house, £81. 13s. 1d.; felting for roof and improvements in engine-room, £68. 16s.; pumps in boiler-house and other sundries, £237. 3s. 7d. — total, £1,574. 16s. I ought here to say that these extras appear somewhat heavy, but I am informed that they are according to the scheduled prices mentioned in the contract and specifications, and that careful and accurate measurements were made by a competent quantity surveyor acting for the Council, and there can be no doubt full value for money has been received. Boilers, £709. 1s. 4d.; extra for surface condenser in lieu of ejector condenser, £550; donkey pump, £14. 13s.; stanchions under tank, £17. 10s.; extending exhaust piping to end of building to avoid alterations when new engine required, and sundries, £126. 18s. 4d.; engines and dynamos, £214. 8s. 2d.; recording voltmeter, £15. 12s.; motor for economiser, £26. 13s.; meters, £70; extra length of cables and sundries for connecting dynamos to switchboard, £102. 3s. 2d.; mains, £1,295. 8s. 11d.; laying cables each side of High-street, Joy-street, and Cross-street, to avoid repeated interference with wood paving by crossing, £426 4s. 8d.; house services, £269. 19s. 1d.; cable through North Walk, £47. 7s. 7d.; two extra arc lamps and sundry cable work, £551. 17s. 7d.; accumulators, £29. 17s. 3d.; for cable to connect regulating switches on switchboard instead of on wall in battery-room; crane—extra length of rail, £17. 10s. The foregoing extras, it will be observed, could not be foreseen, but as the works proceeded it was considered desirable, for the better management and equipment of the station, that they should be carried out, there being a surplus available. There are other items expended which had nothing whatever to do with the contracts, but which must be placed to the capital of the undertaking. They are: clerk of works, etc., £91. 19s. 9d.; cost of trials of machinery, £40. 3s. 2d; switchboards for meters, £16. 9s.; fuse-box services on mains, £26 4s. 1d.; Board of Trade fees, costs of provisional order, mortgagor and mortgagee's costs on loan, official advertisements, Mr. Adams's and Mr. F. W. Chanter's fees for preliminary reports, first cargo of coal for drying and testing purposes, etc., £597. 19s. 2d.; engineer's fees and expenses, £1,125; instruments for station, £48. 14s. 4d.; service lines, meter fixing, and miscellaneous, £43 7s. 5d.—total, £1,989. 16s. 11d. The total amount, therefore, charge

Digitized by Google

able to capital is £20,488. 6s. 1d.—viz.: contracts, £14,657. 7s. 6d.; extras on buildings, £1,574. 16s.; extras on boilers, £709. 1s. 4d.; extras on engines and dynamos, £214. 8s. 2d.; extras on mains, £1,295. 8s. 11d.; extras on accumulators, £29. 17s. 3d.; extras on cranes, £17. 10s.; extras on miscellaneous items outside contracts, but chargeable to capital, £1,989. 16s. 11d.—total extras, £5,830. 18s. 7d. It will be seen that the total amount of the contracts, extras, and incidentals properly chargeable to capital is below the engineer's estimate, and below the amount you were authorised to borrow. A far better station than was at first intended has been erected. Experts say it is one of the best in England. You have a better building, improved condensing plant, cables laid on both sides of High-street, Joy-street, and Cross-street, and extra public lamps. The Council is accused of frittering away thousands of pounds of the ratepayers' money in this undertaking. Now what is the result? As I have before stated, the original estimates amounted to £21,450. To this should be added the cost of work which was not intended to be executed at the time the estimates were made, but, in consequence of the careful management by the engineer and the Council, whereby favourable contracts were entered into, these extra works have been carried out at a cost of £2.218. 18s. 5d., that being the extra amounts to Babcock and Wilcox, the Newton Electrical Company, and the St. Helens Cable Company, without seeking further borrowing powers. Further, there is the difference between the cost of well and Tucker's contract, amounting to £209. Notwithstanding the two latter amounts being charged to capital, there is a balance of £1,111. 13s. 11d. to the credit of capital account not expended as originally contemplated, so that instead of exceeding the amount borrowed a saving of £3,379. 12s. 4d. has been actually effected on the undertaking, as follows: to amount of estimates, £21,450; add works not contemplated—to Babcock and Wilcox, £709. 1s. 4d.; to Newton Electrical Company, £204. 8s. 2d.; to St. Helens Cable Company, £1,295. 8s. 11d.; difference on well and Tucker's contract, £209—total, £23,867. 18s. 5d. Amount actually expended, £20,488. 6s. 1d.—balance, £3,379. 12s. 4d. Besides all the expenditure for improved building, clerk of works, trials of machinery, instruments at station, first cargo of coal, and other items. I am not overlooking the fact that a considerable sum has been paid for meters and connecting same which should be debited to capital (and this is a daily expenditure in consequence of the application for current), but this will be a source of revenue to the undertaking, and the larger the demand for meters the better for the undertaking. A large sum has also been expended in public lighting not included in the before-mentioned contracts, and this is a matter of account hereafter which will have to be paid by the Council and credited to the electric light account. I have gone into the monthly statements showing units generated, quantity consumed, cost of the production, etc., and believe that at the end of the first year's working the profit will not only be sufficient to pay all the interest on the sum borrowed, but a considerable amount on account of principal. At Lady Day our private consumers numbered 98, and consumed 5,967 units; at Midsummer, 105, and consumed 7,742; at Michaelmas, 124, and consumed 10,182. And there are numerous applications from persons within the compulsory area waiting to be connected, but this cannot be done in consequence of the mains being charged to their utmost capacity. To comply with these applications, new feeders are being laid, and when this work is complete the plant will be sufficient to supply an almost unlimited amount of current throughout the town It is said that the purchase of the Town Mills has been secured for the sole purpose of the electric light undertaking. But this is a misconception; the object was to secure the water rights, not only for electric light purposes, but for the general use throughout the town hereafter, and in justification of this step I would point to the reported evidence of the borough surveyor at the recent Local Government Board enquiry. Further, I am advised and convinced that the Town Mills site was inadequate for the electric light station, and that the Council acted wisely in selecting the Castle-street side, upon which were dilapidated buildings requiring a considerable sum to be expended to make them tenantable. I will now deal with the general finances, and I think I cannot do better than give you the balances at Michaelmas of the Town Council and Urban District Council accounts, for which rates are levied for the past six years, from which you will gather that there has been no extravagance as alleged. At the year ending Michaelmas, 1898, the credit balance was £1,530. 4s. 2d; 1899, £780. 9s. 3d.; 1900, £654. 17s. 10d.; 1901, £934. 19s. 7d.; 1902, £1,322. 15s.; 1903, £1,285. 14s. 1d. In addition to the above credit balance, there is to the credit of the other accounts of borough, such as markets and schools, a sum of about £350. During the past half-year special payments have been made amounting to nearly £200 for the costs of a licensing appeal, presentation to Mr. F. C. Gould, works in markets, and purchase of a horse. My statement, therefore, made in August last, that there would be a balance of about £1,800 was correct, as will be seen by the addition of the three last items. Until the past half-year the annual precepts to the overseers have been the same, and there has not been any increase in the general district rate. During this period £300 had to be provided for elementary education, £150 towards the cost of wiring the Council's premises, and £150 towards the costs of the recent action, and these sums have been paid. It will be remembered that although the borough has been extended and very considerable works of street improvements executed, it has not been found necessary by the Council to increase the rates. The increase has been caused by demands over which the Council have no control, and they are not responsible for the increase of the rates. There is no party majority in this Council, our united aim being—and it has been so since I have been a member—to protect the interests of all the ratepayers, and I can only express my amazement and regret that a member of this Board should associate himself with two others by signing his name to an address which, in my opinion, casts a grave reflection upon every member of this Council." A discussion ensued, and a vote of thanks to the Mayor closed the meeting.

PROVISIONAL PATENTS, 1903.

Oct. 19.

22497. Improved electrical numerical switch. Joseph Makin, Bank-buildings, George-street, Sheffield.

22507. Improvements in and relating to electrically-controlled hoists. John Alexander Steven, 96, Buchanan-street, Glasgow.

22532. Improvements in and connected with electric arc lamps. John Owen Girdlestone and Carl Frederik Grimur Thorkelin, 16, Davies-street, Berkeley-square, London. (Complete specification.)

22551. Improvements in or relating to electric motors and controlling devices for use in the electrical propulsion of vehicles or trains of vehicles. John Smith Raworth, 46, Lincoln's-inn-fields, London.

22556. Improvements in and relating to electrically operating fire-alarms, burglar alarms, and the like. Edwin Hughes, John Charles Jones, and Arthur Graham Mackie, 322, High Holborn, London.

22572. Improved method of and means for working electrical winding engines. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Actien-Gesellschaft, Germany.) (Complete specification.)

22573. Improved safety fuse device for electrical installations. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Actien-Gesellschaft, Germany.) (Complete specification.)

Oct. 20.

22601. Improvements in electrical switches for electric ignition as applied to internal-combustion engines. Fredrick Harold Hall and Constance Hall, Unity Works, Highgate-street, Birmingham.

22602. Improvements in contact breakers for electric ignition of internal-explosive engines. Fredrick Harold Hall and Constance Hall, Unity Works, Highgate-street, Birmingham.

22606. Improvements in apparatus for the generation of electricity primarily designed for the electric lighting of trains. Thomas William Stainer Hutchins, 17, St. Ann's-square, Manchester.

22634. Improvements in or relating to terminals for stranded electrical and other wires. Frederick Henry de Veulle, 9, Exchange-chambers, Birmingham.

22643. Improvements in brush-holders for dynamo-electric machines. Milton Ellsworth Thompson, 52, Chancery-lane, London. (Complete specification.)

22654. An improved clip adapted to be used for suspending electric cables. Thomas Henry Walker, 72, Cannon-street, London.

22658. Improvements in induction electric motors. Franklin Punga, Oswaldestre House, Norfolk-street, Strand, London.

22664. Contact apparatus for electric relay master clocks. Oliver Imray, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens-Schuckert-werke, G. m. b. H., Germany.) (Complete specification.)

22668. Improvements in electrical insulators. James Ernest Spagnoletti, 53, Chancery-lane, London.

22673. An improved current regulator for electric machines. Albert Richard Müller, 6, Lord-street, Liverpool. (Complete specification.)

22674. Improvements in and connected with telephone systems. Paul Hardegen, 6, Lord-street, Liverpool. (Complete specification.)

22680. Improvements in and relating to coherers for wireless telegraphic systems. Louis Dorman, 77, Chancery-lane, London. (Complete specification.)

22696. Electrical vibratory motor. Charles Sumner Whitney, Palace-chambers, Westminster, London. (Complete specification.)

22698. Improvements in telephone transmitters. Jerome Prince, 18, Buckingham-street, Strand, London. (Complete specification.)

Oct. 21.

22742. Improvements in dynamo-electric machines and motors. Henry Francis Joel, 74, Windsor-road, Forest Gate, London.

22758. An improved voltage-regulated electric lighting system for railway and other carriages. James Dalziel, 104, Savernake-road, Hampstead, London.

22778. Improvements in apparatus for commuting electric currents passing through combined arc and incandescent lamp circuits. Campbell Smart, 65, Chancery-lane, London.

22785. Improvement in storage battery plates. Edward Wanton Smith, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London (Date applied for under Patents Act, 1901, Sept. 10, 1903, being date of application in United States.) (Complete specification.)

Oct. 22.

22804. Improvements in means for controlling electric circuits. Henry Leitner and Richard Norman Lucas Lynton, Dartnell Park, Byfleet.

Digitized by Google

22805. Improvements in regulators for electric circuits. Henry Leitner and Richard Norman Lucas Lynton, Dartnell Park, Byfleet.

22820. Improvements in electrical fuse-boxes or fittings. Charles Douglas Burnet, 15, Water-street, Liverpool.

22840. Improvements in lampholders for electric lighting. Albert Moore Barnes, 12, Warbeck-road, Shepherd's Bush, London.

22858. Improvements in or relating to electrically-synchronised clocks and the like. Frederick Augustus Chandler and Bahne Bonniksen, 18, Hertford-street, Coventry.

22904. Improvements in controlling electric boosters. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

22905. Improvements in electric rheostats. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

22906. Improvements in machines for covering electric conductors or the like with insulating material. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

22907. Improvements in and relating to controlling devices for electrically-propelled vehicles. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

22908. Improvements in electric switches or circuit breakers. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

22909. Improvements in dynamo-electric machines. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

22910. Improvements in bearings for electric meters and other measuring instruments. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

22911. Improvements in alternating-current motors. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

22912. Improvements in dynamo-electric machines. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

22913. Improvements in alternating-current motors and methods of controlling the same. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

22914. Improvements in emergency brakes for railway and tramway vehicles or trains. Edgar Alfred Carolan, 83, Cannon-street, London. (The General Electric Company, United States.)

Oct. 23.

22955. An electric wire terminal grip. Walter Henry Copus, 22, Clapham-road, London.

22981. Improvements in welding by electricity and apparatus therefor. Johann Harmatta, 4, South-street, Finsbury, London.

22996. Improvements in connection with incandescent electric lampholders with shade carriers. William Robert Newbold Gard, 18, Southampton-buildings, Chancery-lane, London.

Oct. 24.

23021. Improvements in electrical switches, cut-outs, and the like. Vernon Hope, 55, Market-street, Manchester.

23043. Improvements connected with magnetic compasses. William David White, 100, Wellington-street, Glasgow. (Complete specification.)

23057. Improvements in single-phase alternating-current motors. Benjamin Garver Lamme, Westinghouse-building, Norfolk-street, Strand, London. (Date applied for under Patents Act, 1901, Oct. 31, 1902, being date of application in United States.) (Complete specification.)

23086. Improvements in or relating to the regulation of dynamo-electric generators. Martin Hamilton Kilgour, 46, Lincoln's-inn-fields, London.

COMPLETE SPECIFICATIONS ACCEPTED.

To be published Nov. 12, 1903.

1902.

22712. Alternate-current motors. Fynn.

23344. Electrical billiard marker and indicator. Malam.

23694. Automatic shunting switch for protecting the shunt coils and carbon-holders of arc lamps. Eckstein and Angold.

24102. Surface-contact structures for electric railways and tramways. Carolan. (General Electric Company.)

24531. Appliance for use in testing for electric currents. Oliver.

25965. Systems of electrical distribution. Carolan. (General Electric Company.)

26035. Photometers. Carolan. (General Electric Company.)

26037. Electric railways on surface-contact or like systems. Carolan. (General Electric Company.)

26379. Magnetic clutches. Carolan. (General Electric Company.)

26385. Electric arc lamps. Carolan. (General Electric Company.)

26673. Devices for the measurement of electrical energy. Lake. (Arno.)

26706. Electrical resistances. Bray, Markham, Reiss, and Bray, Markham, and Reiss, Limited.

26717. Electric locomotives. Swinburne.

27752. Arc-extinguishing devices. Carolan. (General Electric Company.)

27754. Apparatus for forming coils for dynamo-electric machines. Carolan. (General Electric Company.)

27759. Control systems for searchlight projectors. Carolan. (General Electric Company.)

27762. Electric condensers. Carolan. (General Electric Company.)

27766. Potential indicators for high-voltage electric circuits. Carolan. (General Electric Company.)

1903.

346. Conduits and troughs for electric conductors. Devonshire.

13373. Electromagnetic face-plate or work-holder for machine tools. Margowski and Gorick.

15048. Electric signalling apparatus for railway trains. Bonemeyer.

16698. Means for actuating valves, cocks, electric switches, and similar apparatus at predetermined times. Boot.

16878. Printing telegraph instruments. Stiner.

19886. Electromotive force regulators. Lamme. (Date applied for under International Convention, Oct. 2, 1902.)

NOTES.

Electro - Harmonic Society.—The society's next concert is a "ladies' night," and will be held in the large King's Hall at the Holborn Restaurant on Friday evening, the 13th inst. Mr. Robert Kaye Gray, president of the Institution of Electrical Engineers, will be in the chair.

Royal Institution.—A general monthly meeting of the members of this institution was held on Monday afternoon, Sir James Crichton-Browne, treasurer and vice-president, in the chair. Mr. A. K. Huntingdon, Sir Oliver Lodge, LL.D., D.Sc., F.R.S., Mr. J. Francis Mason, and Mr. Edward H. Woods were elected members.

Tramways and Light Railways Association.—The council of the above association announce that they will annually grant a prize of a bronze medal and books to the best essay on improved means of communication. For this year's prize papers must be sent to the secretary, Mr. Ernest Benedict, on or before the 30th inst. Essays must not exceed 4,000 words in length.

Institution of Electrical Engineers.—We would remind our readers that the inaugural address of Mr. Robert Kaye Gray, as president of the above Institution, will be delivered at the opening meeting of the session to be held at the Institution of Civil Engineers at 8 p.m. on Thursday, Nov. 12, and that the annual dinner will be held at the Hotel Cecil on Wednesday, Dec. 10.

Electricity in Green Park.—An important stage in the daily transformation scene progressing round Buckingham Palace in connection with the laying-out of the ground plans for the National Memorial of Queen Victoria was reached on Saturday, when a portion of the new roadways from the Mall and the grounds contiguous to them were lighted by electricity for the first time. After a successful test, permanent wrought-iron standards will take the place of temporary poles, and powerful arc lamps will be gradually extended to light every part of the large site.

Physical Society.—At the end of last session the council of the above society decided to hold meetings alternately in the afternoons and evenings, and to change the place of meeting from the Chemical Society to the Royal College of Science, where the facilities for experimental demonstration are very complete. The first evening meeting will be held on Friday, the 13th inst., at 8 p.m., when Sir Oliver Lodge will describe and illustrate by experiments (1) "Means for Electrifying the Atmosphere on a Large Scale," and (2) "An Arrangement for Driving Mercury Pumps."

Glasgow Municipal Telephones.—We have received from the telephone department of the Glasgow Corporation an interesting little booklet on the progress of the telephone undertaking in that city. It shows that over 10,100 instruments are now working mostly on direct lines to the exchange, and in other respects a very healthy state of affairs is presented. The numerous testimonials which the department is able to print at the end of the booklet indicate how highly the municipal service is appreciated by the citizens. At the present time the traffic through the various switch-rooms is at the rate of 32 million messages per annum.

Lectures on Rays.—Prof. Arthur Schuster is delivering a series of lectures on "Rays and Radioactivity" at the Manchester University. The second of the course delivered last week dealt with the different kinds of radiation observed in a vacuum tube. Cathode rays, Röntgen rays, and radium rays were described successively, and Prof. Schuster concluded by speaking of the use of light rays in the cure of lupus and other skin diseases. Several photographs were thrown on the screen showing the treatment of patients by this method in the Manchester Skin Hospital. The course promises to be very popular, the first two lectures having attracted large audiences.

Technical Education in the Transvaal.—We are glad to see that a determined effort is to be made to organise technical education in the two new South African Colonies. Prof. H. S Hele-Shaw, of Liverpool University, has been entrusted with this responsible duty, his appointment having been announced through the Colonial Office. The appointment is not a permanent one, and Prof. Hele-Shaw has been granted leave of absence by the Liverpool University Council until September next year. In his mission the professor will take into view not only the immediate organisation of technical education, but the future university scheme of the Transvaal and Orange River Colonies.

Rumoured Electrical Combine.—Rumour is again busy as to a proposed American-Continental electrical combine. This time the names of the following companies are coupled together: the French Thomson-Houston Company, the Mediterranean Thomson-Houston Company, the General Electric Company of America, and several important German electric construction companies. Rumour also has it that the French Thomson-Houston Company is about to obtain a large share of orders in connection with the electrification of the London Metropolitan Railway, but this is officially denied in Paris. We give the above information for what it is worth, but we may add it has obtained considerable credulity on the Paris Bourse. The present close relations between the above companies gives support to this rumour.

Underground Cables.—So satisfactory has been the progress made in the work of extending the underground telegraphic system from Birmingham to the North, that it is hoped to complete the line as far as Carlisle in about two months' time. The next step will be for Parliament to vote the money necessary for extending the service to Edinburgh and Glasgow. A short underground cable has been laid in the Beattock incline, in a very exposed part of the south of Scotland, and a breakdown of the overhead wires would not now, it is thought, interrupt telegraphic communication between London and the two principal Scottish cities. As regards the North of England, the Department have commenced to lay an underground cable from Manchester to Leeds, Warrington, Manchester, and Liverpool being already connected in this manner.

Future of Wireless Telegraphy.—Prof. Silvanus Thompson lectured on this subject at the Hampstead Conservatoire on Tuesday evening. After tracing the progress of the art from the earliest experiments to the present time, he gave it as his opinion that within the next few years we should probably be able to hold wireless communication with the Antipodes. He advocated the adoption of an international agreement such as was recommended by the Berlin Conference for the benefit of ships of all nations, and instanced a recent occurrence when a ship in distress called repeatedly for help, and the nearest wireless telegraph receiving station either could not or would not receive the messages. Future arrangements should be made in a perfectly frank and scientific manner, and not by the haphazard methods of the financier. In his opinion, the financier had been the bane of wireless telegraphy.

Manchester Local Section.—This section of the Institution of Electrical Engineers opens its winter session

Digitized by Google

on Nov. 17, when Mr. E. W. Cowan, chairman, will deliver his address, followed by a short demonstration of the properties of radium by Dr. Schuster. Subsequent meetings are as follows: Dec. 15, "Polyphase Electric Traction," by Mr. A. C. Eborall; Jan. 19, "Coal Consumption in Central Stations," by Mr A. S. Giles; Feb. 2, "Steam Turbines," by Mr. W. Chilton; Feb. 16, "Manchester Tramways Equipment," by Mr. J. M. McElroy; Feb. 26, annual dinner; March 1, "The Mersey Railway," by Mr. H. L. Kirker; March 24, at Liverpool, joint meeting with the Liverpool Engineering Society, "Notes on the Design of Electrical Machinery," by Mr. J. L. Hunt; March 29, "Safety Devices for Electric Traction," by Mr. T. W. Sheffield; and April 12, general meeting.

Electrical Cardcutting.—The use of automatic cardcutting machines in connection with textile patterns has been much sought after in recent years, and there have been a large number of attempts to utilise electricity in the process. The ordinary process of cutting these cards in the piano machines, with foot power for driving the punches, takes a considerable time, and is none too accurate unless highly skilled operators are employed. We understand that a Bradford syndicate have been developing a machine designed by an Austrian engineer named Zerkowitz, and that they have succeeded in turning out an electrical cardcutting machine on the following lines: The machine works on the principle which has been often tried before, but which has previously failed, due to troubles of practical nature. The design is painted on a metal surface with some non-conducting material, and then a number of pins resting on the plate determine which of the punches shall operate. The actual details of the machine are not before us, but we understand that it enables the design to be cut at the same time as the groundwork, and that the speed is at least 10 times greater than by previous methods of cardcutting.

New Zealand Cables.—There is trouble brewing between the Eastern Extension Telegraph Company and the Australian Commonwealth with reference to the telegraph cables which connect New Zealand and Australia. The company, it seems, has gone so far as to threaten to lift its two cables unless better support is accorded by the mercantile community. From what we hear, however, there is not much likelihood of the threat being put into executon. As a matter of fact, the Colony is only waiting a chance to lay State-owned cables between New Zealand and the mainland, and if the company does as it says, there could be no better opportunity. At all events, nobody would be in the least hurt except the company itself. This, however, the company will doubtless realise, and if it really wants to get out of its obligations so far as telegraphic communication between New Zealand and Australia is concerned, the Government of New Zealand has declared itself ready to negotiate for the purchase of the company's cables, provided the price be equitable. A State-owned cable direct between the Commonwealth and New Zealand would, with the present portion of the Pacific cable now connecting the islands with Queensland, give the Colony a splendid service between the two countries.

Municipal Loans.—Money is dear, and the time is unpropitious for the issue of big loans. This is beginning to be recognised by the corporations generally throughout the country, and in many cases large and costly works are being held over until the money market should assume more favourable an aspect. Also just now there is found to be considerable difficulty in obtaining the underwriting for municipal loans, and corporations have been forced to cast about for some other means of raising small sums of money than in the ordinary money market. The obvious course which commends itself in these circumstances is to appeal direct to the public for loans of moderate amount, and in many instances at the present time this action is being had recourse to. Thus, the Glasgow Corporation is asking for loans, by means of advertisements, on mortgage at 3¼ per cent., and Bolton, Middlesbrough, Sunderland, and Leicester are in the same line. For temporary accommodation the offer made is usually at the rate of 3 per cent. This will give the small investor a chance to obtain a safe and profitable outlet for his surplus funds, and, what is more, the corporations will be able to get money at a cheaper rate than if they adopted the usual course of raising loans with the large financial houses, which are bound by the market price prevailing at the time.

International Electrical Congress, 1904.—Some further information is available concerning the international electrical congress which it is proposed to hold during the second week of September next year at St. Louis. In addition to our own Institution of Electrical Engineers, which has already decided to attend the congress, the Italian Institute of Electrical Engineers, the Verband Deutscher Elektrotechniker, as well as other German and French scientific societies will be officially and largely represented at the meeting. According to the tentative programme adopted in regard to the European delegates, they will arrive in New York from Sept. 3 to 15, and, under the direction of a reception committee of the American Institute of Electrical Engineers, will visit the large electrical power stations and factories in the city and its environs. On Sept. 7 the delegates will depart for St. Louis, stopping at Washington *en route*, where the new laboratories of the National Bureau of Standards will be dedicated. Arriving in St. Louis on the 10th, the delegates will have plenty of leisure to visit the exposition before the congress opens on the 12th. A committee has been appointed to make the necessary preparations for the congress, with Prof. Elihu Thomson as president, and the advisory Board includes such men as Mr. B. J. Arnold (the incoming president of the American Institute), Mr. B. A. Behrend, Mr. W. J. Hammer, and Prof. C. P. Steinmetz.

Mechanical Road Vehicles.—The *Journal* of the Society of Arts for Oct. 30 prints the third of Mr. Mr. W. Worby Beaumont's Cantor lectures delivered before the society on the subject of mechanical road vehicles. The lecture in question embraces the subject of electrical cars, as to which, however, there is very little variety in either the principles of design or in the practice as to batteries, motors, or general arrangements of the machinery. For those who can afford to pay for an electrical vehicle and its maintenance, a thoroughly practical and trustworthy vehicle with any form of body can be had. The construction of lighter vehicles, of motors better suited to the requirements, with some improvements not only in the batteries in themselves, but more particularly in their usage, have made it possible to-day to produce electrically-propelled vehicles much more economical and satisfactory than were some of the older forms of electric cars. At no very distant date their radius of travel will, no doubt, be increased by the extension in the numbers of vehicles in use, by the standardisation of the cells and batteries and methods of connection, by universal methods of exchange of cells and batteries, and by extended knowledge and care in the use and charging of the cells. This must, however, be of gradual growth, and for a field more limited than that of vehicles less heavily weighted, of longer range, and cheaper propelling power. The storage battery may be slightly decreased in weight, but any great

Digitized by Google

decrease must wait for the discovery of other than present known materials or combination of materials. Great promises, says Mr. Beaumont, frequently come across the Atlantic, sent by enthusiastic newspaper correspondents. There is some little ground for these claims, but not much.

Electrical Pumping Machinery.—At the opening meeting last week of the Birmingham Municipal Technical School a paper on pumping machinery was read by Mr. Edward C. R. Marks. In the course of his remarks Mr. Marks urged that for electrically-driven pumps gearing should be dispensed with as far as possible, and referred to the efforts of pump-makers and electric motor manufacturers in this direction. Whilst on the one hand electrical engineers had directed themselves, with a great measure of success, to the reduction of the speed of electric motors to adapt them for pump driving, hydraulic engineers were now making pumps known as "express pumps," in which the piston or plunger speed was much increased, as compared with ordinary pump practice, to permit of direct coupling to an electric motor. Hitherto a pump piston speed much above 200ft. per minute had been considered impracticable, but with Riedler and other type water-valves in which a mechanical operation or control was adopted, pumping engines of large size were now working with piston speeds exceeding 600ft. per minute. In the adoption of such high plunger or piston speeds for large steam pumping engines, he thought it was open to question whether the small economy in steam consumption attained might not be purchased too dearly.

Street-Lighting at Westminster.—Mr. J. W. Bradley, city engineer of Westminster, has issued another of his valuable quarterly reports comparing, from an economical point of view, the gas and electric lamps used for street-lighting in Westminster. While the Sugg high-pressure gas burner takes the lowest place in cost per candle-power per annum for this quarter, the average of the five quarters still shows it to be considerably behind the arc lamp. The average figures are gas 10·3d., as against 8·7d. for the arc lamps. The following figures, representing the total cost per candle-power per hour in every case, speak for themselves: for the electric arcs supplied by the Charing Cross and Strand Company the cost is ·0033d., those supplied by the St. James's and Pall Mall Company ·0036d., and those supplied by the Westminster Supply Corporation ·00238d. In the case of the gas lighting, the refuge lanterns fitted with four incandescent mantles cost ·0072d.; Sugg's high-pressure lamps with incandescent mantles, ·00232d.; ordinary single burners with incandescent mantle, ·00435d.; ordinary flat flame, with two burners, ·0062d.; and ordinary flat flame, with three burners, ·0117d. Thus it will be seen that while the lowest total cost per candle-power per hour of the electric arcs is ·00238d., or 9·4d. per candle-power per annum, the lowest figures for gas lighting are ·00232d. or 9·12d. respectively. Similarly, while the highest total cost per candle-power hour of the electric arcs is given at ·0036d. or 13·95d. per candle-power per annum, the highest cost of the gas lamps was ·0117d. or 46·3d. respectively. The value of the above figures is enhanced by the fact that they extend over a considerable period of time, and include all charges on capital account.

Depth of Electric Light Mains.—Electric lighting companies, and, incidentally, cable contractors, will welcome a decision which has just been given by the Board of Trade in a dispute as to the depth at which electric light mains should be laid under the public highways. The case in question occurred in the district supplied by the Leatherhead and District Electricity Company. This company wanted to extend its mains into the parish of Ashstead, which comes within the Epsom Rural District Council's area, and submitted plans showing that it was proposed to lay the mains at a depth of 18in. under pathways and 2ft. under the roadways. The mains in question are Glover's three-core, paper-insulated, lead-covered, and laid solid in Howard asphalt conduits. The Council refused their sanction to the work unless the mains were put at a depth of 3ft. throughout. To this the company objected, and on the advice of their consulting engineers, Messrs. Handcock and Dykes, appealed to the Board of Trade. The appeal was heard on the 22nd ult., the Council being represented by counsel; and Messrs. Handcock and Dykes and Mr. L. Atkinson, the London manager of Messrs. W. T. Glover and Co., the contractors for the work, gave evidence on behalf of the company. The Council urged, first, that in their opinion all electric lighting mains, as well as gas and water mains, should be laid at a continuous depth of 3ft., on account of the danger of damage, and, secondly, because, if the mains were laid at 18in. under the pathway, and the roads were subsequently widened, the Council might be at the expense of lowering these mains if the alterations should bring them too close to the surface. These objections, however, have been overruled by the Board of Trade, which gave its decision in favour of the company on all points.

Bending of Magnetometer Deflection Bars.—A paper on this subject was read by Dr. Chree before the Physical Society of London at the first meeting of the new session on the 23rd ult. A theoretical paper contributed to the society by the present author in May, 1901, proved, amongst other results, that the bending of the deflection bar of an ordinary magnetometer, under the combined weight of the bar and its load, must increase the distance between the deflecting and deflected magnets, during a determination of horizontal force, to an extent which is not negligible. This conclusion has been borne out by direct observations made at the National Physical Laboratory on a number of magnetometer bars, including specimens from the leading makers. The mean results thus obtained are recorded in the present paper. The great majority of the data were derived from direct observations made with a pair of microscopes. But a method is described whereby the necessary information can be deduced without the aid of microscopes from the magnetometer's own readings. The magnetometer is set up exactly as in an ordinary deflection experiment, with the deflecting magnet on its carriage at any convenient position on the deflection bar, and equal weights are hung up symmetrically one on each arm. The consequent increase in distance between the two magnets diminishes slightly the deflecting force on the deflected magnet, and a slight change of reading is observed in the magnetometer telescope. The weights are put off and on several times, and the mean change of reading determined. As a check it is well to observe at two distances. From the change of reading it is possible to determine the increase in distance between the two magnets. In many magnetometers the increase in distance due to the bending is roughly proportional to the distance itself. In the case of bars by the Cambridge Instrument Company, the bending increased the distance by almost exactly 1 part in 10,000 at all distances. It is hoped that the method employed will prove useful to magnetic observers who have not ready access to a physical laboratory.

Economy of Electric Traction.—Most of our readers will be aware that some 12 months ago steam traction on the Manhattan Elevated Railroad system in

Digitized by Google

New York City was superseded by electric propulsion. The system has now been worked electrically long enough to afford an excellent opportunity to test the new against the old; in fact, too much stress cannot be laid upon the significance of the results shown in the first months of the electrical operation of this railway, in which the conditions, such as track, rolling-stock, character of traffic, etc., remain precisely the same, year in year out. For the sake of comparison, we take a period of three months in two successive years—viz., the quarter ending June, 1902, and the same quarter in 1903. During the 1902 quarter the gross earnings under steam operation amounted to £571,450. In the same quarter in 1903 the gross earnings under electrical operation were £654,357—an increase of £82,907. The expenses for the quarter in 1902 were £280,221; for the corresponding quarter in 1903 they fell to £260,418—a decrease of £19,803. The net earnings, therefore, showed for the quarter an increase due to the introduction of electrical traction of £102,710. And we must remember that both the company and the public have reaped the benefit, for while the former has increased its profits the public has been given a better, quicker, and more frequent service of trains. Whereas the old steam-engines exerted a maximum draw-bar pull of 7,000lb, with electric traction the power has been raised to the equivalent of a 20,000lb draw-bar pull, or the equivalent of about three of the steam locomotives. This has resulted in an acceleration of speed of from 20 to 30 per cent The immediate effect of increasing the capacity of the road, as stated above, has been an all-round improvement in the service, from which the public especially benefits. To sum up, we find that the change from steam to electricity has resulted in reducing the operating expenses at a rate of about £80,000 per annum, and increasing the earnings at the rate of over £400,000 per annum. Electrical engineers may be warmly congratulated on having accomplished this feat, with the added convenience to the public of higher speed and more frequent and more comfortable service.

New Books.—"Notes on Electric Railway Economics and Preliminary Engineering," by W. C. Gotshall (McGraw Publishing Company, New York). This book is based upon a series of lectures delivered by the author at Lehigh University last spring, the subject of which dealt with the economics of the preliminary and other determinations, and of the construction and operating of high-speed and heavy traction interurban electric railroads. — "Tube, Train, Tram, and Car; or Up-to-Date Locomotion," by Arthur H. Bevan. (Geo. Routledge and Sons, Limited, London, 6s.) This work is very amply illustrated, and contains an introduction by Mr. Llewellyn Preece, M.I.E E. The subject is treated in a popular vein, the object being to present to the layman information about tube, train, tram, and motorcar, avoiding as much as possible technical and scientific detail. From this point of view the book contains much that is of interest at the present time, and its value is greatly enhanced by reference to and descriptions of special cases, such as the London United Tramways, and the Fischer "combination" omnibus, which Londoners hope to see running in the streets of the Metropolis before long.—"Elementary Telegraphy and Telephony," by Arthur Crotch. (E. and F. N. Spon, Limited, London. 4s. 6d.) This is one of the Finsbury Technical Manual Series, edited by Prof. Silvanus P. Thompson. The book is evidently intended especially for the elementary student, as its scope is that of the syllabus of the ordinary grade examination of the City and Guilds Institute. The volume is profusely illustrated.—"Theorie und Berechnung Electrischer" [illegible] Zeitungen von Dr. Ing. H. Gallusoer, engineer of Brown, Boveri, and Co., and Dr. Ing. U. Hausmann, engineer at the Allgemeine Electricitäts-Gesellschaft. Dedicated to their technical instructor, Prof. E. Arnold, director of the electrotechnical branch at the Grand Ducal Technical College, Karlsruhe. (Julius Springer, Berlin. 5s.)—"Liquid Fuel and Its Combustion," by W. H. Booth. (Archibald Constable and Co., Limited, Westminster. 24s.) "Proceedings of the Chemical and Metallurgical Society of South Africa." (R. W. Hunter, Edinburgh. 21s.) This volume records the proceedings and transactions of the society from February, 1897, to September, 1899. Its publication has been delayed through the late war, during which period the various papers could not be revised by their respective authors. The third volume—May, 1902, to June, 1903—is now in preparation.

Magnetism of Basalt.—A paper, entitled "On the Magnetism of Basalt and the Magnetic Behaviour of Basaltic Bars when Heated in Air," was contributed by Dr. G. E. Allan to the proceedings at the meeting of the Physical Society of London on the 23rd ult. In the experiments carried out by the author, bars cut from basalt obtained from Rowley Regis and from Linz, Germany, were tested by means of a magnetometric method to determine their magnetic properties at temperatures from 15deg. to 800deg. C. Hysteresis curves are given in the paper, and the temperature permeability curves show that whilst the English basalt has, in general, a maximum permeability near 500deg. C. followed by a minimum about 550deg. C, the temperature of maximum permeability in the case of the German basalt lay in the neighbourhood of 50deg. C., there being a subsequent gradual loss of strength with rise of temperature. Sections of heated and unheated rocks are also given, showing evidence of chemical change in some of the rock constituents, and a table of values of susceptibility of the specimens is appended. Prof. W. F. Barrett made an interesting written communication on the paper, in which he stated that several years ago he examined the magnetic properties of various specimens of columnar basalt which had been taken from the Giant's Causeway in co. Antrim, and a note on the result of this investigation was published in the *Proceedings* of the Royal Dublin Society for December, 1889. Each block was found permanently magnetised with a strongly marked north and south pole, the magnetic axis running diagonally through the block, and inclined to the horizon approximately at the angle of dip. As the blocks formed part of vertical columns in the causeway, their magnetisation was undoubtedly due to the earth's magnetic field, the concave end of each block—for the ends are not plane, but slightly concave or convex—was (in all the blocks examined) found to be a north-seeking pole, and must therefore have been downwards when *in situ* at the causeway. The weight of the blocks varied from 24 kg. to 37 kg., and the specific gravity of a fragment of one of them was found to be 2·86. With such large irregular and feebly magnetised masses only a very approximate estimate of the magnetic moment was possible by the ordinary method. This was, however, attempted, the blocks being placed on a turn-table with their centres 60cm. distant from the reflecting magnetometer. As might be expected, the magnet moment per gramme was found to be very small, and almost alike in each case. The volume of the blocks being known, their permanent intensity of magnetisation was found to be less than that estimated by Everett for the earth, regarded as a uniformly magnetised body—viz., 0·079. Nothing could be inferred from this, as the blocks had been removed a long time from the causeway, and had been lying about in different magnetic positions to that which they originally

Digitized by Google

occupied. The long retentivity of the direction of their original magnetisation, in spite of rough usage, was, however, somewhat remarkable.

Novel Electrolyte for the Wehnelt Interrupter. We are indebted for the following to a note recently read by Mr. D. E. Hauser before the Spanish Physical and Chemical Society: The use of a sulphuric solution in connection with the Wehnelt interrupter, as so far employed, presents, as is known, two essential drawbacks—viz., first, the necessity of a relatively high voltage as required for its operation, and, second, a comparatively high current traversing the primary of the Ruhmkorff coil, according to the great value of the voltage. The first difficulty, which only concerns small coils, has partly been overcome by Mr. Carpentier, by augmenting the conductivity of the electrolyte, raising the temperature of the latter in virtue of a rather complicated arrangement. As regards the second drawback, it has so far been obviated by increasing the resistance of the interrupter, diminishing the surface of the platinum point, so as to have the latter reach an incandescent state at a much lower expense in current. Another process for diminishing this increase in inefficient current consists in using an electrolyte which under otherwise equal conditions gives rise to an increase in the number of interruptions of the current traversing the primary of the coil, and according to the great self-induction of the latter, to an increase in the inductive resistance, this increase resulting in the intensity of the current in the primary being diminished without absorption of energy. The electrolyte best fulfilling this condition is a half saturated solution of magnesium sulphate, slightly acidulated with sulphuric acid. This electrolyte, though exhibiting a considerable conductivity, is not corrosive, and allows of starting the operation at a much lower voltage, although it works perfectly well as far as 118 volts, the author having discontinued his work with this limit. In the tables recorded by the author some experimental results are given, beginning with the sulphuric solution of the specific weight of 1,195, and adding afterwards to the latter successively increasing amounts of magnesium sulphate or potassium alum. In order to separate the effects due to the sulphuric acid from those caused by the salts, the author employed in a second series of experiments, first a more concentrated solution of sulphuric acid without salts, and afterwards a sulphuric solution more diluted and containing increasing amounts of salts. As a result of these experiments, a considerable decrease in the intensity of the current necessary to excite the interrupter has been found. Whereas, in fact, with a solution of sulphuric acid of the specific weight 1,195, the interrupter would begin working for 65 volts and ·26 amperes, only with considerable oscillations in the indications of the measuring instruments, and with sulphuric acid of the specific weight of 1,305, at a voltage of 20, and with 15 amperes, the author has succeeded, by using a solution of sulphuric acid of the specific weight of 1,050, containing 20 per cent. of magnesium sulphate, in starting the interrupter at 20 volts with a consumption of only five amperes; 20·5 amperes have been reached only at a point corresponding with 118 volts, whereas with the sulphuric solution more than 25 amperes were necessary under equal conditions, and with a number of interruptions much lower than with the magnesium solution. The above voltages indicate the number of volts absorbed while the primary and the interrupter were connected in series. The influence of potassium alum is very singular, the number of interruptions being very much increased even for lower voltages. The author further made some experiments with electrolytes containing sodium bichromate, the results being much inferior to those obtained with the above solution besides of the drawback of a very considerable corrosion. A current of 20 amperes was the maximum limit which the arrangement of these experiments would allow.

The Magnetic Storm.—On Saturday last the telegraph systems both in Europe and America were seriously interfered with by earth currents which in many cases rendered telegraphic communication impossible. Thanks to the care shown by our Post Office engineers, the confusion and interruption to business in this country were less than on the Continent. The magnetic storm which was apparently responsible for these violent earth currents was carefully noted in the various observatories, and the following facts taken from the *Daily Telegraph* report are of great interest. Last Wednesday, Oct. 28, it was announced in our contemporary's columns that a sunspot had appeared on the edge of the sun at the beginning of the week. On Saturday last this spot was "crossing the central meridian"—in other words, the sun, by making a quarter of a rotation on its axis during the week, had brought the spot nearly to the centre of the disc, so that it was, so to speak, immediately opposite the earth, and, as was indicated in the note referred to, it is when a large spot is in that position that terrestrial magnetic disturbances are to be expected. On Saturday morning, about six o'clock, the recording needles at Greenwich began to move. "True as the needle to the pole" is sweetly poetic, but departs somewhat from the hard facts of Nature, for the delicately-poised magnet which at Greenwich registers the "declination," or divergence from the direction of the North Pole in a horizontal plane, lies at present about 16deg. west of north, and is slowly changing its position. Moreover, under normal conditions, each day it vibrates gently through an arc of seven or eight minutes' amplitude. On Saturday this arc was increased nearly twentyfold, and the declination magnet from one o'clock in the afternoon until about an hour before midnight oscillated violently through an arc of 2deg. and more. Then the storm abated, and the magnets resumed their usual calm by nine o'clock on Sunday morning. The other registering instruments were equally agitated. There are two wires about three miles in length laid down in the earth for the purpose of recording at the Royal Observatory the occasional spontaneous electric currents which pass through them. On Saturday afternoon these records showed disturbances as violent as those of the declination magnet above described, which is exactly analogous to the experience of the telegraphists who found their instruments useless. This is the greatest storm of the kind which has occurred for 21 years; for the previous worst happened on Nov. 17, 1882. The attempt to establish a relation between sun spots and weather always meets with the rebuff that weather is local, and varies at different parts of the earth; but this is not the case with magnetism. These storms invariably begin sharply; there is no gradual increase of vibration or of current, no warning, but suddenly the earth current leaps, as it were, through the wires, and the needles swing. Mr. William Ellis, F.R.S., who has made this subject peculiarly his own, in a paper read before the Royal Society in 1892 showed that on 17 occasions, and he might have added many more, at eight observatories in widely different parts of the world, this sudden beginning happened practically simultaneously. There were small variations in some cases for a few minutes, but the author was not prepared to say that these small differences were not due to imperfections of the records; at any rate, the fact that the whole of the earth is disturbed magnetically at the same moment was sufficiently proved.

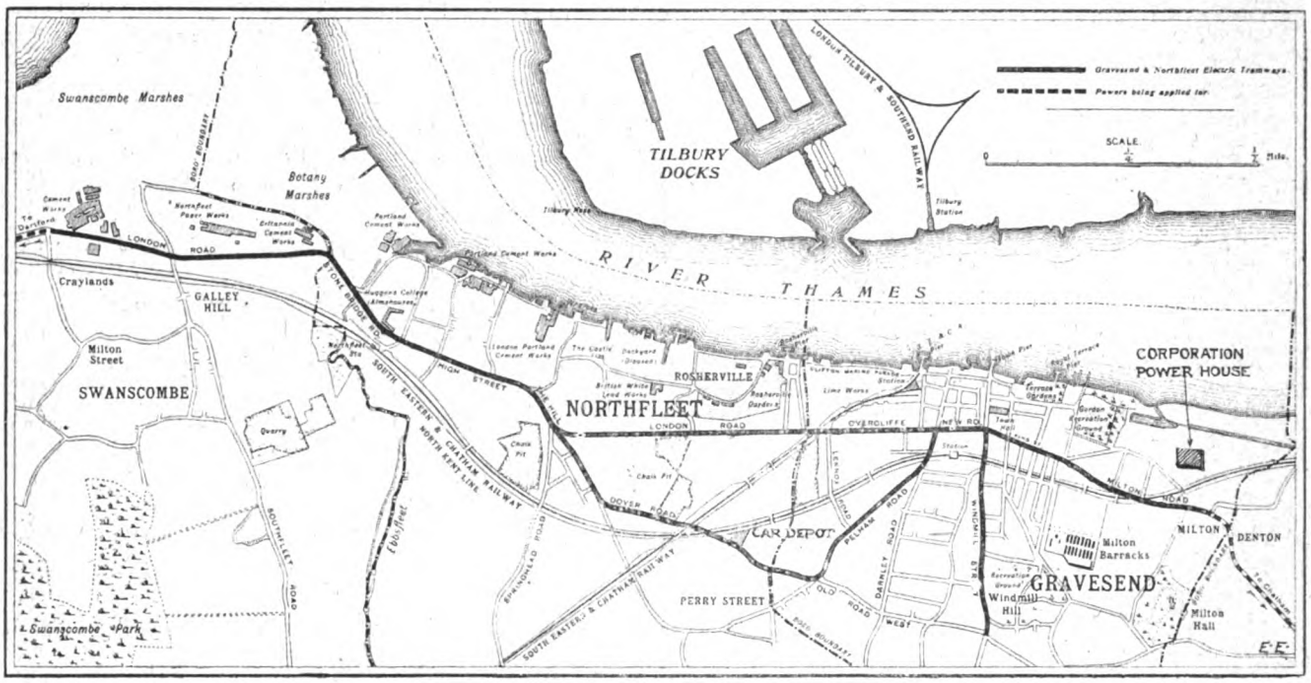
GRAVESEND BOROUGH ELECTRICITY SUPPLY.

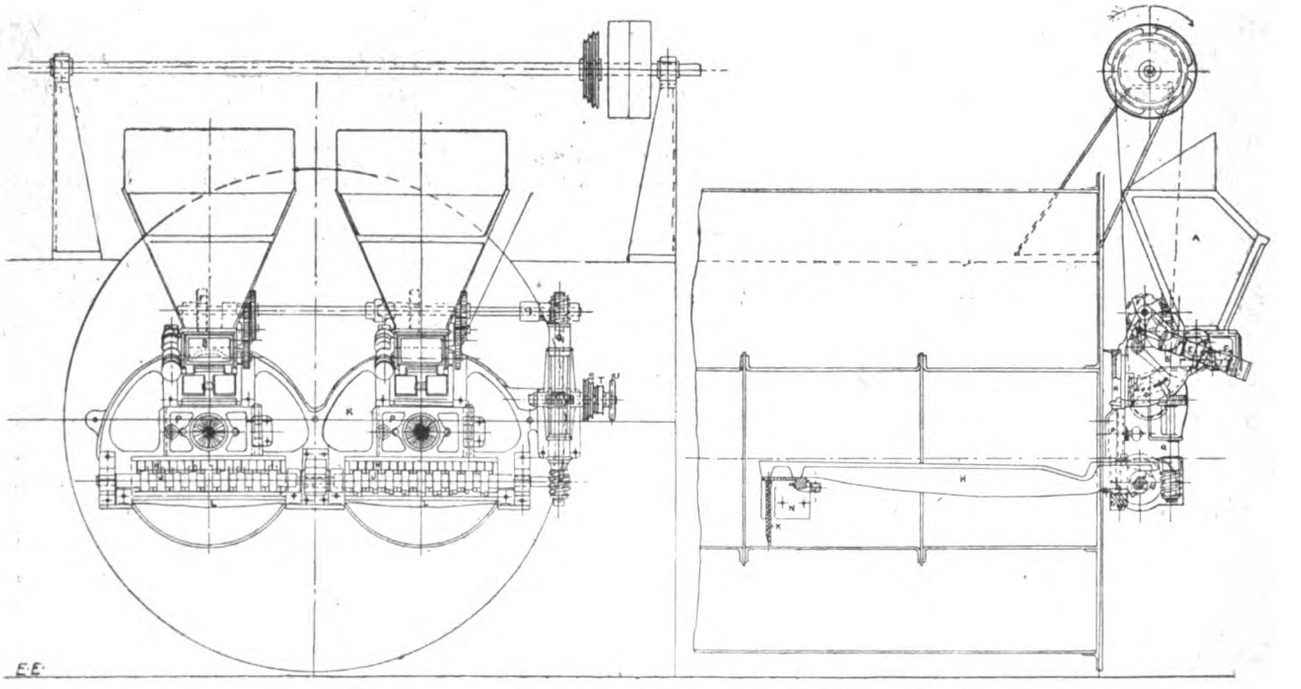
BY B. PONTIFEX.

The above scheme was originally designed by Mr. W. H. Trentham, and has recently been extended to cope with the extra load due to traction and increased lighting. The alterations and additions have been carried out by Mr. C. F. W. McInnes, the electrical engineer to the Corporation. Low-tension continuous current is supplied on the three-wire system, with separate mains and feeders for public lighting, private consumers, and traction work.



Map of the Gravesend and Northfleet Electric Tramways.

Power-House.—This is situated near the river, close by the canal basin at the boundary of Milton and Denton parishes, in a convenient position for railway facilities, and also for securing circulating water. Feed water is obtained from an artesian well, 150ft. deep, sunk by Messrs. Isler, and fitted with a three-throw Isler pump, and a 2-b.h.p. Western Electric Company's motor. The average demand is for 1,000 gallons per hour, though, as the result of an experimental trial, 250,000 gallons were obtained in 10 hours. There are three Babcock and Wilcox boilers, and two Lancashire. One Babcock boiler receives the hot gases from a four-cell Sterling refuse destructor as a supplement to its own grate, which arrangement is estimated to produce 100 h.p. if the refuse is of fair burning quality. This boiler is of the double-drum pattern, and is capable of evaporating 8,000lb. of steam per hour, at a pressure of 180lb. per square inch, which is lowered by a reducing valve to 160lb. per square inch. The other two Babcock boilers are of the single-drum type and have an evaporative capacity of 6,400lb. per hour at 160lb. pressure. All the boilers, except the double-drum Babcock and Wilcox, are fitted with "Triumph" mechanical stokers made by Messrs. Ransomes and Rapier, Ipswich, and driven by electric motors from a countershaft. The Lancashire boilers, built by Messrs. Galloway, are 30ft. × 8ft., fitted with five Galloway cross-tubes to each flue. They can each evaporate 6,700lb. of steam per hour at 165lb. pressure, and are fitted with "Triumph" mechanical stokers and Sugden's U-tube superheaters with isolating dampers. There is a 96-tube Green's economiser with by-pass flue. The feed pumps are two compound, vertical, double acting, by Messrs. Hall, of Peterborough, and are capable of

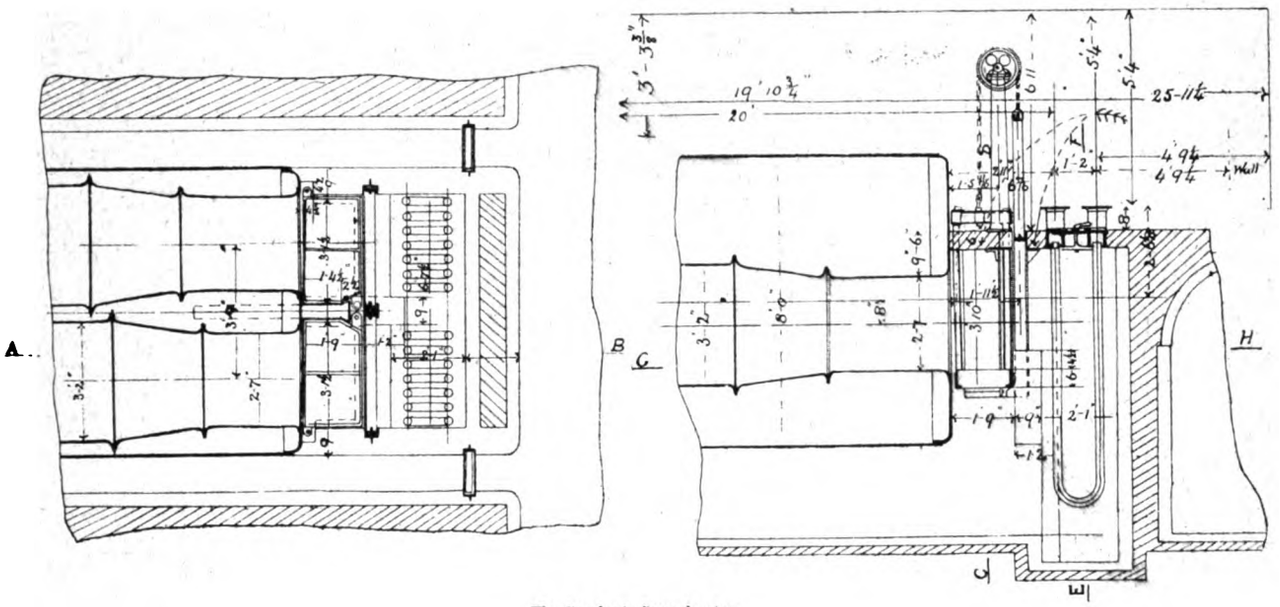


Elevation and Section of the Triumph Stoker.

Digitized by Google

dealing with 3,000 and 2,000 gallons of water per hour respectively. The Lancashire boilers are also supplied by a three-throw motor-driven pump, supplying 1,100 gallons per hour. The armature of this motor has a double commutator and winding, which, by means of a change-over switch, allows the two halves of the armature to be put in series or parallel, so that with the help of a regulating resistance any speed may be obtained from 450 revolutions per minute to 900 with good efficiency.

Maclellan Lancashire dynamo sets, working at 160lb. pressure. The engines are three-crank tandem compound enclosed single-acting, 11in. × 18in. × 9in. stroke, running at 400 revolutions per minute, and fitted with piston valves. Contrary to general practice, the dynamos are not overcompounded, which necessitates the use of positive boosters for the traction load, as will be seen farther on; they also have a switch fitted on the magnet frame of each machine, to enable them to be run as shunt machines for

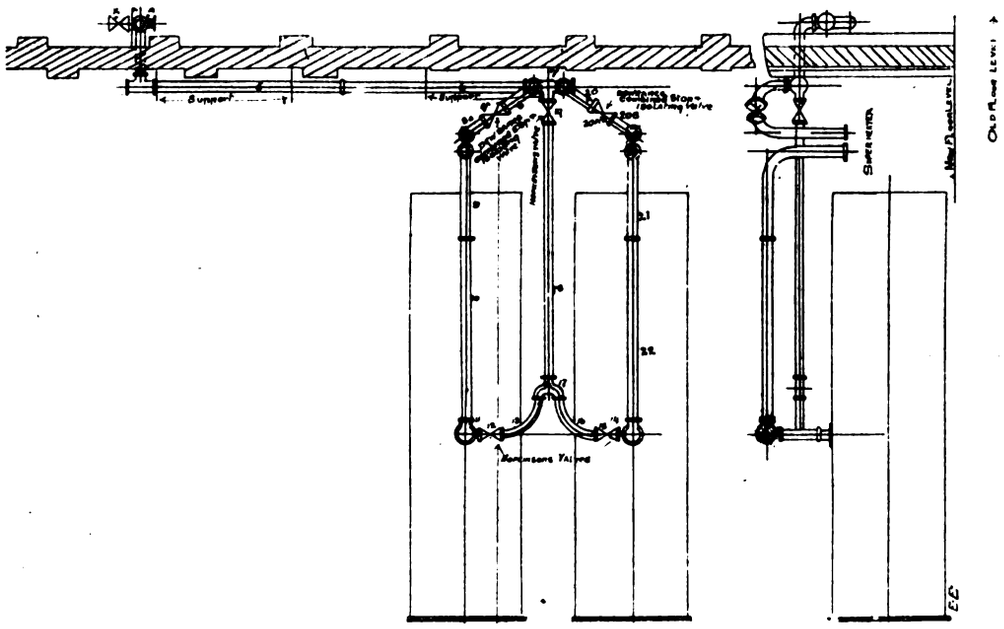


The Sugden's Superheater.

Estimates are now being obtained for the erection of a coal store in accordance with designs by Mr. McInnes, fitted with automatic coal-handling plant, with a capacity for dealing with 350 tons. Coal will be tipped out of trucks into the elevator hopper and be carried up to the large conveyor which will distribute it over the floor of the coal store by means of suitable outlets. When the coal store is full, or before that if necessary, these outlets can be closed. Coal will then be taken along the small conveyor, and delivered into the hoppers of the mechanical stokers at each boiler. In order to empty the coal store, a small conveyor along the front of the store picks up coal from the store floor and redelivers it into the hopper at the foot of the elevator. The Corporation have also recently sanctioned a proposal by Mr. McInnes to instal a storage tank of 15,000 gallons capacity, with the necessary filter tanks for improved methods of treating the feed water, but the details of this are not yet available.

The engine-room contains three 200-kw. Alley and accumulator charging. The engines are fitted with ejector condensers. There is also a 100-kw. Belliss-Westinghouse set in course of erection, to run at 450 revolutions per minute at 160lb. pressure, the engine being two-crank compound enclosed with central valves. There is a 7in. centrifugal pump by J. and H. Gwynne, driven by a 10-h.p. motor by the Lancashire Dynamo Company, for pumping the circulating water.

The main switchboard, supplied by Messrs. Brook,

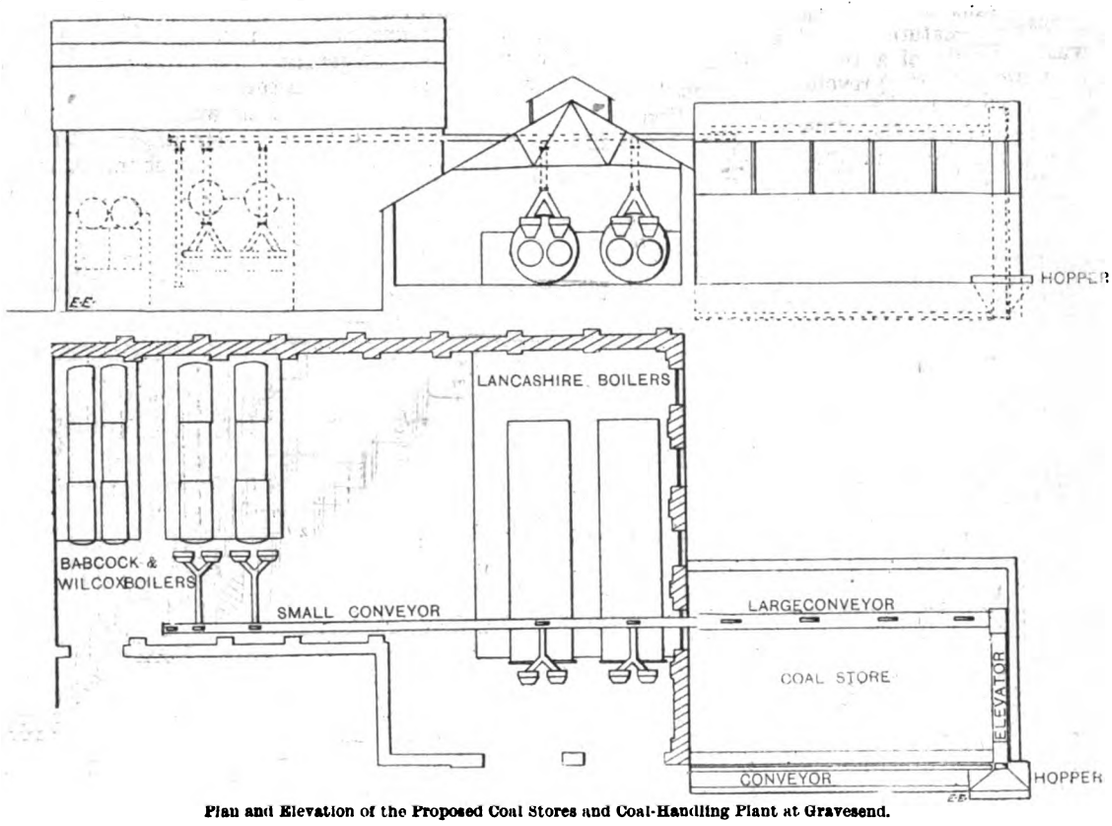


The Steam Pipes as Rearranged at Gravesend.

Hirst, and Co., of the Northgate Electrical Works, Chester, is of enamelled slate, with separate panels for each section, but not for each generator or feeder. The lighting section is arranged on the plug principle, so that any generator can be put on to any feeder. The battery section contains the usual regulating step-by-step switch, on the negative end of the battery, and connections for the lighting boosters and balancers; each generator can either be put on the traction or lighting circuits. Western Electric and Thomson-Houston circuit

Digitized by Google

breakers are now being fitted. The generator switches, etc., carry 400 amperes, each lighting feeder panel is constructed for 250 amperes, and the traction board for 800. The traction board has the usual Board of Trade connections, and also change-over switches, so that the positive booster can be switched in to help the generators when necessary. This booster, which can carry 500 amperes at 60 volts, is on an extension of a 50-kw. motor-generator, which is arranged so that the traction side can take the lighting at light loads and *vice versâ*. The lighting balancers can work up to 38 kw. at 250 volts, while the boosters are constructed to give 100 amperes at 110 volts. All cables have disconnection links placed under the switchboard gallery.



Plan and Elevation of the Proposed Coal Stores and Coal-Handling Plant at Gravesend.

There is a battery of 280 640 ampere-hour accumulators by Messrs. Pritchetts and Gold in glass boxes, 23 plates per cell, arranged on wooden stands in two tiers. These are always in use for lighting, and have only on rare occasions been placed on a traction load. The station is fitted with a hand-driven 10 ton overhead travelling crane by

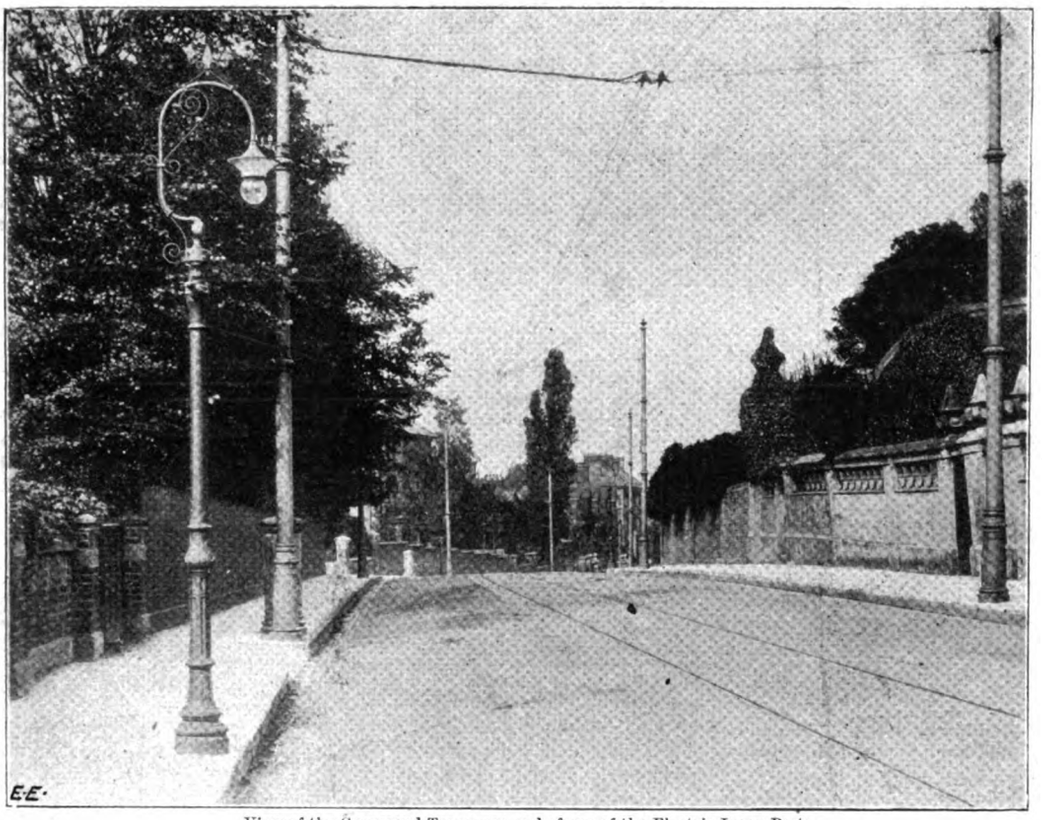
Messrs. Garrick and Sons, of Edinburgh, having a span of 38ft. There is also a small workshop for effecting any repairs or alterations which are necessary.

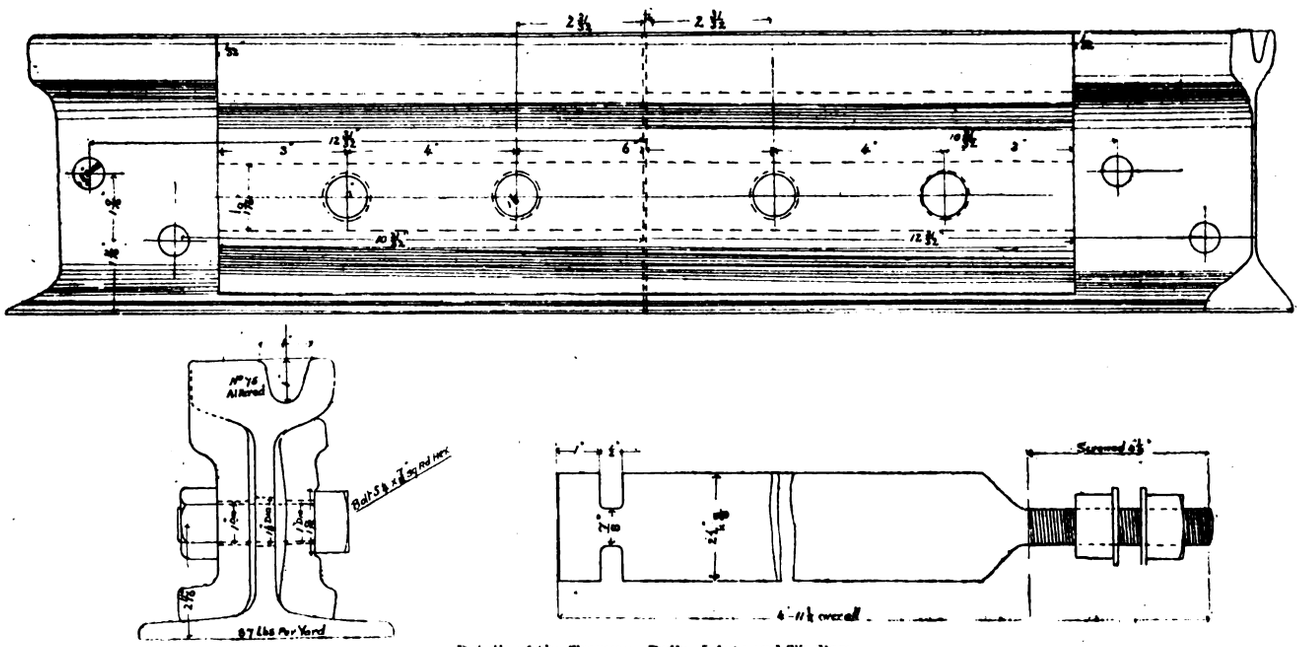
Mains.—These are made by the Western Electric Company, and are lead-covered, paper-insulated, laid solid in wooden troughing and stoneware conduit. The four feeders are triple concentric, with a positive inner and neutral outer, the cross-section of each in square inches being as follows: ·25 × ·25 × ·12, 2 × ·2 × ·1, ·12 × ·12 × ·06, ·1 × ·1 × ·05. The distributors are three-core twisted cables, paper-insulated and lead-covered, and laid in the same way as the feeders. Their size is ·125 square inch × ·125 square inch × ·062 square inch.



View of the Gravesend Tramways and of one of the Electric Lamp Posts.

success of the scheme can best be judged by the fact that Nernst lamps have been ordered to be fitted as opportunity occurs, wherever the public mains are carried. The average life of the lamps is rather over 700 hours. Some of the arc lamps are suspended from the tramway side poles. There is a private telephone installation, so that an employé can communicate with the power-house from any feeder box. Ferranti and Bastian meters are used.

Tramways.—These are run by the Gravesend and Northfleet Electric Tramways Company, who purchase their electric energy from the Gravesend Corporation. At present there is in operation 6½ miles of single track with turn-outs, consisting of the main line, Denton to Swanscombe, a loop line from Gravesend to Northfleet, and a shuttle line along Windmill-street. Extensions are now being negotiated to Dartford and to Chatham. The gauge of the line is 4ft. 8½in. The feeders are two ·3 square inch twin concentric, paper-insulated cables, laid solid in wooden troughing with the outer earthed at the generating



Details of the Tramway Rails, Joints and Tie-Bars.

The public lighting is varied in character. There are three sets of nine open-type arc lamps by the New Century Company, 30 enclosed Western Electric arcs, two in series, and 55 ½-ampere Nernst lamps. These last were adopted in order to keep the public lighting cost at the same or a lower figure than the previous gas contract; the

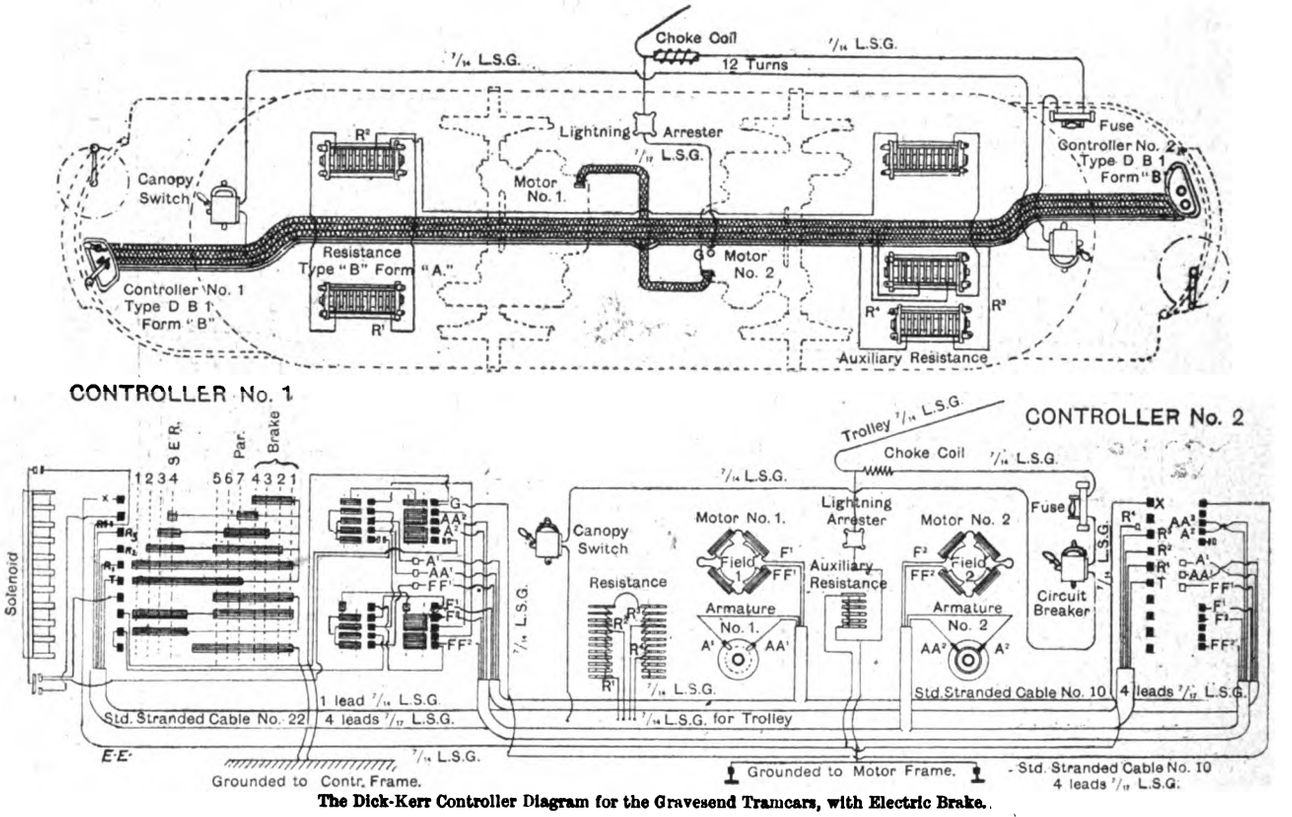
station. The sub-feeders are single cables of the same type, varying in sectional area from .3 to .25 square inch. These are all laid solid, and, together with the main feeders, were supplied by the Western Electric Company. There is also a four-core $^{7}/_{21}$ pilot cable. The feeder pillars are of the British Electric Traction Company's standard pattern with Brush panels and Bates fuses, a telephone being fitted to each pillar in a separate cast-iron box; the telephones are supplied by the General Electric Company.



The Dick-Kerr Controller Diagram for the Gravesend Tramcars, with Electric Brake.

The overhead work was carried out by Messrs. G. Hill and Co The trolley wire is 0 S.W.G., and is suspended from side bracket arms and span wires, flexible suspension being used throughout the job. There are no centre poles,

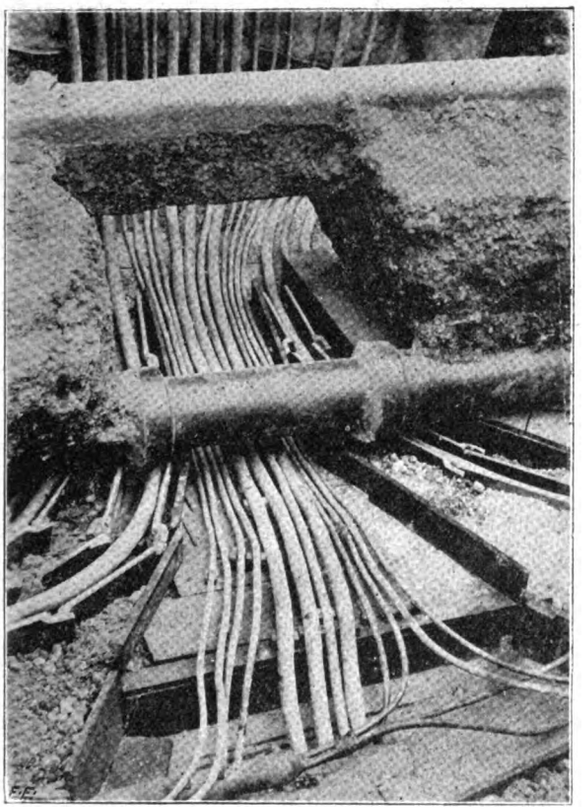
At every turn-out, from which it is impossible to see the next one, signalling apparatus has been installed by Messrs. Saxby, Farmer, and Co., who have fitted their "Dover" type of signals throughout. The track is of standard construction, the girder rails weigh 87lb. per yard, and the joints are Messrs. Dick, Kerr, and Co.'s patent without sole-plates. There are two "Columbia" bonds to each joint, and cross-bonding is used every 100 yards.

There are 20 cars at present in use, 10 single-truck and 10 double-bogie, all of them double-decked cars of the Liverpool with reversed stairway, supplied by Messrs. Dick, Kerr, and Co. The trucks are of Brill standard patterns 21 E and Eureka. The bogie cars are run with the pony wheels leading, although the trucks were not built for this, increased smoothness of running and less hammering on the permanent way being the most noticeable results. The cars are fitted with hand wheel brakes, lever track brakes, and electric short-circuiting brakes, and also carry Tidswell standard lifeguards.



Cable Laying at Gravesend.

The car depôt is situated by the railway on the loop line between Gravesend and Northfleet, and has five tracks each with a pit running the full length of the shed and connected by means of a subway with a small bogie running on metals for carrying heavy machinery from one pit to another. One track is prolonged into the paint shop, and one into the repair shop, which is furnished with the usual tools, including a 120-ton Miller wheel press, lathes, jacks, drills, etc. A 5-h.p. Westinghouse motor drives all machine tools by means of a countershaft carried under the floor. The depôt is laid with 65lb. Vignoles rails spiked to sleepers.

My best thanks are due to Mr. McInnes, the Corporation electrical engineer; Mr. Kipping, the tramways manager; and Mr. Barber, the tramways engineer, for their courtesy in affording all possible assistance in the preparation of the above article.

ELECTRIC FIRE ALARMS v. AUTOMATIC SPRINKLERS.

On Wednesday, the 4th inst., an interesting trial of the May-Oatway fire-alarm system took place in the offices of the *Glasgow Herald*, Buchanan-street, Glasgow, in the presence of a large number of leading merchants, scientists, engineers, fire brigade and insurance experts. Prior to the test being made, Mr. Oatway explained that the alarm differed from others, inasmuch that it did not necessitate a fixed temperature as the call point, but was compensated to maintain an even actuating point of 25 per cent. above the normal temperature of the apartment. The position of the fire in the building was indicated by the lowering of a drop indicator, and a distinctive signal was transmitted to the fire station over a metallic circuit line wire by a specially constructed automatic transmitter. At the fire station, in addition to the imprinting of this Morse code signal on a tape, a legibly inscribed shutter fell indicating the name of the building attacked. The tape signal acted as a check on the lowering of the shutter, insomuch as the latter might be dropped by a fault on the line, in which case the Morse signal would not be given. The shutter in turn prevented the misreading of the code signal by the officer at the fire station. In order that the test might be thoroughly impartial, a committee consisting of the fire-masters of Edinburgh, Glasgow, and Aberdeen, Dr. Gourlay, Mr. W. A. Chamen (electricity works), and Mr. Buyers Black (of the Liverpool, London, and Globe Insurance Company), and Mr. D. L. Laidlaw (of the North British and Mercantile Insurance Company) were appointed to time and regulate the test, while two gentlemen were selected from the spectators to proceed to the fire station as a guarantee against any special provision being made there to facilitate the test. The test was of a rigid nature, as may be seen from the official report given below. The results were of a highly satisfactory nature, as may be indicated by the fact that the fire brigade was on the spot several minutes before the sprinkler began to eject water. This report of the above committee reads as below:

"We, the undersigned, the committee nominated to supervise comparative test of the May-Oatway automatic fire-alarm system with the sprinkler installation at the *Glasgow Herald and Evening Times* building report as follows: The fire, consisting of two spirit tanks, one 24in. in diameter and the other 36in. by 18in., was placed in a position on the floor level indicated by us about 7ft. equidistant from each of a group of three sprinklers, and 12ft. from the 7½ft. May-Oatway detector, adjusted to ⅜in. Windows and doors were kept open during the test, and representatives were sent to the fire brigade station to see that no preparations were made in advance for the call. Temperature 60deg. F. Dimensions of room furnished by the engineer to the *Herald*, 66ft. by 50ft.; area, 3,300 square feet; height, 12ft.; protection, 42 sprinkler heads, two May-Oatway detectors. From the lighting of the fire the May-Oatway alarm sounded in 1 min. 4 sec. The indicator showed fire in publishing room on ground floor of Mitchell-street block, and the alarm was telegraphed to the central fire station. Sprinkler installation started 11 min. 22 sec., ejecting air; water a few minutes after. Fire brigade arrived 3 min. 45 sec. from ringing of alarm. Salvage corps arrived 3 min. 50 sec. Diameter of additional spirit tanks lighted, if any, after May-Oatway alarm was given, *one of 24in.*"

(Signed) ROBERT GOURLAY, as representing the *Glasgow Herald*; WILLIAM PATERSON, firemaster, Glasgow; A. PORDAGE, firemaster, Edinburgh; DANL. L. LAIDLAW, North British and Mercantile Insurance Company; J. BUYERS BLACK, Liverpool and London and Globe Insurance Company; W. INKSTER, firemaster, Aberdeen; W. T. CHAMEN, Glasgow Corporation electrical engineer."

"We certify that no preparation had been made at the fire station prior to receipt of the alarm.

"E. H. MONTGOMERY and JAS. TYRE."

Newcastle.—At a meeting of the Tramways Committee it was agreed to make a survey of the proposed extensions in Heaton district. With reference to the wages and employment of persons to act as motormen and conductors, it was arranged that a report should be prepared by Mr. Le Rossignol dealing with the subject, to be presented at the next meeting of the committee. It was agreed that steps be taken to obtain about 2,000 tons of new rails to be used for renewals. It was also agreed that the rails should be obtained from English firms, if possible.

WILKINSON OVERHEAD TRAMWAY ACCESSORIES AND SIGNALLING SYSTEM.

The cost of upkeep of an overhead system of an electrical tramway is closely bound up in the type and durability of the accessories used. Defects in construction tending to increase this cost are, of course, discovered after trial, and in consequence it is to tramway engineers that we have to look for improvement in design of such accessories. The following fittings are the invention of Mr. J. Wilkinson, the tramway engineer to the Hull Corporation, and they will be of great interest to all tramway men.

The trolley tester (Fig. 1) is an ordinary ear with a loose centre piece, E, arranged to move vertically up or down. When the trolley wheel passes under E, this is lifted, and either the circuit of an electric bell is closed or a mechanical gong is struck. To perform either of these operations, however, the spring of the trolley pole must be sufficiently screwed up to lift the dead-weight, C, which is carried on an extension of E. As a general rule, trolley-pole springs err in being too slack, with a resultant tendency to jump the wire, especially at frogs and crossings—a defect which the present form of the apparatus shows perfectly. One of these trolley testers fixed just outside each car-shed would show if the trolley on each car is in order as the cars leave the shed each day.

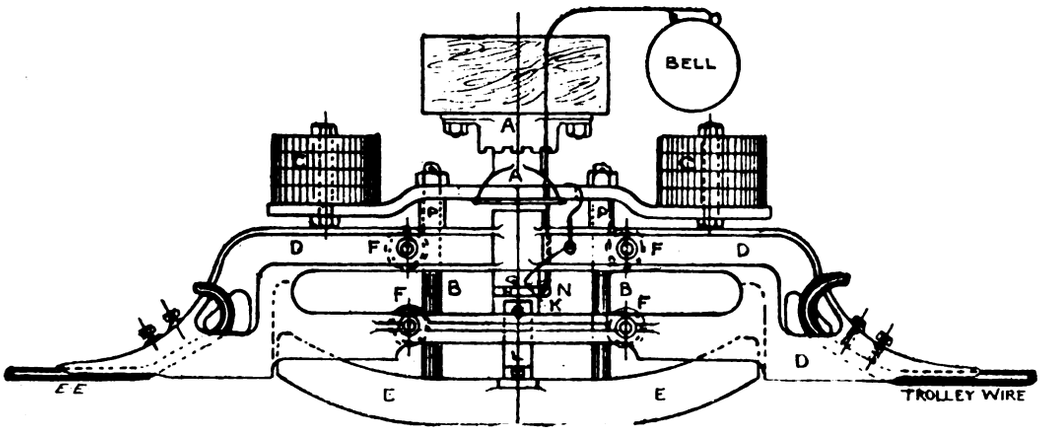

FIG. 1.—Wilkinson's Patent Trolley Tester. A A, car shed suspender; B B, guide rods; C C, adjustable weights; D D, trolley ear E E, movable runner; F F, guide sheaves; G, ebonite; H, contact piece; K, contact screw; L, flat spring; M, flexible connection; N, terminal from bell: P, loose distance pieces.

Some New Line Fittings.—The trolley signalling ears (Fig. 2) are an adaptation of the same principle to signalling, the upward pressure of the trolley raising the loose centre-piece of the ear until contact is made between insulated terminals which close the circuit that actuates the signalling apparatus. The difference between the details of the two ears shown is owing to the fact that A is for use on systems that employ independent batteries for the signalling work, and B for those that use current from the line. B would appear to be simplest and most easy to maintain. A diagram of the signalling connections is

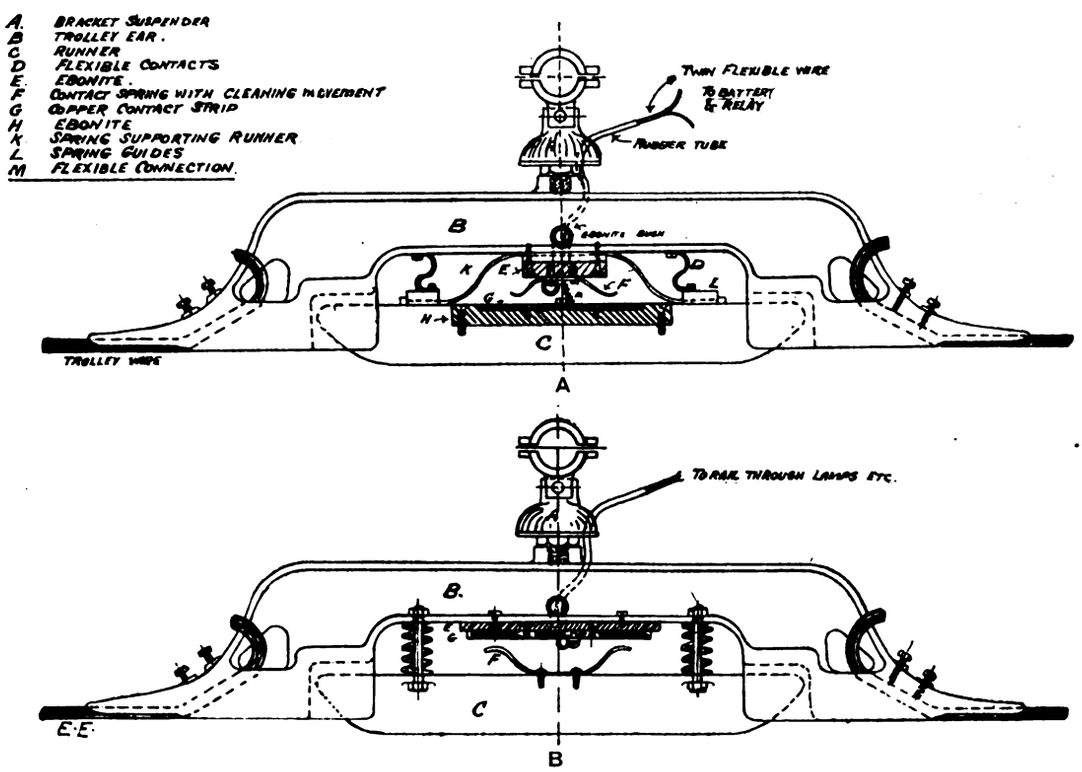

FIG. 2.—Signalling Ears.

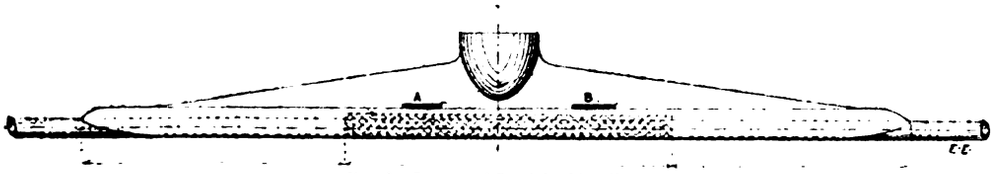

FIG. 4.—Improved Straight-Line Ears.

Digitized by Google

shown (Fig. 3). It will be seen that when the contact at A is closed the armature switch D is pulled down, whereupon the magnet, F, is excited and places the semaphore in the "danger" position, where it is locked by the lip and catch, K and L; as soon as the trolley leaves the ear, A, contact is broken, and the semaphore arm remains locked until the trolley reaches A_2, when the armature switch D_2 is pulled down and current passes through the magnet, N, which attracts L and releases the semaphore, which drops to the "clear" position. The feature of the straight-line ear, shown in Fig. 4, is that slots are provided at A and B where solder and flux can be applied, so that the wire is only soldered to the ear at the centre, thereby leaving the physical condition of the wire unaltered by heat at the ends of the ear, where mechanical strength is most important.

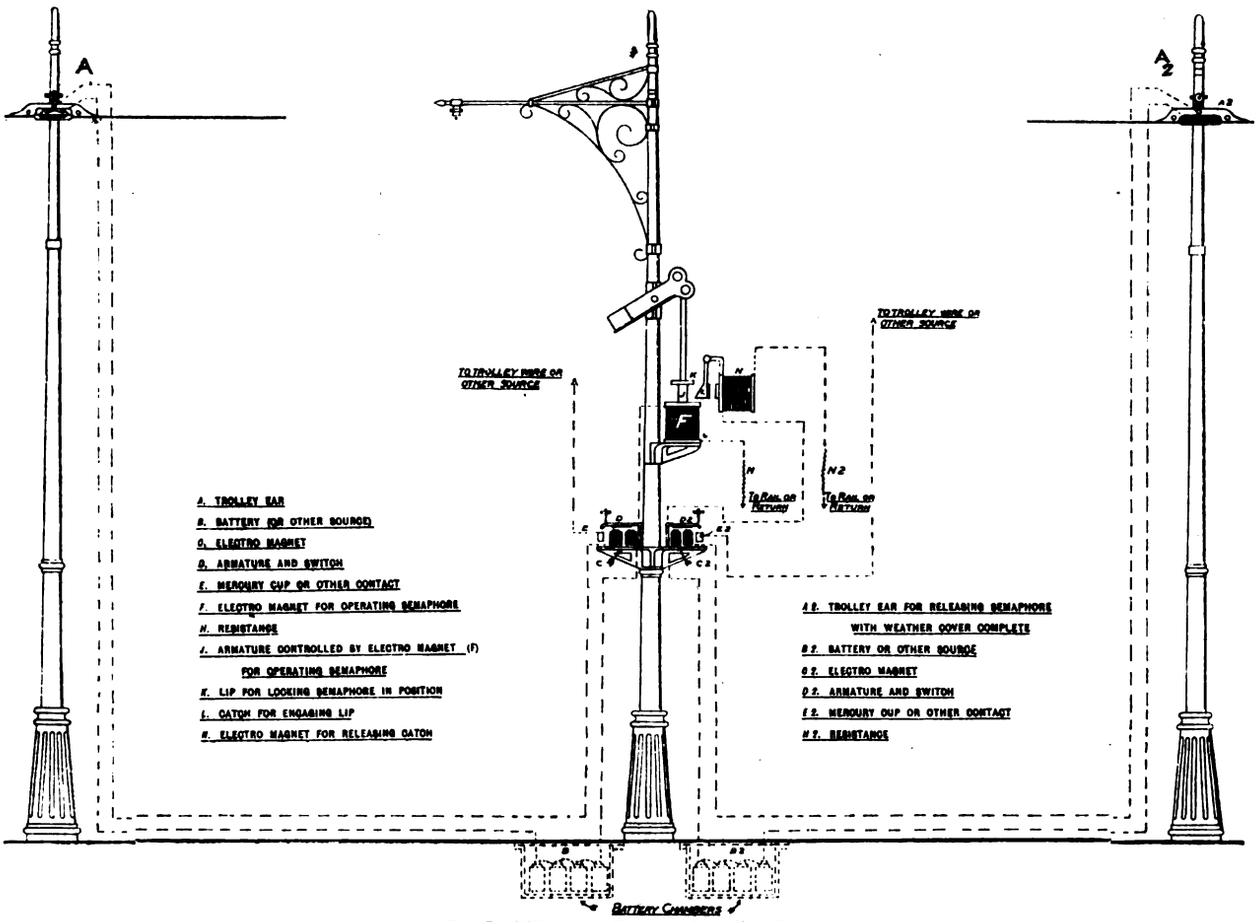

FIG. 3.—Wilkinson's Tramway Signalling System.

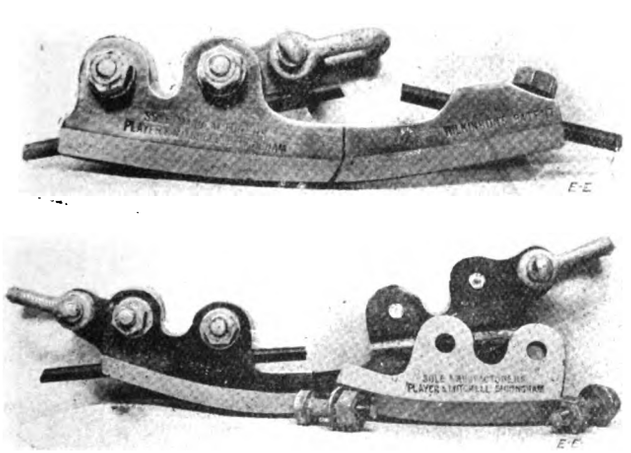

FIG. 5.—Wilkinson's Emergency Clamps for Repairing Broken Trolley Wires.

Fig. 5 shows some emergency trolley clamps for use when the wire breaks during running hours. They are speedily fixed, and allow cars to run past the repair without any necessity to either slacken the pace or swing the trolley over the joint. The first illustration shows a clamp for use, one on either side of a broken ear, the lower one for use between ears. They are strong and easily fixed, and have been proved to give satisfaction in use. It will be further noted that the clamping grooves are arranged at an angle that brings the two halves of the broken wire together in a straight line without any bending of the loose ends, which would only prove a further source of weakness, especially in the scramble that usually takes place over emergency repairs.

With the above brief notice we would commend to our readers the tramway accessories patented by Mr. Wilkinson. The drawings and photographs make further detailed description unnecessary, but the articles seem to fill distinct requirements which have been discovered in the practical running of the overhead trolley system. All these accessories are being manufactured and put on the market by Messrs. Player and Mitchell, of Birmingham.

FORTHCOMING EVENTS.

MONDAY, NOV. 9.

Institution of Mechanical Engineers (Graduates' Association).—At 7.30 p.m., ordinary meeting. Paper: "Heating and Ventilating on the Plenum System," by Mr. Walter H. A. Robertson.

TUESDAY, NOV. 10.

Institution of Electrical Engineers (Glasgow Section).—At 8 p.m., ordinary meeting. Inaugural address of Mr. Wm. A. Chamen, chairman.

Institution of Civil Engineers.—At 8 p.m., ordinary meeting. Paper: "Tensile Tests of Mild Steel, and the Relation of Elongation to the Size of the Test-Bar," by Prof. W. C. Unwin, F.R.S.

THURSDAY, NOV. 12.

Institution of Electrical Engineers.—At 8 p m., opening meeting. Address of Mr. Robert Kaye Gray, president.

FRIDAY, NOV. 13.

QUESTIONS AND ANSWERS.

If thou hast knowledge, let others light their candle at it.

Under this heading we insert questions and answers of a practical character relating to central-station work, tramway work, or construction work; and for each suitable question offer *one shilling*, and for the best solution of any question we offer *ten shillings*. We also give *five shillings* for every other answer we print. The answers to any questions should be sent within 10 days after the question has appeared. We would call the attention of those sending in answers to the fact that the neatness of any sketches (which must be in *ink*) sent in is considered when marking the relative values of these answers. All formulæ should be carefully written to prevent mistakes as to symbols, and all loose sketches should be signed by the author. The matter must be written on one side only of the paper. Questions may be sent at any time.

QUESTIONS.

633. Several car axles of an electric tramway have broken lately, all *exactly* in the same place—viz., ½in. inside keyway of gear wheel. Upon examination of these and other axles they show signs of being eaten away by electrolysis. Describe a remedy for this, also the action of the electric current upon the axles. The motor box is used for the earth return.—JANET.

634. Describe the theory and working of the Diesel oil-engine, and state wherein its advantages lie over a good make of ordinary oil or gas engine.—E. R. A.

ANSWERS.

Question No. 625.—If a three-core distributor (of ·15 square inch section) was supplied at one end with three-phase currents from three single-phase transformers connected on the mesh system, having 220 volts on the secondary coils; if incandescent lighting constituted the whole of the load. and consumers were supplied with single-phase current from one of the three sides at the rate of one ampere per two yards run, arranged so as to obtain a good balance—(1) How would the carrying capacity and drop be calculated? (2) To what distance would it distribute efficiently? (3) How would the lamps on each phase be affected if (*a*) one transformer burnt out, (*b*) one of the three low-tension fuses blew, (*c*) one of the high-tension transformer fuses blew?

Best Answer to No. 625 (*awarded* 10*s.*).—Customers taking one ampere for every two yards run, and the circuits being evenly balanced, it follows that one ampere is taken off each phase on six yards, and consequently the current in each core of the cable is increased by $\sqrt{3}$ amperes for every six yards run. The diagram with one one-ampere lamp on each phase would be as shown in Fig. 1; thus with a length

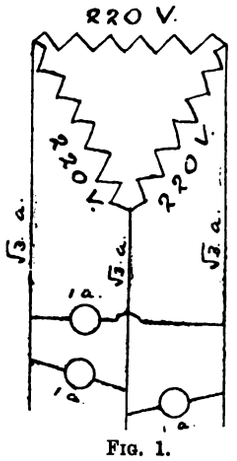

FIG. 1.

of x yards of distributor the current entering each core of the cable will be

$$\frac{\sqrt{3}\,x}{6} \text{ amperes} \quad . \quad . \quad . \quad . \quad . \quad (1)$$

and as it dwindles to nothing at the end the average current will be $\frac{\sqrt{3}\,x}{12}$ amperes per core. The resistance of stranded copper of ·15 square inch section may be taken as ·000166 ohm per yard. The resistance of each core of this distributor, x yards long, is therefore 000166 x ohm. The total drop in each core (average amperes × resistance) will be $\frac{\sqrt{3}\,x}{12} \times$ ·000166 x, and the drop, as measured across one side of the mesh at the extreme end, will be $\sqrt{3}$ times this, or $\frac{3x}{12} \times$ ·000166 x—*i.e.*,

$$\cdot 0000415\, x^2 \quad . \quad . \quad . \quad . \quad . \quad . \quad (2)$$

Note.—The relation between drop per core and drop on the phase is best seen from Fig. 2 (grossly exaggerated).

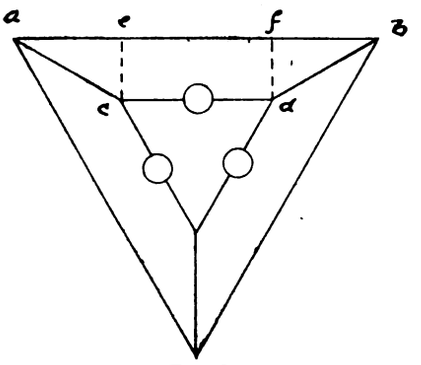

FIG. 2.

Here $a\,b$ represents the transformer voltage, $a\,c$ and $b\,d$ represents the voltage drop in two of the cores, and $c\,d$ is the voltage across that phase at the lamp. Clearly the total drop at the lamp is the sum of $a\,e$ and $f\,b$; or, with equal loading, $a\,c\,\sqrt{3}$—*i.e.*, $\sqrt{3}$ times the drop per core. The expressions (1) and (2) above give the current per core and maximum drop on the lamps for any length of distributor.

2. The determining factor in most cases as to length of distributor is the necessity of complying with the Board of Trade regulations, which stipulate that the voltage upon

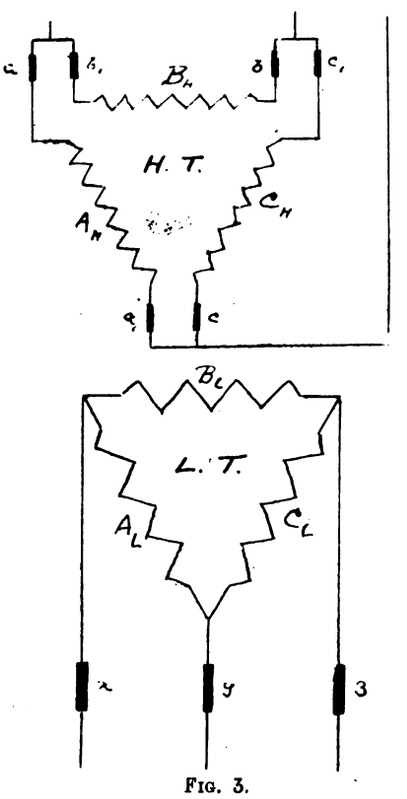

FIG. 3.

the distributing mains must be kept within 3 per cent. of the declared pressure, in this case 220 volts—*i.e.*, the voltage of all parts of the main must at all times lie between 213·4 volts and 226·6 volts, giving a range of 13·2 volts. What proportion of this may be safely dropped in the distributor must depend on many things, from the relative lengths of the high-tension feeders to the likelihood of customers substituting 32-c.p. lamps for present 16's; but, for the sake of illustration, we may suppose that a drop of eight volts in the distributor may be allowed at full load. Thus we have the drop as calculated above—viz.,

$$\cdot 0000415\, x^2 = 8,$$

$$x^2 = \frac{8}{\cdot 0000415} = 193{,}000,$$

or,

$$x = 440.$$

Digitized by Google

i.e., we may run this distributor 440 yards without incurring a drop of more than eight volts on the furthermost lamp. The current entering this cable will be $\frac{\sqrt{3} \times 440}{6} = 127$, giving a current density at this point of 850 amperes per square inch, and this may be allowed in lighting work.

3. The wording of this part indicates that in the present case there are six fuses on the high-tension side (two to each transformer), and on the low-tension side three, or one on each core of the feeder. The connections are, therefore, as in Fig. 3 (switches are omitted). There may be three double-pole or one triple-pole on the high-tension, and one triple-pole on the low-tension.

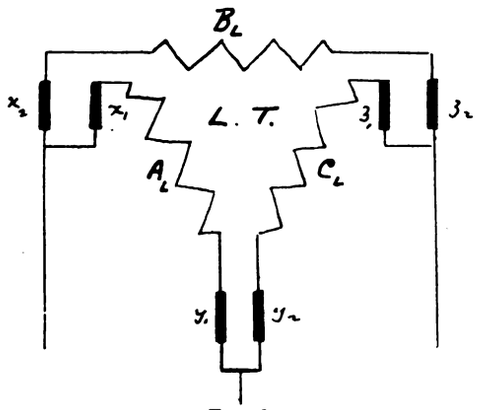

FIG. 4.

(*a*) If, now, one transformer, say A_H A_L, burns out, it will at once blow its high-tension fuses, *a*, a_1, but as its low-tension coils are connected to the two good transformers, it will be kept alive, and the burnout will, therefore, cause the other high-tension fuses—viz, *b*, b_1 and *c*, c_1—to blow as well. Supply will then be entirely off the distributor until the faulty transformer is cut out, and fresh high-tension fuses are supplied. If there are fuses on each transformer on the low-tension side, as shown in Fig. 4, then matters will still be the

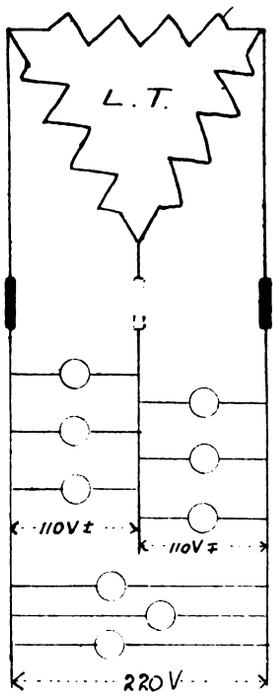

FIG. 5.

same, for on the transformer, A_H A_L, burning out and its high-tension fuses blowing, then the low-tension side will be fed from B_L and C_L through the fuses, x_2 and x_1 and y_2 and y_1, at its two ends; and as the fuses x_2 and y_2 will be carrying the line current as well as the burning-out current, they will blow before x_1 and y_1, and, as a consequence, supply will be shut down. If, however, these low-tension fuses, x_1, x_2, etc., were replaced by non return auto cut-outs, then a transformer might burn out and disconnect itself, leaving two transformers alive and able to keep up supply on all phases.

(*b*) If one of the three low-tension fuses of Fig. 3 blows, the connections on the low-tension side become as in Fig. 5, one phase remaining intact while what were the other two phases become the two halves of a three-wire system across the good phase. The voltage on these being something like half the proper voltage, of course the lamps upon them are useless as light givers If the low-tension fuses are placed as in Fig. 4, the circumstances become similar to "*c*," as below

(*c*) If one of the high-tension transformer fuses blows (*vide* Fig. 3), then we still have two transformers alive and at work—A_H and C_H, for instance These are supplied with the proper voltage and phase, and consequently produce the correct voltage and phase in their low-tension coils, and these maintain the proper relationship between the three cores, and hence the supply on all three phases is maintained. The third transformer is excited from its low-tension side, so keeps alive and in proper phase although the high-tension fuses are gone. The only point to be noted is this. Owing to the uselessness of transformer B, the current in A and C (assuming balanced lamps) is raised in the proportion of 1 to $\sqrt{3}$ (with, in addition, the no-load low-tension current of the third transformer), so that, if it was a heavy load that blew the one fuse, it is almost certain that the others will go too. If, however, the load is not too heavy, the blowing of the high-tension fuses on one transformer will not affect the supply. Should there be only three high-tension fuses arranged as the low-tension ones of Fig. 3, then the blowing of one will destroy the utility of two phases, just as discussed under (*b*), except that the two idle transformers will exactly balance the pressure on the two half-voltage circuits.—C. E. C.

Answer to No. 625 (*awarded* 7*s.* 6*d.*).—Let us first of all consider the exact relation between the current in each of the three cores of the cable and the length in yards.

The total current from the three phases } = 1 ampere every two yards.
The current per phase... = 1 ampere every six yards.
The current per core ... = $\sqrt{3}$ amperes every six yards.

If, then, the length of the distributor is *n* yards, the current flowing into each of the three conductors is

$$\frac{n}{6}\sqrt{3} \text{ amperes,}$$

and the average current is of course, half the current at the feeding end—that is

$$\frac{n}{12}\sqrt{3} \text{ amperes.}$$

From tables we find that the resistance of a copper conductor of sectional area ·15 square inch is about $\frac{1}{6000}$ ohm per yard, hence the drop in volts for *n* yards when carrying a current of $\frac{n}{12}\sqrt{3}$ amperes, is $\frac{n^2}{72{,}000}\sqrt{3} = \cdot 000024\, n^2$. This fall of potential can be shown by a curve most easily by starting at the distant end of the distributor and plotting

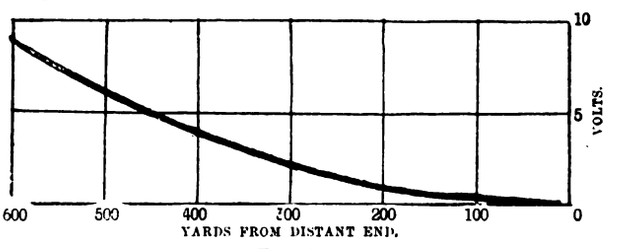

FIG. 1.

the relation between the rise of voltage and the yards travelled towards the feeding point. Such a curve is shown in Fig. 1; it is, of course, a parabola, and the ordinates at any point represent the total drop in the distributor when its length is that given by the abscissa.

In Fig. 2 is shown the vector diagram of voltages. A B C is an equilateral triangle whose sides represent the phase relationship between the impressed volts; each side represents to scale 220 volts. As we proceed from the feeding

Digitized by Google

point the triangle shrinks in size, and at some distant point on the distributor the triangle A′ B′ C′ would correctly represent the actual E.M.F.'s; the lines A A′, B B′, and C C′ give in phase and magnitude the fall of potential in the three mains respectively, and can be obtained from the curve in Fig. 1, as described. It will be seen from Fig. 2 that A′ B′ is less than A B by an amount equal to $\sqrt{3}$ times A A′—that is, the E M.F. per phase is less than the impressed E.M.F. by 1·73 times the voltage drop that has taken place in each conductor of the three-core cable.

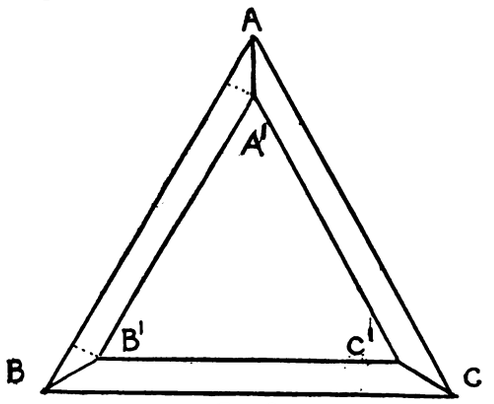

Fig. 2.

We can now calculate the maximum length of distributor that can be used, if the variation of voltage on the lamps is not to exceed 4 per cent. Suppose the voltage per phase at the feeding end is raised to 228, and the length of the distributor is such that when fully loaded the voltage at the far end is 212 per phase, so that the maximum variation from 220 is within 4 per cent. The reduction in voltage per phase is 16; therefore, the allowable drop in each conductor is $\frac{16}{\sqrt{3}} = 9{\cdot}25$ volts, and from reference to Fig. 1 the length of distributor is seen to be 620 yards. Under these conditions as to permissible fall of potential, the total current supplied to consumers is 310 amperes, and the distributor provides, of course, for both the outgoing and return currents of all three phases. The maximum current per conductor is $\frac{620}{6} \times \sqrt{3} = 180$ amperes approximately. For a current density of 1,000 amperes per square inch the current per conductor would be 150 amperes, so that the actual maximum current density attained is $\frac{180}{150} \times 1{,}000 = 1{,}200$ amperes per square inch. This is in no way excessive; it only applies to the first few yards of cable at full load.

In answer to (3*a*), the lamps would not be affected in any way by the burning out of one transformer, provided the remaining two were capable of maintaining their voltage and phase relationship, for on reference to Fig. 2 it will be seen that two sides of the triangle A B C are sufficient to fix the relative positions of the points A, B, and C.

(3*b*). If one of the low-tension main fuses blows, the supply becomes a single-phase one; one phase is unaffected. The lamps that were on the other two phases are now in series with the conductor whose fuse is blown, acting as a middle wire. The voltage on these two sets of lamps will be about half of the normal; exactly half if quite balanced.

(3*c*). If one of the high-tension fuses blows, the effect on the lamps will be nil, as when one of the transformers is burnt out [see answer to (3*a*)] the transformer whose high-tension fuse had blown would remain excited from the low-tension side.—SUPERHEAT.

Question No. 626.—Give sketch and description of a good clock switch for use in switching on and off incandescent lamps.

Best Answer to No. 626 (*awarded* 10*s.*).—Choice may be had of about 20 types of clock switch (many of them very unreliable). The requirements of a good clock switch are (1) simplicity of construction; (2) accuracy as timekeeper; (3) reliability of switch mechanism; (4) must not require frequent attention. To secure these requirements the clock should not itself supply the energy for the switch; the switch-off must be rapid; *mercury must not be used.*

Fig. 1 shows the most reliable clock switch that the writer has used, but it only switches off. A 4*s.* 6*d.* German alarm clock is taken. On the alarm mainspring spindle an eye of wire is soldered; a hole is bored in the case, and through this is put a piece of catgut fastened to the eye (when the clock is wound up). A bracket, B, is screwed to the wall with a projecting rod supporting the hinged platform, A. A 3lb. weight is attached by a cord and spring to the switch handle. The working is as follows:

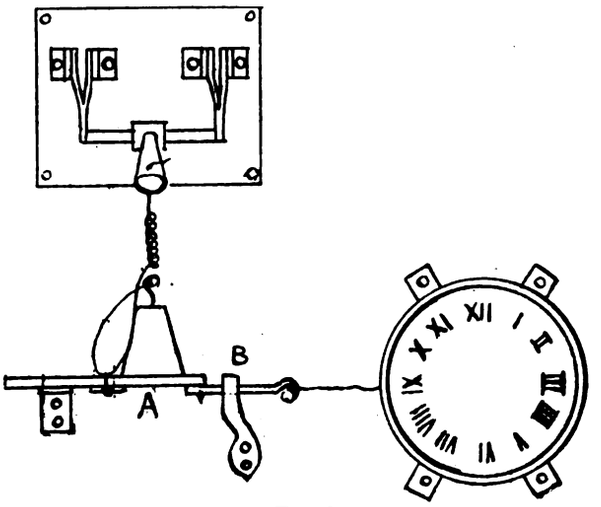

Fig. 1.

Set the alarm to the hour desired. Immediately this is reached the main spindle turns, winds up the gut and pulls away the rod supporting A, the weight drops and pulls off the switch. The spring on the cord should be somewhat stiff. To reset, wind up the mainspring of the alarm again, but note only a few turns are necessary.

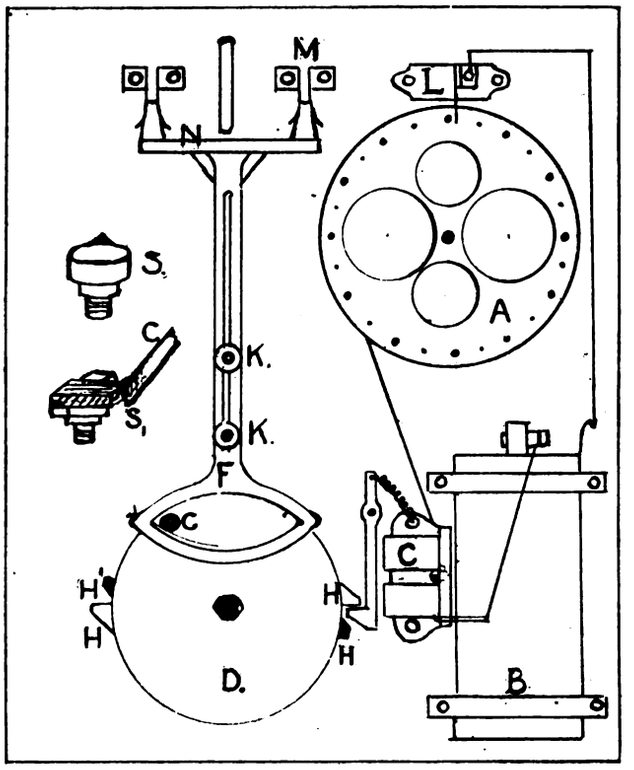

Fig. 2.

To switch off and on a more complicated apparatus is necessary, but the device shown will be found as simple as any, and quite reliable. It is not patented, so may be used by anyone. A and D (Fig. 2) are two double-spring Swiss 18-day clock mechanisms, costing wholesale 10*s.* each. On the hour spindle of each is firmly fixed (and in D bolted) a brass disc. In A holes are bored round the edge and tapped to receive the screw S, shown full size. The holes represent the hours and as many sub-divisions as the maker chooses to make. L is a vulcanite block with a brass piece screwed to it carrying a light nickel spring, which projects over the plate, A. The plate D has four projections, H, H, H^1, H^1, shaped as

Digitized by Google

shown (Figs. 2 and 3), engaging with the armature of an electromagnet, C. The end of the armature is shown in detail in Fig. 3. G is a pin about 60deg. away from nearest H. F is a cam of shape shown, and struck with same radius as D; it is slotted as shown to receive two steadying pins, K_1, K. N is a vulcanite bridge carrying two copper wedges to make contact with switch tongues of double-pole switch, M. B is a dry cell. The plate A is perforated to allow of winding up the mechanism; D also is perforated, but for clearness this is not shown. The holes in A are numbered 1 to 12, with sub-divisions. Method of operation: Suppose we want to light up at 7 and switch off at 10 p.m. Put in a pin, S, at 7 and one at 10 on A.

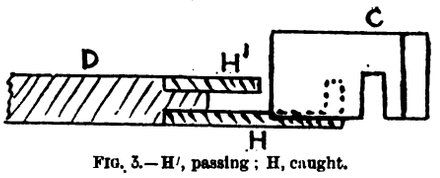

FIG. 3.—H', passing; H, caught.

Let the switch be off at present. A little before 7 p.m. S will make contact with L; the armature of C will be attracted and H^1 will get past, but H will catch. At 7 L will break contact, the armature will fly back, and H will get past; G will then put cam round to position shown in Fig. 2. Switch on. A little before 10 p.m. the next pin, S, makes contact and H_1 is released, but as G is travelling in a circle, no motion of the cam takes place; H now catches. At 10 p.m. L breaks contact, H gets past, and G flies round. At its fastest speed it throws down the cam and switches off. With a 24-hour dial any number of off and on positions may be chosen.

The following detail points should noted: The dial, A, should be fairly large, and spring, L, carefully adjusted to make positive contact, but not too long a contact. Where the mechanism is to be left absolutely in the hands of unskilful persons, it is well to make the pins S as at S_1 (the shaded part being vulcanite), and the stem so adjusted as to allow the spring, L, to take the position shown. The spring, L, then first catches on the vulcanite, and springs off on to the brass projection, making positive contact without any jerks.—POLYPHASE.

Answer to No. 626 (*awarded* 5*s.*).—Automatic time or clock switches have not come into general use to any great

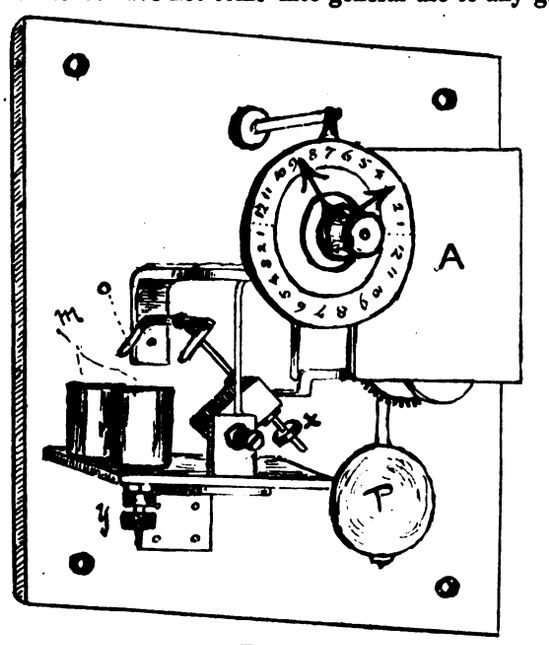

FIG. 1.

extent during the last few years, chiefly because of the somewhat complicated clockwork that is necessary, as the whole principle of the clock switch is identical in most respects with that of the ordinary alarum clock, which rings a bell at any required hour. Consequently, without very careful attention as regards cleaning and winding up, these switches cannot be relied on with much accuracy. But in places where careful attention has been paid to the switches, etc., satisfactory results have been obtained both for single lamps and a whole street of lamps. Fig. 1 gives a rough outline sketch of a satisfactory clock switch made by the Improved Electric Glow Lamp Company, Limited. This switch is made in two sizes—No. 1 size, with brush contact, to make and break up to three amperes at 500 volts; and No. 2 size, with mercury contact (as shown in sketch), to make and break up to 25 amperes at 500 volts. The mercury pots are shown at M in Fig. 1, and the circuit is closed and the lamps switched on when the contact maker, O, is released, *x* and *y* being the terminals to which the circuit is connected. P is the pendulum of the clock, and A is a polished slab on which are placed the keys, etc., for winding up the clock and adjusting the hours for lighting up. The clock only requires winding up once a week, and the hour of lighting up can be altered every night if necessary, or a fixed hour can be maintained throughout the year. The whole clock and switch is mounted on a slate slab, which can be fixed to a wall or switchboard as required.—P.

Answer to No. 626 (*awarded* 5*s.*).—The best form of time switch to use for this and many other purposes is the one made by the Reason Manufacturing Company at Brighton. It was originally designed for use in connection with the maximum demand tariff for which Brighton is famous, and more than 100 are now successfully in use on the Corporation supply circuits. It consists essentially of a strong cast frame provided with lugs for screwing to a vertical wall (or it may be stood on a bracket), carrrying the following apparatus: (1) a heavy pendulum about 10in. long, with regulating screw for adjusting the length of the pendulum to get very accurate time-keeping; (2) a small solenoid coil wound with fine wire; (3) a make-and-break arrangement in series electrically with (2), and connected across the supply mains; (4) an iron core attached to the pendulum and oscillating with same in and out of the solenoid; (5) pallett mechanism, and an ingenious arrangement for making contact at (3) when the oscillation of the pendulum falls to a certain point—both these mechanisms are carried by the pendulum; (6) an ordinary clock dial face provided with hands; (7) a dial provided with hands which may be set to operate the trip mechanism at any desired time—by this means the time of making and breaking circuit can be nicely adjusted; (8) an ingenious trip mechanism actuated by the dial (7); (9) a weight, which we will call the striking weight, to which is attached a striking rod; (10) a mercury change-over switch, having either four or eight terminals, according as the instrument is used on a two-wire or three-wire circuit; (11) a weatherproof cover provided with sealing arrangement and having two glass windows, one for the clock face and the other to indicate whether the lamp or other circuit is switched on or off.

The action of the switch is briefly as follows: The instrument having been suitably connected up, the heavy pendulum is started by hand and the mechanism (2), in conjunction with (3), keeps the clock going, an impulse being given three or four times a minute. When the proper time arrives for the lamps to be switched in, circuit (7) operates to trip (8), which allows (9) to come into play. The weight falling a short distance strikes the change-over switch a sharp blow and knocks it over, while at the same time the weight is pulled up again ready for the next trip by a suitably arranged spring. When the time for breaking the circuit arrives this process is repeated.

The writer has tested a number of these switches for several months and has not found a single instance of the clocks stopping so long as the pressure is maintained at the terminals of (2) and (3). The action of the mechanism is accurate and reliable, and they have apparently a very large field of usefulness. The overall dimensions of the complete instruments are about 14in. by 7in. by 7in. By suitable modifications a single clock can be made to operate *any number* of switches either at the same time or at *different times*, and the switches, each controlling a separate circuit, can be placed at any distance from the clock, the only connection required being a couple of small wires (bell or telephone wires). No sketch is given as it would require a detailed drawing to show the exact arrangement (which is patented), and not really complicated, but doubtless the manufacturers would be pleased to give information and quote for same.—E. D. W.

ELECTRIC FIRE PROTECTION.

One of the earliest uses to which electricity was put was that of giving alarm in case of fire. The form of apparatus first used for the purpose consisted of the ordinary mercury thermometer, in the stem of which are fused two wires. The first of these is in the mercury bulb, while the second s placed up the stem at a point corresponding to the temperature at which an alarm signal is to be given. This type of apparatus has one or two serious defects, and we presume that it is owing to this that electric fire-alarm systems have not been sufficiently recognised either by the fire insurance companies or by the fire brigade authorities of some of our large towns. In this respect the London Fire Brigade is the chief offender, in that it refuses to allow in its fire stations any automatic signalling apparatus for giving direct alarms of fire from private systems Quite apart from the details of any of the various systems now on the market, the subject is a most interesting one. An examination of the facts concerning particular instances of fires which have been exceptionally severe in causing damage and loss of life is especially so, as showing how these losses could have been minimised. Taking first any particular factory or building most liable to fire risk, there is likely to be an internally-organised fire service. In fact, in certain instances we have in mind the fire-extinction apparatus installed in factories are amply sufficient to meet all contingencies without calling on the brigade. In all of these, however, electric fire-alarms are used, in order that the firemen taken from amongst the employés may have prompt warning both that a fire has occurred and of its locality. The protection which these firemen are able to give entirely depends upon the hold which the fire has obtained before they are able to commence playing water on to the same. In other instances, while a fire service is organised amongst the staff, outside help is relied upon, and here it is that there is most need of prompt connection between the firm and the fire brigade. With the present attitude of the London fire brigades there are two ways in which a call can be made—the first is by telephone, and the second by utilising one of the fire-alarms placed in the public streets. Both of these call for individual effort at a time when confusion reigns, with the result that many more lives are lost and much more damage is done than need be. As an example, without mentioning names, we would instance a fire we have full particulars of, in a building which was amply provided with electric fire-alarms, and which was situated within two minutes of a fire brigade station. A fire occurred which the staff were quite unable to cope with, and nearly ten minutes elapsed before anyone remembered to call in the brigade. As a result several lives were lost which could have been saved if the warehouse in question had had its electric alarm system connected up to the brigade. Elsewhere in this issue will be found some particulars of some trials made in Glasgow on Wednesday last at the offices of the *Glasgow Herald*. The fire, of course, was an artificial one, and hence we should deprecate any close comparison between the electric fire-alarm and the automatic sprinklers as a means of securing protection. The interesting fact is that the fire brigade received warning of the fire in one minute four seconds from the time it was lighted, and that they were on the spot within five minutes. There was an interval of eleven minutes twenty-two seconds from the lighting of the fire before the automatic sprinklers went off, so that with the conditions of the test the electric alarm obtained the attendance of the fire brigade some six and a half minutes before the temperature had risen sufficiently to operate the automatic sprinklers. This fact should impress fire insurance company experts

Digitized by Google

with the advantages of the electric system when connected right up to the fire brigade, and if they are convinced we look for two results: the first is that such connections between fire brigades and large premises having electric alarms will become universal; and, secondly, that the electric fire-alarms will entitle their users to a reduction in premium. At the present time this method of coping with fire risks is, we believe, the only one not recognised by the tariff offices when fixing premiums.

CORRESPONDENCE.

Justice needs that both be heard."

WATER-LEVEL INDICATOR.

SIR,—In reference to the above subject, I have examined the provisional specification No. 1,748 of 1878, and handed same to my patent agent, who informs me that I am in no way infringing Mr. Kelway's invention. I shall be glad to demonstrate my system to Mr. Kelway if he will kindly make an appointment. I shall not, however, be at our London office until the end of present month.—Yours, etc.,

C. MAY.

Glasgow, Nov. 3, 1903.

STEAM-TURBINES.

SIR,—In your issue of Oct. 30 you print an abstract of a paper by Mr G. Wilkinson on "Steam Turbo-Electric Generating Plants." The author gives in parallel columns the supposed performance of a 1,400-kw. set, with triple-expansion reciprocating engines, recently erected by us at the Leeds central station, and that of a steam-turbine at the Newcastle and District Electric Lighting Company's works. We say supposed performance, because the actual result for our set was 19·49lb. per kilowatt, and not 19·9lb, and this, again, was water measured into the boilers, and includes boiler and steam-pipe losses, the actual engine consumption measured at the hot-well (as, no doubt, in the case of the steam-turbine) being only 18·7lb. per kilowatt.

The turbine was, moreover, running at 237deg. F. superheat, whilst we had about 71deg. F., which, of course, makes an enormous difference. With triple-expansion engines of 500 b.h.p. running at 25·4in. vacuum, and with 200deg. F. superheat, we have obtained 16·1lb. per kilowatt, and with 237deg. F. superheat we should be prepared to guarantee for the Leeds engine something under 16lb. per kilowatt, as against the 17·73 shown for the 1,750-h.p. turbine. Immediately preceding the above comparison, figures are given for a Sulzer-Kolben plant with *saturated* steam and *24in. vacuum*, and a Parsons turbo-generator with *100deg. superheat* and *28in. vacuum*. Such comparisons are, of course, worthless and misleading. The 4in. difference in vacuum at 4 per cent. per inch as given in the paper means 16 per cent. to the turbine, and the 100deg. of superheat another 12 per cent., as also stated, so that after due allowance has been made for the vacuum and superheat, the result for the turbine comes out worse and not better than the other.

Again, the tests of the 500-kw. turbo-alternator at the Cambridge electricity works, after 12 months' running, are made with 9lb. higher steam pressure and 3·3in. better vacuum than on the original test, when 24·1lb. per kilowatt was registered. At the 4 per cent. per inch, the vacuum is good for 13·2 per cent., and the consumption should have come down to 20·92lb., or allowing for the working of pumps, say, 21·5lb., but instead of this it goes up to 25lb., and yet the conclusion is come to that the trials show that there has been no deterioration due to wear.

It is in our opinion regrettable that advocates of steam-turbines should make such misleading statements. At the present date the turbines of Mr. Parsons's make or design are the only ones having any claim to be considered beyond the experimental stage, and the latest tables published in the electrical papers giving the figures for 12 months' running show that these turbines are very far from behind reciprocating engines in economy in actual central-station work, though the results with them on the test-plate were supposed to be good.

The present booming of the turbine will surely result in a serious set-back when experience has been purchased at a heavy cost by the users.—Yours, etc.,

BELLISS AND MORCOM, LIMITED.

P.S.—It should always be borne in mind that the cost of obtaining the high vacuum necessary for efficiency with steam-turbines may become a very formidable item in the majority of inland stations.

THE "PHIELASHOK."

SIR,—My attention has been called to a notice in your last edition concerning the introduction by Messrs. Oliver and Co. of an appliance called a "Phielashok." I am greatly

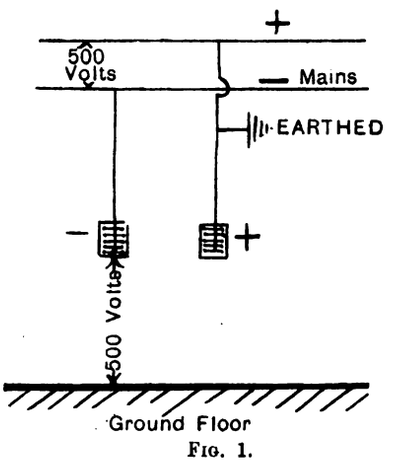

FIG. 1.

surprised and almost "shocked" that such an instrument should ever have been invented. I feel quite sure that if it be used on a great many of the electrical installations now at work, very unpleasant, if not disastrous, consequences will be experienced. In order to use the "Phielashok," one hand must be placed *directly upon* one pole of the circuit. What, then, will be the effect if the other pole at some other part of the installation is earthed through damage or accident?

The sketch will show how an operator will take, with his bare hand unprotected, a shock of the full supply voltage, whether that is 100, 200, 500, or 1,000 volts. By reference to Fig. 1 it will be seen that the operator will get a shock through left hand, arm, and feet to earth without the slightest current passing through the "Phielashok." Then, again, in Fig. 2 it is seen that the circuit

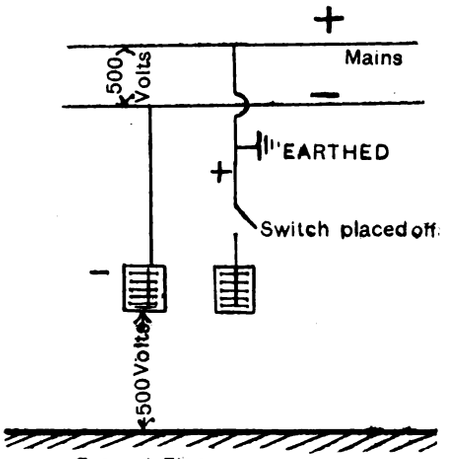

FIG. 2.

may be opened on one side, and still the operator will get the same violent shock. In this case there would be no advantage and no indication with the instrument.

No doubt need ever exist in the minds of those engaged in the repairs or alterations to electric circuits as to whether certain wires are "alive" or not. I always recommend and never fail to use a simple appliance, cheap and inexpensive, and, above all, always handy, for it is to be found on every

Digitized by Google

electrical installation, both large and small. Its parts consist of one lamp (of normal voltage), one lampholder to suit, and two pieces of $^1/_{18}$ insulated wire. Wire together in the usual way, and it is complete. There is nothing new in this, but it is the best friend I have ever met when on duty amongst live wires. It is really wonderful how much assistance and information this humble appliance will give when intelligently applied.

If you will permit, I shall be pleased at an early date to show to those of your readers who are employed on live circuits how a good deal of the everyday troubles may be tracked down and located.—Yours, etc., J. ISAACS.

11, Highfield-terrace, Somerby-road, Grantham.

A NEW GRAPHITE RESISTANCE.*

The large number of patents taken out for the employment of graphite for electrical resistances shows how strong a desire to use graphite for such purposes exists. The

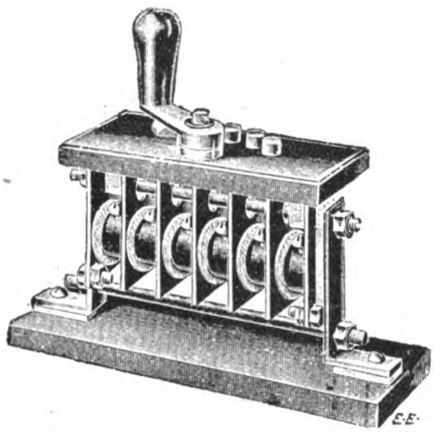

FIG. 1.

writer has for several years been working in this direction, and his latest results are given below.

Figs. 1 to 4 shown the form taken by these resistances. The graphite is in the form of a powder, and is put into separate iron rings closed at the ends by iron plates, which are, however, insulated from the rings by mica and asbestos. The iron plates carry the current and also serve to rapidly dissipate the heat generated inside. As many such cells

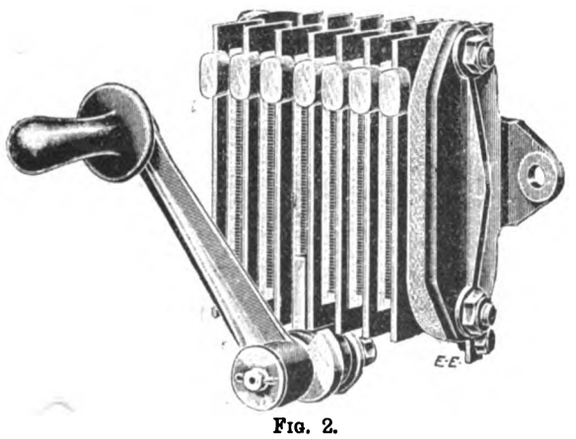

FIG. 2.

as are required can, of course, be connected together in series. If such a resistance, say a 6-h.p. 220-volt starting resistance, is connected directly to 220 volts, the current commences at about five amperes, but increases in less than 10 seconds to 35 amperes. Within the next five seconds it will increase to over 100 amperes, so that the resistance has fallen from 42 ohms to 6·3 ohms in the first 10 seconds and to 2·2 ohms in the next five seconds. If, however, after the first 10 seconds an additional adjustable resistance is put in series and regulated to maintain a constant current of 35 amperes, the voltage across the graphite resistance will fall from 220 to about 130 volts within the next 10 seconds, and will then remain constant, however long the test be continued. The writer is of opinion that this and similar results are probably to be explained not by the heating, but by the fact that the numerous infinitesimal sparks occurring between the different particles of graphite serve to ionise the air remaining in the apparatus, and that then this air, rather than the graphite itself, carries the current.

TABLE 1.

Amp.	Volt.	Ohm.	Amp.	Volt.	Ohm.
0·1	40	400 0	2 6	127	49·0
0·2	43	215 0	2·8	130	46·5
0·4	54	135 0	2·9	132	45 5
0·8	66	82·5	3·0	135	45·0
1·0	76	76·0	3·4	144	42 5
1·2	84	70·0	4·0	164	41·0
1·6	96	60·0	4·8	183	38·0
1·9	105	55·5	5·5	202	36·8
2·1	113	54·0	6·0	216	36·0
2 3	118	51·3	6·3	221	35·0
2·5	122	49·0			

Table 1 shows the result of another experiment. A small resistance consisting of three cells, and which had been in

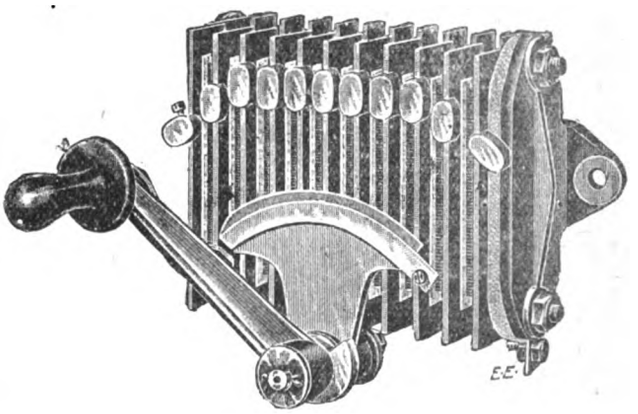

FIG. 3.

constant use for some time previously, was tested at different currents for quite short periods at a time, an interval of a quarter of a minute was allowed between each reading and the next, so that the resistance remained practically as cool at the end as at the beginning of the test. The resistance was quickly measured in each case by means of a dead-beat ammeter and voltmeter. It will be seen that at ·1 ampere the resistance was 400 ohms, whilst at 6·3 amperes it had fallen as low as 35 ohms. It is also clear that the differences between successive readings become smaller the higher the current strength,

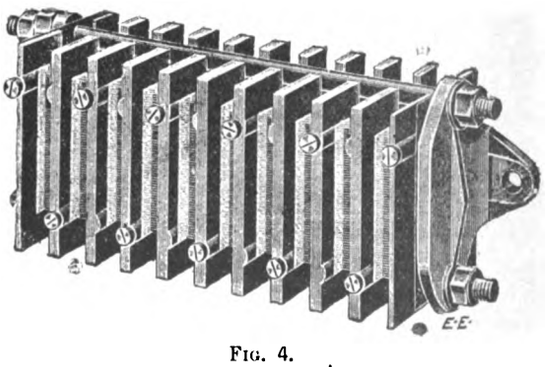

FIG. 4.

so that it would seem that the resistance finally becomes independent of the current. After the last reading the current was suddenly reduced to ·2 ampere again, and the resistance then measured 213 ohms against 215 ohms when quite cold. The apparatus was then connected direct on to 221 volts, and showed 6·3 amperes again. After five seconds' connection to 221 volts the current had risen to 7·5 ohms and the resistance load fallen from 35 ohms to 29·5 ohms. The current was then once more suddenly reduced to ·2 ampere, and the resistance then measured 195 ohms.

This same test was repeated with 10, 15, and 20 seconds' loading, and showed the following results :

* Translation in abstract of an article by R. Hopfelt in *Elektrotechnische Zeitschrift* for Oct. 8, 1903.

Digitized by Google

At start.				After 5 seconds.
6·3 amperes,	35	ohms	.....	7·5 amperes, 29·5 ohms.
				·2 „ 195 „
				After 10 seconds.
6·3 „	35	„	.....	8·8 amperes, 24 ohms
				·25 „ 140 „
				After 15 seconds.
6·4 „	34·5	„	.....	12 amperes, 18·4 ohms.
				·35 „ 71·5 „
				After 20 seconds.
6·7 „	33	„	.....	18 amperes, 12·3 ohms.
				·4 „ 37·6 „

An interval of half a minute was allowed between the tests. From these readings it is clear that after a considerable current has passed, the resistance rises considerably even in the first tenth of a second after reducing the current, showing that the resistance is practically dependent on the current strength and not on the heating.

As a further test, various currents passed for sufficient lengths of time for the resistance to become constant. After each test an interval of half a minute was allowed, and the following results were obtained:

At start	5 amperes	171 volts,	34·2 ohms
After 85 seconds		140 „	28 „
At start	8 „	165 „	20 6 „
After 60 seconds		115 „	14·4 „
At start	12 „	150 „	12 5 „
After 50 seconds		96 „	8 „
At start	15 „	115 „	7·7 „
After 40 seconds		70 „	4 7 „

These readings show that the higher the current, the shorter the time required for the resistance to become constant. Half a minute after the above tests weak currents of various amounts were passed through the resistances for about a second, and the resistances then measured showed that, although fairly hot, the original cold figures, especially at the higher currents, were almost repeated. After an interval of five minutes the exact original resistances had been reached once more, although the resistance was not yet quite cold. As a result of these changes of resistance, these regulators can be constructed with comparatively few contacts, and yet motors started with them will run up more evenly than with wire starters.

For cases in which a considerable change of resistance would prove harmful, the regulators must be so constructed that the changes of resistance are kept within the permissible limits This is the case, for instance, in feeder regulators and in tramway and crane work, since the resistances are often required for speed regulation.

These regulators are already largely employed for such purposes, as well as for ordinary motor starters, their small size being in their favour. They are also supplied as arc lamp resistances, as accumulator-charging resistances arranged with minimum current cut-outs, and also for use with accumulators charged at constant pressure, as they prevent the excessive rise of current at starting.

SOME NOTES ON STEAM TURBO-ELECTRIC GENERATING PLANTS.*

BY GEO. WILKINSON (MEMBER).

(Concluded from page 659.)

Economy in Steam Consumption.—According to the published data, the maximum steam consumption guaranteed by the builders of the Sulzer-Kolben plant works out with saturated steam at 150lb. pressure and a vacuum of 24in. at 22·2lb. per kilowatt-hour at full load, 23lb. per kilowatt-hour at half load. The makers of the Parsons turbo-generator guarantee the steam consumption, with steam at 150lb. pressure, vacuum of 28in., and superheat of 100deg. F., at 17·5lb. per kilowatt-hour at full load, 20lb. per kilwatt-hour at half load. I have not the exact steam consumption of the 5,000-kw. Curtis turbine which is running in Chicago, but it is a much more economical plant in this respect than the Sulzer-Kolben plant referred to above. At low loads the efficiency of turbo plants is shown by published returns to be superior to that of ordinary steam-engine generators of equal capacity. A further interesting comparison in this respect is given between the most economical of the two 1,400-kw. two-phase plants with triple vertical engines recently installed in the Leeds electricity works and the 1,750-h.p. direct-current turbo plants installed last year in the works of the Newcastle and District Electric Lighting Company.

—	Speed.	Superheat.	Kilowatts.	Steam pressure.	Vacuum.	Water per kw. hour.
				lb.	in.	lb.
Leeds	200	·76° F.	1,400	183	25·6	19·9
Newcastle.	1,710	237° F.	897	145,	26·5	17·73

Other advantages which may be named are as follows: (1) No expensive cylinder oil is necessary such as is demanded by reciprocating engines using superheated steam. (2) There is no oil in the condensed water, and it may be used for boiler feed without the provision and use of expensive and troublesome oil separators. (3) There are no "big ends," packings, and bearings to take up. (4) There is less difficulty in maintaining a good vacuum, there being no piston and valve rod packings through which air may gain admission to the condenser. The importance of a good vacuum is obvious in view of the fact that every 1in. of vacuum above 25in. or 26in. has been found to reduce the steam consumption by about 4 per cent. (5) A greater degree of superheat may be maintained with a great gain in efficiency and no danger. Tests on a 500-kw. turbo-generator have shown an improvement in steam consumption resulting from a superheat of 50deg. F. of about 8 per cent., and at 100deg. F. it averages about 12 per cent.

There are no figures, so far as I can find, showing the economy effected by using very high superheat, but I believe further economy in steam will be obtained in this direction provided the vanes at the high-pressure end of the turbo are made of a metal which does not become brittle at high temperatures. In the case of large engines of the usual types it is not advisable to superheat the steam by more than 200deg. F., and in some cases there is much trouble with the valves if the superheat exceeds 150deg. F., but in the steam-turbine there are no such limitations. In a recent paper read before the Institution of Naval Architects, Prof. W. H. Watkinson made the following interesting observations on this subject: "The steam-turbine is the only engine in which condensation of the steam by previously cooled internal surfaces does not take place; but the steam in turbines is, of course, wet from another cause—namely, on account of the expansion it has undergone while doing work—and the efficiency of this type of motor is very considerably increased when the steam is superheated prior to its admission to the engine. In steam-turbines the reduction in the amount of steam required when superheated steam is used is due mainly to the increased volume and the decreased frictional resistance between the rotating vanes and the steam. In steam-turbines of the De Laval type, using saturated steam, the discharge from the nozzle is generally more or less intermittent, due to the intermittent choking of the nozzle with the water in the steam. When the steam is superheated the discharge from the nozzle is free and continuous, and the velocity, and therefore the efficiency of the steam, is on this account still further increased."

So long as proper adjustments are maintained between the fixed and moving vanes, the efficiency as to steam consumption appears to be well maintained. This is shown by comparing a test made by Prof. Ewing on a 500-kw. turbo-alternator, driving its own air and circulating pumps, which had done heavy duty at the Cambridge electricity works for a period of 12 months, with a test made on the same plant 14 months earlier by the Cambridge Electric Supply Company's engineer, as set out below:

Date of test.	Steam pressure.	Vacuum.	Load in kw.	Lbs. steam per kw.-hour.
	lb.	in.		lb.
Prof. Ewing's tests,	148	27·8	518	25
January, 1901.	151	28·2	273½	28·3
Engineer's tests,	139	24·5	526·4	24·1
October, 1899.	145	26·6	256·1	27·5

In Prof. Ewing's tests the steam was not superheated, and there was no water separator, but water which collected in a pocket under a vertical limb of the steam-pipe leading to the engine was from time to time blown off. In the case of the engineer's tests in 1899 dry steam was used, and the turbine was not driving its own pumps. Prof. Ewing concludes his report as follows: "Considering the altered conditions in these two respects, I am of opinion that the results of the present trials show that there has been no deterioration due to wear." This view is confirmed by the following tests taken on a 300-kw. Parsons turbo-generator under my own control, in which the tests made at the Harrogate electricity works in February, 1902, are compared with tests made in the same works and under precisely the same conditions after over 19 months' heavy work. It will be

noted that the results of the 1903 tests are better than those of 1902, which may be partially owing to the increased speed, but chiefly to the fact that the number of the vanes in the high-pressure end were found broken off on opening out after the tests of 1902.

In concluding these notes I have to express my thanks to Messrs. Parsons and Co., the Brush Electrical Engineering Company, the Thomson-Houston Company, and to Messrs. Greenwood and Batley, who have willingly placed data at my disposal.

DISCUSSION.

Mr. Wilson Hartnell said that he would like a little more information, especially on the small points in which Messrs. Willans and Robinson's turbine differed from the Parsons. In conversation with Mr. Robinson he had told him that he thought the time for reciprocating engines for electrical work was slowly coming to an end, and he himself fully recognised that fact. One point he might mention was that of driving at a uniform speed. He mentioned a town where there were 50-h.p. motors driving direct, and which had given trouble owing to the pinions wearing as much on the back as on the front side. To get the same low consumption of steam with a reciprocating engine as with a turbine, the very greatest pains in every direction would have to be taken.

Mr. Holiday said that he had been using Parsons turbines at a colliery since 1895. When asking for quotations for reciprocating engines and turbines, the reciprocating engine-makers told them that they could not do a worse thing than get a Parsons turbine for power purposes, but in spite of that they got two 150-unit machines, and were so pleased with them that they had now got more. They were not big units, the largest being about 300. Being a new thing, a little difficulty was experienced at first with the very varying loads, due to the armature connections breaking off at the commutator. That was owing to insufficient flexibility, but was overcome, and since then the trouble had not recurred. He had some reciprocating engines driving dynamos, and the attendants said they would rather run the whole of the turbines than one of the reciprocating engines. Messrs. Parsons had fitted an automatic brush rocking gear, which consisted of a piston with a spring on the top. It always drew the brushes back to the normal position as the steam pressure on the first blade was always proportional to the load. There was a pipe from this first row of blades underneath the piston, the steam from which always worked against the piston locking the brushes This had been running for 18 months, and had caused no trouble whatever. The speaker mentioned a rather curious fact—namely, that there was one megohm of resistance between the steel spindle of the turbine and the frame of the bearings in which it was running, the film of oil on the bearings being sufficient to insulate the shaft.

Mr. S. D. Schofield thought that the steam-turbine was the greatest advance in heat engines since the days of Watt. Many who had seen the large reciprocating engines at Pinkstown power station, Willesden, and other places, had no doubt wondered whether it would not be possible to obtain the same capacity by utilising the power of the steam direct in a rotary. One great advantage of the turbine was its low first cost, and also the inexpensive foundation required. The machine itself in the smaller sizes could be moved to suit the pipework, condensers, etc. Some 12 months ago he had occasion to borrow a 120-kw. machine from Messrs. Parsons until they could deliver a larger size, and to save expense of special pipes, he borrowed a number of scrap 12in. cast-iron pipes, bolted them together the best way they would fit, and then set the machine to suit them. With reference to the suggestion that in the Curtis turbine the condenser could not be driven from the shaft, he would suggest that a separate motor-driven condensing plant was much better, as he found that even driving the force pumps at times spoilt the governing of the machines. In the older type of the Parsons turbine both pump and governor were driven from one vertical shaft, and on two machines slight hunting of the governors occurred due to the reciprocating motion of the pump, causing the governors to slow up, owing to the back lash of the gearing. With regard to the claim that no expensive cylinder oil was necessary, he held, however, that an expensive lubricating oil was necessary. On two occasions he had had trouble with oil, once due to the water and oil combining, and the second time to impurities in the oil attacking the cast-iron reservoir and choking up the oil passages. He had found it a good thing to draw off a few gallons of oil each day, putting it into the filter and making up the deficiency with filtered oil. With regard to superheating, he had tried one machine with steam superheated over 600deg., and had not had the slightest trouble with the blades. The tests on a 200-kw. machine taken on Aug. 1, 1903, worked out as follows:

Steam pressure.	Superheat, deg. Fahr.	Vacuum, inches.	Load, in kilowatts.	Speed.	Lbs. of steam per kilowatt.
150	56	26·5	half load	3,000	26·6
150	56	26·5	full	3,000	22·23
150	166	26·5	half load	3,000	24·41
150	181	26·5	full	3,000	20·39

Note.—Excluding power for air and circulating pumps. Decrease of steam consumption for higher superheat = 8·3 per cent.

Mr. Stoney said that with respect to economy of space both Parsons and Curtis turbines were exactly the same, whilst the Curtis was double the height, and therefore took up double the amount of engine room. He would also like to know how the Curtis turbine could be taken to pieces when anything went wrong, as it appeared to him that the whole of the alternator would have to be lifted off. With regard to a vertical clearance of about $\frac{8}{100}$in., he would like to know how they managed to obtain such a small clearance as that. With reference to the tests given at the end of the paper, these tests were made on a 1 500-kw. machine, and results obtained now were 2 per cent. better than these, which were made 16 months ago. Regarding the oil consumption, he had both reciprocating engines and also turbines, and they saved £5 a week in oil for a load of 600 kw., being equivalent to a steam consumption of 2lb. per kilowatt-hour less.

Mr. Jackson said that the Curtis turbine was in no way an infringement of the Parsons patents. It was stated in the paper that in order to get the steam consumption one must multiply by 10 and divide by 6, but he would suggest that the figure be increased to 7, otherwise it put the efficiency of the generator rather too low. The friction with the Curtis turbine was so small that they could turn the governor balls round by hand. Mr. Jackson added that the Curtis people would shortly deliver a continuous-current turbine in which, he thought, they had overcome certain difficulties peculiar to that type.

Mr. W. J. A. London, referring to the De Laval steam-turbine, in which there was only 2mm. clearance between the exhaust end of the nozzle and the wheel, said he had always understood that steam issuing from a properly-constructed nozzle flowed in a parallel stream for a considerable distance, and that a clearance of 20mm. or so could be allowed without decreasing the efficiency. To bring out the point of parallel running still more, he would like to mention the instance of the Parsons-Brown-Boveri turbo-generator of 3,000 kw. installed at Frankfort. That machine was started up and put into parallel with a slow-speed machine without the slightest difficulty and without assistance from the turbine expert. He referred to the difficulty of dismantling a vertical turbine, and thought that it was very much more difficult to dismantle than the same machine would be if built on a horizontal plane. Referring to the Westinghouse turbine, the new machine was a modified combination of the De Laval and Parsons type, steam entering at the centre of the cylinder and issuing both ways through a series of stationary and revolving nozzles, the low-pressure expansion being taken care of by Parsons blades. The Westinghouse people had recently guaranteed on an 1,800-kw. machine, with a steam pressure of 180, vacuum 27½in., and superheat of 150deg., 16·4lb. per kilowatt-hour. The over-all length of the 5,500-kw. turbine for the London Underground Railway would only be about 40ft., which compared favourably with any slow-speed horizontal reciprocating steam-engine. The total weight of the combined plant was about 200 tons, being about one-third of the 3,500-kw. Sulzer-Kolben plant. He failed to see how any additional ventilation was obtained in the Curtis turbine, because with the generator being placed directly above and the steam entering at the top one would think there would be a great deal of radiation, and that the hot gases from the turbine would arise and heat up the generator to a greater extent than in a horizontal machine. With reference to oil economy, the speaker gave the following results, which he obtained whilst with a Continental firm, the machines being of 1,000 kw. output: reciprocating engine plant (per day's run of 24 hours)—four gallons engine oil, four gallons cylinder oil, four gallons filtered oil; steam-turbine—·8 gallon engine oil, ·4 gallon cylinder oil. Assuming a station of 10 units of 1,000 kw. reciprocating plant, and taking an average price for oil and assuming the machines to be giving two-thirds of their output all the year round, the oil bill for the year would come out about £2,300, whereas that of a turbine station would only be about £300. Considering the London Underground station consisted of a total kilowatt of 44,000, the saving would be quite a big factor, and he thought that the oil consumption was a point which should receive more consideration than it did.

Mr. A. B. Mountain said that the figures they had had given them showed what excellent results could be obtained providing the superheat was very high; but what was the difference in the coal bill? They knew a certain amount of coal had to be burnt to produce superheat, and he thought it was unfair for the author to compare the Sulzer plant with the Parsons plant, because in the one case he had a plant with saturated steam and in the other case one with 100deg. superheat. And, again, in one case there was 4in. more vacuum than in the other. He thought that the Curtis turbine would have a larger diameter than the Parsons. The other day he had a steam leakage of something like 100ths of an inch, and he was astounded at the amount of steam which could pass through that little space. It was obvious that if the diameter was increased, the leakage past the edge was also increased.

Mr. Samuelson said that by superheating 100deg. the steam consumption was reduced 1lb. Previous speakers had alluded to the fact that it was impossible to superheat without some expense. He would assume the consumption to be 19lb, and that they had improved their efficiency 10 per cent. That 10 per cent. was made up as follows: Four-tenths had been added in heat, and more coal had had to be put on the fire, but 2 per cent. more was obtained from the superheated steam. The quality which that steam had gave another 2 per cent., because when wet steam went through the machine the friction was very much greater than when the steam was dry, and thus nearly 6 per cent. represented the total gain. The speaker then gave some tests on a 500-kw. Curtis turbine, the steam pressure being 150lb., superheat 150deg., and vacuum 28½in. The full load consumption was 18·75lb. of steam, half load 20½lb., and quarter load 22½lb. The turbine was under-rated, as it was really a 750-kw. machine, and could be run up to 900. For 50deg. of superheat he had obtained 9½ per cent., and for 100 deg., 14 per cent. improvement in steam consumption. With reference to the machine being taken to pieces, there had been no occasion to do so since it was erected. Should that be required it is only necessary to lift the generator up a couple of inches or so, when the turbine could readily be got at. In that machine the temperature was not high inside as in the Parsons, being only 220deg He should like to add that the machines were designed to give a full load when running non-condensing, which meant that the steam only did half its work. The weight of a 1,500-kw. machine was 60 tons, and of a 3,000-kw., 130 tons. He

Digitized by Google

also added that the blades on the wheels were cut from the solid, so that they would stand any amount of superheat.

Mr. Barker said that it was his privilege to have been the station engineer of the second turbine station in this country, and the history of that station (Cambridge) had been a continued success. The coal costs were rather high, the output being less than 500,000 units. The station was two miles away from the centre and transmitted a quarter of a mile before getting to a consumer. The centre of the town was composed of colleges, and the density factor could never be high. The coal cost of ·66d. per unit sold would have been equal to ·5d. if it had been direct current. Another thing was that the coal cartage was 8s. per ton from the pit to the station, whilst in their district, with cheap coal, the cost could be brought down to something like ·25d. or ·2d. per unit. He added that the blades in the Parsons turbine did not come out, although on one or two occasions through faulty material they had broken off, but such a thing was nearly unknown in the Parsons turbine.

Mr. Wilkinson, in reply, said that he did not anticipate any difficulty in replying to criticism, inasmuch as the subject matter consisted largely of statements and facts. He did not agree with the view of some speakers that the days of the reciprocating engine, so far as electric power stations are concerned, were numbered, as, notwithstanding the assurances which had been given that all the objections named as to the fitness of steam-turbines for driving direct-current generators were surmounted, there was no doubt that the future of direct-current generation laid with the slower reciprocating engine, at least until a type of turbine was perfected to run economically at speeds not exceeding 500 per minute. Automatic rocking gear for the brushes of direct-current generators, operated by a piston in a steam cylinder connected to the turbine side of the throttle-valve governor, had been named, but that was a makeshift device, and did not get over the difficulty of excessive wear and tear on the commutators and collecting brushes. He regretted that they had had no definite information given them as to the effect of high superheat, and he would suggest that it would be highly interesting and useful if they could have a paper dealing with the economics of superheat, both with reference to steam-turbines and reciprocating engines, setting forth exactly at what point the advantages of superheating were nullified by the increased consumption of fuel to produce such superheat. It had been suggested that it was unfair to compare the steam consumption of the Sulzer-Kolben plant with the Parsons plant, inasmuch as the results in the latter were obtained by superheating 100deg. with a 4in. better vacuum, but he contended that it was useful to compare results obtained in actual practice. It would be interesting to know why advantage was not taken in the Sulzer engine of the increased economy obtainable by superheating. Possibly it was not easy to improve the vacuum on the reciprocating plant, whereas one of the advantages of turbines was that no air was drawn into the condenser. A fertile cause of low vacuum in reciprocating plants was air leakage at the low-pressure piston rod and valve packings, and in such cases he found it of great advantage to waterseal the packings at the low-pressure end, especially in the case of engines with metallic packings. Recently in a 600-h.p. plant he had obtained by that means 2½in. increased vacuum in the condenser.

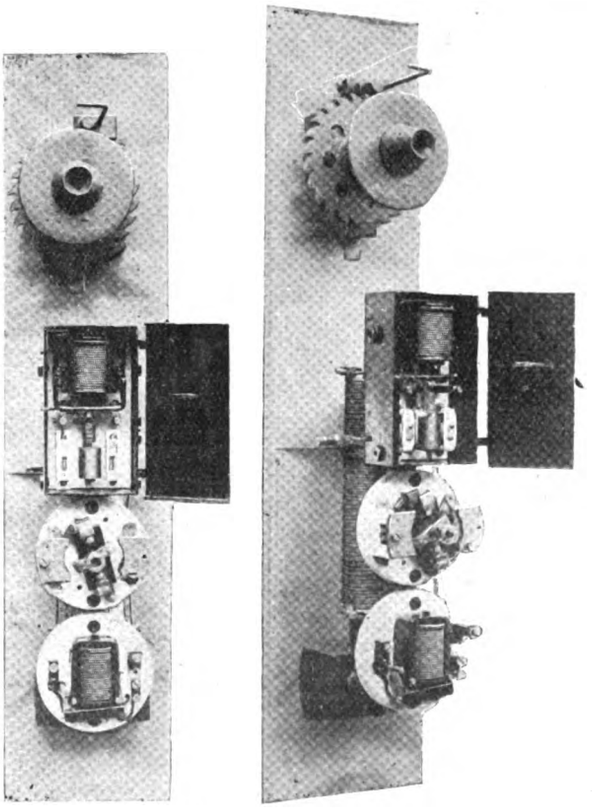
TRADE NOTICES AND NOVELTIES.

Arc Lighting in the Suburbs.

We draw attention to the new arc lighting of Kilburn, Harlesden, Hampstead, and Willesden, which has been carried out during the past year by the Gilbert Arc Lamp Company, Limited, of Chingford, for Mr. E. T. Ruthven-Murray, of Willesden, and Mr. G. H. Cottam, engineer to Hampstead, in which many of that company's most recent improvements and inventions have been made use of. The Hampstead lighting consists of lamps run in series off a constant potential of about 1,800 volts, special machines being provided in the borough's alternating station to supply continuous current at this pressure. The Kilburn and Willesden lighting is carried out with lamps in series off a constant potential of 480 volts. All the lamps are interchangeable, and are fitted on similar posts, of which we give an illustration (Fig. 1). They are provided with lowering gear, which is a speciality with the Gilbert Arc Lamp Company, and has been adopted on almost all the important work which that company have carried out for the past two years. The external appearance of this gear can be seen in Fig. 1, and it will be noticed that neatness and strength are combined in the design. It is mechanically very simple, uses very stout double cord for suspension, which whilst adding immensely to the strength, at very slight expense, also avoids any twisting of the lamps and allows plain knife switch contacts to be used, which can be effectively and clearly insulated. When the lamp is in position it is supported independently of the cord by special catches. The lamps used are of the Gilbert Arc Lamp Company's improved type. The feature of this lamp, which forms a departure from the usual practice, is the great power of the striking portion of the arc lamp mechanism. In other words, the lamps are able to open out the arc to a much larger extent than is usual, and with a very slight alteration in the electrical quantities. The advantage of this is proved by experience at Hampstead, where the engineers have ammeters in each of the series circuits. The uniformity of the ammeter readings is said to be very marked. These lamps are of the type which have previously been described in our columns, containing 6ft. of carbon. Most of the pillars are fitted with two incandescent lamps, which are provided with unusually substantial cast-iron fittings, forming also a suitable reflector.

FIG. 1.—A Gilbert Arc Lamp as used at Kilburn and Willesden.

These incandescent lamps are controlled by "Gilbert" patent automatic switches. We shall later give a separate detailed description of this switch, but shortly we may mention that it



FIGS. 2 AND 3.—Complete Gear for the Base of Arc Lamp Posts as standardised by the Gilbert Arc Lamp Company.

is a simple direct magnet switch, and its action is controlled at will, from a distance, by means of a catch, which takes a distinct time in accomplishing its motion, so that it engages or not, leaving the switch open or shut, in response to a short or

Digitized by Google

longer application of electrical energy to it. The whole is contained in a neat cast-iron box 8in. by 4in. by 4in., and can be seen in our illustration of the "post gear." The box also contains double pole fuses and convenient terminals.

The gear used by the company in the bases of the arc lamp-posts will also be of interest to engineers, as this class of gear is too often unsatisfactory. In the usual way the controlling arrangements are independently fixed inside the post, and are quite inaccessible. As will be seen from our illustration, the Gilbert Arc Lamp Company build up a complete gear on one base-plate and insert it as a whole in the post base, where it is

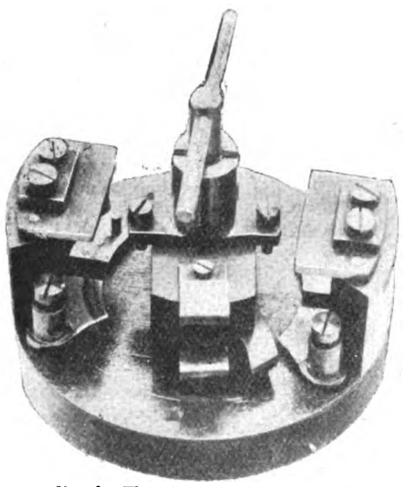


FIG. 4.—The Gilbert Arc Lamp Switch.

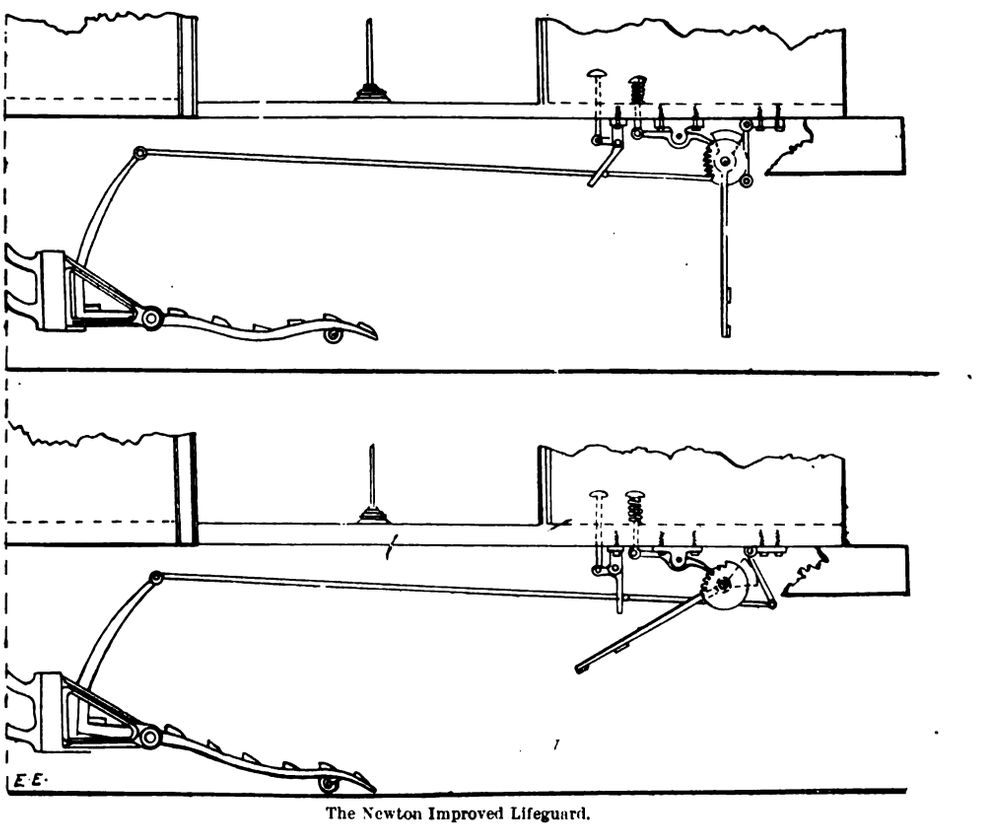
secured by two bolts. The various units of the gear, which can be seen in Figs. 2 and 3, have been specially designed by the company with a view of being used together. They are all mounted on porcelain bases so as to give a high insulation, and these are attached to a light iron frame. It is this iron frame which is fixed on to wood blocks in the post. The arc lamp resistances are kept a considerable distance away both from these wood blocks and the various cables. Any water of condensation falling down the inside of the post is kept off the apparatus by an umbrella over the top of the gear. The first apparatus, which will be seen below the winch, is the Gilbert automatic patent switch, described before, used for controlling the incandescent lamps by means of the arc lamp circuit. Beneath that is a special switch (Fig. 4) carrying out all the operations required in an arc lamp-post. It is a turn switch, mounted on porcelain, provided with a quick break. The break is double-pole, and is capable of dealing with ease with 20 amperes at 500 volts. The switch acts when necessary as a starting switch, utilising the compensating resistance as a steadying resistance—*i.e.*, switching on at the first position nine lamps out of ten, plus one substitutional resistance. In a few moments the tenth lamp can be put in in place of the resistance. This is always useful, and particularly so with such powerful and free-range sensitive lamps as the Gilbert. Of course, this switch will further act as a switch to cut the lamp out of circuit if required. The next porcelain base carries the automatic cut-out and strong terminals, capable of gripping and supporting the leads. The chief features of the cut-out are the absence of any part likely to stick or jamb and its unusual power, enabling a stiff rubbing contact of bronze to be used having a definite self-cleaning rub, which the firm have found to be more satisfactory than any touching contacts of carbon or any special metal. The resistances are made of steel wire wound on the usual spiralled porcelain formers, care being taken to securely clamp them from end to end, so that there is no harm done should they crack from the heat.

The Newton Lifeguard.

Mr. D. Newton, of 27, Hart-street, Southport, has put on the market a new tramcar lifeguard, of which the following is an illustrated description. It was recently tried successfully on the Southport tramways. It consists of a drop platform hung on trunnions fastened to the pilot board of a car, with an iron framework covered by wire netting, or wood laths, the back end of the guard being turned up to prevent an obstacle from falling off over its rear. Underneath and close to the front edge, which is slightly depressed, there are steel rollers, one at each side of this front portion of the guard, which run upon the rails when the platform is down, and keep the centre of the edge from contact with the ground, the rear end of the guard being sufficiently weighted to keep the guard in a horizontal position. Attached to the pilot board are adjustable brackets which uphold this weighted end, and can be made to raise or lower the front edge of the guard as desired. The gate in front automatically lowers the platform is struck by a body on the track, but it can also be lowered by the car driver by a foot-plunger, seen in the drawing. When the gate lowers the platform by means of the cams, seen in the drawing, it is locked by a pawl, and does not rise until this pawl has been released by the motorman. The advantages claimed for the "Newton" improved patent lifeguard are as follows: The platform or guard works loose on its pivots, and is retained in its position by counterbalancing weight only. The guard works both in conjunction with and independently of the gate, and is drawn down by the gate through the medium of the cam and lever. The guard is under direct control of the motorman, who can bring it down and return it to its position at will. The ratchet wheel and pawl arrangement, by which the gate and guard are locked. Last, but not least, there are no springs to get out of order. Major Druitt, an inspecting officer of the Board of Trade, has had this guard before him and tried the same, and approved of it subject to the Board of Trade requirements being carried out—viz., the placing of the drop platform or guard 2ft. 6in. away from the gate, which has since been done.



The Newton Improved Lifeguard.

LEGAL INTELLIGENCE.

SPEED OF TRAMCARS.

On Saturday the West London magistrate was further engaged in hearing the summonses against four drivers in the employment of the London United Electric Tramways Company for driving their cars at a speed exceeding the limit of 10 miles an hour laid down in the Board of Trade regulations. The summonses were taken out at the instance of Mr. Moffatt Ford.

Colonel Matthew H. Purcell, the officer nominated by the Board of Trade to make an independent test of the speed at which the West London cars could travel, now gave evidence. He stated that he posted an assistant at the generating stations, and Mr. Parker, of the London Athletic Club, took the times. For his experiments he measured off a distance of one furlong at Goldhawk-road. With a flying start the following were the times made by the cars. No. 272: first trial, 34⅘ seconds, equals 13·006 miles an hour; second trial, 34⅘ seconds, equals 12·93 miles an hour; third trial, 32 seconds, equals 14·06 miles an hour. No. 75: first trial, 34⅗ seconds, equals 13·08 miles an hour; second trial, 33⅘ seconds, equals 13·37 miles an hour; third trial, 36 seconds, equals 12½ miles an hour. No. 60: first trial, 35⅕ seconds, equals 12·78 miles an hour; second trial, 36⅗ seconds, equals 12·29 miles an hour. No. 173: first trial, 33⅗ seconds, equals 13·39 miles an hour; second trial, 30⅗ seconds, equals 14·8 miles an hour. These results showed the highest speeds attained by these particular cars. Mr. Ford came up soon after the first test was taken, and said that unless the car was in exactly the same condition (number of passengers, etc.) it was no test at all. Mr. Ford then withdrew. The statement that Mr. Ford was not admitted to the test was untrue. Witness also tested two other cars that came along, and the fastest speed was 14·5 miles. Having ascertained the voltage power at the power station, he was of opinion that nothing was done to interfere with the test. He was not an expert.

Mr. Edward J. Smith, an electrical engineer, who was at the power station, said he did not think the system could have been interfered with.

Mr. Clifton Robinson, the managing director, said he gave instructions that the test was to take place under normal conditions. He denied that the cars could exceed 13 miles an hour.

The **Magistrate** said his difficulty was that evidence had been given as to the speed which was over the limit.

Mr. Ford then obtained permission to call **Colonel Crompton,** who said that, seeing there was no instrument in the car he was in to test the speed, he advised Mr. Ford to withdraw. He had tested the cars on other occasions, and they had exceeded the speed stated.

Mr. Evershed, of Chiswick, was of opinion that after passing Young's-corner on the day the tests were made the voltage was abnormally low, and the next day he communicated with Mr. Ford, whom he had not previously known. He judged by the speed and the lights.

A further adjournment of the hearing was ordered.

DISTRICT RAILWAY v. METROPOLITAN RAILWAY.

On Tuesday in the King's Bench Division, before Mr. Justice Wright, the Metropolitan District Railway Company brought an action against the Metropolitan Railway Company for a declaration that it was entitled to run over a certain piece of line affecting trains chiefly on the Inner Circle. For many years the two companies have run a joint service, and under an agreement the receipts derived from the traffic running between South Kensington and High-street, Kensington, stations are pooled. The District Company, however, claims the right to run over a piece of line and exchange its traffic from one line to the other at a junction just south of High-street Station, and divide accordingly. There had been previous contention, and the point at issue rested solely on the legal reading of documents.

Mr. Cripps, K.C., for the District Company, said it was not denying the right of the Metropolitan Company to keep its trains on its own line as long as possible. That was the right of both companies, but the District Company did claim the right to use this particular piece of line which belonged to it. As a matter of fact, what it now claimed to do was actually the method of working some years ago.

Mr. Robson, K.C., for the Metropolitan Company, pointed out that the piece of line in question was not sanctioned by Parliament, and it was clear this piece of line was not considered when parliamentary permission was given for the construction of the Inner Circle for a "continuous working" with the other portions of the line to the advantage of the public. What the District Company now asked for was rather a "discontinuous working" of the line.

His Lordship reserved judgment.

DEFINITION OF A WORKMAN.

At the Leeds Police Court on the 29th ult., the Stipendiary was called upon to define "a workman" in a case in which an estate agent's clerk named William Asquith was summoned for declining to pay the proper tram fare.

It was stated that on the evening of Oct. 1 the defendant travelled on a Stanningley car, and refused to pay more than 1d., the workman's fare. The conductor issued him a ticket under protest, and the defendant had since declined to pay the excess fare of 2d.

The defendant's reply to this was that the Corporation's by-laws provided that artisans, mechanics, and daily labourers might travel between certain hours at reduced fares, and he claimed that being in receipt of a weekly wage he was a daily labourer. Asquith added that since the date in question he had travelled at the reduced fare without any interference from conductors or inspectors.

The **Stipendiary** observed that in his opinion all this difficulty had arisen owing to non-compliance with the Act of Parliament, which provided not that workmen might ride on any cars between certain hours at reduced fares, but that the authorities should run cars specially for the purpose of conveying workmen.

In reply to the Magistrate, the **Conductor** said that if a man had soiled hands he should consider him a labourer. That was what they were given to understand was the definition in By-law 11 in their rules.

The **Stipendiary** (to the defendant): I understand that if you were working with your hands and making £4 a week you would be allowed to travel for a penny, but if you are a clerk earning 23s. a week you must not so travel.

Eventually his **Worship** said he would take time to consider the question, and adjourned the case *sine die*.

FERRANTI LIMITED.

Tuesday night's *London Gazette* contained a notification that a petition for the winding-up of Ferranti Limited has been presented in the High Court by a creditor, and that the same will be heard on the 17th inst.

PERSONAL.

A smoking concert was held at the Collingwood Hotel, Newcastle-on-Tyne, on Saturday, in honour of Mr. James Parmley Graham, who has just terminated his service of 15 years with J. H. Holmes and Co., as one of their commercial staff, to take up an important agency for the North of England for electrical and mechanical apparatus and materials. On behalf of the officials and staff, the secretary, Mr. Allen Crowe, presented Mr. Graham with a roll-top desk, and he was also the recipient of a handsome silver tea service from the firm.

Mr. C. F. Coldwell has been appointed electrical engineer to the Honley Urban District Council.

Subject to his passing a satisfactory medical examination, Mr. A. L. Coventry Fell has been appointed chief officer of tramways at a salary of £1,500 a year with retiring allowance, and on condition to give his whole time to the duties of his office.

On Thursday evening the general manager, Mr. W. Binns, on behalf of the staff of the tramways department, presented Mr. Robert J. Fardell, chief clerk of the tramways department, with a handsome leather travelling bag, fitted with toilet accessories, as a token of their esteem and good wishes on the occasion of his marriage.

The Rowley Regis District Council have appointed Mr. Evans, engineer to the British Electric Traction Company, as the engineer for the Council for the purpose of superintending the construction of the proposed new tramway from Old Hill to Blackheath.

Mr. H. England, who for the past 2½ years has been general manager of the municipal tramways at Sunderland, has resigned, having been appointed general manager for the Yorkshire Tramways Construction Syndicate, which proposes to establish an extensive system of electric tramways in Leeds, Wakefield, and West Riding districts. The Sunderland Tramways Committee had been prepared to recommend that Mr. England's salary be advanced by £100 a year till £700 was reached, but he is going to receive £700 per annum at once, rising to £900, with a five years' engagement.

The Norwich Electric Tramways Company have reappointed Mr. George Moore Chamberlin, of Norwich, to be one of the directors of the company.

We are informed that Mr. H. Smethurst, having terminated his engagement with Messrs. Wheatley Kirk, Price, and Co., London, after 18 years' service with the firm as chief of the staff, has commenced business as valuer, etc., to the engineering and allied trades under the style of H. Smethurst and Co., at 37, Ommaney-road, New Cross, S.E. Prior to his connection with Messrs. Wheatley Kirk, Price, and Co., Mr. Smethurst was a pupil of William Galloway, jun., Manchester, afterwards draughtsman and assistant to Mr. R. Heber Radford, consulting engineer and valuer, Sheffield; science and art master, Sheffield, under the Science and Art Department; first-class certificate in iron manufacture, City and Guilds of London; and chief draughtsman and demonstrator to the Institution of Mechanical Engineers, London, S.W.

APPOINTMENTS VACANT.

Improvers at high-tension alternating station, London. See advertisement issue of 23rd ult.

Advertisement Assistant, London County Council. Applications, by 10 a.m. on Nov. 16, to County Hall, Spring-gardens, S.W.

Engineering Assistants (2), London County Council, with good experience in the design and construction of the permanent way and general arrangement of electric tramways on the conduit system (if possible) and on the overhead system. Salaries up to £7 a week. Applications to Clerk of the Council, County Hall, Spring-gardens, S.W., by 10 a.m. on Nov. 10.

Improver, Perth Corporation Electricity Works. Commencing wages, 12s. per week. See advertisement in last issue.

Jointer, Erith Corporation, £2. 5s. per week. Also Mr. C. Turnbull, Tynemouth Electricity Works, North Shields. See advertisement in last issue.

Lecturer in Engineering, technical schools, Rotherham. Salary £129 per annum, Nov. 10. See advertisement.

Shift Engineer, Tunbridge Wells, £100 per annum.

COMPANIES' MEETINGS AND REPORTS.

WESTERN TELEGRAPH.

The ordinary general meeting of the shareholders in this Company was held at River Plate House, E.C., on Wednesday, Sir John Wolfe Barry, K.C.B., presiding.

The **Chairman**, in moving the adoption of the report (which appeared in our last issue), said it indicated a steady and satisfactory business. The message fund amounted to £213,000, while that for the corresponding half-year of 1902 had been £196,500, so that a satisfactory increase of £16,500 was shown. A large proportion of the improvement was due to an increased business with the River Plate. The dividends on investments in other telegraph companies showed a small decrease of £800. Repairs to cables and expenses of ships were comparatively small during the corresponding half-year of 1902, so that for the half-year under review there was an increase of £11,000. The Company had lately bought a small steamer, which was being very usefully employed in South America. The revenue to date for the current half-year was not quite so satisfactory as for the corresponding portion of 1902. The decrease was not serious, but there were no signs of an increase. That was due to a falling off in the inter-South American receipts. The Company had to compete with the Governments, and had to do the best it could. On the other side of the accounts, he was happy to say the expenses and repairs to cables were below the average. As he had said on former occasions, the revenue depended on the trade of the countries served, and on the cost of the repairs to cables. On the whole, he could congratulate the shareholders on what was a satisfactory but uneventful report.

The motion was adopted.

BRITISH ALUMINIUM.

An extraordinary general meeting of this Company was held at Winchester House, E.C., on Wednesday, for the purpose of passing a resolution for the reduction of the capital from £400,000 to £310,000 by cancelling £9 per share upon each of the 100,000 issued ordinary shares. Mr. J. D. Bonner presided.

The **Chairman** said that the resolution only provided for the writing down of the capital by the minimum amount that anyone could have anticipated after the result of Mr. Harmood Banner's investigation into the affairs of the Company in 1902 became known. No doubt there were many shareholders who considered that the directors' proposals were not of a sufficiently drastic character, especially as the goodwill still figured in the accounts at the sum of £100,000, and as the large stock of aluminium was not valued on so conservative a basis as the present cost of production rendered desirable. Some time ago the directors would not have been disposed to regard the proposal now made as sufficient, but, though the result of the last year's trading was insufficient by about £3,400 to meet the interest on the debenture stock, the circumstances of the Company had so much improved that they considered at the present time the course suggested was a satisfactory one. The directors would not have decided to leave £13,000 to be provided out of revenue if they had not felt that the Company was at last on the eve of earning profits sufficiently substantial to enable that sum to be provided out of profits without unduly delaying the liquidation of arrears on the "A" preference shares.

The resolution was carried.

MONTE VIDEO TELEPHONE.

The ordinary general meeting of the shareholders in this Company was held on the 29th ult. at Winchester House, E.C., Mr. Frank W. Jones presiding

The **Chairman**, in submitting the usual motion for the adoption of the report (*vide* issue of 23rd ult.), said that the past year had been one of continued progress, and the prospects for the future were satisfactory. The feature of the year had been the acquisition of the telephone system known as La Hispano Uruguaya. The Company had had a working agreement with the concern for a number of years, and had also been in negotiation for several years to acquire it. The property had been taken over on a fairly paying basis, and it was decidedly useful in regard to the Company's business in Monte Video. A general improvement was manifest in Uruguay, particularly in Monte Video, and it was hoped that a settled condition of affairs had been reached. The item "sundry creditors" in the balance-sheet stood at a high figure, but a portion of the amount to be paid for the system acquired was included. The value of the securities, taking the latest Stock Exchange prices, was 10 per cent. more than the amount shown in the balance-sheet. The directors had been fortunate enough to arrange for the expenditure for the year without issuing new capital. Continued expenditure, however, would be necessary, and in time a debenture issue would have to be made, but until it was necessary the expenditure would be kept within the bounds of the reserve.

The report was adopted.

BRITISH COLUMBIA ELECTRIC.

The annual meeting of the shareholders in this Company was held at Winchester House on the 30th ult., Mr. G. P. Norton presiding.

The **Chairman**, in moving the adoption of the report (which appeared in our issue for the 23rd ult.), characterised it as one of a thoroughly progressive character. The Company showed a highly satisfactory development of the business in all directions. In December next, when they hoped to have the advantage of the partial utilisation of the water-power installation, they had every reason to hope their progress would then be even more rapid than hitherto. From all the evidence they received from British Columbia they might safely assume that the undertaking of this Company would continue to develop and expand for many years to come. It would in all probability grow into a great business of considerable magnitude, and this would mean constant addition to the expenditure on capital outlay. In confirmation of those views he mentioned that since the close of the financial year the earnings for the three months to Sept. 30 last showed an increase of £3,647 over the corresponding period of last year. The undertaking had thus become thoroughly well established upon a strong and permanent basis, both financially and as a steady dividend-earning enterprise, and as an institution supplying public needs and rendering services indispensable to the comfort and prosperity of the people. The Board believed they had an organisation in British Columbia which it would be difficult to improve, and their reports, both as to the general equipment of the railway and the lighting plant, were of a highly satisfactory character. He directed attention to the proposed issue of £45,000 Vancouver Power Company debentures, which would be offered to the stockholders of this Company probably in December next. The directors considered these bonds an excellent investment, and they would first be offered to existing stockholders.

Mr. E. L. Evan-Thomas seconded the motion, which was carried.

CAPE ELECTRIC TRAMWAYS.

The report of the directors for the year ended June 30 last states that the profit and loss account, after provision for debenture interest and redemption of debentures, shows a net credit balance of £66,372, which, added to the balance of £14,540 brought forward from last year, makes a gross total profit of £80,912. Dividends amounting to 15 per cent. have been paid. The directors have also placed to the credit of reserve fund the sum of £8,000. These several sums aggregate a gross total of £80,000, and leave a balance of profit of £912 to be carried forward. The result of the year's transactions shows that the traffic on the tramway systems in South Africa has maintained itself at the high level of previous years. On the other hand, expenditure and maintenance have, owing to a variety of causes, shown a large increase over 1902, reducing the profit by about £15,000. Improvements and additions to the car-shed and power-house, with additional machinery in Cape Town, have at last been completed. The total cost of these new works has amounted to £84,919, which has exceeded the original estimate by £30,000; this increased expenditure is mainly due to the enhanced prices for all labour and material which obtained during the unsettled period of the war and immediately following the conclusion of peace. The reserve fund, which has now reached a total of £137,000, has met this expenditure, and consequently it has not been found necessary to raise further capital. The Port Elizabeth system also has not escaped increased expenditure, owing to the general rises in values and scarcity of labour before referred to, although these causes were not felt so acutely as in Cape Town. On Jan. 1, 1903, the directors leased from the Cape Town Consolidated Tramways and Land Company their Camps Bay tramline, to work the same for a period of three years, with an option of purchase at the expiration of the lease. The first six months' working by this company has shown a loss of £3,284, caused by the exceptionally bad weather prevalent in Cape Town during the greater part of this period. The directors anticipate, however, a satisfactory improvement on these figures as development progresses on the townships projected on the estates of the Cape Town Consolidated Tramways and Land Company at Camps Bay and Oranjezicht.

CONTRACTS FOR ELECTRICAL SUPPLIES.

Whitehaven.—The Guardians require tenders for the lighting of their infirmary. Tenders by Nov. 18.

Dublin.—The Corporation invite tenders for carbons. Tenders by 5 p.m. on 14th inst. See advertisement.

Bermondsey.—The Borough Council invite tenders for cables, arc lamp standards, and accessories, by Nov. 9.

Hornsey.—The District Council invite tenders for one 300-kw. steam dynamo to be delivered in October, 1904, and another in March, 1905.

Dudley.—The Guardians invite tenders for the supply and fixing of the various appliances for the electric installation to the laundry and boiler house.

Windsor.—The Town Council invite tenders for the supply of electricity or gas for the purpose of public lighting throughout the district for a period of five years.

Wood Green.—The Urban District Council invite tenders for the erection of a power station and the buildings in connection with the Council's electric lighting scheme.

Rangoon.—The Municipal Committee have decided to call for amended tenders for the electric lighting of the town on a continuous-current system. Five tenders were received for the first call.

Wisby (Sweden).—Tenders are invited for a private and public electricity supply estimated to cost 180,000 kroner. Particulars may be obtained from the Director of the Draetselkammaren at the above place.

Wakefield.—The City Council invite tenders for the supply and erection of one 400-kw. two-phase generator, comprising engine, alternator, exciter, and accessories. Tenders by Nov. 7. See advertisement in last issue.

Digitized by Google

Kilmarnock.—The Corporation invite tenders for the supply, delivery, and erection of three Lancashire boilers, engines and dynamos, overhead hand travelling crane, storage battery, and switchboard, by Nov. 18.

Christchurch (New Zealand).—Tenders are invited for the complete installation of electrical tramways, other than buildings. Specifications, etc., may be obtained from the Agent-General for New Zealand, Victoria-street, S.W. See advertisement.

Blackpool.—The Electricity and Tramways Committee invite offers for various plant. Particulars can be obtained from the borough electrical and tramway engineer, Mr. Charles Furness, West Caroline-street, Blackpool. See advertisement in last issue.

Glasgow.—The Scottish Office of the May-Oatway Fire Appliances, Limited, invite tenders for the wiring of various installations. Full particulars from the Managing Director, 49, Queen-street, Glasgow. Tenders by Nov. 7. See advertisement in last issue.

Sydney (N.S.W.).—As will be seen from advertisement columns, tenders are asked for the supply of continuous and alternating current meters. Specifications, conditions, and forms of tender are obtainable from Messrs. Preece and Cardew, 8, Queen Anne's-gate, S.W.

Dartford.—The Metropolitan Asylums Board invite tenders for installing a complete system of telephones at the Darenth Asylum, Dartford, Kent. Specifications, etc., may be obtained at the office of the Board, Embankment, E.C. Tenders by 10 a.m. on Nov. 17.

Todmorden.—The Corporation invite tenders for one Lancashire boiler, two steam dynamos and balancer booster, two feed pumps and one injector, economiser, surface or jet condenser, switchboard and instruments, storage battery, cable work, and overhead hand crane.

Shanghai.—The French Colony propose to instal motor-propelled tramways. Tenders may be sent by Oct. 31, 1903, to Secrétariat de la Municipalité Française de Shanghai. Particulars may be obtained from l'Office National du Commerce Extérieur, Rue Feydeau, 3, Paris.

Blackadon (Devon).—The Corporation invite tenders for fitting up an electric light installation at the borough asylum. Specifications, etc., may be obtained from Mr. E. G. Okell, borough electrical engineer, Electricity Works, Prince Rock, Plymouth. Tenders by Nov. 14.

Barrow-in-Furness.—The Corporation invite tenders for the completion of the electric lighting installation at Hawcoat and Walney police stations and the pig slaughtering hall and lairage at the public abattoirs. Further particulars may be obtained from the Borough Engineer.

Swindon (Wilts).—The Corporation invite tenders for complete traction switchboard cables, etc. Specifications, etc., may be obtained from Messrs. Lacey and Sillar, 78, King-street, Manchester, and 2, Queen Anne's-gate, Westminster. Tenders by Nov. 23. See advertisement

Russia.—The Russian Minister of the Interior has sanctioned a plan for the reconstruction of three lines of municipal tramways—namely, those in Newsky, Sadovaïa, and Wassiliostrow districts. Each car is to provide for two classes of travellers, and will accommodate 52 persons.

Brighton.—The Council invite tenders for six water-tube boilers; a system of steam, exhaust, feed, blow-off, and suction pipes; and cast-iron storage tanks. Specifications, etc., may be obtained from Mr. Francis J. Tillstone, Town Hall, Brighton. Tenders by Dec. 7. See advertisement.

Kilmarnock.—The Corporation invite tenders for three Lancashire boilers, engines and dynamos, overhead hand travelling crane, storage battery, switchboard. Specifications, etc., can be obtained on and after 12th inst. from the Town Clerk. Tenders must be delivered at the Town Clerk's Office by Nov. 18.

Culiacan (Mexico).—Tenders are invited for lighting the town by electricity; 60 arc lamps of 1,200 c.p. and 110 incandescents of 50, 30, and 16 c.p. will be required. Propositions will be received by letter until Dec. 31 in the Secretaria del Ayuntamiento, Culiacan, where further information may be obtained.

Edinburgh.—The Lord Provost, Magistrates, and Council invite tenders for the wiring and fittings for the electric lighting installation at Gayfield-square police station. Specifications, etc., can be obtained at the office of the Resident Electrical Engineer, Dewar-place, Edinburgh. Tenders by 10 a.m. on 21st inst.

Blackpool.—The Electricity and Tramways Committee invite tenders for one new 450-kw. traction set (vertical triple-expansion engine and multipolar generator). Specification may be obtained from Mr. Charles Furness, borough electrical and tramways engineer, Electricity Works, Blackpool. Tenders by Nov. 14.

Hornsey.—The Urban District Council invite tenders for the supply of meters, indicators, and consumers' fuse boxes. Specifications, etc., may be obtained on application to Mr. Norman Staniland, Electricity Works, Tottenham-lane, Hornsey. Tenders by 4 p.m. on Nov. 30 to Mr. F. D. Askey, clerk, 99, Southwood-lane, Highgate, N.

Handforth (near Manchester).—The Guardians of Chorlton-upon-Medlock Union invite tenders for an electric motor for the new laundry at Styal Cottage Homes, Handforth, near Manchester. Specifications, etc., can be obtained from the consulting electrical engineer, Mr. G. R. Peers, A.M.I.E.E., 16, John Dalton-street, Manchester.

Swindon.—The Corporation invite tenders for the supply, delivery, and erection of steel poles, overhead line section boxes, arc lamps, and accessories. Specifications, etc., may be obtained from Messrs. Lacey and Sillar, 78, King-street, Manchester, and 2, Queen Anne's-gate, Westminster. Tenders by Nov. 16. See advertisement in last issue.

Radcliffe (Lancs.).—The Urban District Council invite tenders for the supply of the pitch and oil required in the construction of the tramways in the district. Specifications, etc., may be obtained on application to Mr. W. L. Rothwell, engineer, at the Council Offices. Tenders to Mr. S. Mills, clerk, Council's Offices, Radcliffe, by Nov. 14.

Chichester.—Tenders are invited for the installation of a system of electrical water-level indicators and recorder and telephones. Specifications may be seen and bills of quantities obtained at the office of the city surveyor and waterworks engineer, Mr. I. Pym-Jones, Lion-street, Chichester. Tenders by Nov. 6. See advertisement in last issue.

Radcliffe.—The Council invite tenders for the supply and completion of (Contract No. 12) lighting and traction switchboard and accessories; (14) rail bonds. Specifications may be obtained from Messrs. Lacey and Sillar, 2, Queen Anne's-gate, Westminster, and 78, King-street, Manchester. Tenders by Nov. 14. See advertisement in last issue.

Beckenham.—The Urban District Council invite tenders for the electric wiring of houses in their district under a free wiring scheme. Specifications, etc., may be obtained from the consulting engineer, Mr. Reginald P. Wilson, 66, Victoria-street, Westminster, or Mr. John A. Angell, surveyor, Council Offices, Beckenham. Tenders by 4 p.m. on Nov. 9.

Wednesbury.—The Corporation invite tenders for the electric wiring and fittings for the town hall, municipal offices, art gallery, public baths, public library, and electricity sub-station. Specification, etc., may be obtained at the offices of Mr. F. J. Warden-Stevens, A.M.I.M.E., A.M.I.E.E., 34, Victoria-street, Westminster, London, S.W. Tenders by noon on Nov. 20.

Harrogate.—The Corporation Electricity Department invite tenders for the supply and part laying of two high-tension concentric, paper-insulated, lead-covered trunk mains from the electricity works to the town. Specification may be oblained from Mr. Geo. Wilkinson, M.I.M.E., M.I.E.E., engineer-in-chief, Corporation Electricity Department, 33, Swan-road, Harrogate. Tenders by Nov. 16.

Sydney (New South Wales).—Tenders will be received at the office of the Deputy Postmaster-General, Sydney, New South Wales, up to 2.30 p.m. on Dec. 30, for the supply and delivery at the departmental stores, Sydney, of telegraph, telephone, and electric light material. Specifications, etc., may be seen and tender forms obtained at the General Post Offices, Sydney, Melbourne, Brisbane, Adelaide, Hobart, and Perth.

Wednesbury.—The Corporation invite tenders for the electric wiring and fittings for the following public buildings: town hall, municipal offices, art gallery, public baths, public library, and electricity sub-station. Specification, etc., may be obtained between 2 and 5 p.m. on and after the 23rd inst. at the offices of Mr. F. J. Warden-Stevens, A.M.I.M.E., A.M.I.E.E., consulting engineer, 34, Victoria-street, Westminster. Tenders by 12 noon on Nov. 20.

Manchester.—The Commissioners of H.M. Works and Public Buildings invite tenders for erection of a telephone exchange and engineer's office and store at Quay-street, Manchester. Specifications, etc., may be seen at H.M. Office of Works, New Bridge-street, Manchester. Forms of tender may be obtained at H.M. Office of Works, etc., Storey's-gate, S.W. Tenders before 12 noon on Nov. 11 to the Secretary, H.M. Office of Works, etc., Storey's-gate, London, S.W.

Harrismith (South Africa).—The Town Council invite tenders for the supply, f.o.b. British port, of the galvanised iron buildings required for a small electricity generating station. Drawings, specifications, etc., may be seen at the offices of, or obtained from, the Council's consulting engineers, Messrs. Mordey and Dawbarn, 82, Victoria-street, Westminster, S.W. Tenders to Messrs. Webster Steel, and Co., 5, East India-avenue, Leadenhall-street, E.C., by noon on Nov. 9.

Derby.—The Directors of the Midland Railway Company invite tenders for the supply of stores for 12 months from Jan. 1, 1904, including telegraph instruments, telegraph stay rods, bolts, insulators, etc., telegraph and signal wire. Samples may be seen at the General Stores Department, Derby, on and after Nov. 2, between the hours of 10 a.m. and 4 p.m. (Saturday, 10 a.m. and 1 p.m.) Forms of tender on application to Mr. Alfred Derry, stores superintendent, Derby. Tenders to the General Stores Committee, Midland Railway, Derby, by 9 a.m. on Tuesday, Nov. 10.

Colombo (Ceylon).—The Government of Ceylon invite proposals from persons willing to enter into a contract for the supply of electrical energy to the various offices, buildings, and premises of the Government, within the Municipality of Colombo, for a term of years commencing on or about Aug. 1, 1905. Proposals must be delivered at the office of the Colonial Secretary, Colombo, by Dec. 1. The *Ceylon Government Gazette* containing above notice may be seen on application at the Commercial Intelligence Branch of the Board of Trade, 50, Parliament-street, S.W.

RESULTS OF TENDERS.

Hull.—It is reported that the Ericsson Bell Telephone Company are to supply the municipal telephone instruments.

Nelson.—A tender for the supply and erection of a 400-kw. engine and dynamo by Messrs. Bruce Peebles and Co., of Edinburgh, has been accepted.

Arbroath.—The Council have accepted the tender of the Empire Electric Light and Power Company, Limited, for the lighting of the town by electricity.

Brierley Hill.—The Urban District Council have accepted the tender of Mr. John Williams for supplying electric light wiring, etc., at the new technical school, his price being £63, 12s.

Digitized by Google

Bridgend.—The Guardians have accepted the tender of Singer and Brown, Bridgend, Glam., at £148. 16s., for wiring in connection with the installation of electric light at the workhouse, Bridgend.

Wood Green.—The Urban District Council have accepted the tender of Henley's Telegraph Works, at £7,678. 2s. 5d., for electricity supply works in connection with the Council's electric lighting scheme.

Shoreditch.—The Borough Council have accepted the tender of F. Willmott, Ilford, at £1,120. for pulling down and rebuilding 5, Hoxton-square, N., to be used as stores for the electricity department.

Holyhead.—The Urban District Council have accepted the tender of the Alphons Custodis Chimney Construction Company, Limited, 119, Victoria-street, S.W., at £617, for erection of a chimney shaft in connection with their proposed destructor and electricity works.

Dewsbury.—The Council have accepted the following tenders: British Schuckert Company, London, for the supply to the electricity works of three automatic cut-outs and slate panel; Messrs. Crompton and Co., of London, for the supply of a new armature for the 50-kw. engine; and Messrs. William Scott and Sons, of Dewsbury, for the setting of the new boiler at the electricity works.

Swindon.—The Corporation have accepted the tender of J. G. White and Co., 22A, College-hill, Cannon-street, London, at £24,675. 6s. 4d., for the supply, delivery, and laying of all the rails, points, crossings, and accessories for the permanent way of the Corporation's tramways, and all material and labour for the construction of the underbed and for the paving of the tramways.

London.—The Highways Committee of the London County Council have received the following tenders for the supply of four 5,000-h.p. engines, required for the electricity generating station now being established at Greenwich in connection with the electrical working of the Council's tramways:

Fullerton, Hodgart, and Barclay, Limited, Paisley (incomplete)	£36,817	0	0
Maschinenfabrik Buckau Aktien-Gesellschaft, Magdeburg (not to specification)	58,871	3	0
Cole, Marchent, and Morley, Limited, Bradford	84,921	10	0
Wallsend Slipway and Engineering Company, Limited, Wallsend-on-Tyne (German steel)	88,525	0	0
Ditto (English steel)	92,525	0	0
A. Borsig, Berlin (incomplete)	92,995	0	0
Davey, Paxman, and Co., Limited, Colchester	96,693	0	0
J. Musgrave and Sons, Limited, Bolton	96,713	0	0
Ferranti Limited, Hollinwood, Lancs.	99,250	0	0
Allis-Chalmers Company, London	99,750	0	0
Yates and Thom, Blackburn	100,680	0	0
Aktieselskabet Burmeister and Wains, Copenhagen	105,683	0	0
Gourlay Bros. and Co., Dundee	107,168	0	0
D. Stewart and Co. (1902), Limited, Glasgow	109,068	0	0
Ditto (alternative)	105,492	0	0
Willans and Robinson, Limited, Rugby	131,857	0	0

The tender of J. Musgrave and Sons has been accepted, with the following sub-contractors: J. Brown and Co., Sheffield, heavy forgings; J. Webb and Co., Bury, light forgings; W. Jessop and Sons, Sheffield, steel castings. The report of the committee on these tenders appears in another column. The Council have accepted the offer of Messrs. F. J. Cooleby and Co. to continue to maintain until Dec. 31, 1903, the electric bells belonging to the fire brigade, and the telephone installation at the chief station, on the same terms and conditions as are contained in the existing contract with the firm—viz., at the rate of £315 per annum, in addition to certain stipulated small amounts for additional bells fixed from time to time.

BUSINESS NOTES.

TRACTION.

St. Annes.—Plans have been approved for a new tram shed.

Aberdeen.—The Tramways Committee are adopting, by way of experiment, the Thermit process of welding rails.

Luton.—The Corporation have decided to apply for a provisional order for laying down a system of electric tramways in the borough.

Devonport.—The tramway extensions from St. Budeaux to Salthouse Passage, and from Milehouse to Tor-lane, were opened on Saturday.

Rowley Regis.—The Urban District Council are raising a loan of £21,000 for the construction of tramways from Old Hill to Blackheath.

Altrincham.—A special meeting of the Urban District Council has decided to apply for a provisional order for the construction of tramways in the district.

Chobham.—The Parish Council have approved the plans of the light railway proposed to be constructed by the West Surrey Light Railway Company.

Dalton-in-Furness.—The British Electric Traction Company have been requested by the Urban District Council to extend their tramways from Barrow to Dalton.

Dunfermline.—It is proposed to construct a tramway between Dunfermline and Rosyth, the new naval base on the Firth of Forth, the distance being four miles.

King's Norton.—The District Council on Wednesday decided to borrow £30,000 for the purpose of the King's Norton and Northfield Urban District Tramways Act.

Belfast.—A proposal has been launched for an electric tramway between this city and Bangor, about 12 miles away on the sea coast. Bangor is a fashionable watering-place.

St. Kilda.—After some discussion at the last Council meeting it was resolved to approve of the amended order in Council in relation to the construction of electric tramways in the borough.

Portmadoc.—An electric railway is projected from Portmadoc through the Gwynant Pass on through Bettws-y-coed to Corwen. Engineers are at present engaged in surveying the land.

Accrington.—The tramways company have submitted an offer to the Corporation by which they propose to electrically equip their lines provided they are not disturbed for a period of seven years.

Hull.—The city engineer has been authorised to proceed with the laying of the tramway in Clarence-street continuation from Great Union-street to Holderness-road, and with the paving of the street.

Cleckheaton.—The matter regarding the alleged failure of the British Electric Traction Company to construct the proposed tramway in the Westgate district was referred to the Council's solicitors at the last meeting.

Gloucester.—The City Council have decided to advertise for a general manager at a salary of £300 per annum, rising by annual increments of £25 to £450, to supervise the construction of the proposed light railways.

Kingsbridge.—On the subject of the proposed light railway, the clerk at the last meeting of the District Council said he was in a position to say that if the order was obtained, all the money was ready to be subscribed—*i.e.*, £300,000.

Litherland.—At the monthly meeting of the District Council reference was made to the opening of the Litherland tramway route. It was stated that everything was in readiness to be inspected, and in a short time the line would be opened.

Southampton.—Having made a further inspection of the curves at the top of Four Posts-hill and at the Stag Gates, the Tramways Committee recommend that tenders be invited for a new section of rails, with ½in. lip, for use at curves throughout the tramway route.

Salford.—The Town Council have adopted a recommendation of the Tramways Committee to apply for sanction to borrow £3,417 to cover the cost of the overhead equipment of the tramways in Middleton-road from the Manchester boundary at Cheetham Hill to the Middleton boundary.

Folkestone.—A special meeting of the Town Council has decided to adopt the G.B. system of electric traction for the proposed tramways from Cheriton-road boundary to central station and from central station to the harbour. An expert is to be engaged to advise the Corporation in the matter. The estimated cost is £30,000.

Heath Town.—On Wednesday the Urban District Council approved recommendation urging the Wolverhampton Tramways Committee to complete the tramlines to Heath Town at the earliest possible date; and that they be asked if they would pave the road opposite the public buildings with wood blocks, on the condition that Heath Town paid half the cost.

Tramcar Brakes.—In reference to the Westinghouse magnetic brake, we are informed that the large addition recently erected by the Westinghouse Air-Brake Company, Wilmerding, for the magnetic brake department has been worked to the utmost extent, and the plant is now about to be enlarged, having been found inadequate for the requirements.

Darwen.—In reply to questions at the last meeting of the Town Council, the Chairman of the Tramways Committee said that enquiries had been made, and it was ascertained that only four tramways departments in the whole of the United Kingdom reported favourably on the issuing of season tickets. The Darwen committee therefore could not see their way to institute the system.

Lincoln.—The Board of Trade have appointed an arbitrator to fix the price to be paid for the tramways undertaking by the Corporation, who have decided to purchase the system as a prelude to adopting electric traction. The Corporation offered the company about three-fourths of the paid-up capital, and this the directors refused. The arbitrator is Colonel Sir Colin Scott-Moncrieff.

Walsall.—On Thursday last week a trial car was run over that portion of the Corporation tramways which has been newly laid. The system is now quite ready for the Board of Trade inspection, which will probably be held in about a week's time, and everything will then be in order for the Corporation to commence the working of the trams on the date which has been already fixed—Jan. 1.

Kirkcaldy.—The Corporation tramways continue to show successful results, but the proposal to increase the number of ½d. stages is being warmly discussed. The extended route is expected to come into operation about four weeks hence. As a result of the extension of the system a large addition to the car-sheds has been decided upon, for which Mr. Masterton has been instructed to prepare plans.

Batley.—Last week two sections of the Corporation electric tramways (leased to the British Electric Traction Company) were opened for public service. They are the Healey and Mount Pleasant routes, both starting near the centre of the town, and connecting with the company's Dewsbury and Spen Valley tramway. The cars are of the Westinghouse type, and electric energy is supplied from the Corporation power station.

South Hams Light Railway.—Colonel Boughey and Mr. H. A. Steward have held an enquiry at Kingsbridge into the proposed light railways, which are embraced in a scheme for linking up the Great Western Railway branch at Yealmpton with that which runs down to Kingswear, and providing or improving railway communication for Modbury, Kingsbridge, Salcombe, Newton Ferrers, Dartmouth, and other centres in the South Hams.

Digitized by Google

Camberwell.—The question of an additional tramway to that already sanctioned, from Denmark-hill *vid* Champion-hill Fields to Green-lane, and Townley-road to Lordship-lane, was raised at the last meeting of the Borough Council, and after some discussion the matter was referred to the General Purposes Committee. It was stated that as regarded the sanctioned tramway to Dulwich, the London County Council had served notice to treat.

Nidd Valley Light Railway.—Notice is given that application is intended to be made to the Light Railway Commissioners by the Corporation of Bradford for an order to amend the Nidd Valley Light Railway Order, 1901, and to transfer to the Corporation all or some of the powers conferred by the order of 1901. It is proposed by the order to extend the time limited by the order of 1901 for the compulsory purchase of the lands for one year until March 30, 1905.

West Bromwich.—Colonel von Donop on Tuesday visited West Bromwich for the purpose of inspecting the electric tramlines which have been laid by the Corporation in Spon-lane and Bromford-lane. The lines are intended to connect West Bromwich with Oldbury and Smethwick, and will join up with the tramways between Dudley and Birmingham, in the Market-place, Oldbury, and Spon-lane. Trial trips were made along both sections, and everything passed off satisfactorily.

Richmond.—The local residents are petitioning the Town Council to invite the London United Tramways Company to promote a Bill for the extension of their system to Richmond. So far the local authority have rejected the company's proposals in respect of this district, but the matter will come up for reconsideration at Monday's meeting of the Town Council. The company want to lay a double line over the new bridge at Kew, and for this they must obtain the sanction of the local authority.

Durham.—At Wednesday's meeting of the Town Council attention was drawn to the continued delay in commencing the work of laying the tramlines between the city and Brandon. It was stated that powers were granted to the electric tramways company in November, 1901, but nothing had been done, and next year the powers would lapse unless something were done. It was decided to write to the Local Government Board and ask them to press the company to get on with the work.

Stretford.—The District Council have instructed the Parliamentary Committee to include in their Bill now in course of preparation powers for the construction of additional tramways in Warwick-road, Seymour-grove, and Talbot-road. The chairman of the Electricity and Tramways Committee stated, in answer to a question, that the committee had begun to supply electricity to the Manchester Corporation on one of the tram routes in the Stretford district, and that there would be current for the other two routes next week.

Preston.—At the last meeting of the Town Council the Tramways Committee asked to withdraw the following recommendation which it was said had been agreed to in committee under a misapprehension as to who were to be the sub-contractors for the special steelwork: "That the tender of Messrs. Dick, Kerr, and Co., Limited, for permanent-way construction and overhead equipment (with the Lorain Company's special work), according to plans and specification, for the sum of £80,582, be accepted." After a long discussion the necessary leave was obtained by 32 votes to 7, and the recommendation was withdrawn.

Proposed Electric Railway.—A meeting of the guarantors of the Bristol, London, and South Counties Railway, which failed to obtain parliamentary sanction last session, has been held in Bristol to consider an alternative scheme, the chief features of which were the provision of electric traction for passengers between Bristol and Trowbridge, and the erection of a separate station at Basingstoke. After careful consideration, it was decided that, although the promoters could see their way to considerable support, it would be impossible to complete the work of survey and reference in time to deposit a Bill next session. Action is therefore necessarily delayed for a year.

Paisley.—A start was made on Monday with the laying of the new Paisley and district electric tramways. The work has been commenced at the east terminus on the Glasgow-road, and after the main line has been constructed in Paisley it is intended to have the system extended to Johnstone. The new system will connect Paisley with Johnstone, Renfrew, and Glasgow. A dispute has arisen between the Corporation and Mr. Murphy, the promoter, as to the quality of the granite setts to be used in the laying of the track, and an injunction was on Tuesday obtained by the former restraining Mr. Murphy proceeding further with the work pending an appeal to the Board of trade.

Rochdale.—At the last meeting of the Town Council a letter was read which the Negotiating Sub-Committee had sent to the legal advisers of the tramway company. In this the sub-committee expressed regret at the inability of the parties to come to a working agreement, and declared that they were still desirous of completing a working agreement, based on the original agreed heads, to take effect at the end of the company's next half-year's working. If the company cannot see their way to co-operate in this and do not reply in four days, the sub-committee will ask the arbitrator to at once proceed with the arbitration under the 1881 order, and leave any contentious question under the 1882 order to be decided hereafter.

Christchurch (N.Z.).—That practical operations will soon be commenced in connection with the reconstruction of the tramways at Christchurch, New Zealand, for electric traction will be gathered from the advertisement which we publish this week calling for tenders for carrying out the works. Tenders are to be all in by March 17, 1904, so that operations will probably begin in the spring. There will be 36 miles of single track converted for electrical working, which includes about 2½ miles of double track. The engineer in charge of the scheme is Mr. F. Hubert Chamberlain, formerly with the General Electric Company of America, and, until the present engagement, chief assistant electrical engineer to the New South Wales Government in Australia.

Buenos Ayres.—The electric tramway companies, in view of the numerous taxes imposed upon them by the Buenos Ayres Municipality, decided to protest against those for levels and cables, as well as for the tax of £3 for every permit to open the streets. The solicitor of the Corporation is of the opinion that the taxes are perfectly legal, and the companies will now be called upon to pay same. The Committee of Public Works of the City Corporation have reported on the petition of the City of Buenos Ayres Tramways Company for the electrification of their line. They recommend that a 99 years' concession be granted, to count from the date of the primitive concession, which would give it another 64 years.—*Review of the River Plate.*

Competition at Glasgow.—At the half-yearly meeting of the Cathcart District Railway Company the competition offered by the Corporation cars was referred to. A shareholder gave it as his opinion that so long as they had these municipal cars running cheaper and cheaper day by day, they would have the greatest difficulty in earning any dividend at all. It looked as if, from the present trend of events, they would by-and-by have free Corporation cars, and then they could make a present of their undertaking to the Corporation. He hoped the Council would endeavour to look at the matter from a public point of view, and see that they were pushing out private enterprise, and keep the fares more in accordance with what they should be commercially.

Additional Traffic Returns.—Anglo-Argentine, £2,113 increase; Barcelona Ensanche y Gracia, £117 increase; Barcelona, £209 decrease; Brisbane, £185 increase (month of August, £11,736, increase £294), British Columbia Electric (month of March), gross earnings £10,352, net income £2,659; Buenos Ayres and Belgrano Electric, £89 decrease (month of October, £14,055, increase £1,002); Calcutta, £366 increase; Cape Town (month of September), receipts £15,174, expenditure £8,503; Isle of Thanet Electric, £23 decrease; Lisbon Electric (month of September), receipts 89,636 milreis, expenses 51,231 milreis; Mexico Electric (month of August), receipts £48,600, expenses £27,900; Perth Electric, £220 increase; Port Elizabeth (month of September), receipts £3,730, expenditure £2,767.

Crystal Palace.—Speaking at the ordinary half-yearly meeting of the shareholders of the Crystal Palace Company, the chairman said the plans for the tramways authorised to the Penge entrance from Croydon were in course of preparation, and their construction would, no doubt, be commenced at an early date. He looked to a considerable increase in revenue from this direction, but far more important would be the extension of the County Council tramways from the London side. He had the pleasure, with the rest of the Board, of meeting a committee of the London County Council quite recently upon this question, and so unanimous was the opinion that the extensions should be made that he was satisfied that they would have all the electric tramway feeders they required in the near future.

Central Wilts Light Railway.—Colonel G. F. C. Boughey, R.E., C.S.I., and Mr. Henry Allan Steward sat as Light Railway Commissioners at Marlborough, on Wednesday last week, to enquire into the expediency of granting the application of a syndicate for an order to authorise the above-named light railway. The arguments having been heard, and the Commissioners having consulted, the Chairman delivered their decision as follows: "The omissions to give the necessary notices have been proved in respect of a considerable length of the railway. It appears that without compulsory powers to acquire these lands the promoters could not carry out their scheme. The Commissioners do not consider that they could give such powers under the circumstances, and they will therefore not proceed further with the application."

Portsmouth.—Application is to be made to the Board of Trade for sanction to borrow £736 for the laying of a double junction at Bradford-road, and £150 for the laying of a cross-over in Commercial-road between Edinburgh-road and the station. At the last meeting of the Town Council a member asked the chairman of the Tramways Committee if, in view of the recent fatalities, any experiments had taken place in testing the efficiency of the guard in front of the cars, and if they were tested in systematic manner from time to time, to see if they were in working order? Mr. Kimber said that the guards they had now were practically recommended by the Board of Trade, and were in almost universal use throughout the country. They had been very fortunate in Portsmouth with regard to accidents as compared with other towns.

Manganese Steel.—Hadfield's Steelfoundry Company, Sheffield, have during the past month obtained the following new tramway contracts for points and crossings in their patent "Era" manganese steel: Paisley tramways, through Messrs. Murphy and Sons; King's Norton tramways, through Messrs. Blackwell and Co. (contractors); Scarborough tramways, through Edmundson's Electricity Company—all special junctions, etc., for this work are also being built by Messrs. Hadfield; Aston Manor tramways, through Mr. G. Trentham (contractor); Edinburgh Tramways Company; Liverpool Corporation tramways, for 12ft. points, etc.; and Sheffield Corporation, for 12ft. points, etc.; Brighton tramways, for points and crossings for their new extensions lines. This is Brighton's first manganese work, all the existing special track work being in crucible cast steel.

Derby.—At the conclusion of the Council meeting on Wednesday last week, at which an adverse vote was given against the Burton-road scheme, as reported in our last issue, the members of the Tramways Committee held a meeting to consider their position. The Chairman (Mr. Alderman Duesbury, J.P.) expressed a desire to tender his resignation, and the other members of the committee were also of opinion that it would be best for them to retire, considering the decision of the Council with respect to the Burton-road scheme. The matter was discussed at some length, but it was felt that in view of the undertaking just entering upon a

Digitized by Google

practical stage, it would be a great pity to leave it, even for a short period without any committee or body of administration. This was the general feeling of all present, and under these circumstances the committee decided to adjourn the meeting. They agreed to act in a body, and if the chairman retires his colleagues will follow his example.

Bushey and Barnet Light Railways.—Sir Herbert Jekyll on the 30th ult. heard an appeal from the Light Railway Commissioners, who have granted the Hertfordshire County Council running powers for the Barnet and Bushey Light Railway over the proposed lines of the Watford and District Tramways. Mr. C. C. Hutchinson, on behalf of the latter, objected to these running powers of the County Council, but if they were granted, then his clients asked for reciprocal running powers. Mr. Danckwerts, K.C., objected, and stated that the policy of the Hertford County Council was to get the people from the crowded districts into the country, and the Watford and District Tramways, whose powers expired in another year, merely wanted the running powers which the Light Railway Commissioners had refused the company, to enhance the value of its undertaking, in order to sell it. Sir Herbert Jekyll said the Board would very carefully consider the point, but he did not think they were likely to reverse the decision of the Light Railway Commissioners.

Barrow.—It has been a matter for conjecture what system of supplying the current for that portion of tramways crossing the high-level bridge would ultimately be adopted. A difficulty was expected in this direction, but, so far as can be ascertained, the matter will be overcome in a very simple way. The plans provide for a continuation of the overhead wires over the bridge, each wire being supported in the centre by fixed brackets. At either end of the bridge there will be fixed special poles or standards, and also immediately on the roadway. On the top of the latter will be arranged a kind of cup and socket, so that when the bridge is being raised the bar containing the wires will automatically become disconnected and will return into position again when the bridge has been lowered. It is expected the trolleys will be a little higher when running over the bridge than on the roadway, and in order to get over this difficulty a simple coupling arrangement has been devised. When the bridge is raised the current will, of course, be cut off, but immediately the bar returns into position the circuit will be renewed. The electric mains to Barrow Island are laid at the bottom of Devonshire Dock, and, therefore, although the bridge may be "off" and the circuit disturbed, the cars running on the island will be assured of a supply of current, and there will be no temporary stoppage of the service.

Wolverhampton.—A long and animated discussion took place at the last meeting of the Town Council on a report of the Tramway Committee, which brought forward recommendations that the electrical engineer be instructed to forthwith invite tenders for the supply of six double-deck cars, and that the chairman and deputy-chairman of the Tramways Committee and the electrical engineer be authorised to accept such tenders as they might deem advisable. The cars will be required for the laying down of the Dudley-road track, which it is expected will be completed before the end of the year. Several of the members objected to the matter being left in the hands of the gentlemen mentioned in the resolution, while others contended that the whole of the members of the committee should have a voice in the selection of the tenders. There were other members who contended that the tenders should not be confined to double-deck cars. A number of amendments were proposed and discussed, but ultimately the original resolution was adopted. The Council confirmed the promotion of a Bill for the extension of the tramway system to Wednesfield. The Tramways Committee have announced by a printed notice placed inside the New Hampton-road cars that the service of trams from Coleman-street to Newbridge will be discontinued "until further notice." The reason for this step is that the line does not pay.

Brighton.—The recommendation mentioned in our last week's issue, that the tramways engineer should be instructed to prepare specifications and detail drawings for a public shelter and tramway room at the Old-steine terminus of the tramway system, has been rejected by the Town Council. Arising out of the recent action of the Tramways Committee in disqualifying a tender for cars on the ground that the firm quoted only for British trucks instead of American as specified, the employés of the truck shop at Falcon Works, Loughborough, have held a meeting and passed the following resolutions unanimously: "That this meeting, having heard that in several towns it is the custom to exclude British firms from putting in tenders for trucks in competition with foreign makers, respectfully appeals to members of tramway committees and other buyers of cars to give fair play to an industry on which the welfare of so many of their countrymen—not only ourselves and our families, but other workers concerned in the preparation of the material—is absolutely dependent. That, while having no right or wish to interfere with the actual placing of orders, we urge that in our own country it is unjust that British truck makers should be barred from opportunities of selling goods which are the product of British labour. That we protest against any suggestion that foreigners can claim superiority or even equality in any branch of steelwork, and we are confident that with fair and open competition foreign-made electric traction trucks would soon fail to find any market whatever in this country, and that employment would then be provided for a large number of additional men in this industry."

Sunderland.—On the 25th inst. a special meeting of the Town Council will be held to approve an application to the Board of Trade for a provisional order authorising the Corporation to construct new and additional tramways within the borough. At the last meeting of the Tramways Committee an important report respecting the depreciation and renewals fund was presented. It stated that from the experience of the working of the Sunderland tramways, and from the experience of tramway engineers, managers, and accountants in other towns, the probable life of the works had been ascertained, and the committee was asked to set aside as a depreciation and renewals fund such an amount annually as would depreciate or renew the assets at the end of the period they had laid down. Already £27,426 had been set aside, whilst the sum required on the basis now presented was £23,854, so that a substantial balance was left in hand over and above the estimate. Five thousand pounds had also been invested as a further reserve fund in accordance with the provisions of the Act of Parliament, and an accident reserve fund of £2,000 was now being built up, £911. 3s. 9d. having been contributed during the last two years. The report continued: "We have no hesitation in saying that there is every indication that the life we have allotted to many portions of our plant will be greatly exceeded, but it is better to err on the side of caution, and, therefore, the fund may be considered quite equal to any demand that may be made upon it. Probably it is unnecessary to deal with the statement in detail, but we should like to direct your attention to the fact that there is a large scrap or surrender value in much of our plant, even when the plant is useless for its present use. Rails, bonds, trolley wires, and cables will all realise a large sum when sold, and the amount gained in this way will be taken into account when dealing with the depreciation question. There are many portions of the undertaking that will appreciate rather than depreciate in value. The land we have is certain to be worth much more in 30 years' time, but within this period the debt will be paid off, and, so far as we can foresee, the tramways will be enjoyed by the inhabitants of the borough at that time free from debt." The report is signed by Thomas Summerbell, chairman; T. E. Bryers, vice-chairman; H. England, general manager; John F. C. Snell, borough electrical and tramways engineer; and Haswell Brown, borough accountant. Appended to the report is a detailed statement showing the capital expended on each portion of the tramway works, the estimated life of each, etc.

Leith.—A special meeting of the Town Council has been held to consider matters connected with the tramways undertaking. In a report by the town architect and the burgh electrical engineer as to additional buildings and plant in connection with the possible introduction of electric traction in the burgh, it was stated that, judging from the present progress of the undertaking, an addition to the existing station buildings and plant would have to be provided within two years, and they recommended that the first addition should comprise generating and steam plant, with auxiliaries, to the extent of 1,000 h.p. This addition would suffice for both electric tramcars and the general supply of electricity for public and private lighting then connected to the undertaking. They also recommended that the future extensions of the plant should be in units of 1,000 h.p., and either of the plans they submitted showed a completed station of 7,710 h.p. The first plan showed the extension of the electric station by the absorption of the whole of the site presently occupied by the cleansing department. The cost of the site would be about £10,060, and to erect the new buildings would cost about £10,986, giving a total cost of £21,046. The report stated that if this plan was adopted the whole scheme would require to be carried out at one time, and that the cost of the plant under it would be about £11,000. The second plan showed the extension of the station by the acquisition of Mr. Young Pentland's ground adjoining the station, and under it the extensions could be carried out in sections by erecting bays from time to time as each engine and boiler was added. To erect all the new buildings in accordance with this plan would cost about £8,200, and to erect only a portion—viz., a bay of engine and boiler house, chimney flue, economiser building, pump and tank room, workshops, etc., would cost £5,400. The plant to be laid down in the first instance would cost about £12,000. The initial cost of the two plans was given as: No. 1, cost of site, buildings, and plant, £29,540; No. 2, cost of site, buildings, and plant, £25,400. Final cost of site and buildings: No. 1 plan, £21,046; No. 2 plan, £16,200. The final cost of the plant would be almost identical for either No. 1 or No. 2 schemes. The Council decided to accept Mr. Pentland's offer for the purchase of his land. The following are the proposed heads of agreement which it is proposed to enter into with the lessees of the Edinburgh tramways: (1) On the acquisition of the tramways in Leith by the Council, the Council to immediately proceed to convert the whole system, doubling the lines throughout where practicable, for electric traction; (2) the whole tramways and any alterations or extensions thereof to be now agreed upon by the Council, and what is known as the Morton-place property, to be leased from the date of acquisition of the tramways by the Council to the lessees of the Edinburgh tramways; (3) no claim to lie by the lessees against the Council consequential on the said process of conversion or extension; (4) the lessees to take electric energy from the Council at 1½d. per unit; (5) fares and service to be subject to arrangement; (6) the lessees to take over the horse plant of the present owning company at cost to the Council; (7) the lessees, for the purpose of through traffic with the city of Edinburgh, to equip their electric cars so that these electric cars may be taken from Pilrig over the cable system in Edinburgh up to St. Andrew-square, or other point which may be agreed on by the parties, unless the City Corporation agree to electrify that portion for the like purpose of through traffic; (8) the lessees to state what percentage and rent they are prepared to offer; (9) in the event of an arrangement under these heads, an agreement on these and on other relative matters to be negotiated on the lines of the previous provisional arrangement with the Edinburgh lessees.

London County Council.—Mr. A. L. C. Fell, of Sheffield, has been appointed chief officer of tramways to the London County Council at a salary of £1,500 a year. Further reference to this appointment will be found in our "Personal" notes. The tramway item that raised most discussion at the usual weekly meeting of the London County Council on Tuesday was probably the recommendation of the Highways Committee not to purchase the undertaking of the London

Digitized by Google

Southern Tramways Company. The lines in question run from Vauxhall to West Norwood, with a branch to Camberwell-green, where they join up with the Council's system. The committee reported that the latest information available showed that the company's undertaking was not at present remunerative. The Council would not, the committee thought, make the new line pay. They stated that, with street widenings, the total capital sum which would have to be provided was estimated at over £450,000. Having regard to the present capital commitments of the Council, they did not feel justified, in the circumstances of the case, in recommending the Council to take any steps at the present time for the compulsory purchase of the undertaking. This course would not preclude the Council from purchasing the lines at the expiration of the next statutory period—seven years—when the development of the Council's existing tramways south of the Thames, under the conditions which obtained with the use of electrical traction, would have probably reached a stage which would justify the Council in undertaking all the further developments in the locomotive requirements of London, which were undoubtedly demanded, and would enable it to formulate those requirements with more accuracy. In addition, the Council might then be in a better position, with reference to its other capital commitments, to undertake the service, even should the position of affairs outlined in the present report remain unchanged. After a long discussion the Council referred the report back, the opinion being that there should be no break in the Council's policy of becoming the sole tramway authority within their area. The same committee brought up an important report with reference to the tenders received for the supply of four 5 000-h.p. engines for the Greenwich generating station. Sixteen tenders were sent in in response to the Council's advertisements, and the full list will be found in our "Tenders" columns. It will be seen from the following report of the committee that they recommended for acceptance the tender of Messrs. John Musgrave and Sons at a price which is nearly £12,000 higher than the lowest tender sent in, which they were able to take into consideration. Their reasons for adopting this course are given in the report. It reads as follows: "The tenders have been carefully examined by the Council's electrical engineer, and we have had before us his report upon them. As the result of our consideration of the matter, we are of opinion that the tender of Messrs. John Musgrave and Sons, Limited, amounting to £96,713, should be accepted. It was not possible to consider the first two tenders, as that of Messrs. Fullerton, Hodgart, and Barclay, Limited, was incomplete, while the second lowest tender was not in accordance with the Council's specification. The next lowest tender amounts to £84,921. 10s., or £11,791. 10s. below that of Messrs. Musgrave and Sons, which, it is suggested, should be accepted. As the difference between the two tenders is about 12 per cent., we have given very careful consideration to the course which should be taken in the matter. Certain details of construction of the engines were left to the tenderers to decide, and we have, therefore, in considering the matter, borne in mind the relative advantages of the various proposals submitted by the firms who have tendered having regard to the Council's requirements. Moreover, in view of the vital importance of the engines to the success of the tramways undertaking, we have also felt compelled to take into account the experience and qualifications of the firms submitting tenders to undertake so large a work, as it involves the largest order for engines which has ever been given by a municipal body. In order that there should be no risk of failure, and that the best possible form of construction should be secured, we are of opinion that the extra expenditure involved by accepting the tender of Messrs. Musgrave and Sons is fully justified, as it is essential to the successful completion of the large and costly tramway works which the Council has in hand that the most satisfactory results should be obtained from the engines. Messrs. Musgrave and Sons have submitted the names of certain firms to whom they propose to sublet different portions of the work, and we are advised that no objection need be raised to that course. The necessary expenditure is provided for in the estimate approved by the Council on July 21, 1903, for the provision of plant at the Greenwich generating station." A discussion took place on the report, in the course of which Mr. Torrance said he would like more reasons to be given for the committee declining to accept the lowest tender. He was getting alarmed at the growing capital expenditure of the Council. He was very reluctant to move an amendment, but was afraid he would have to do so unless a satisfactory explanation was forthcoming. Mr. D. S. Waterlow said there was a great difference in machinery, and it was very necessary that they should be extremely cautious. The firm recommended by the committee had a very high reputation. They had to consider how serious it would be if these large engines gave trouble at any future time. Sir William Collins said that the objections offered by Mr. Torrance had not been answered, and he saw no reason why they should depart from their usual practice of accepting the lowest tender. Mr. Benn, chairman of the committee, pointed out that the engines were the biggest ever ordered by any municipality. He proceeded to read a document prepared by the electrical engineer, showing why other and lower tenders had been rejected. The firm now recommended had built similar engines for the Glasgow Corporation and for the City of London Electric Lighting Company. Mr. Torrance said he was quite satisfied. The recommendation of the committee was then agreed to. Another report which the Highways Committee had on the agenda referred to the temporary supply of electrical power in connection with the working of the New Cross and Greenwich tramways. The reconstruction of these tramways is now almost completed, and the arrangements with regard to the erection of the necessary plant at the London Electric Supply Corporation's generating station are nearly completed, and it is hoped that it may be practicable to commence the electrical working of the tramways early next year. The agreement entered into with the company with regard to the matter provides for the payment by the Council at a rate to be agreed, but not exceeding 1½d. per unit of electricity generated. The Council's plant at Deptford will be in the same engine-room as that of the company, and the question has arisen as to the advisability of having two separate staffs in the same building under different control. It has been suggested that the company should take over the running of the mechanical plant and be responsible for all repairs, maintenance, and stores for an inclusive charge of 1·65d. per unit, including the supply of steam. The committee think that it would be advisable, however, for the Council to employ a charge engineer to give instructions as to the running of the plant, to supervise the working of the switchgear, and also to make necessary repairs to the electrical plant. Having regard to the circumstances, they are of opinion that this arrangement would be the most economical and convenient one to be made, and it is probable that the extra cost involved in the increased charge of 0·15d. per unit would not exceed the expenditure incidental to the establishment by the Council of its own staff of workmen. The rate of pay for charge engineers employed at temporary electricity generating stations of the London County Council Tramways was fixed by the Council at from £3. 10s. to £4. 10s. a week, and the charge engineer proposed to be employed at Deptford will be paid according to this rate. The Improvements Committee presented a report in which they asked for authority to spend £21,500 for the purchase of property needed for the widening of Brook Green-road and Scrubbs-lane authorised by the Tramways and Improvements Act of 1903. During the meeting Mr. Collins asked if the Council's inspectors had been to Belgium to see the tramrails made, and if the employers paid fair rates of wages and observed reasonable hours of labour. Mr. Benn said he must ask for notice of such a question. He would reply to it next week.

LIGHTING AND GENERAL.

Nuneaton.—The Electric Committee made a profit during September.

The New Mall.—The processional road in the new Mall is to be lighted by electricity.

Dudley.—The Guardians are arranging for the installation of electric light and power at the workhouse.

Lincoln.—The Council propose to apply for power to borrow £11,500 for extensions at the electricity works.

Swansea.—The electrical engineer in his last report recommends that 48 gas lamps be replaced by Nernst electric lamps at a cost of £28. 16s.

Exeter.—The City Council have informed the Heavitree Council of their willingness to entertain a proposal to supply that district with electric light.

Batley.—A satisfactory start has been made by the electricity department, the generating station having now a load already equal to 3,124 8-c.p. lamps.

Bedford.—The charges for the supply of electricity for motive power and heating purposes are to be reduced from 2d. to 1½d. per unit from April 1 next.

Bourne (Lincolnshire).—The Post Office telephone system was opened on Tuesday. There are 23 subscribers, and further additions are to be made shortly.

Shoreditch.—The Borough Council propose to raise the pressure from 120 volts on a two-wire system, to three-wire system at 240 volts for lamps and 480 volts for motors.

Yardley.—The Rural District Council propose to apply for a provisional order enabling them to supply electricity for public and private purposes within the area of the rural district.

Cirencester.—The Council have resolved not to assent to the application intended to be made by the Southern District Electricity Corporation for a provisional order to supply electricity.

Heanor.—The National Telephone Company intend to instal a telephone service. It is at present proposed to connect Heanor with Langley Mill, where there has been a public call office for some time.

Hull Telephones.—It is stated that the design of the switchboard will in no way be affected by the modifications necessary for intercommunication with the National Company. The extra cost is £200.

Sutton-in-Ashfield.—The Urban District Council have decided to apply for a provisional order enabling the Council to produce and to supply electric energy for public and private purposes within the urban area.

Huddersfield.—The proposed extension of the electric cables up Victoria-road, along Burley-street, and on to Dempster's works will necessitate a further loan, as this extension was not included in the estimates.

Stafford.—The experiment of throwing open the gas and electric lighting works for public inspection on the previous Friday and Saturday proved very successful, from 500 to 600 persons being admitted on the latter day.

Alfreton.—The Urban District Council have approved a report by the Water Sub Committee upon the Overton water supply at Ashover. The cost is estimated at £14,226. The motive power is electricity.

Italy.—The Minister of Public Works has been authorised to acquire, without the formalities of calling for tenders, a permanent lighting apparatus for the central lighthouse service, at a cost of about £383, set up.

Golcar.—A special meeting is to be held on Dec. 8 to consider an application to be made for a provisional order authorising the Corporation to supply electricity for public and private purposes within the urban district.

Kirkcaldy.—The demand for electric lighting is gradually increasing, and in a few weeks' time there will be as many as 104 arc lamps on the public streets of the burgh, nearly half the number being on High-street.

Digitized by Google

Steyning East.—The Rural District Council have granted permission to the Brighton Corporation to supply electricity in the parishes of Preston Rural and Patcham, conditional upon an agreement being entered into.

Woolwich.—The new electric lighting station erected on Plumstead Marshes by the Woolwich Borough Council at a cost, including the dust destructor, of £90,000, has been opened. It contains four engines of an aggregate of 1,000 h.p.

Redditch.—The District Council will apply for sanction to raise a new electricity loan of £8,500. Of this sum £5,581 is required to cover expenditure already incurred in anticipation of the loan, the remainder being required for extensions.

Limerick.—The Electric Lighting Committee of the Corporation announce that they will be very soon in a position to supply intending consumers of electricity with a supply for lighting, heating, and cooking, and also for motor power.

Leith.—The Town Council have resolved to purchase, in view of additional buildings and plant being required after the possible introduction of electric tramway traction, a piece of ground adjoining the present electrical station, at £7,500.

Sandringham.—The electric lighting has just been completed. Every room in the house is now lighted by electricity, also York Cottage and the stables and other outbuildings, and Park House, the residence of Sir Dighton Probyn.

Agency.—Messrs. W. H. Allen, Son, and Co., Limited, Queen's Engineering Works, Bedford, have appointed Messrs. Inniss and Riddle, City-chambers, 82, New-street, Birmingham, as their representatives for Birmingham and neighbourhood.

Coventry.—At the last meeting it was proposed that the Council instruct the Electric Light Committee to discontinue the further purchase of slack or smudge for use as fuel at the electric light station. After discussion the proposition was defeated by a large majority.

Dublin.—Under the new schedule for electric current private consumers are to be charged 6d., places of worship 4½d., and theatres and music halls 4d., in order to induce theatres where they had at present their own installation to come to the Corporation installation.

Wrexham.—Application is to be made for sanction to the borrowing of £4,500 for the purpose of extending the electric lighting cables. The Electricity Supply Committee in their last report state that out of 12 applications for the post of dynamo attendant and engine driver no suitable person has been found.

Acton.—At a recent special meeting of the District Council the question of the proposed dust destructor and electricity works was discussed. It was agreed that steam power be used for the generation of electricity, and that the question of the dust destructor be referred to Mr. W. H. Trentham to report upon.

Carlisle.—The Lunacy Committee of the Cumberland and Westmoreland Asylum at Garlands have framed a scheme for extensions which have received the approval of the Lunacy Commissioners and the Secretary of State, and which is estimated to cost £53,000. They include £8,000 for an installation of the electric light.

West Bromwich.—The Electric Lighting Committee in a report issued on Tuesday recommend that a new feeder cable be laid from the works to Bull-street, a distance of 1¼ miles, at a cost of £1,433. They further report that application has been made for permission to borrow £12,217 for further extension of the electricity plant.

St. Austell.—The electric lighting undertakers have served notices on all their consumers that the supply would be discontinued on the 31st ult. This is greatly to be regretted, and the question is being raised by the Council with the Board of Trade as to whether electric lighting undertakers have the right to discontinue supply on such short notice.

Teignmouth.—The District Council have decided that application be made for a provisional order to enable the Council to transfer the undertaking created by the order to Messrs. Crompton and Co., Limited, upon such terms and conditions as, subject to the approval of the Board of Trade, might be arranged between the Council and the company.

Caerphilly.—The Council, after consultation with Mr. Preece, on Tuesday decided to proceed this year with the application for a provisional order if the result of the vote to be taken immediately throughout the district showed that the inhabitants would take 1,000 lights. It was also decided not to consider the question of the generating powers till the result of the vote be known.

Ramsgate.—We understand that the Corporation have consented to the promotion by the Ramsgate and District Electric Supply Company of an electric lighting order for the borough of Ramsgate, subject to the insertion therein of special terms as to purchase by the Corporation and other matters, and also subject to the agreement now laid before the committee being duly entered into.

Wandsworth.—The General Purposes Committee in their last report state that they had come to the conclusion that the Brush Electric Lighting Company's price had been 5·77d. per unit for current sold during 1902. It was difficult to fix the amount exactly, as the company did not keep separate accounts for this district. The Board of Trade is to be asked to require the company to keep separate accounts.

Arbroath.—The Town Council have agreed to accept the offer of the Empire Electric Light and Power Company, Limited, for the electric lighting of the burgh. Under the conditions agreed upon between the company and the Council, the Council will have the option of taking over the undertaking at the term of Martinmas of 1909, and at the expiry of every subsequent period of five years on terms arranged.

Llanelly.—At a meeting of the Estates Committee of the Urban District Council on Monday, the question of electric lighting and traction for the town was further considered. The Board of Trade had threatened to revoke the provisional order for the electric lighting of the town, and it was decided to recommend the Council to go to Parliament to compel the specific performance of the contract with the British Insulated Wire Company.

Hull.—At a meeting of the Coltman and Albert Wards (Hull) Ratepayers' Association on Tuesday a resolution was carried that the association should send a deputation with the Myton Ward Ratepayers' Association to the Chamber of Trades, and support them in their endeavour to induce the Electric Light Committee to reduce the cost of the current, and, as a means of encouraging the use of the current during the daytime, to lend out motors to small users.

London Gazette.—The partnership subsisting between Frederick William Walker and William Robert Gray, carrying on business as electrical engineers at 124, Putney Bridge-road and 39, Page-street, Westminster, under the style or firm of Gray and Harris, has been dissolved from Oct. 1, 1903. The estate of Walter Morton and Trevitt Walter Sampson, lately trading as Morton and Sampson, electrical engineers, Ash Cottage, Bush Green, Lymm, Cheshire, has been released from the trustees.

Deal.—As the order granted to the Kent Electric Power Syndicate contained a clause providing that the order should be inoperative so far as Deal and Walmer were concerned if a provisional order were applied for by the local authorities of those places during the current Board of Trade session, and obtained, the town clerk placed the matter on the agenda for decision at the last Town Council meeting. It was thought that as the town had executed a very favourable agreement with the syndicate, it was unnecessary to apply for an order.

Wolverhampton.—The Town Council have decided to extend the electric lighting mains at a cost not exceeding £1,300. An amended wiring scheme for houses at rentals of £40 to £65 per annum, in streets where the mains are laid, has been agreed to. If this should prove successful, the Electric Lighting Committee will ultimately bring before the Council a scheme to extend it to houses at lower rentals. The capital outlay will amount to £26, and the revenue to £9. 3s. 4d., including cost of current, hire of wiring, and fittings for 20 lamps.

Glasgow.—The introduction of electric light into the new court has been suggested, but Mr. George Bell, the architect, states that, looking to the condition of the buildings, and the remits that had at various times been made to committees upon matters involving an alteration of the construction of the buildings, the introduction of electric light now could not be properly dealt with. If it were introduced, some alteration of the building in the immediate future might involve a great part of the work being thrown away. Consequently nothing will be done in the matter at present.

Stock Exchange.—Applications have been made to the Stock Exchange Committee to appoint a special settling day in and to grant a quotation to Dick, Kerr, and Co.'s 61,000 6 per cent. cumulative preference shares of £5 each, fully paid, Nos. 1 to 61,000, and £300,000 4½ per cent. debenture stock. The committee have been asked to allow Bath Electric Tramway's 59,394 5 per cent. cumulative preference shares of £1 each, fully paid, Nos. 1 to 59,394, and 75,606 preferred ordinary shares of £1 each, fully paid, Nos. 75 001 to 150,606, to be quoted in the official list.

St. Marylebone.—The municipal election turned on the policy of completing the purchase of the local property of the Metropolitan Electric Supply Company, and getting a new Act of Parliament to enable the Borough Council to borrow the requisite money for this purpose, and also for providing a self-contained system of electric lighting. Six of the nine wards were contested, with the result of an aggregate poll of 6,941. All the leading members of the old Council were re-elected. The upshot of the election increases the majority pledged to this policy by five, making the total majority 48. The Progressives now count 22—an increase of 5. The rest of the Council of 60 are either Moderates or Independents.

Wood Green.—The Urban District Council have decided to invite tenders for the erection of a power station and the buildings in connection with the Council's electric lighting scheme, and to accept the tender of Henley's Telegraph Works at £7,678. 2s. 5d. for electricity supply works in connection with the Council's electric lighting scheme. It is proposed to borrow £43,200 to cover the estimated cost, and, further, to erect a dust destructor. The electrical engineer has been instructed to prepare plans and specifications for the provision of plant in connection with the generating station. The Council have accepted the tender of Messrs. Hill and Smith, of Brierley Hill, Staffordshire, for the supply of wrought-iron fencing, gates, etc.

Luton.—The electrical engineer in his last report states that since Sept. 11 12,273 units had been generated; an equivalent of 372 8-c.p. lamps and six motors of 22 h.p. connected, making a total of 128 consumers with 8,459 lamps and 30 motors of 92 h.p., and that at the present time over 600 additional lamps and four motors of 16 h.p. were being wired. The number of units generated showed an increase of 64 per cent. over the number generated during the corresponding period of last year. Upon receipt of the report at the last meeting, it was resolved that the best thanks of the committee be presented to the chairman, Councillor Wilkinson, for the efficient and excellent services rendered by him during the past year.

Beckenham.—The Urban District Council at their last meeting adopted a report recommending the laying of services in cases where new houses have been wired by builders. Applications for the wiring of certain houses in course of erection having been submitted, it was agreed that, until the further order of the Council, proposals for wiring new houses may be accepted subject to the builder indemnifying the Council to some extent for the outlay until the buildings are let. It was referred to the officers to consider and report as to what this indemnity should be. The subject of electric current of the tramways was referred to the officers, with instructions to communicate with the British Insulated and Helsby Cables, Limited, and report.

Digitized by Google

Clyde Valley Electric Power Co.—We regret to learn that last week a serious accident befell the works of this company, which are at present in course of construction at Motherwell. It is stated that the large structure collapsed without any warning, and hundreds of tons of girders, columns, and beams are lying in one huge heap, the girders and beams being twisted and bent like so much tin. The collapse is supposed to have been due to the wind. The erection was bolted to the concrete foundations, and supported by guy ropes. Fortunately, the accident occurred after the workmen had ceased work for the day.

Swindon.—With regard to a petition signed by residents in Durham-street and Belgrave-street, the Council have resolved that, on the owners of the property agreeing to pay the cost of providing and erecting the lamp columns, etc., and laying the electric light mains for lighting those streets, the Corporation will light the same; also that in the event of the Education Committee deciding to light the Euclid-street Schools with electricity, the electric mains be extended to the schools. Alderman Skurray, the chairman of the Electric Light and Tramways Committee, said at the last Council meeting that it would be possible to reduce the cost of current at least 20 per cent. within the next 12 months if the present rate of progress continued.

Ealing.—Since the last meeting applications have been received from 46 consumers for 2,006 lamps. These figures constitute a record in two ways. The greatest number of applications ever previously received between two meetings was reported on June 15 as 34; the present 46 is thus a long way ahead. The 2,006 lamps applied for exceed the previous record of 1,350, which was reported at the meeting of May 25, by 656. The total number of lamps now applied for is 67,536, representing 1,661 consumers; 1,812 lamps, representing 44 consumers, have been connected since last meeting, the total now connected being 66,349. The connections keep pace with the applications, the number of lamps waiting to be connected being only 1,187, or about 1·75 per cent. of the total applications.

London County Council.—On Tuesday sanction was given to the borrowing by the Kensington Borough Council of £27,098 for erection of a dust destructor. Notices under Electric Lighting Acts and Orders were agreed to as follows: from the Charing Cross and Strand Electricity Supply Corporation of intention to lay mains along portions of Chandos-street and Bedfordbury, and also along May's-buildings or Hop-gardens to St. Martin's lane; the City of London Electric Lighting Company, across and along a portion of Upper Ground-street; and the Metropolitan Electric Supply Company, across and along a portion of North Wharf-road, and also along a portion of Clifton-hill. The receipt of a notice from the Stepney Borough Council of intention to lay mains along portions of Broad-street and Medland-street was also reported.

Gloucester.—After considering the application of the Council for sanction to borrow £25,000 for the purposes of their electricity undertaking, the Local Government Board have sanctioned the borrowing of £24,673, an item of £285. 12s. 7d. having apparently been deducted by mistake, as although the cost of the provisional order was included in the particulars furnished, it was shown that the same had been paid out of the general district fund, and therefore the mistake would probably be corrected. The electrical engineer has done a large amount of additional work in preparing the particulars required for the Local Government Board, most of such work having been carried out in his own time, and a fee of £15. 15s. has been paid for this additional work. It has been resolved to supply electricity to the Gloucester Infirmary at the rate charged for churches.

Portsmouth.—Application is to be made for sanction to borrow £24,000, the estimated cost of laying new mains during the next three years. In presenting the annual report and balance-sheet of the Electric Lighting Committee last week, Alderman Ellis did not go into details, but declared that the results had been eminently satisfactory. The committee reported that they had again had under their consideration the question of sinking a well at the electric light station, and in order to save, if possible, an expenditure of about £500 per annum for water, they thought that it would be desirable to endeavour to sink a well so as to get the requisite supply of water at the station. They now recommended that a well should be sunk, at an estimated cost of £762, but with an arrangement that, in the event of water not being found, the contractors should remove the tubes and apparatus, the charge in that case being about £500. In either case, however, the whole expenditure would be met out of income, as they could very well afford to do so. This was agreed to.

Cape Colony.—The following regulations and tariff have been framed by the Table Bay Harbour Board for the use of electric cranes at the docks—viz.: "At those quays where electric cranes are installed, the masters or agents of all vessels desiring to discharge or ship cargo must, if required by the dock superintendent, use these cranes exclusively for loading or unloading their vessels." The following is the scale of charges: for the use of each crane during ordinary working hours, 5s. per hour; for the use of each crane out of working hours, 7s. 6d. per hour; minimum charge for each crane during working hours, 12s. 6d.; ditto out of working hours, 20s. If cranes are required during the dinner hour 2s. 6d. extra will be charged. The charge will commence from the time stated in the requisition handed in to the quay superintendent by the master of the ship (or if the crane is not ready, from such time as it is ready) till the work is finished for the day or night, exclusive of stoppages caused by defects in the electric service. All requisitions for the use of the crane must be made in writing to the quay superintendent.

Hove.—The new electric lighting works of the Hove Electric Lighting Company, which are situated just inside the boundaries of Aldrington, will probably be opened in the course of the week. The generating sets, by Messrs. Crompton and Co., are being erected whilst the boiler-house is complete. The extension of the mains has been carried out wherever possible on the existing system of bare copper in culverts, paper cables being connected for the road crossings and other places where there has been insufficient room for the larger construction. Outside of the central station a large water-cooling reservoir has been built, with a system of spray inlet pipes. The water supply will be taken from a well dug in the vicinity of the station, and the advantage of the reservoir will enable the engines to be worked on condensers. The approach to the station is somewhat difficult to find—it is built close to the Brighton and Shoreham branch railway, but stands back some little distance from the main road. The chimney is, however, almost the only one of its kind in the town, and is sufficient guide to those in search of the generating works.

Chilworth (Surrey).—The Chilworth Gunpowder Company, Limited, has placed with the British Schuckert Electric Company, Limited, a contract for the complete electric lighting and driving of their gunpowder mills at Chilworth. The estate covers an area of 40 acres, and the 18 buildings, as well as the roads, are to be lighted by means of 142 32-c.p. incandescent lamps and four outside arc lamps. Special precautions are to be taken to ensure safety, and the buildings in which explosives are manufactured or stored will be lighted by outside lanterns provided with special reflectors. Eight shunt motors—viz., two each having an output of 25 b.h.p., two of 3¼ b.h.p., and four of 1¼ b.h.p.—are to be employed in the manufacturing processes, and five ventilating fans will be supplied for expelling explosive gases. The generating plant consists of two belt-driven machines, one of 75 kw. and the other of 30 kw., both of which generate current at a pressure of 220 volts. The switchboard is so arranged that either generator may supply the lighting circuits or motor circuits separately, or, if desired, the two generators may be run in parallel and supply the total combined load conjointly.

Birmingham Tame and Rea District Drainage Board.—With regard to the electrical power transmission scheme of the Board, which we noted in our last issue, we have received the following further particulars: In the last session of Parliament, authority was granted to the Board to sell two acres of land in the city of Birmingham for the purpose of constructing a refuse destructor thereon. In payment for this land the city of Birmingham has undertaken to generate steam condensing 24 hours a day in sufficient quantity to develop 175 b.h.p. when utilised in a high-speed engine. The Drainage Board propose to utilise this power in generating electric power in the form of three-phase current at the generating station, which will be erected at Saltley, near Birmingham, and transmit the power a distance of five miles over the Drainage Board's outfall works and irrigation lands at a transmission pressure of 2,300 volts. There will be two generating sets, consisting of two high-speed engines by Bellis and Morcom, each of which will be direct connected to one British Thomson-Houston revolving-field type of generators, the latter generating three-phase current at 50 cycles and 2,300 volts. This current will be led direct to the overhead transmission line, which line will be tapped at eight points along the route, at each of which a sub-station will be erected, containing the necessary step-down transformers for transforming the high-tension current from 2 300 to 200 volts. At four of the sub-stations centrifugal pumps direct connected to British Thomson-Houston standard type of induction motors will be installed for pumping purposes, replacing separate installations of steam-driven pumps, the transport of fuel and water to which is necessarily an expensive item, these pumps being placed at different positions on the Board's estate, where the level of the land is such as to necessitate pumping the water on to the land from the main culvert, which runs throughout the length of the estate. There are 14 motors in all, ranging from 2 h.p. to 28 h.p., a number of which are used for operating machinery on the different farms situated on the Board's estate, and also for operating distributors and such machinery of a special nature as is used in connection with the treatment of sewage. The lighting of the principal buildings situated on the Board's estate will also be carried out from the same generating station. This scheme, which, in its comprehensive nature, might almost be called a pioneer scheme, and as applied to pumping in connection with sewage disposal is undoubtedly a pioneer scheme, is entirely due to the initiative and enterprise of the engineer, Mr. John D. Watson. The contracts, as already stated, have been provisionally placed with the British Thomson-Houston Company, Limited, of Rugby, and work will be commenced immediately the Local Government Board have sanctioned the necessary loan.

Kingston.—The Town Council are raising a loan of £7,784 for electric lighting purposes at 3¼ per cent. interest, the charge for all legal and other expenses (excluding stamp duty) being 5s. per cent. Messrs. Burstall and Monkhouse, in their last report, stated: "All the plant, etc., is in good order. The motor for driving the stokers has been running, and has now been permanently fixed. Work has commenced on the mechanical stokers, and we understand that there is a probability of the small condensing plant being delivered about the end of the month. Mr. Edgcome has sent us weekly reports as to the costs, which we think are most encouraging. Comparing these with the figures of the corresponding weeks of last year, the number of units generated has increased 14 per cent., while the maximum load has only increased 10 per cent. The works costs per unit generated are nearly 20 per cent. lower than the corresponding period of last year. It will be some little time before the alterations we recommend can be made, but we anticipate a further reduction when the new machinery is at work." A week later they say: "The costs, we are glad to say, still continue to show the improvement mentioned in our last report; the units generated show an increase of about 13 per cent. on the month, while the works costs show a reduction per unit generated of about 20 per cent. in comparison with the corresponding period of last year. The maximum load is increasing more rapidly. As far as can be judged from the station results, the present plant at the station should be just sufficient to carry the undertaking over the present winter with a proper provision of spare plant, but will

Digitized by Google

not be sufficient for the winter load of 1904-5. For this we are of opinion that one new steam alternator will be required with the necessary steam and other pipes, switchboard gear, etc. We consider that a plant of the same size as the largest at present installed would in all probability be sufficient for the purpose, as it would allow of an extra load of 200 kw., beyond what may be expected this winter to be put on to the station. We do not expect that more than this will come on in the ordinary course of events, and any abnormal demand would most probably be known of in sufficient time to allow of proper arrangements being made. We would advise a new set by the same maker as those at present installed, so as to reduce the number of spares, etc. A set of this size would be quite economical. We do not think any extension will be necessary in the boiler-house, as in our opinion you have sufficient boiler and condenser power for the enlarged station. The new steam alternator should be arranged so that no extension of the buildings is necessary." Further particulars have been asked for. Several extension of mains have been agreed to. The Electric Light Committee have had under their consideration the charges for meters and indicators, and hope to make some reductions in the near future.

River Plate.—We have recently seen a copy of a very readable English paper, called the *Review of the River Plate*, published at Buenos Ayres, from which we purloin the following paragraph: "The Compañia Alemana Transatlantica de Electricidad recently issued bonds to the value of eight million marks, so as to enable it to acquire the works of the River Plate Electricity Company and the Primitiva Gas Company, and from the prospectus we take the following information: The station of the former company stands on a property of 5,217 square metres; the capacity is 1,800 h.p. alternating current, the price including all the cables, accessories, contracts, etc., counting from April 1, 1903, for the sum of £2,500 cash, and £150,000 in 5 per cent. bonds to be redeemed at par before 1943. The contract with the Primitiva Gas Company dates from Aug. 12, 1903, by which the company rents all the electrical properties of the company, its contracts, etc., equivalent to 69,000 lamps of 16 c.p., the contract to commence June 1, 1903, and to last for 41 years; the price to be paid being £30,000 per annum. On the last payment being made all the property will pass over to the Compañia Alemana without further expenditure. The yearly sum of £30,000 will be paid to the trustees for the debenture holders. By this new arrangement the debentures will be amortised by Nov. 30, 1943. In the eventuality of the Compañia Alemana being more than six months behind hand in any yearly payment, the Primitiva Company has reserved the right of immediately demanding of payment of the remaining capital, and can also declare the contract as rescinded without having to pay back any of the sums received for rent, and can take over the works again. The Compañia Alemana is now the sole provider of electricity in the city of Buenos Ayres. The capacity of its stations is 16,050 h.p. The revenue of the company for the first six months of the year was 555,879dol. gold, as against 418,850dol. gold in the same period of 1902. The working expenses were 222,164dol. gold, as against 192,585dol. gold, so that the gross profits on the first six months of 1903 amount to 333,715dol., as against 226,265dol. for 1902, an increase of 107,450dol. The current sold during the first six months of the year was 6,877,576 kilowatt-hours, as against 4,773,483 in the same period of 1902. The following table shows the progress made by the company:

	1,000 kilowatt-hours		
	1902.	1901.	1900.
Private lighting	3,416	3,264	2,944
Public lighting	1,041	1,081	962
Power (motors)	1,041	667	483
Tramways	4,618	4,175	2,865
Own use	165	177	216
	10,281	9,364	7,470

PROVISIONAL PATENTS, 1903.

Oct. 26.

23102. Improvements in and relating to the application of electricity for the production of scenic effects at theatres and other places of entertainment. John Francis Carey, 6, Oriel-road, South Hackney, London.

23103. Improvements in and relating to the application of electricity for the production of scenic effects at theatres and other places of entertainment. John Francis Carey, 6, Oriel-road, South Hackney, London.

23110. Improvements in electric potential governors. Thomas Large Boyden, The Elms, Newbridge, Wolverhampton.

23129. Storage battery plates. Joseph Bijur, 28, New Bridge-street, London. (Complete specification.)

23151. Improved method and apparatus for producing a suitable circulation of the electrolyte in electrolytic processes. Hugo Koller and Paul Askenasy, 46, Lincoln's-inn-fields, London. (Complete specification.)

23161. Improvements in electrically-heated handles. Robert Anton Fliess, 53, Chancery-lane, London. (Complete specification.)

23173. Improvements in protecting devices for parallel feeders used in the distribution of electrical energy. Leonard Wilson, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

23181. Improvements in and relating to electric traction systems. John Mannheim, 18, Southampton-buildings, Chancery-lane, London.

23182. Improvements in connection with vacuum brake apparatus and mechanism for use therewith on electrical and other railways. James Gresham and Henry Albert Hoy, 18, Southampton-buildings, Chancery-lane, London.

Oct. 27.

23192. Improvements in or relating to dynamo-electric generators and motors. Adrian Denman Jones and the Jandus Arc Lamp and Electric Company, Limited, Hartham Works, Hartham-road, Holloway, London.

23224. Improvements in electrically-illuminated signs. John Henry Goehst, 65, Chancery-lane, London. (Complete specification.)

23225. Improvements in electric lamp sockets. John Henry Goehst, 65, Chancery-lane, London. (Complete specification.)

23226. Improvements in electrically-illuminated signs. John Henry Goehst, 65, Chancery-lane, London. (Complete specification.)

23260. Improvements relating to receiving instruments of printing telegraphs. Philip Arthur Newton, 6, Bream's-buildings, Chancery-lane, London. (Eltypic Manufacturing Company, United States.) (Complete specification).

23285. Improvements in telephone relays or repeaters. Gustavus Emerel Sundquist and Albert Henry Wahl, 6, Lord-street, Liverpool. (Complete specification.)

Oct. 28.

23318. Improvements in devices for suspending the overhead conducting wires of electric tramways and railways. Archibald John Howard, Clifton House, Cheddon-road, Taunton.

23333. Improvements in magnetic separators for ores or like materials. Joseph Mansell Moss, 4, Clayton-square, Liverpool.

23337. The adjustable arm rest for the telephone. Edith Moore, 13, Peel-road, Douglas, Isle of Man.

23355. Improvements in electrically-operated valves. The Warwick Machinery Company, Limited, 83, Cannon-street, London. (The General Electric Company, United States.)

23359. Improvements in sparking plugs and the like for electric ignition. Frederick Henry de Veulle, 9, Exchange-chambers, New-street, Birmingham.

23375. Improvement in electric silent discharge apparatus. August Schneller and Dirk Koeleman, 4, South-street, Finsbury, London.

Oct. 29.

23406. The electric automatic twin-wire switch. Walter Parkinson, 18, Fife-road, Kingston-upon-Thames.

23443. Improvements in electrical instruments. Crompton and Co., Limited, and William Arthur Price, The Arc Works, Chelmsford.

23444. Improvements in electrical instruments. Crompton and Co., Limited, and William Arthur Price, The Arc Works, Chelmsford.

23461. Improvements in or relating to electric generating apparatus. Paul Alfred Reubens, 111, Hatton-garden, London.

23469. Automatic switch for control of starting electric motors. Frederic Collyer Newton, 30, Clovelly-road, Hornsey, London.

23478. Improvements in and relating to the electrical transmissions of energy through space. Alessandro Artom, 45, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Aug. 23, 1903, being date of application in Italy.) (Complete specification.)

23482. Improvements in or relating to secondary batteries. Georges Rosset, 70, Chancery-lane, London. (Date applied for under Patents Act, 1901, Nov. 24, 1902, being date of application in France.) (Complete specification.)

23488. Improvements in and relating to the electrical transmissions of energy through space. Alessandro Artom, 45, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Sept. 12, 1903, being date of application in Italy.) (Complete specification.)

23490. Improvements in electric storage battery plates. Oliver Imray, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Carroll Potter, United States.)

Oct. 30.

23521. Improvements in and relating to loose handle automatic magnetic blow-out circuit breakers. Samuel Whipp, Old Market-chambers, Yorkshire-street, Rochdale.

23523. Astatic magnet, and process for the making of same. Johannes Zacharias and Emanuel Lasker, 15, Water-street, Liverpool. (Complete specification.)

23540. Improvements in electric resistance boxes. Arthur Henry Adams and Arthur Herbert Curtis, 11, Southampton-buildings, Chancery-lane, London.

23545. Improvements in or relating to electric batteries. Alfred Blackman, 20, Bucklesbury, London.

23546. Improvements in telephone mouthpieces or receivers. Arthur Benjamin Cruickshank, 33, Cannon-street, London.

23557. Improvements in electrical clutch and brake mechanism. Abram Peters Stockel, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

Digitized by Google

23574. Improvements in wireless signalling systems. Harry Shoemaker, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

23585. Improvements in electrical signalling apparatus for fire calls and the like. Edward Lawley Pinching and Walter Henry Walton, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London.

OCT. 31.

23592. Improvements in electric circuit controllers. George Joseph Philpot and George Herbert Alderton, 37, Ditchling-road, Brighton.

23603. Improvements in electric switches. John Tomlinson and Henry Lomax, 57, Barton-arcade, Manchester.

23630. Improvements in connection with overhead wiring, spans, ears, circuit breakers, frogs, and trolley heads for electric traction. Albert James and the London Motor Engineering Company, Limited, 87A, Wellesley-road, Chiswick, London.

23636. Improvements in raising and lowering electric arc lamps. William Anderson Brown, 40, Chancery-lane, London.

23647. Improvements in and relating to electric arc lamps. James McLaughlin, 45, Southampton-buildings, Chancery-lane, London. (Complete specification.)

23652. Improvements relating to electric meters. Société Anonyme des Ateliers de Mecanique de Precision de Territet, 45, Southampton-buildings, Chancery-lane, London. (Date applied for under Patents Act, 1901, Nov. 10, 1902, being date of application in Switzerland.) (Complete specification.)

23663. Improvements relating to telpherage. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (The Union Telpherage Company, United States.) (Complete specification.)

23664. Method of and means for automatically starting and breaking motors. Siemens Bros. and Co., Limited, Birkbeck Bank-chambers, Southampton-buildings, Chancery-lane, London. (Siemens und Halske Actien-Gesellschaft, Germany.) (Complete specification.)

COMPLETE SPECIFICATIONS ACCEPTED.

To be published Nov. 19, 1903.

1902.

16354. Electric accumulators. Danzer.

20645. Means for regulating the consumption of current by electromotors. Siemens Bros. and Co., Limited. (Siemens und Halske Actien-Gesellschaft.)

21021. Poles or electrodes of electrolytic apparatus and the like. Atkins.

23243. Insulating material for electrical purposes, and process for manufacturing the same. Sefton-Jones. (Isola Werke A.-G. in Oerlikon.)

23288. Alternating-current dynamo-electric apparatus. Winter and Eichberg.

23333. System of telegraphing or telephoning to or from a railway vehicle. Edgar.

23565. Electrically-actuated musical instruments. Dickson.

23842. Electric telegraphy. Hesse and Heurtley.

24707. Electric arc lamp hangers. Carolan. (General Electric Company.)

25840. Means for conducting electricity to tram and like cars on the underground system. Howarth.

25906. Phase modifiers and systems of electrical distribution. Carolan. (General Electric Company.)

26658. Means for guiding tramway vehicles and their trolley wheels at rail and conductor points. Holmes and Holmes.

26735. Electric light pendants and electroliers. Kemp.

27056. Automatic electric signalling apparatus for railways. De Labarthe.

27161. Electricity meters. Evans. (Allgemeine Electricitäts-Gesellschaft.)

27232. Rotary electric contacts for high-tension circuits. Blake.

27253. Apparatus for selective electric signalling. Lake. (Stone.)

27295. Apparatus for amplifying electromagnetic signal waves. Lake. (Stone.)

27486. Means for controlling or regulating the supply of electricity in installations subjected to considerable fluctuation in the demands thereon. Johnson. (Elektrizitäts Actien-Gesellschaft vorm. W. Lahmeyer und Co.)

27628. Electric ignition devices for explosion motors. Thézard. (Date applied for under International Convention, Dec. 16, 1901.)

27739. Means for transmitting and receiving electric signals. Lake. (Stone.)

27742. Method of transmitting and receiving electrical signals. Lake (Stone.)

27746. Method of determining the direction of magnetic waves. Lake. (Stone.)

27753. Bearings for electric or other measuring instruments. Carolan. (General Electric Company.)

27763. Means for varying the voltage of alternating electric currents. Carolan. (General Electric Company.)

27764. Systems of electric phase transformation. Carolan. (General Electric Company.)

27781. Apparatus for determining the direction of magnetic waves. Lake. (Stone.)

28039. Apparatus used as standards or brackets for gas or electric light. Morrall.

28446. Polarised electric bell. Brander.

1903.

1529. Insulating material for dynamo-electric machines, electric motors, and conductors. Oliver and Philpott.

2976. Electric switches. Knipping.

12032. Electrolytic apparatus such as secondary batteries. Johnson. (Ford.)

13750. Electro-deposition of gold. Kington.

19877. Electromagnetic relay apparatus. Siemens Bros. and Co., Limited. (Siemens und Halske Aktien-Gesellschaft.)

20102. Bracket attachments for telegraph and like posts. Gray.

20401. Electric switches. Hunter and Warren.

20497. Electric plant for the synthetical production of nitric products by means of discharges of electricity in gaseous mixtures. Kowalski and Moscicki.

20655. Process for the electrolytic production of metals of the earthy alkalies and more especially of metallic calcium. Evans. (Elektrochemische Werke G. m. b. H.)

NOTES.

Faraday House.—Prof. C. A. Carus-Wilson, M.A., M.I.E.E., commenced a special course of lectures to the senior students of the Electrical Standardising, Testing, and Training Institution, entitled "Direct-Current Motor Construction," yesterday (Thursday).

Wilkinson Overhead Tramway Accessories.—In our article under this heading in our last issue we named Messrs. Player and Mitchell, of Birmingham, as the makers of the fittings and accessories described. This is correct so far as it goes, but we should have added that Messrs. Brecknell, Munro, and Rogers, of Bristol, are also manufacturing and placing these articles on the market.

Electro-Harmonic Society.—We have received the programme of the "Ladies' Night" concert to be held by the above society at the Holborn Restaurant to-night under the chairmanship of Mr. R. Kaye Gray. It reveals an attractive array of talent, the artists including Miss Gertrude Maxted, Miss Lilian Gardner, Mr. Harry Dearth, Mr. Alf. E. Izard, Mr. T. E. Gatehouse, and others. The orchestra will play selections.

American Institute.—A most valuable volume has been issued by the American Institute of Electrical Engineers, covering part of the transactions of the society at the Niagara Falls Convention from June 29 to July 1. The papers and discussions of July 2 and 3, the last days of the meeting, will appear in the next issue. The present volume runs into some 460 pages, and contains a very large percentage of the papers read at the convention, together with the discussions thereon, as well as the independent discussions on engineering topics. The whole forms a very complete and exhaustive book of reference.

The Metric System.—The secretary of the Decimal Association has received from the Premier of New Zealand a copy of a Weights and Measures Act which was passed by the House of Representatives at Wellington on July 28 last. This measure contains a clause rendering it lawful for the Governor at any time by proclamation to declare that from and after the date named in the proclamation, being not sooner than Jan. 1, 1906, the metric system shall be the only system of weights and measures recognised for use in New Zealand, and thereafter it shall not be lawful to use any weights and measures other than those.

International Electrical Congress, 1904.—In connection with the above congress, about which we gave some particulars in our last issue, we understand that one of the most important and far-reaching efforts of the organising body will be in the direction of starting a movement favouring international standardisation in things electrical. Expression of opinion on this proposal will be specially invited from the representatives of England, Germany, France, Italy, and other countries attending the congress, and if matters can be taken far enough at the time, it will be suggested that a permanent committee on international electrical standardisation be appointed which would, from time to time, report to properly accredited electrical bodies in the participating countries.

The St. Marylebone "Purchase."—As an alternative to seeking parliamentary powers enabling the St. Marylebone Borough Council to complete the purchase of the local property of the Metropolitan Electric Supply Company, a newly-elected member of that body suggests that a committee shall be appointed "to confer with the company with a view to an arrangement being arrived at to remove the present deadlock." We would remind that member that the question of raising the purchase money does not rest with the company any more than it does with the Borough Council, and that having failed to induce either the Board of Trade or the Local Government Board to lend their assistance in obtaining a loan, the only alternative for the local authority is to take parliamentary proceedings. This has already been decided upon as "expedient."

Edison's Storage Battery.—The American technical Press reports a successful trial run of an automobile equipped with the new Edison storage battery. A 68-cell battery was used, and the carriage was equipped with two 80-volt motors. The route was from Boston to New York, and some stiff hills were encountered. When climbing one of the steepest the battery gave out 100 amperes of current during a greater part of the time, and at the discharge reached 102 amperes. The total distance traversed was 249⅛ miles, and the cells had to be recharged several times during the run. No information, however, is given on the important point as to the ground covered on one charge At the end of the run there was a little trouble through one of the motors heating, but otherwise there were no mishaps. The actual running time was 24 hours 56 minutes, making an average speed of 10 miles an hour.

Marconi's Experiments.—Mr. Marconi has returned from his cruise to Gibraltar on H.M.S. "Duncan," but his experiments do not seem to have turned out so successful as was anticipated. He was unable to hold communication with Poldhu, in Cornwall, from Gibraltar, although messages in the reverse direction are stated to have been received with ease by Mr. Marconi. The distance is over 1,000 miles. The reason that is given for the failure to transmit messages from Gibraltar to England is that the instruments used were not sufficiently powerful. To this same cause has been attributed Mr. Marconi's inability to communicate with America from his Poldhu station, and he is supposed to be installing more powerful apparatus on this side. From reports received, Mr. Marconi is shortly to turn his attention to overland wireless telegraphy. His company is erecting a station at Fraserburgh, on the Aberdeenshire coast, and experiments will be carried out between this place and Cornwall.

Line Voltages in South Africa.—Mr. H. J. S. Heather, A.M.I.C.E., engineer to Moodie's Gold Mining and Exploration Company, Limited, sends us some noteworthy figures on the performance of an electric generating plant of which he has charge for supplying the company's mines with power at Barberton, in the Transvaal. Current is generated at 220 volts, and is transformed up to 11,000 volts on the overhead transmission line. As showing the reliability of such voltages, even in a district where thunderstorms are notoriously severe and frequent, Mr. Heather mentions that before the war he obtained a record uninterrupted run of 88 days. Operations were restarted on Sept. 15, 1902, and since that date uninterrupted runs have been recorded of 82, 77, and 108 days. The engineer is to be congratulated on having obtained such successful working, especially under the climatic conditions he mentions. It is scarcely necessary to add that the plant is run 24 hours per day and seven days a week.

Electric Power in New Zealand.—It will be remembered that we recently stated that an engineer was to be called in by the New Zealand Government to report on the proposal to utilise the Haku Falls for power purposes. This has now been done, and the engineer, Mr. Allo, has issued his report, which may be accepted as favourable to the scheme. He estimates that 39,000 h.p. could be obtained by harnessing the falls even in a dry season. The idea is to work the whole of the present

Digitized by Google

steam railways in the North Island by electricity, and the engineer thinks that 9,000 h.p. would be sufficient for this purpose, leaving 30,000 h.p. to be distributed for general industrial uses. According to Mr. Allo's figures, there will be a great saving ultimately in changing from steam to electric traction on the railways. Thus he says that steam power at present costs £7 to £7. 10s. per horse-power per annum, while under the proposed scheme electrical power could be supplied at from £4 to £5 per horse-power per annum.

Society of Arts.—This society opens its one hundred and fiftieth session on Nov. 18 with an address by the vice-president, Sir Wm. Abney, K.C.B., F.R.S., etc. Among the papers to be read at ordinary meetings during the session are: "The Universal Exposition at St. Louis, 1904," by Mr. Geo. F. Parker; "Fiscal Reform," by Sir Chas. Malcolm Kennedy, K.C.M.G., C.B.; "Science and Industry," by Sir Wm. H. Preece, K.C.B., F.R.S.; "Thermit," by Prof. Chas. Vernon Boys, F.R.S.; and "Steam Motors," by Mr. Thomas Clarkson. The arrangements for the Cantor lectures are as follows, so far as they are of interest to engineers: "The Mining of Non-Metallic Minerals," by Mr. Bennett H. Brough (four lectures), Nov. 23, 30, Dec. 7, 14; "Oils and Fats—their Uses and Applications," Dr. J. Lewkowitsch (four lectures), Jan. 25, Feb. 1, 8, 15; "Recent Advances in Electro-Chemistry," Mr. Bertram Blount (three lectures), March 7, 14, 21. The annual conversazione of the society will probably be held on Thursday, June 30, 1904.

Birthday Honours.—There are just one or two names in the birthday honours list which arrest our attention. The first is that of Prof. Clement Le Neve Foster, F.R.S., who is created a Knight Bachelor. As our readers know, Prof. Foster is professor of mining at the Royal School of Mines, London, having held that office since 1890. He was an inspector of mines from 1873 to 1901, and at the present time is editor of the general reports and statistics relating to mines and quarries at the Home Office, and is also an examiner in mining for the Board of Education. The new knight was born in 1841. The name of Mr. Chas. Scarisbrick also figures in the list of new knights. He will be chiefly remembered by scientists for the active part which he took in connection with the British Association meeting at Southport this year. He is a large property owner in Southport, and was mayor of that town in 1902. Among the appointments to the Imperial Service Order are those of Mr. H. Hatfield, chief examiner at the Patent Office; and Mr. Cecil West Darley, engineer-in-chief for public works in New South Wales.

Wireless Telegraphy in Italy.—A message from Rome reports some important extensions in wireless telegraphy development in Italy. The work of constructing a station at Bari with a capacity to operate over a radius of about 320 miles is far advanced, and will shortly be completed, so that the station may be opened for working towards the end of the present year. This station will be able to communicate with the other stations established along the Italian coast, with vessels in the Adriatic, and with the Montenegrin station at Antivari, where the work of installation will be commenced very soon. The site for the largest Italian station contemplated has been definitely chosen. It is at San Rossone, where the Villa Royale has been selected. This station, according to Mr. Marconi's expectations, will be able to communicate not only with Argentina, but also with the stations at Table Head (Canada), Cape Cod (United States), and Poldhu. The rate for wireless telegrams between Italy and England when a commercial service is started is expected to be 10 centimes (or 1d.) per word; and for telegrams to Canada and the United States 30 or 40 centimes (3d. or 4d.) per word.

New Books.—"Electric Lighting and Power Distribution," by W. Perren Maycock, M.I.E.E. (Whittaker and Co. 7s. 6d.). This work by Mr. Maycock is in two volumes, the present publication being the second. It is of principal interest to students preparing for the preliminary and ordinary grade examinations of the City and Guilds of London Institute, and to such is well worth study. The value of the book is enhanced by the inclusion of numerous questions and exercises, embracing all those set for the preliminary and ordinary grade examinations in 1890, and the pages are embellished by over 400 illustrations.—"The Practical Engineer's Electrical Pocket-Book and Diary," and "The Practical Engineer's Pocket-Book." The first of these two little annuals has now reached its fifth edition, while the second is in its sixteenth year. The present issues for 1904 are no exception to their predecessors, in that they are replete with the latest information, and should be an invaluable acquisition to the equipment of the practical electrician and engineer.—In our notice of "Tube, Train, Tram, and Car" (Geo. Routledge and Sons, Limited. 6s.) in our last issue we regret that a slight error occurred in the spelling of the author's name. He is Mr. Arthur H. Beaven, *not* Bevan as appeared.

German Electrical Industry.—During the past week the amalgamation of the Siemens and Halske Company with the Schuckert Company in Vienna has been carried through, and matters are so far advanced that on Jan. 1 next the united working of the concerns will commence. This fusion is only a natural sequence of the previous amalgamation of the Berlin firms of Siemens and Halske and the Schuckert Company. The Berlin correspondent of the *Financial Times* states that in this amalgamation are included not only the works of Siemens and Halske at Vienna and Leopoldsan, and the branch establishments at Budapest, Graz, Larbech, Lemberg, and Olmütz, but also the Vienna establishment of Schuckert and the entire plant of the new Viennese Electric Tramway Company. The Schuckert establishment represents a value of about 30,000,000 Austrian crowns, and the Siemens and Halske concern, according to the last balance-sheet, has a capital of 20,000,000 Austrian crowns. Another rather important fusion in the electrical line is reported as having been accomplished. This is the amalgamation of the Bitterfeld Electro-Chemical Works with the Rheinfelden Electro-Chemical Works. The arrangement was made by the Bank for Electric Enterprises at Zürich, called for brevity the Electrobank, which is in possession of most of the shares of both of the concerns in question.

Kelway's Sound-Locating System.—For a number of years Mr. C. E. Kelway has been experimenting with a range-finding apparatus which depends for its accuracy on the difference in the rate of transmission of light and sound waves. He has recently introduced a somewhat similar system for locating the position of ships at sea when, owing to fogs or atmospheric conditions, it is impossible to obtain direct bearings. In this case the sound signals are worked in connection with wireless telegraphy messages. The idea is that lightships or lighthouses should send out simultaneously a foghorn signal and a Hertzian wave signal. This being done, the officer on watch could, by noting the interval between receiving the Hertzian wave signal and the foghorn signal, tell at once his distance from the signalling source. For this purpose a Kelway range-finding watch which is direct reading would be used. Further information as to the bearing of the lighthouse or lightship could be obtained by taking the distance again after the ship had run over a known

Digitized by Google

course. It is obvious that this could be done, as it only involves the solution of the construction of a simple triangle, the three sides of which are known. It would be interesting to find how accurate the system would be in actual use, but this can only be done by means of a series of practical trials. It would seem, however, that the system may be a valuable adjunct to warnings given by lighthouses in heavy fogs.

Coal Storage under Water.—In our issue for Sept. 25 last we recorded the beneficial results obtained by Mr. John Macaulay, general manager of the Alexandra Docks and Railway, Newport, Mon., in some experiments upon the sub-aqueous storage of steam coal. It appeared from these that coal thus stored loses an inappreciable amount of calorific value—if under certain circumstances it does not actually gain value—compared with that lost by the alternative method of storage with access of air. Mr. Macaulay has since published some notes, in which he offers some reasons or suggestions for this result. He finds in the first instance that the saving of calorific value and gain in working power of coal stored under water is probably due to the retention more completely by the coal of its original chemical and physical properties lost in storage in air by (*a*) the dissipation of natural volatile constituents; (*b*) oxidation; and (*c*) the weathering effects of sun, wind, rain, and frost. Also, there may possibly be some increase in the working power of submerged coal due to its permeation by the salt of sea-water. In considering the question Mr. Macaulay has limited the practical application of the system to the navy, but it applies widely to every manufacturer throughout the world who has to store coal in small or large quantities. He estimates that at present at least a fifth of the coal power is lost unnecessarily owing to the method of storing. The alternative method of storage under water is simple and cheap, and readily practicable everywhere.

Mechanical Road Vehicles.—In No. 4 of his Cantor lectures on mechanical road vehicles, which is published in the current number of the *Journal* of the Society of Arts, Mr. W. Worby Beaumont deals in part with the various forms of engines or motors which may be used in automobiles. It would seem that the internal-combustion motor is likely to retain the place which it has now among the different forms of motor for propelling vehicles. On the other hand, the author thinks there is little doubt that the field of the electrically-propelled vehicle is one that will rapidly widen. There is a limit which will affect the electric vehicle, and leave the others in the position which they now relatively occupy. A very important direction of progress which the author urges lies in the development of the simplest arrangement of motor and gear which will best suit the parcels and light vehicles, for loads from 5cwt. up to about 25cwt. With regard to the omnibus of the future, he refers to the electrically-propelled vehicle operated by a current received from a wire either overhead or by the side of the road, as is the case with the tramways. His comment on this form of vehicle is that it has all the advantages of the tramways without any of their numerous disadvantages, the chief among the former being that it requires no rails in the streets, but, of course, like other vehicles, it will work best on good roads. Concerning the motor wagon for heavy traffic, these vehicles are the requirements of great manufacturing centres. If, however, the motor wagon for carrying heavy loads is to be successful for distributing goods mainly on the same roads day by day, we shall have to meet these vehicles half way, and recognise the necessity for tram plates which will not interfere with other traffic, or tramways of some form off the beaten track of other traffic, so that the motor wagons shall be able to run from docks and railways stations to the mills or other loading or unloading destinations.

Tube Railways and Fire Risks.—In one light the recent disastrous fire on the Paris Metropolitan Railway may be looked upon as a blessing in disguise. It has served to call attention to the totally inadequate precautions taken on certain underground electric railways against the fire fiend. Before its occurrence the management of such railways were content to go on in the old ways and methods, which in nine cases out of ten spell disaster. One of the immediate results of the Paris casualty is to be found in the investigation which the German Government has caused to be made into the position of affairs on the Berlin Elevated and Underground Electric Railway, especially on the low-level portion of the railway. The result of this enquiry is that various alterations and improvements are to be made on this system. These comprise a more adequate tunnel lighting system which shall be independent of the power circuit, and efficiently protected from such external influences as overheating of the tunnels or mechanical damage. Arrangements are to be made whereby each official accompanying a train will be able immediately to switch off the working current at any point in the tunnel. It is also proposed to arrange for the porters' barrier at the platform exit being easily pushed on one side, and to increase and improve the existing fire-extinguishing appliances. In addition to these proposals experiments are to be made to ascertain whether the establishment of air shafts with extractors would render it possible in case of necessity to remove smoke and afford quicker access to the permanent way for the fire brigade, and whether the arrangements for a rapid clearance of the passengers from the cars are capable of improvement. The existing regulations governing employés are to be amplified with a view to coping more successfully with any case of emergency, while a short intimation is also to be published for the guidance of the public as to the attitude to be observed by passengers in the event of an accident occurring on the railway.

Electrical Progress in the Nineteenth Century. The Royal Philosophical Society of Glasgow has arranged for the delivery of a special centenary series of lectures during the coming session in connection with the advancement of science during the existence of the society. The first of the series was delivered by Prof. Andrew Gray at the opening meeting of the session on the 4th inst., and he chose for his subject "Electrical Progress in the Nineteenth Century." The lecturer traced the progress of electricity from the time of Galvani and Volta up to the present day, passing in review the work of leading scientists and physicists who had been chiefly responsible for this development. Thus, the achievements of Cavendish, Davy, Oersted, Nicolsin, Carlile, Ampère, and Faraday were individually described and commented on by the lecturer, who, in his reference to the electro-chemical industry, deplored the fact that an electrical discovery made in this country had, through the apathy of our manufacturers, been allowed to become the foundation of what was mainly a German industry. In connection with Faraday's work, Prof. Gray showed Lord Kelvin's reflecting galvanometer for the observation of induced currents, and made some experiments with it during the evening. Lord Kelvin's papers on the voltaic cell were mentioned, and a short account was given of his theory of the oscillatory discharge of a condenser, and the bearing of this result on the present-day experiments in electric wave telegraphy. Prof. Gray next sketched the work of Gauss and Weber and the British Association Committee on Electrical Units and Standards, and gave a

Digitized by Google

short history of the earlier researches on the determination of the ohm carried out by Thomson, Maxwell, and more lately by Lord Rayleigh. The lecturer also referred to Dr. John Hopkinson in connection with improvements in electric generators and motors, and went on to give a short exposition of Clerk Maxwell's great generalisation—the electromagnetic theory of light—and of its direct verification by the experiments of Hertz. He concluded with references to the experiments in Hertzian wave telegraphy, and to the astonishing results that have followed the discovery of radioactivity. As to the progress made in the next century, he said it would be based on the knowledge gained in the past 100 years, and those who by spending laborious days and nights had built it up would be held in imperishable renown.

High-Speed Work at Zossen.—In view of the record speeds in electric traction recently obtained on the Berlin-Zossen military railway—the highest recorded being at the rate of $130\frac{2}{5}$ miles per hour—it will not be out of place to give some general details as to the improved methods that have yielded such highly successful results. The first experiments on this railway were made some two years ago, but since then the track from Marienfeldt to Zossen has been relaid with new steel rails weighing 86·1lb. per lineal metre, resting on heavy spruce ties 22in. from centre to centre, and heavily ballasted with broken basalt. The rails are set on each tie in a steel chair, strongly bolted down, and are joined perpendicularly by bevelled joints 7in. in length, held firmly together by bolts passing horizontally through the fishplates, so that the effectiveness of a continuous rail is practically secured. The old light rails, which had failed in 1901, and were, therefore, taken up, have been laid down flat as guard rails, resting horizontally on special cast-iron chairs in such a way that the flat bottom flange of the rail stands vertically along the inside line of each heavy rail, and about 2in. distant from the inner edge of its face. The track is a nearly level air line throughout its length, except one curve of 2,000 yards radius near its southern extremity, and is in all respects up to the highest standard of modern railway construction. The motors have been likewise improved in various minor details, but the cars are substantially the same as when first constructed. Each is 72·18ft. in length and weighs 90·5 metric tons, or about 200,000lb. avoirdupois. Of this weight 48 metric tons comprise the body and running gear, and 42·5 tons are made up by the motors, transformers, and other details of the electrical equipment. Each end of the car rests on a six-wheel bogie truck of the American type, and the motors are four in number, one attached to the front and rear axle of each truck, the middle pair of wheels in each group running free. The wheels are 49in. in diameter and are equipped with pneumatic brakes of the standard type. The transformers, which are hung beneath the middle section of the car, weigh 12 tons, besides which a storage battery of 631lb. weight supplies the current for lighting purposes. The interior of the car is provided with upholstered seats lengthwise along the sides, and an open railing encloses at each end the space occupied by the driver, who, standing behind a curved front of plate glass within easy touch of volt and ampere meters, gauges which show the resistance of the air, and a dial that indicates and registers the speed, controls its movements by turning a pilot wheel. We understand that in due course the engineers and technical committee in charge of the trials are to report the results in detail.

Glasgow Local Section Dinner.—The Glasgow Section of the Institution of Electrical Engineers opened its winter session this year with the annual dinner, with a view to bringing the members into closer union at the start. There was a large attendance, and among those who supported the chairman (Mr. Wm. A. Chamen) were Mr. R. Kaye Gray and Mr. W. G. McMillan, president and secretary respectively of the Institution, Mr. M. B. Field, Mr. John Young, and Mr. Geo. Tidd, hon. local secretary. In responding to the toast of "The Corporation of Glasgow," the Lord Provost naturally referred to the electrical development of the city, pointing particularly to the electrical tramway system as evidence of what had been done in this direction. He thought electrical science might come to their aid in solving the smoke problem, and, speaking of the domestic use of electricity, he reminded his hearers that the electricity department had reduced the rate for heating purposes to the level of the power rate. Mr. W. R. Copland proposed the toast of "The Institution," and Mr. R. K. Gray, in acknowledging the sentiment, testified to the favour with which the parent institution viewed the development of the local sections. He claimed for the profession of electrical engineers that it was as well equipped as any other profession in Great Britain. Other branches of engineering had to contend against certain disadvantages, amongst which was the difficulty of freeing themselves from past practice. Mr. Gray also referred to the work of Lord Kelvin, and in this connection characterised Glasgow as the cradle of the electrical industry. Mr. W. G. McMillan gave the toast of "The Glasgow Local Section," putting the local sections in the relation of colonies to the parent institution. The interests of the profession would be advanced by the development of the local sections, and the parent institution was anxious to keep the "colonies" together, and assist them in every way. He congratulated the Glasgow Section in particular on the excellence of its work, and referred in praiseworthy terms to Mr. Chamen, the present chairman, and Mr. Tidd, the hon. secretary. In his reply Mr. Chamen pointed out that the work of the sections differed in some respects from that of the parent institution. There were in the local sections a large number of members of a less highly technical character, and it became the duty of the sections, therefore, to encourage the reading of papers of a less technical kind than were presented before the London body. But if the local sections did no more than keep the members together and provide them with pleasant evenings, they would accomplish a great deal in the way of banding together the outlying branches of the Institution and encouraging young engineers to join the local sections. The dinner proved a highly successful affair, and for all of those present a very interesting evening was spent.

Peat Fuel by Electricity.—Of the many attempts that have been made to employ electricity in the conversion of peat into a fuel which should compete with the best steam coal, scarcely one has resulted in any practical measure of commercial success being obtained. The principal objections which have been common to all such processes, have been the high cost of production and the length of time occupied in the drying and manufacturing. Now, a Mr. J. B. Bessey claims to have perfected an electrical process which satisfactorily overcomes both of these difficulties, and in a demonstration last week at the works of Messrs. Johnson and Phillips at Charlton, Kent, he attempted to show that he has achieved practical success. Unfortunately, the facilities for witnessing the "demonstration" were not such as to induce an intelligent idea of the essential features and inner working of the process, and, moreover, no reliable data were forthcoming. We were, however, furnished at the works with a printed description of the process setting forth the claims made by Mr. Bessey for his invention, but if the demon-

Digitized by Google

stration was intended in any way to substantiate these important claims, it must be regarded as a regrettable failure. We gather from the printed matter that the *modus operandi* is, shortly, as follows: Virgin peat, said to contain from 70 to 80 per cent. of water, is packed tightly in rotary iron cylinders, which are rotated at high speeds in order to expel the water from the peat. An electric current of 220 amperes at 200 volts is then passed through the peat, which is claimed to give the objective result aimed at—viz., a perfectly disintegrated or pulverised material, operating freely in particles, without loss to any of the valuable properties primarily contained in peat. The disintegrated peat is afterwards passed through a set of rollers on to a kneading apparatus, where it is reduced to a putty-like condition. By an automatic process the mass is passed on to the moulder, and the material is then formed into briquettes or any other form required. A great deal of hand labour is at this stage employed in the process, which occupies about 2½ hours throughout, but we were informed that in practice automatic operation would be used almost entirely. From the scanty figures we were able to elicit as the result of our enquiries, we understand that 24 units of electricity are consumed in treating one ton of virgin peat, and that the resultant yield of fuel is about 15cwt. 10lb. This means a loss in operation of just under 25 per cent., and this in spite of the fact that virgin peat contains from 70 to 80 per cent. of water, which, we are told, is extracted in the process. We were unable to get a satisfactory explanation of this curious contradiction. Moreover, we were seriously informed that the total cost of producing one ton of peat fuel by this invention is about 5s., which seems remarkably low when considered in the light of the comparatively large amount of electricity used in the process, the cost of handling, etc. Another fact we gathered was that a complete plant to treat 100 tons of virgin peat per day costs about £4,000. We understand that an initial plant is to be erected in Ireland immediately, and if it is then found possible, as claimed, to produce a ton of peat fuel equal to the best South Wales steam coal at 8s. 4d. a ton at the pit's mouth at an inclusive cost of 5s., we shall be ready to admit that the Bessey process is a distinct advance on previous inventions; but all we can say at present is that on Thursday the inventor completely failed to produce any proof whatsoever in support of the claim. Messrs. Johnson and Phillips kindly lent their works for the purposes of the demonstration, but, so far as we could discover, they are not the proprietors of the process.

Financial Aspect of Electric Traction.—This important question is dealt with by Mr. D. N. Dunlop, a member of the Tramways and Light Railways Association, in a long statistical paper which is published in the association's October circular. The author has gone into the subject in a very thorough manner, and the great mass of valuable data he is able to present must be the result of much arduous work. The figures he gives relate to the development of electric traction in this country, on the Continent, and in America, and an interesting comparison is thus afforded. The States are dealt with first, and the author shows that the average operating expense percentage of a group of 18 of the largest electric tramway companies in that country is 52·44, which, including taxes, is increased to 60 44 per cent. The gross receipts per passenger work out at 1·99d., and per car mile 10 69d., or about the same as in England, where the gross receipts per car mile vary between 9d. and 13d. In Germany the receipts per passenger for the electric tramways of the 11 largest cities average 1·16d. An income account of the street railway or electric tramway companies of the States for the year 1902 is given, from which it seems that the gross earnings from operation were £49,510,799, while the operating expenses amounted to £28,462,519, leaving net earnings to the total of £21,048,280. To this is added a sum of £590,125, income from other sources, making a total of £21,638,405. After allowing for interest on loans, etc., amounting to £15,519,010, the net income was £6,119,395, from which dividends on stock amounting to £3,176,422 were paid, leaving a surplus for the year of £2,942,973. Incidentally Mr. Dunlop throws an interesting light on the effect of the electric lines on the steam railways in the States. For example, in Massachusetts last year the electric lines carried four times as many passengers as the steam, and in seven years the works of the trolley in America has doubled, whereas that of steam has decreased. Since 1894 the electric tramways and railways of Massachusetts have increased annually from 9 to 10 per cent. In Connecticut the electric lines in 1901 carried 20 per cent. more than the steam roads. In promoting new lines, American practice has always been to make the electric tramway development the forerunner of the population, and in nine cases out of ten the population has followed. Another example of this to which the author refers is the electrification of steam lines in Italy. On the line connecting Bologna and St. Felice the speed and frequency of the trains were both doubled with the introduction of electric traction, and the fares reduced to 40 per cent. of the original amount. This has produced the notable result of increasing the passenger traffic five-fold. In England, under similar conditions, to make up for the increased capital cost of electrification, the passenger traffic would have to increase 61 per cent. if fares remained unaltered. Comparing the cost of running electric and steam lines in Italy and England, in pence per train mile, it is found that in Italy the total with steam is 20·69 as against 12·71 with electric, and in this country 13·04 with steam and 18·16 with electric. In some further statistics the author shows that the City and South London, the Waterloo and City, and the Central London Railways paid dividends of 2¾, 3¼, and 4 per cent. respectively for the first half of the present year. The total capital involved in London tubes is stated to be £50,277,000, thus apportioned: lines in operation, £7,158,000; in construction, £18,493,000; authorised, £3,680,000; in contemplation and extensions, £20,586,000. The author then turns his attention to the development of electric traction on the Continent, showing that the majority of the undertakings in Germany, both under municipal and private control, are worked profitably. In France, with the exception of Paris, electric traction is backward. An interesting comparison is made between the conduit and trolley system as operating in Brussels. The total comparative working expenses of the two systems are 2·197d. per car mile with conduit lines, and 1·941d. per car mile with trolley lines. In other words, the complete cost of working in Brussels is 1¼ farthings more for conduit than overhead, or ·3125d. per mile. In Paris, in 1902, the average working expenses stood thus per car mile: trolley lines, ·1914d.; conduit lines, ·6505d.; showing a difference of ·459d.—roughly 1¾ farthings per car mile in favour of trolley. From the facts and figures thus brought together the author concludes that in those countries in which electric traction is allowed to develop freely the trolley tramways, with few exceptions, prove, under adequate management, to be safe and profitable investments. Tube railways, in spite of enormous initial cost, hold their own in the face of competition, and the dividends show a slow but steady upward tendency.

SWANSEA MUNICIPAL TELEPHONES.

On Thursday, Nov. 5, the Mayor of Swansea formally opened the municipal telephone exchange, which adds another to the rapidly growing list of telephone undertakings in the hands of municipal corporations. The history of the Swansea scheme and the details of the work are briefly as follows: On May 3, 1901, upon the Watch Committee of the Swansea Corporation reporting that the police telephone lines were very unsatisfactory and the fire calls were ineffective, the Council appointed a special committee to consider the whole question of telephonic communication. The committee met on several occasions, and eventually recommended the Council to request Mr. A. R. Bennett to act as their consulting engineer and to prepare a report. This report was considered by the committee at several meetings, and adopted by them on Jan. 22, 1902, and by the Council on Feb. 19, 1902. Application was made on Feb. 20 to the Postmaster-General for a license, and to the Local Government Board for sanction to borrow £20,500 to cover cost of building and construction of routes; the license was granted and sanction to borrow the money was obtained on Nov. 5, 1902, just a year from the date of the formal opening. The amount which has been expended to date is £12 036.

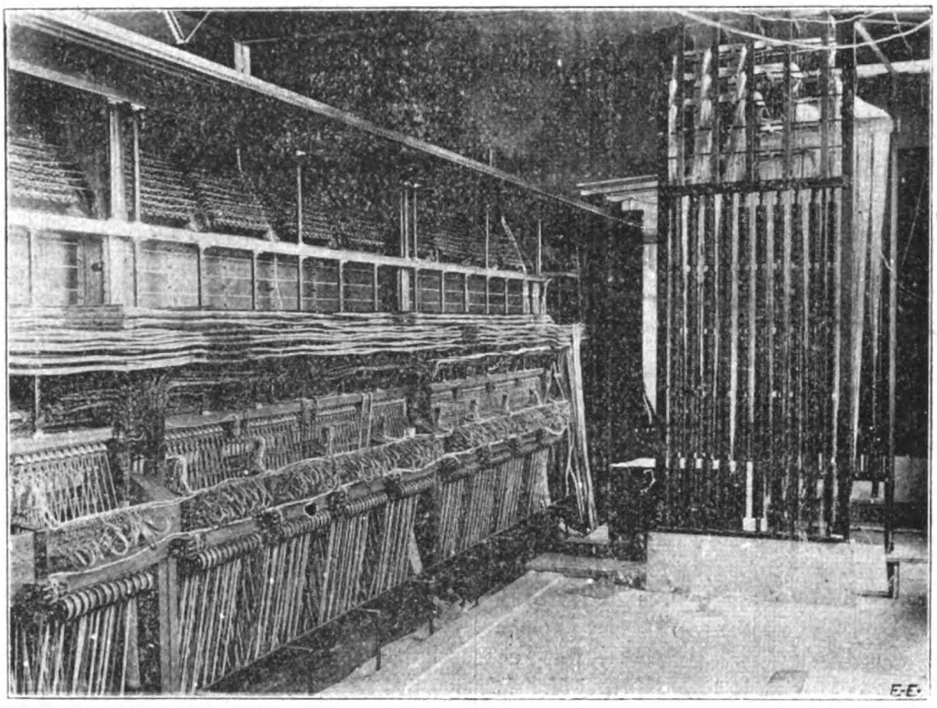

FIG. 1.—Back of Switchboard.

The scheme provides fully for 750 lines, and spare accommodation is also arranged for 750 more lines. All the main routes within the borough are carried out with underground cables. For these 5 miles 907 yards of trenching, together with 10 manholes, have been excavated in the streets. In these has been laid 6 miles 1,557 yards of 3in. iron pipes, and 5 miles 1,610 yards of multiple-core paper and air insulated cable. These cables contain 742 miles of copper wire. The central exchange switchboard (Fig. 1) has already accommodation for 700 subscribers, and may be extended to 1,000 without alteration. Since the first subscriber was connected to the central

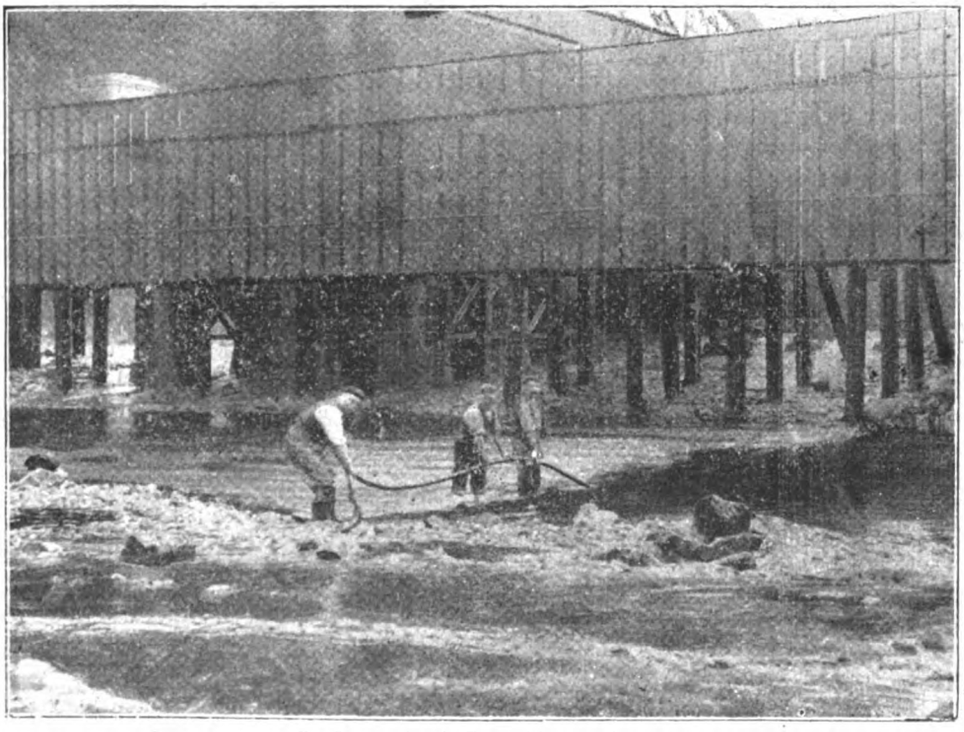

FIG. 2.—Crossing the Tawe with a Telephone.

Digitized by Google

exchange, exchanges have been opened at Morriston and Mumbles, the number of subscribers actually connected being 366, and the number of orders in hand 258. The Government trunk lines were available on Aug. 19, 1903, and every Corporation subscriber from that date has been able to speak to all the other exchange systems in the kingdom.

The exchange at Swansea is unique amongst municipal telephone undertakings, in that a special building was erected for the office, switch-room, and stores. This building was designed by Mr. George Bell, the borough engineer, and is admirably suited for its purpose. It is so arranged that it can be conveniently extended, as the demand for telephony exceeds the capacity of the present building. One advantage of the separate edifice for a telephone exchange is that there was no need to carry the heavy lead-covered cables up to the top of a high building in order to get immunity from sound disturbances. The work of laying the cables in Swansea also involved some novel problems. For instance, the configuration of the town rendered two submarine crossings necessary. The first of these is illustrated in Fig. 2, which shows the cable being laid across the River Tawe. The other crossing was at the north dock. For this work the cable used was of the dry-core type, but it is protected by two distinct lead sheathings, the one over the other. It is then armoured with steel tape, and finally protected with a jute serving steeped in preservative compound. A unique incident in telephone work is illustrated in Fig. 3, which shows a diver working in a manhole. In constructing the manhole, the contractors inadvertently broke into an old culvert having connection with two of the dock basins. The water immediately filled

FIG. 3.—Diver working in Wind Street.

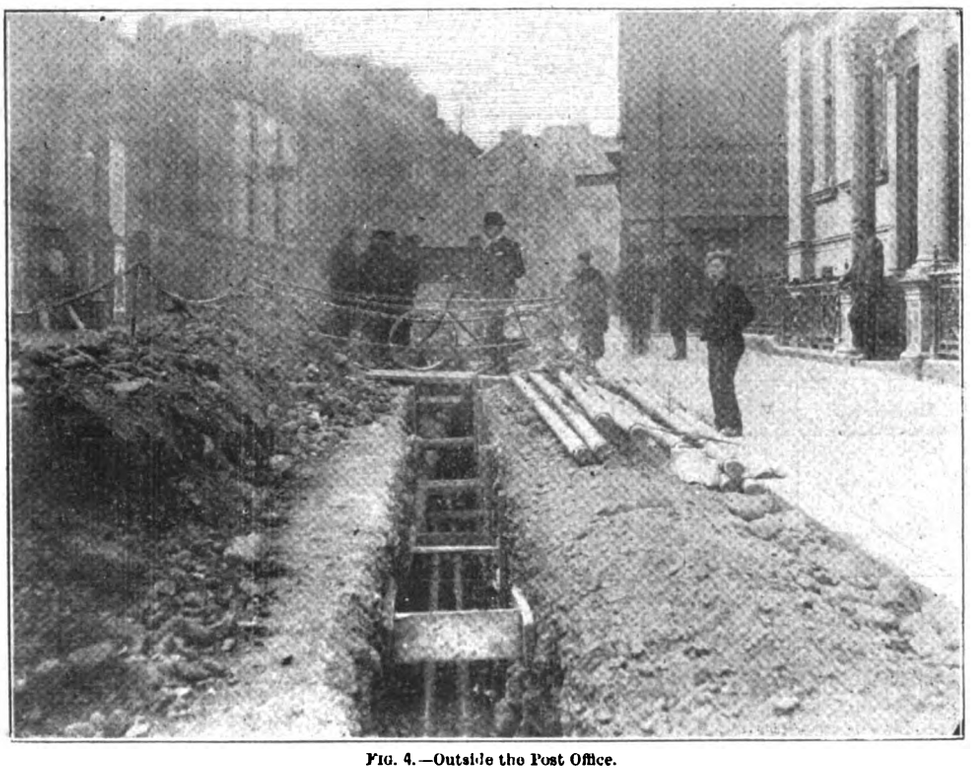

FIG. 4.—Outside the Post Office.

Digitized by Google

the manhole, and all efforts to stop the flow were entirely fruitless until the harbour diver was requisitioned, when, after hours of submerged labour, the leak was repaired sufficiently to admit of the manhole being pumped out.

Fig. 4 shows the ordinary process of laying the pipes outside the Swansea Post Office. The whole of the work has been carried out under the supervision of the consulting engineer, Mr. A. R. Bennett, M.I.E.E., Glasgow. With the exception of the erection of the poles, fixing instruments, and wiring subscribers' premises, which have been done by direct labour under the supervision of the manager, Mr. A. G. Mackie, the work of construction has been carried out by contract, Messrs. W. T. Henley's Telegraph Works Company, Limited, supplying the cable and carrying out the construction of the underground work; the switchboards were supplied and fixed by the British Insulated and Helsby Cables, Limited; the test-jacks and lightning and high-voltage guards by the International Electric Company; the instruments by the Ericsson Bell Telephone Company, Glasgow.

MR. A. G. MACKIE, TELEPHONE ENGINEER TO THE SWANSEA CORPORATION.

At the opening ceremony last week the Mayor, Mr. Griffiths Thomas, was presented with a gold key with which to open the switchroom, whereupon the working of the exchange was explained to the company present by Mr. A. Mackie, the telephone engineer. The subsequent function was held at the Guildhall, when the Mayor, in an able speech, wished the undertaking success. Councillor H. G. Solomon, the chairman of the Swansea Telephone Committee, then traced the history of the undertaking, and dealt with the vexed question of competition between the Corporation exchange and that of the National Telephone Company. He said that directly the municipal subscribers amounted to half those on the National Company's system, the Corporation could insist on intercommunication, but that he was yet to be convinced of the advisability of that course.

Mr. A. R. Bennett also spoke of the admirable quality of the work, and referred to the fact that all the materials used, even the switchboard, were of English manufacture.

The annual charges for telephone connections to the municipal exchange are either at the rate of £5 per annum for unlimited service, or £3 per annum with a charge of 1d. for every call made We wish the undertaking every success.

INDEPENDENT TELEPHONY IN GREAT BRITAIN.

BY GARDNER AND HOLME.

(Continued from page 609.)

(4) Management and Switching Systems.

(*a*) *Management.*—The management of construction work will be given in the various articles dealing with that portion of the subject, and an outline of the method of treating faults has already been given. The only remaining section of the subject is the book-keeping necessary to give a general idea as to the financial condition of the undertaking. But the fact that with good construction and perfect internal management a system will fail through lack of courteous treatment of subscribers should never be forgotten. An undertaking so largely depending on the goodwill of the customers, both as regards the renting of telephones and the granting of wayleave facilities for running the wires, will slowly diminish, or tend to public ill-will, unless a good and efficient service and courteous treatment is rendered in return. A manager, therefore, should bear in mind that what suits one subscriber will not suit another, and the system, while being based on general principles, should be as flexible as possible, and a customer's wants personally enquired into and met as far as possible.

Works Order.

To Chief Foreman and Inspector.

Please execute the following work:

.....

.....

.....

Hours spent (Foreman).....

" " *(Inspector).....*

.....

Manager.

N.B.—All material used on this order to be filled in on the back. No work to be done without an order.

Fig. 8.

As regards the internal management, as soon as an order is received, it should be entered into an order book and a works order made out for same. A form of works order is shown in Fig. 8. This should then be handed to the outside superintendent, who will, when the men are in the particular district to which the order refers, give instructions to the foreman to run the line. The foreman should be supplied with a duplicate perforated requisition book, so that on entering the stores required for the works order he can obtain same on presentation of the requisition slip to the storekeeper. As the storekeeper takes the stores from the racks on which they are placed, he should enter the various quantities in one column of the card fastened to the racks; similarly, on receiving stores, he should enter them in the other column on the card, so that at any moment the quantity of stores can be ascertained.

The various stores received should be entered in a stores inward book, as shown in Fig. 9. On the completion of the line, the stores used on that particular work should be entered on the back of the works order by the foreman,

and the outside superintendent should then return the finished works orders to the office. Here they are dealt

Digitized by Google

with as required by each individual case; if an exchange line, a telephone number is allocated, and the order given to the inside superintendent to have the inside work and instrument fixed. On completion of the whole work, the various stores used will be entered on the back of the works order in the columns as shown in Fig. 10, and as the time of the men and fitters is entered on the front of the works order, the actual cost of any line can easily be ascertained. The stores requisition slips used by the foreman and fitters, and shown in Figs. 11 and 12, should be sent up each day by the storekeeper to the office, where they should be entered in a stores analysis book, totalled monthly. These totals are then transferred into an ordinary stores ledger, which should agree with the cards at the store. The stores analysis book should be so ruled that the quantities of stores per line are analysed, as this proves a very useful source of information for estimating the cost of extension work; also an engineer can quickly tell if material is being used recklessly, as the quantities per line remain very constant in a well-organised system. The works orders on completion are entered into the rental register, or sales and removals book, and the various bills sent out. The toll and telegram accounts are entered into books arranged in telephone number order, and the totals of these books transferred to the general ledger.

FIG. 14.

The wages paid are analysed under various headings, as it must be remembered that the same staff are partly employed on constructions and partly on maintenance. The wages book is made up from an analysis of the men's and fitters' time, as shown on the time-sheets. Figs. 13, 14, 15, and 16 give an idea as to these.

A statement giving the number of lines working, and other interesting data, income, and expenditure, receipt per station, and capital cost per station, also percentages of working costs per station, should be prepared at least once per quarter. From these books an accurate statement as to the capital cost, income, and expenditure of any single exchange in the system can be laid before the committee for their information, and any chance of unremunerative work being proceeded with obviated.

(*b*) *Switching System.*—There are various methods of switching which can be adopted, and four will be described as giving an all-round idea of the best methods at present in use—viz.: (1) magneto call and ring-off; (2) central battery signalling and ring through; (3) common battery; (4) call wire.

1. Fig. 17 is a diagram of the magneto call and ring-off suitable for small exchanges and adopted for large ones in several countries. It is less liable to faults than battery systems, and does not need the same skilled attendance. The subscriber calls the exchange by turning the handle on his instrument. This drops the indicator at the exchange, and to reply the operator inserts an answering plug into the corresponding jack, and throws over the combined

speaking and listening key to the speaking position. This cuts the indicator out of circuit, and places the operator's phone in direct metallic contact with the subscriber. On

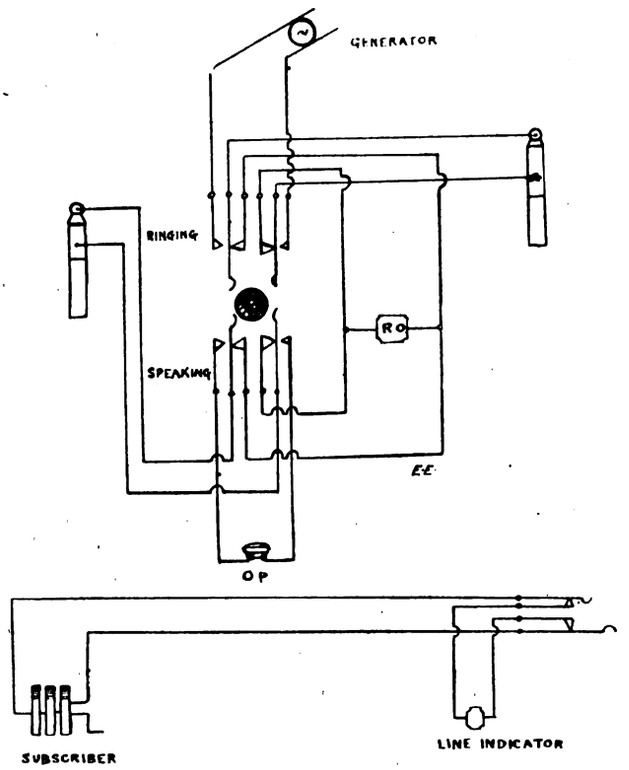

FIG. 17.—Magneto Call and Ring off. R.O., ring-off indicator; O.P., operator's set.

ascertaining the number required, the operator lifts the corresponding calling plug, and inserts it into the jack of the called subscriber, thereby cutting out the corresponding line indicator, and pulls over the lever of the key to the ringing position, which rings the bell on the instrument of the required subscriber. On releasing the key a high-resistance ring-off indicator is bridged across the plugs, so that on the termination of a conversation either of the sub-

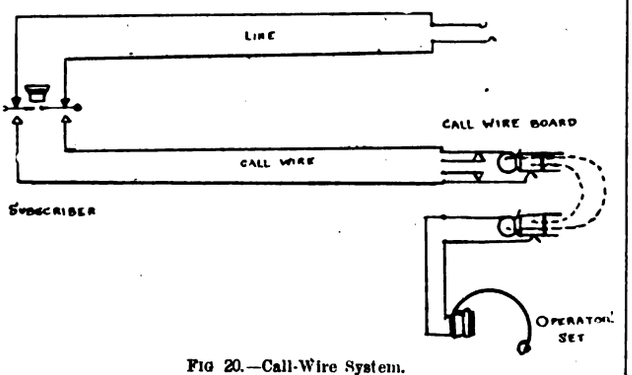

FIG 20.—Call-Wire System.

scribers turning the handle of their instrument will drop the ring-off. The operator then disconnects by taking out the plugs, and everything is restored to normal.

maintenance, compared with the magneto, but, as it simplifies the subscriber's end, is a better system to adopt. A general idea as to the method of working can be

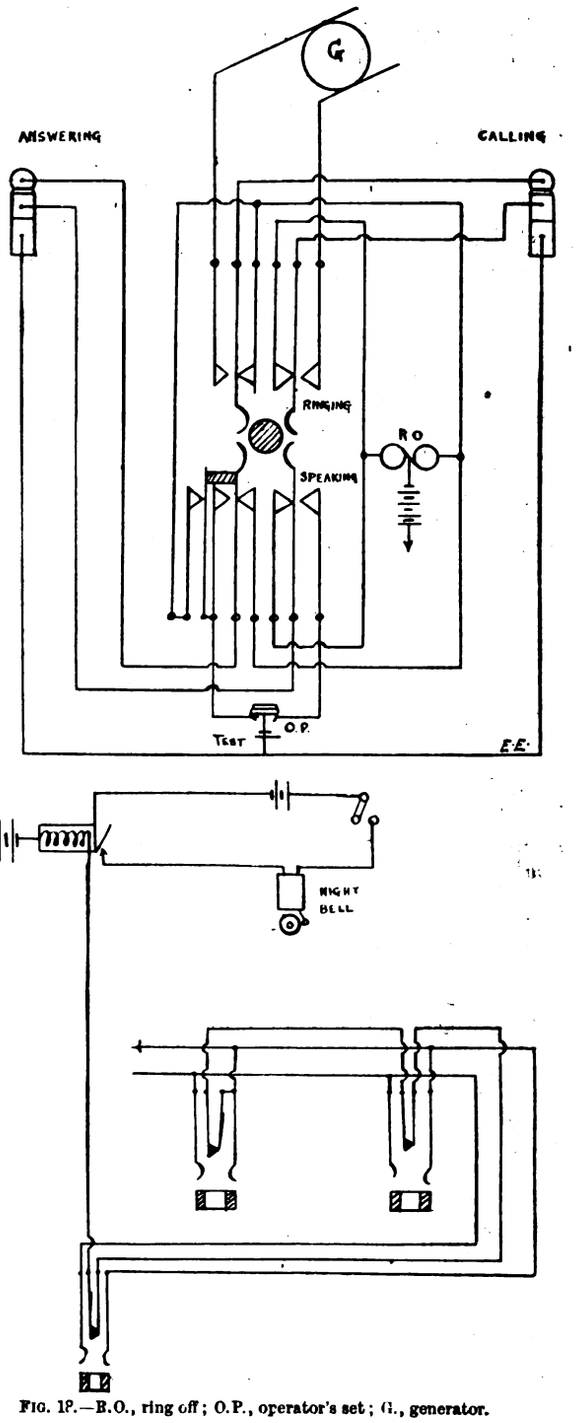

FIG. 18.—R.O., ring off; O.P., operator's set; G., generator.

gained on a reference to Fig. 18. To call, a subscriber momentarily touches a button on his instrument, which drops the corresponding indicator at the exchange.

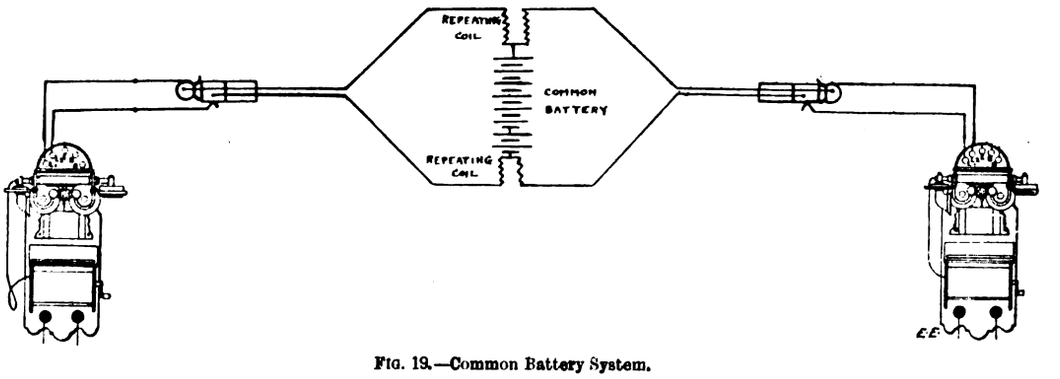

FIG. 19.—Common Battery System.

2. *Central Battery Signalling and Ring Through.*—This is a more expensive system, both as regards first cost and

The circuit which effects this can be traced on reference to the diagram: a current flowing from the central

Digitized by Google

battery through the indicator, the inner springs of the home jack, the inner springs of the multiple jacks, to the first multiple, where the inner spring is connected to the earthed side of the line, whence there is a return to the earthed side of the battery. In answer to a call the operator lifts the answering plug and inserts it into the corresponding local jack, and throws over the combined listening and speaking key to the speaking position. This breaks the contact of the inner springs, thereby cutting the battery circuit, mechanically restoring the indicator, and at the same time connects the operator's phone to line. On ascertaining the number required, the operator lifts the corresponding calling plug and touches the bush of the wanted subscriber's jack, and if the line be engaged hears a click in her receiver. The circuit which causes this is from the bush of the jack touched by the tip of the calling plug to the bush of the jack on the multiple where the line is already engaged, thence to the barrel of the plugs which are connected to one side of the test battery, the other side being joined to the key and tip of the plug through the operator's receiver, thereby causing a click or engaged test. If the line is not engaged the operator pushes the plug home, and pulls over the lever of the key to the ringing position and calls the wanted subscriber. On releasing the key a "ring-through" indicator is bridged across the plugs. This indicator is wound so that a current passing through both coils in series will not work it, but if a current enters between the coils the shutter falls. From a point between the two coils a connection is made to the negative side of a clearing battery, the positive side of the battery being connected direct to earth. On the termination of a conversation either of the subscribers momentarily pressing the button on the instrument will drop the ring off, as a current will flow from the clearing battery to the centre point between the two coils, through one of the coils, one side of the line, which is momentarily earthed, and thence to the earthed side of the clearing battery. Subscribers can thus ring through to one another without being cut off, as they would be in the magneto ring-off system, and consequently listening at the telephone while information is sought at the other end is entirely done away with, and the subscribers' time saved. The central battery ring-through system necessitates excellent construction work and insulation, and so subscribers are, at least, ensured an efficient system as regards speaking.

3. *Common Battery.* — This is similiar to the central battery ring through, with the exception that lamps and relays are used in place of the indicators, and no battery is required at the subscriber's end. The current for speaking is supplied from accumulators at the central in shunt across the cord circuit as shown in Fig. 19, the transmitter and receiver being in series. This system reduces a subscriber's instrument to receiver, transmitter and polarised bell, condenser, and switch-hook, thereby saving a considerable sum of money, which, however, is expended on the switchboard. To call, the subscriber takes the receiver from the hook, thereby closing the line circuit, which when not in use is disconnected at the instrument, a condenser being joined in series in the bell circuit. This lights a lamp through the closing of the line relay circuit. In answer to a call the operator lifts an answering plug, and inserts same in the jack immediately under the lamp, thereby disconnecting the central battery from the lamp, and at the same time shunting it across the plug, as shown in Fig. 19. Two ring-off lamps are used, one in each plug circuit, so they act as a guide to the operator that the called subscriber has replied as well to notify the termination of a conversation. It will be seen that if lines are run overhead, the liability of false signals is very great, and consequently the common battery system should only be used where an entirely underground system is installed. One advantage of the system is the compactness of the lamp signals, and the consequent large boards which are capable of being worked in one exchange, and so the system readily lends itself for installation in the capitals of the world where a complete underground system is possible, and where the grouping of thousands of lines on one board is economical.

4. *The Call Wire.*—In this system all indicators are done away with, several subscribers' instruments being bridged across a common call wire, in addition to the ordinary line wires, which is joined to an operator's position at the exchange end. On depression of the call-wire button instant communication with the operator is obtained, as shown in Fig. 20. As the operator does not know who calls, it is necessary for the subscriber to give his own number as well as the one required. The operator then inserts a pair of plugs into the corresponding jacks. It will thus be seen that the system is eminently adapted for rapid switching, provided too many subscribers are not placed on the one call wire. The traffic can also be quickly regulated, as the call wires can be transferred from one operator to another at the call-wire board. The abolition of line indicators also reduces the risk of switchboard faults to a minimum.

(To be continued.)

SOME POINTS THAT DETER THE SPREAD OF ELECTRIC LIGHTING.

BY F. H DAVIES.

The strenuous rivalry between the advocates of electric light and gas has been responsible in the past for many schemes and novel ideas to attract the consumer on the one side and to keep him on the other; and although electrical engineers may fairly congratulate themselves upon having done well, it is still obvious in practically every town that by far the greater part of the lighting is in the hands of gas men, and that a tremendous amount of work has yet to be done by the former before he can even claim equality in output with his rival.

The question arises, What is left for the electrical engineer to do? He has cut down his price per unit, in many cases to the lowest margin; he has invented lamps of marvellous efficiency that can compete with the much-vaunted Welsbach of the gas engineer; he has put forward free-wiring schemes, good, bad, and indifferent, to entice the small householder; and yet practically everywhere he is still decidedly in the minority. It is obvious that for the present there is little more to be effected in this direction, and that things have arrived at a pass where it would almost seem to be only possible to contentedly wait for the coming of some great invention that will considerably reduce the cost of generating electrical energy, or until time and observation have convinced the gas user of the error of his ways.

While it is difficult to point out anything new that the electrical engineer should do to further the interests of his undertaking, it is comparatively easy to find faults and to say what he should *not* do; and although most of these faults are small, and to his credit be it said not universal, they undoubtedly *do* have a bad effect upon his business.

It is an axiom with the successful trader that he must first of all please and make things easy for his customers. If he does this, his profit is bound to show up in time. But in electric lighting work generally this axiom does not appear to be at all appreciated. Start at the very beginning, and take the case of a new householder who is wavering between gas and electric light. He goes to the gas company, and is informed plainly that gas is so much a thousand, less, perhaps, a certain simple discount, plus a small meter rent; the service is probably already in, and if he says the word and writes a short note to the effect that he requires a supply, his meter will be fixed and the supply started without any further bother. He now journeys to the electricity works, and we must admit is very probably met with a different reception.

He is informed that the charges are based upon the maximum demand system, or a complicated sliding scale, and perhaps there is also an alternative flat rate offered him. The engineer talks maximum demand for half an hour, leaving the prospective consumer somewhat dazed, and too frequently with the idea, carefully fostered by the gas company, that this is an elaborate system for doing him. He is then told that if he wishes he can take the alternative flat rate, but, although he understands this, the engineer's maximum demand diatribes have left him with a lurking idea that he may on that system get his current a halfpenny a unit cheaper. The result is

Digitized by Google

doubt and perplexity, which frequently drives him to—gas, as being a thing he understands, and one that does not offer two systems of charging and a large element of uncertainty as to their comparative results. But supposing, however, he perseveres, and, despite its intricacies, decides on the maximum demand system, with its problematic halfpenny in the background, or the flat rate with its known quantity, but perhaps higher cost—the next blow he gets is that the meter rent is 2s. or 2s. 6d. per quarter, against possibly 6d. with the gas company. Say he survives this, he is now called upon to fill up a more or less legally-worded and formidable application form, in some cases binding himself to pains and penalties that he has not the slightest idea how to avoid. To the educated man the usual application form is not a thing of terror, but it must be remembered that all consumers are not educated men, and that many of the small shopkeeper class—who, by the way, are often excellent consumers—would be deterred from taking the light by the necessity of putting their names to a document beginning with "Whereas" and ending "Dated this —— day of ——."

It is difficult for an educated man to lower himself to this level of intelligence, but it is no exaggeration to say that cases such as the above do happen, and any engineer who has had personal dealings with prospective consumers in a provincial town must have met with them. Obviously this is not the way to secure every bit of custom that is to be had. The function of an electricity undertaking is to sell current, and to do this thoroughly it is necessary, especially in the provinces, to start with the assumption that the public generally is not endowed with either brains or time to solve intricate electrical or economic problems, and does not wish for a sword of Damocles over its head in the shape of a wordy agreement adorned with a sixpenny stamp reposing in the coffers of the supply authority. It may be truly argued that without such an agreement risks out of proportion with those of the gas company are incurred; but risks have to be run at times, and years of experience in gas supply do not afford any great instance of disaster in this direction.

Decidedly some sort of application and agreement form is necessary, owing to the great expense of service laying, but beyond the necessary data of the installation it should be as concise as possible, and so worded as to be within the comprehension of the meanest intellect, instead of, as is too frequently the case, a field for some small legal light to display his knowledge of the law's technicalities. A clause that is frequently seen in agreements, and one that has done as much harm to the popularity of the light as anything, is the minimum charge. It was, of course, based upon sound commercial principles when incorporated in the Electric Lighting Acts, but in these days of strenuous competition there must be grave doubts whether its use is advisable. It pays a gas company, on the whole, to put in a service for a couple of lights, and they do not penalise a consumer with a minimum charge for shutting up his house for a quarter. In a like manner it must pay an electric lighting concern, although, perhaps, in a lesser degree. What we have to look to is the moral effect of this sort of thing, not the present monetary return. A progressive policy that neglects minimum charges and such like petty annoyances is one that pushes the light into all sorts of unexpected quarters, thus advertising it and loading up mains that do not bring in a satisfactory return on their capital outlay. Fining a consumer to the tune of 20 units at, say, 7d., because he has had the audacity to suit his own convenience and make small or no use of the light, is a proceeding that interferes too much with the liberty of the subject to produce good results in this country. Legally it may be right, but economically it is a mistake—a mistake that appears to be owing to the electrical engineer, or those above him, being in too much of a hurry to make money at once, and entirely neglecting the future, in accordance with what seems to be the policy of the present day.

Chaos is surely exemplified by the various systems of charging now in use. It is not the desire of the writer to awake the wrath of the maximum demand, sliding scale, or flat-rate advocates, besides which any attempt at discussing the various merits of these systems is perfectly useless and beside the mark. But is there any excuse for the extraordinary combinations that a glance down the columns of a central-station list will reveal? One town favours the flat rate, another the maximum demand, and so on. That is all very right and simple, merely a difference of opinion, but how is it possible to combine the two, offering one as an alternative to the other? Maximum demand literature strives to convince the reader that the only possible system is the maximum demand, and in like manner flat-rate advocates strenuously uphold their opinions. What, then, are the ideas of the engineers or corporate bodies using both systems. On the face of it, it appears that they cannot thoroughly believe in either. The concurrent use of the maximum demand system does not hurt the flat rate, but the latter is surely both theoretically and practically fatal to the results sought after by the use of the former. This sort of thing is not reassuring to the consumer; he is apt to think that he is being done on the system he uses, and in the average case, where the results of the two systems are fairly equal, there is a very general tendency to chop and change about, on the strength of the old adage, "there is always better grass on the other side of the fence." This feeling of indecision is liable to have bad results where the gas company's tariff is simple and straightforward, and, it must be borne in mind, places a very powerful tool in the adversary's sometimes not too crupulous hands.

The cost and inconvenience of wiring is perhaps one of the greatest deterrents to the popularity of electric light. Free wiring very successfully combats the former point where a good system is in vogue, and seems about the only answer to the problem. There can be no doubt that in most cases wiring prices are cut to the very smallest limit of profit, which is unfortunately only too frequently a source of bad work and consequently moral harm to the light. On any of the present systems we cannot hope to compete with the gasfitter in price, but there is one thing that we can and should do, and that is try and conduct wiring operations with a little more regard to the comfort of the householder and the well-being of his property. There are, of course, many good firms and individual wiremen who make this point a special feature, but there are also very many who do not, with the result that one of the commonest objections to installing electric light is the havoc made by wiremen.

Who has not seen cases of molten solder dropped on carpets, furniture ruined by being used as scaffolding, and unsightly holes left in walls and ceilings, because, forsooth, "it is a plasterer's job to repair them"? Now, the wireman is by trade essentially a handy man; he is able to leave the house in as good order as when he entered it, and when he is a sensible man, and not overburdened with absurd socialistic and trades union doctrines, he recognises that the more satisfaction he gives to his employers, the better in the long run for himself and the trade in general. But there is a class, recruited usually from the sweepings of other trades—and, by the way, not at all loved by the genuine wireman—the presence of one of whose members on a job is harmful in the extreme to the prestige of electricity generally and wiring firms in particular.

Cheapness cannot be put forward as an excuse for employing this type of man. Generally he is the one that is most insistent upon being paid the full union rates for skilled work. Respectable wiremen who have an appreciation of *meum* and *teum* are to be had in hundreds; why, then, do those men find employment who are not only often bad workmen, but perfectly unscrupulous? It is obvious that the wiring contractor should be most particular about the men he employs. As a body he has a bad name; that is indisputable, and the chief cause for this lies in some of the men who work for him. If the contractor is more careful in his selection, the results will be better work at possibly less cost, greater satisfaction to his customers, and increased trade. In the present state of affairs a firm with a reputation for employing civil, clean, and careful men has a future in front of it far beyond the gloomy expectations that are usually entertained of the outlook of the wiring trade.

Returning to the central-station engineer's side of the

Digitized by Google

question, there are one or two points in general management that have an important bearing on success. Canvassing obviously suggests itself first as a means for obtaining consumers, and the usual proceeding appears to be to obtain a *soi disant* canvasser, pitch him out into the streets of a town he knows nothing of for so many hours a day, and trust to the man himself and a good dose of luck for results. This is usual, but far too casual. In an article in the *Electrical Engineer*, vol. xxi., No. 16, the writer gave his opinion on this subject, based upon a fair amount of experience, and he would reiterate the point that bad canvassing, and a system which depends entirely upon the canvasser himself, instead of providing for the proper supervision of his work, invariably does more harm than good. As a calling it is looked down upon, and yet there is no getting away from the fact that the successful canvasser must be endowed with an unusual amount of tact and determination that is worthy of a larger scope, and such a man properly supervised will bring in good results if they are to be had. It is a most important, almost vital part of pioneer electricity supply, and as such should be conducted in a manner that tends to render everything easy for the prospective consumer, and in a way that does not jar upon him.

A petty annoyance that is often complained of is the too frequent calling of inspectors, sometimes at inconvenient hours. The men themselves are generally to blame for this; calling on consumers with the vague excuse of having to look at the meter, while scarcely profitable to the inspector's employers, is a very congenial way of spending an odd hour or two, affording him as it does the company of the female denizens of the lower regions and a possible glass of beer. This is only one of the many small points that have a bearing upon general results, but such details, insignificant as they may seem, all add up, and we have reached that stage in competition where even the smallest point must not be despised.

LIVERPOOL ENGINEERING SOCIETY.

President's Inaugural Address.

The above association held the first meeting of their thirtieth session on the evening of the 4th inst. The minutes of the last meeting of the previous session having been duly read and confirmed, the secretary, Mr. R. C. F. Annett, produced a list of new members, the length of which gave abundant testimony as to the vitality of the association. The retiring president, Mr. Ernest S. Wilcox, M.I.C.E., then introduced to the meeting Mr. T. L. Miller, M.I.C.E., M.I.Mech.E., M.I.E.E., the president-elect, who thereupon took the chair and delivered his inaugural address.

The main question discussed in the president's address is the cost of the production of power, and probably no more interesting subject could have been chosen at a time when the cheap supply of power is a matter of vital importance to the industrial welfare of the country. The address is of considerable length, but in this article we propose to briefly outline the chief points touched on by the author. He first considers the sources of energy on which we may draw for mechanical power. They are tidal and wave energy, wind, water, and fuel. As regards water power, the author says that under favourable conditions it is unrivalled as a cheap source of energy, and he supplies figures which show this to be the case. For instance, in Columbus, Georgia; Columbia, South Carolina; and Anderson, South Carolina, electrical energy for power purposes from water power stations is sold to consumers requiring 1,000 h.p. and over at £3. 2s. 6d. per horse-power year delivered on the secondaries of the transformers, the transformers being furnished by the power company. This energy can be used under contract for 66 hours per week, or 3,432 hours per year. Assuming that full advantage could be taken of the supply of energy available, or, in other words, that the load factor is 100 per cent., the cost of energy works out at ·218d. per unit, which is an extremely low figure. He also shows that the capital cost of a water-power plant is low, instancing the case of the chlorate works at Vallarbe, where the capital expenditure upon the development of 3,000 h.p. amounted to but £3·89 per horse-power. The highest capital expenditure appears to have been at Lyons, where it amounted to £84 per horse-power developed, but the conditions in this case were exceptional. In dealing with fuel, the author reviews the progress that has been made in the direction of the economical production of power from fuel, and largely quotes from other papers in order to show the economical results that have been obtained at different times from coal and other fuel. He then turns his attention to turbines. Dealing with the De Laval turbine, he states that this engine has a very high rotative speed, which in the smaller sizes is as high as 30,000 revolutions per minute, and in the larger sizes about 10,000 revolutions per minute, the peripheral speed usually adopted varying from 600ft. to 1,200ft. per second. He describes the Parsons turbine, which is the one most extensively used at the present time in this country, and also the Curtis turbine. Although at first sight it would appear that little gain in economy would result from the use of superheated steam, the results of careful tests show a decided gain. Thus, Prof Thurston, experimenting with a De Laval turbine, obtained an increased economy of 1 per cent. for every 30deg. F. of superheat, which he attributed almost entirely to the reduction in skin friction. From a table of figures which is given of steam consumptions with different makes of turbines, it seems that a 600-kw. Curtis turbine when using steam superheated 150deg. F. has a steam consumption of 16·75lb. per kilowatt-hour. The table further shows that a 1,442-kw. Parsons turbine consumes 18·0lb. per kilowatt-hour with steam superheated 27deg. F.

The next section of the address deals with internal-combustion engines, special reference being made to the Diesel engine. The fuel used in this engine is crude petroleum, having a specific gravity of 0·922 and a calorific value of about 19,150 British thermal units per pound. There is, however, no reason why gas or coal dust should not be used. From the average of a number of tests the consumption of oil appears to vary from ·45lb. to ·5lb. per brake horse-power hour. The thermal efficiency of this engine is high, being 36·3 per cent. for the 35 b.h.p. size, 39·9 per cent. for the 80 b.h.p. size, and 40 per cent. for the 160 b.h.p. size; the efficiency in all cases being calculated on the net indicated horse-power. The cost of production of power from fuel is next considered, and the author quotes a considerable amount of data on this point. In a number of cases cited, Mr. H. A. Foster has found the average working cost per horse-power hour, taking an average of 3,080 working hours per annum, to be about ·412d. Mr. C. D. Gray, another authority, has found the cost of steam power to vary as follows: standing charges from ·045d. to ·37d. per horse-power hour, running charges from ·115d. to 1·22d.—total costs from ·155d. to 1·45; average costs, ·475d. per horse-power hour. In another case, that of an engineering works with a mean indicated horse-power of 773, the costs for a week's test of 139½ hours and an output of 60,403 Board of Trade units worked out at a total of ·399d. per unit. At Messrs. Cadbury's works at Birmingham the cost with a 500-h.p. five-ton Mond producer (without recovery plant) and two 150 kw. gas-driven generators for one week, worked out at ·344d. per unit. In yet another instance quoted—to wit, Mr. H. A. Humphrey's estimate of the costs to be obtained from a 20,000-e.h.p. gas plant, with sulphate of ammonia recovery and with a load factor of 33⅓ per cent.—the figure is ·217d.

In concluding the address, the author says that at the present time both the steam-turbine and the gas-engine are coming prominently into favour, and great developments in their application may be expected during the next few years. As regards the future, he believes much will be done in the way of utilising the heat now going to waste in many of our manufacturing processes, and as a striking illustration of the possibilities in this direction he instances the utilisation of the waste gases from blast furnaces, where, taking the figures given by the late Mr. Bryan Donkin for the world's output of iron from blast furnaces in 1899 as 40,000,000 tons, and assuming a yearly consumption of one ton of coke per ton of pig iron, with a

Digitized by Google

production of 170,000 cubic feet of gas, the total indicated horse-power available from this source alone would be 6,400,000.

A hearty vote of thanks was accorded the president for his able address.

In his reply, Mr. Miller referred to the forthcoming joint meeting which has been arranged with the Manchester Section of the Institution of Electrical Engineers, as marking a notable development in the history of their society. The next meeting will be held on Nov. 18, when Mr. J. B. C. Kershaw, F.I.C., will read a paper, entitled "Fuel Economy from the Chemical Point of View."

INSTITUTION OF ELECTRICAL ENGINEERS.

Inaugural Address.

BY ROBERT KAYE GRAY, PRESIDENT.

Gentlemen,—Another session has opened, and another president addresses you, the twenty-eighth person who has had this privilege. On this occasion one of our usual forms of procedure must be dispensed with, or I should have to fill the *rôle* of vacating the chair in my own favour. You will remember that Mr. Swinburne, who gave us an extremely interesting and valuable address a year ago, resigned the presidentship two months before his term was completed. This he did in order to permit a telegraph man to be at the head of the Institution during the recent International Conference in London, to which telegraph delegates from foreign Governments were invited. For obvious reasons I cannot criticise Mr. Swinburne's action in this matter, but I feel at full liberty to say that the manner in which he carried out what he thought to be the best interests of the Institution was accomplished with great consideration, and for this, so far as it affected me personally, I tender him my sincerest thanks.

You, gentlemen, have placed me in the honourable position which I now fill, but the honour which you have conferred is one that carries with it a responsibility which might better have been confided to other hands. The Institution is ever growing, and shows the life that dwells in every healthy hardy plant which from a seedling becomes a well-grown tree. Not one of the founders of the Institution in 1871 could have foreseen the developments of a third of a century later. The guidance of your former presidents and councils have been wise, and it is for us to follow in their footsteps with the same open minds which have led to the consolidation of many diverging interests into one complete whole. We are under a debt of gratitude to the Institution of Civil Engineers for many advantages they have conferred on us, and not the least is the cordial hospitality they give us in their magnificent building. Your successive councils have continually had brought to their notice the desirability of our Institution possessing a permanent habitation, and it is believed this feeling is general among the members. I take this opportunity of stating that in deference to this view a site has been acquired, which, in the opinion of the Council's technical advisers, will amply suffice for the erection of an Institution building in which a suitable lecture theatre and other necessary offices could find place. Your Council has no intention of proceeding with the construction of the Institution building until they believe the Institution to be strong enough financially to meet the necessary expenditure while remaining in possession of a handsome surplus. It is also thought that developments in the near future may permit of an alliance with kindred institutions for the erection of one large temple of engineering, where the various branches may find their homes. A portion of this building could be allotted to the joint occupation of the various sections of engineering, and each section could in addition possess the accommodation it might require for its own particular work; a senate or court of governors appointed by the sections being constituted the supreme body. I understand that the late Sir William Siemens had such a conception, and perhaps its realisation may now be within the range of practical politics. In the event of such a scheme maturing, the property in Tothill-street, which the Institution has acquired, can be sold, as it will always be a realisable asset so long as no special building is erected on it. A temple of engineering costing a quarter of a million would be a fit home for the engineering bodies of this country.

Many opinions have been advanced as to the scope and aim of an institution such as ours: as to what it should do and what it should not do, and as to its relations with kindred societies. This, of course, is contentious matter, and should not probably be touched in an address, but I take advantage of the immunity from criticism in this room which my position to-day grants me, and will make a few remarks on the subject. In early days the Institution was the only association or body which could voice the views of electrical men, and therefore everything touching their interests was fit matter for discussion. To-day the necessity is not so imperative, as, owing to the great development of the electrical industry, other bodies are springing up who can more properly deal with a variety of questions which affect, but only indirectly affect the Institution as an Institution of Electrical Engineers. As time goes on this necessity will become less and less, and the Institution will fall back into its proper function as an Institution of Electrical Engineers, and will not fill the part of an Association of Electrical Engineers, which it has often been obliged to do in the past. The word "institution" in this connection bears in my mind the meaning of a body for dealing with technical interests, while "association" implies a corporation whose functions are related to everything affecting general interests. I hope that the Institution, for some time yet, will continue to take an interest in things general as well as technical, and conserving the open mind and progressive spirit, to which I referred in my preceding remarks, will assist in every reasonable way the aspirations of the different electrical associations which are being formed from day to day. These associations must not be looked upon as rival or interfering bodies, but rather as bodies formed to meet a real want, and from that point of view deserving every assistance and encouragement from the older body. There is one more point in this connection which from time to time provokes comment and criticism, and that is that many members of this Institution contribute papers to the Institution of Civil Engineers and other bodies which, in the opinion of the critics, should have been presented to this Institution. I do not think this is a fair or a wise criticism. People, readers of papers or others, will always carry their wares to the best market, and the only effective way of dealing with the situation is for the members and officers of this Institution to strive to make our market the best. Those who read papers on electrical subjects in other institutions are in reality doing a great good to the electrical industry and to this Institution, as they play the part of the missionary who goes out into the wilds, spreads the light, and eventually gathers converts into the fold. I, therefore, say that our members who read papers before other institutions or societies are well-doers, and should not be submitted to the unfair criticism which emanates from a spirit akin to some of the elements of trade unionism, and is much to be deprecated. While admitting the desirability of the existence of these electrical missionaries, I also urge that the members and officers of the Institution should leave no stone unturned in their search for what is good and useful to the Institution. Our predecessors have done this, and the task of the present Council and members should be much easier than the task which their forerunners have performed. What they accomplished is made clear by a reference to our membership. An institution, which in 1871 numbered 80 persons, and to-day numbers 4,800, has every reason to be proud of its development and growth. It is my belief that the Institution will continue to develop, and if it is governed in a tolerant and broad-minded spirit will never cease to be the referee in all cases affecting electrical science and industry.

I now propose to lay before you some matter I have had collected relating to the effect that existing legislation has had on electrical enterprise, and containing a few suggestions for the betterment of the present situation. As the generation and supply of electricity for lighting, power, or traction are strictly regulated by Act of Parliament, it is obvious that electrical progress must be seriously affected for good or for evil by the state of the law relating

Digitized by Google

to electricity. It is impossible to attempt here to cover the whole field of electrical legislation, but attention may be directed to one or two special points. If we omit the Electric Lighting (Clauses) Act of 1899, which merely codifies the provisions usually incorporated in a provisional order granted by the Board of Trade, we find that there has been no public legislation upon the generation and distribution of electricity since 1888, when an Act was passed to amend certain defects in the original Act of 1882. This absence of legislation during a period in which the applications of electricity to the service of mankind have been enormously improved and extended, would not be remarkable if the original Acts had been adequate not only to the needs of the time at which they were passed, but to those of the present day; but, as everyone knows, this is far from being the case. Those statutes were framed to meet the case of distribution of electricity over a small area, and no provision was made for the time, which has long since arrived, when it would be possible and even economical to distribute from a given centre over a wide area, extending far beyond the boundaries of any particular parish or municipality. There might still have been a chance that the parochial idea embodied in these early statutes would in the course of time have been abandoned, had not Parliament fixed this idea as a permanent feature of British electrical distribution by giving to the local authorities the right of purchase of the undertakings supplying their areas after a period which was first stated at 21 years, but afterwards extended by the Act of 1888 to 42 years. In addition to this, the Act of 1888, although intended to promote the introduction of electric lighting, went far towards stifling private enterprise in this direction, by giving to the local authorities a veto on any petition to supply electricity within their areas. Thus it has come to pass that in spite of the great progress made since 1888 in the science of distribution, no one but a local authority can to-day obtain free unimpeded access to the Board of Trade with a petition for a provisional order, and as local authorities are as jealous of one another as they are of private companies, the general result is that the municipal area is still the unit area for distribution.

There are, of course, many other prominent defects in the Electric Lighting Acts. They do not, for example, provide for the compulsory purchase and sale of sites for generating stations, nor yet for the erection of these stations outside the area of supply. If promoters of an undertaking desire either of these things they must proceed by special Act, not by provisional order; and the best proof of the inadequacy of the Electric Lighting Acts to modern needs is that these private Acts usually contain special clauses of which the object is to render inapplicable a larger or smaller number of the sections of the controlling public statutes. The whole subject was considered in 1898 by Lord Cross's Committee, which made many recommendations of the highest value—among them, the abolition of the veto and the removal of the defects just noticed—but until the present year the Government has shown no sign of being desirous or willing to give these recommendations the force of law. The Institution of Electrical Engineers, which has always been alive to the serious consequences of this defective legislation, sought in June of last year to bring pressure upon the Government by sending a deputation to the President of the Board of Trade. It is impossible to express more forcibly or more clearly the objections to the present law than was done by the members of our deputation on that occasion; but although we were then promised a measure to remove these objections, nothing was attempted until May of this year, when a Bill, embodying most of the recommendations of the Lord Cross's Committee, was introduced in the House of Lords by Lord Wolverton at the instance of the Board of Trade. But the Bill did not get beyond the introductory stage, and at the close of the session no progress had been made. The measure, however, must not be allowed to drop; and as the President of the Board of Trade has told us that his department desired to "press forward" this measure when opportunity offered, we may express the hope that next session it may not only be introduced, but may be placed upon the statute-book.

With regard to the distribution of electricity for power purposes, the Electric Lighting Acts make no special provision. Any consumer may use his supply either for lighting or power, or both. But in recent years the idea of promoting large power schemes to supply very wide areas has come prominently to the front, and since 1900 several such schemes have been authorised by special Acts of Parliament. The powers of supply conferred upon companies under these Acts are twofold: they may supply energy for power purposes to any person, and they may supply energy in bulk to authorised distributors. In this connection it may be noted that if the Bill introduced by Lord Wolverton becomes law, it will be possible to obtain powers for supply in bulk to authorised distributors by provisional order, instead of proceeding, as at present, by special Act. The most important point, however, about these modern power schemes is that in many cases the promoters come into sharp conflict with local authorities and other authorised distributors supplying urban or rural districts within the large area which they desire to cover by their scheme. The local authorities are especially antagonistic to any proposal which would allow another body to come into their area to supply electricity, and in some cases Parliament has cut out from the area which a particular scheme desires to cover various towns and districts possessing their own electricity supply undertakings. Now, it seems desirable that the local authorities should consider carefully the advantages of taking their supply in bulk from a power scheme, instead of generating for themselves on a small scale. In very many cases it would be much more economical to do so, and they would still be left the sole distributors in their own areas. But if local authorities will not do this, Parliament must consider what is best for the country at large; and as the rural districts must obviously gain by the supply of electrical energy at cheap rates, the towns should not be allowed to prevent this gain by obstructing or rendering ineffective the scheme for the larger area. The point is that if all the towns, which constitute the "fat" districts, are cut out of these schemes, leaving only the "lean" rural districts for the large-area companies, there can be little or no hope of financial success. In order to obtain, therefore, the greatest good for the greatest number, the larger authority ought to be allowed, wherever possible, to prevail over the smaller municipalities opposing it, especially when we consider that this does not entail an injustice to these municipalities, but only a slight narrowing of the field of municipal enterprise.

(To be continued.)

LONDON TRAFFIC ENQUIRY.

The Royal Commission on London Locomotion on Friday last resumed the taking of evidence at the Westminster Palace Hotel, under the chairmanship of Sir David Barbour. This was the first sitting of the Commission after the visit paid to America.

Mr. William Edward Riley, architect of the London County Council and superintendent architect of metropolitan buildings, pointed out various defects of the existing systems of transport. The adoption, he said, of any ideal system in London was hampered by the existence of the Metropolitan and Metropolitan District Railways. He suggested that an ideal scheme would be one giving circumferential lines at various distances apart, and crossing these diametrically by other lines running across the county and joining the circumferential lines with the centre point. The existing and authorised electrical systems, of which only the North-West London and City and Brixton Railway were not now in course of construction, were made up of a series of irregular lines, which, as at present arranged, did not constitute a unified system. In order to further improve the system, broad avenues converging towards the central areas of the county were suggested, which would materially increase locomotion facilities. These avenues would provide for underground as well as for surface locomotion. The underground systems of all the diametrical lines, both tube and shallow underground, might be looped at the outer ends as in the Paris systems, in order not to obstruct possible future extension. The great railway systems brought in masses of persons from the other zones, and poured them into the streets surrounding their terminal stations, by which from necessarily crowded thoroughfares they had to find their way to the various centres. As these points could not, except in a few cases, be contiguous to the railway termini, it followed that these should be so connected with one another that passengers might rapidly reach any centre of these areas. In some cases shallow subways or tramways might be adopted. Witness proceeded to give at some length various suggestions for linking up the various railways, and, amongst other

Digitized by Google

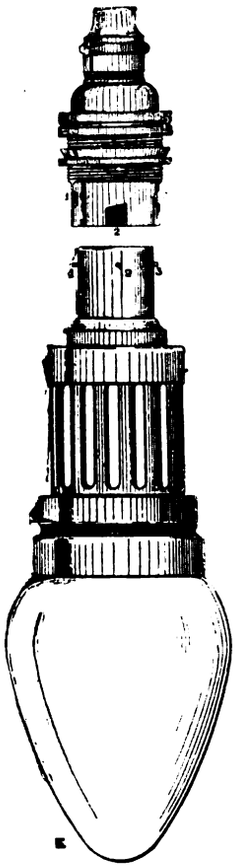
things, pointed out the convenience it would be to extend the Great Northern and Strand tube from the Strand under the river to Waterloo Station, thus forming an approximately north and south line. Another line which was needed in order to provide rapid communication between centre points was one from Piccadilly-circus to Charing Cross, the Law Courts, Ludgate-circus, and the City. Continuing, witness expressed the opinion that tramways should, where practicable, approach nearer to the centres of traffic north of the river than at present, and pointed out that the dangerous termini at Westminster Bridge and Blackfriars Bridge would be abolished by continuing the tramways over these bridges and along the Embankment. The witness also gave particulars of new tube railways which, in his opinion, were required to meet the growing requirements of London.

The Commission adjourned.

TRADE NOTICES AND NOVELTIES.

The Nernst Lamp.

The reason why a few electrical contractors do not get on well with the Nernst lamp while others obtain good results is often due to incorrect treatment of the lamps or their parts. The Electrical Company, Limited, of 121-125, Charing Cross-road, London, W.C., who are the patentees of Nernst lamps for



the United Kingdom, have carefully investigated a large number of such cases, and have found that the following two mistakes are very common: (1) The voltage of the lamp is not matched properly; the burner voltage, plus the resistance voltage, should be approximately equal to the *maximum* (not nominal) voltage of the circuit. (2) With direct-current lamps, especially the B type, the polarity is not observed when the lamp is fitted into the holder; and, what is even worse, the lamp is very often taken out of its holder and put back the wrong way, thus causing the polarity to be reversed and the filament to break very soon. To prevent this the Electrical Company supplies B-type Nernst lamps which have a third bayonet pin in the socket. If the holder is altered, by simply punching a third slot (as shown in the illustration) it will be impossible to put the lamp back into the holder in the wrong way. The polarity when once tested cannot therefore be reversed. With screw holders the reversing of the polarity is impossible *per se*, and it would be a great advantage, therefore, if on large installations screw holders were used. B-type lamps with screw caps can always be supplied by the Electrical Company.

The Locke Steel Chain.

On Wednesday last we had an opportunity of witnessing, at the works of this company at South Tottenham, their steel chain-making machinery. These machines automatically turn out steel chains by stamping the individual links out of steel sheet. The sheet is first cut up into strips, the width of which varies according to the size of the sprocket chain required. These strips are then fed into the chain-making machine, which in five operations completes each link. The metal which is punched out of the centre of the link is bent round to form the cylindrical bearing surfaces at either end. The chain when completed is passed into a gas furnace which heats it up for the hardening process, and after being plunged into water, it is tempered in an oil bath. The process is quite automatic and the chain produced is remarkably strong. Some tests carried out at the works on Wednesday last showed that these tempered steel sprocket chains were considerably stronger than the ordinary malleable cast-iron chains now generally used. We understand that practical trials with agricultural machinery under severe conditions have proved these chains to be superior to the malleable cast-iron type, and that they are especially serviceable where sudden shocks are likely to be transmitted. As regards the speed of manufacture, the machines we saw were able to turn out 200ft. of 1¼in. chain per hour. The company, which has its offices at 18, Bishopsgate-street, E.C., has standardised a number of different machines for the manufacture of special types of chains.

Lightning Arresters.

The British Westinghouse Electric and Manufacturing Company, Limited, have just issued a new circular, No. 1,045, on the protection of electrical circuits from the shocks due to lightning or other static discharges. The subject is treated in a simple but technical manner, and is illustrated by excellent photographs and diagrams. The various types of arresters, choke coils, etc., made by the British Westinghouse Company for high and low tension, alternating or direct current circuits, are described, and a large amount of valuable information, besides practical instructions for installation, is included. The great importance of adequate protection for electrical transmission lines is becoming widely recognised, and Westinghouse engineers were so early in the field that they have had valuable experience in this work. The standard accessories to these grips over which the lightning jumps, are many and interesting. They include choking coils, and their equivalent static interrupters for very high-voltage circuits. The static interrupter consists of a choking coil in series with the line, and a condenser connected between the coil and earth on the side furthest from the line. The arresters themselves listed are of the Wurts type.

Pamphlets, Catalogues, Etc.

ELECTRICITY AT HOME. J. Sunderland and Co., electrical engineers and contractors, 183, Gibbet-street, Halifax. — A well-illustrated booklet illustrative of a few of the very many private residences the firm have equipped with electric light and heating appliances.

B.T.-H. TYPE D-A CONTINUOUS-CURRENT GENERATORS (Pamphlet No. 159). The British Thomson-Houston Company, Limited.—Fully describes the apparatus.

WINN'S ENGINE AND BOILER FITTINGS (Section D, third edition). Charles Winn and Co., St. Thomas Works, Granville-street, Birmingham.—A new list, well printed and well illustrated. The firm's specialities are the reliable automatic water-gauges and glass protectors, boiler mountings and engine fittings, screwing machines for tubes or bolts, metallic packings.

RADIATORS, NERNST ELECTRIC LAMPS, AND OMEGA GUARANTEE FLEXIBLE CORDS (Nos. 1,046, S 1,045, and W 1,043). General Electric Company, Limited, 71, Queen Victoria-street, E.C.—Appendices to general catalogue.

ELECTRICAL FITTINGS (ILLUSTRATED), The Electrical Fittings Company, 38, Conduit-street, W.—Shows a number of charming brackets and electroliers of artistic design. The firm has lately laid down special plant for the manufacture of them at a price which will bring them within the reach of all classes.

PURE WATER for all steam-raising industrial and manufacturing purposes, waterworks for cities, towns, and villages, electric lighting and power plants, bleachers, dyers, laundries, paper mills, chemical works, sugar refineries, etc., obtained by the "Paterson" gravity and pressure filters, water-softening apparatus, effluent purifiers, greasy condensation water purifiers, combined feed-water heater and purifier, etc., as constructed by the Paterson Engineering Company, Limited, 77, Queen-street, Glasgow. When describing the metropolitan borough of Poplar electric works we referred to the good work being done by this grease filter, and we are informed that the firm have recently supplied boiler-feed purifiers to the following electric lighting and power generating stations: Blackpool, Ealing, Barrow-in-Furness, Maidstone, Ipswich, Portsmouth, Poplar (repeat order), Watford, St. Pancras Borough Council, Derbyshire and Notts Electric Power Syndicate. Messrs. Davey, Paxman, and Co., Limited, Western Electric Company, Sir Hiram Maxim Electrical and Engineering Company, Messrs. Babcock and Wilcox, Limited, Messrs. Dick, Kerr, and Co., have, amongst others, favoured the firm with their orders. They are about to open an office in London to better attend to matters in the South of England.

YORK ELECTRICITY UNDERTAKING.

Mr. C. A. Midgley, the city electrical engineer of York, has sent us a copy of the financial statement of the above undertaking for the year ended March 31 last. He reminds us that in the revenue account there is an amount of £661 abnormal expenditure on extensions to buildings, which has, of course, made a considerable difference in the returns. In the following statement the first set of figures is for the year under review, while those in brackets represent the figures for the 1902 year: Units generated, 774,401 (517,055); total units sold, 652,000 (243,000); units sold to consumers, 545,285 (339,354); units sold for public lighting, 106,715 (83.645); units used on works, 28,360 (27,876); units sold per mean 8-c.p. lamp capacity, 17·3 (19·9); actual maximum supply demanded, 550 kw. (410 kw.); load factor, 14·15 per cent. (11·88 per cent.); number of public lamps, 66 (66); number of consumers, 386 (270); connections to mains in 8-c.p. lamps at end of year, 43,167 (32,766); capacity of plant at end of year, 720 kw. (720 kw.).

Capital.—Total authorised, £101,850 (£40,000); total received, £69,428 (£55,832); total authorised not received, £32,422 (nil); total expended, £69,428 (£55,832); lands and buildings, £9,205 (£8,053); plant, etc., £24,493 (£19,654); mains, etc., £32,467 (£25,272); miscellaneous, including meters, £3,263 (£2,853).

Revenue.—Total, £7 372. 17s. 2d. (£6,047. 17s. 5d.); from supply, etc., £6,100. 7s. 7d. (£5,093. 4s. 6d.); from motors, etc.. £110. 16s. 9d. (£12. 0s. 9d.); from public lighting, £1,160. 7s. 1d. (£941. 1s. 9d.); from miscellaneous, £1. 5s. 9d. (£1. 10s. 5d.).

Expenditure out of Revenue.—Total costs, £5,152. 0s. 4d. (£3,456. 1s 7d.; total works cost, £3,135. 15s. 1d. (£2,095. 11s. 10d.). Generation of electricity—fuel, etc., £1,452. 11s. 4d. (£1,237. 18s. 5d.); oil, waste, engine-room stores, etc., £212. 1s. 5d. (£241. 0s. 6d.); wages at station, £611. 5s. 8d. (£481. 13s 5d.); repairs, etc., at station, £761. 8s. 4d. (£89. 11s. 2d.). Distribution of electricity—wages, etc., £26. 5s. 7d. (£17. 8s. 4d.); repairs, renewals of mains, etc., £72. 2s. 9d. (£28). Public lighting—attendance, £259. 9s. 2d. (£247. 19s. 8d.); renewals, £178. 6s. 10d. (£95. 16s.). Management and property charges—rent, rates, and taxes, £426. 8s. 10d. (£202. 12s. 2d.); salaries, £793. 18s. 8d. (£622. 9s. 8d.); stationery, etc., £51. 18s. 11d. (£84. 14s. 10d.); establishment charges, £277. 19s. (£68. 14s. 6d.); law charges, etc., nil (£2. 2s.); insurance, £47. 13s. 10d. (£36. 0s. 11d.).

Financial Results.—Working profit for year, £2,220. 16s. 10d. (£2,591. 15s. 10d.); sum carried to reserve fund. nil (£349. 15s. 8d.); net profit for year, nil (£349. 15s. 8d.); balance from last account, £448. 11s. 5d. (£98. 15s. 9d.); deficit, £799. 17s. 5d. (—); percentage of total costs to revenue, 69·8 per cent. (57·2 per cent.); price charged for lighting per unit, 7d. and 1½d. demand, 4½d. to 3d. flat rate (7d. and 1½d. demand, 4½d. to 3d. flat); power, 1½d. to 1d. (1½d. to 1d.); receipts per unit for private supply, 2·69d. (3·62d.); public lighting, 2·61d. (2·70d.).

FARNWORTH ELECTRIC LIGHTING AND TRAMWAYS UNDERTAKING.

Mr. J. D. Pember, the engineer and manager of the electricity and tramways department of the Farnworth Urban District Council, has sent us particulars of the electricity and tramways accounts for the quarter ending Sept. 30 last. Following are the principal items in the electricity revenue account: Units supplied: private lighting, 8,166; power, 49,829; street lamps, 7,475; tramways, car propulsion, 78,137; tramways, shed lights, 1,417—total, 145,024. Units generated: private consumers, 57,995; street lamps, 7,475; tramways, 79,554; works lights, motors, testing meters, etc., 5,959; loss in accumulators, excitation of dynamos, 381—total, 151,364. Receipts: private consumers—lighting, £168 16s. 11d.; motors, £292 18s. 9d.; street lamps, £180; motor hire, £53. 1s. 11d; tramways, £331. 9s. 6d.; sundry receipts, £3. 1s. 9d.—total, £1,029. 8s. 10d. Expenditure: coal £184. 14s. 9d. (·30d. per unit); oil, waste, etc., £32. 10s. 3d. (·06d.); generation account (wages and materials), £83. 0s. 9d. (·14d.); repairs account (ditto), £61. 0s. 4d. (·10d.); street lamps account (ditto), £32. 11s. 3d. (·06d.); distribution account (ditto), £22. 11s. 3d. (·04d.); rents, rates, taxes, £55. 16s. 8d. (·09d.); management, £69. 15s. 8d. (·11d.)—total, £542. 0s. 11d. (·90d.); interest and sinking fund, £350—grand total, £892. 0s. 11d. Total receipts, £1,029. 8s. 10d.; total expenditure, £892. 0s 11d.; profit, £137. 7s. 11d.

The following applications for current were made: motors h.p., 10; equivalent in 8-c.p. lamps, 266; lamps, 8-c.p., 34. The following were connected during quarter: motors h.p., 88; connected previously, 294½—total, 382½; equivalent in 8-c.p. lamps, 2,345; connected previously, 7,837—total 10,182; 8-c.p. lamps, 349; connected previously, 6,309—total, 6,658; radiators, 99. The total number of 8-c.p. lamps connected to date is 16,939.

Following are particulars of the tramway revenue account: car miles run, 60,296½; receipts, £1,953. 3s. 9d.; receipts per car mile, 7·7d.; total number of passengers carried, 401,240; average receipts per passenger, 1·14d.; units for propulsion of cars, 78,137 = 1·28 per car mile. Expenditure: repairs and maintenance, £170. 1s.; less receipts for scrap brass, etc., £15. 15s. 7d. = £154. 5s. 5d. or ·61d. per car mile. Traffic expenses: current, £331. 9s. 6d. = 1·32d. per car mile; wages and materials. £590. 16s. 8d.; less receipts advertising, £35. 16s. 8d = £550. or 2 21d. per car mile; cleaning and overhauling, £180. 3s. 1d. (·72d. per car mile); rents, rates, taxes, etc., £57. 1s. (·22d.); insurance and general establishment, £36. 14s. (·14d.); management, £58. 7s. 5d. (·24d.)—total working expenses, £1,373. 1s. 5d. (5·46d.): estimated interest and sinking fund, £700; rent Kearsley track, £325. Total expenditure, £2,398. 1s. 5d.; total receipts, £1,953. 3s. 9d.; loss, £444. 17s. 8d.

APPOINTMENTS VACANT.

Engine-Room Attendant. Salary 35s., rising to £2 per week. Particulars from the Secretary, South-Western Polytechnic, Manresa-road, Chelsea, S.W.

Advertisement Assistant, London County Council. Applications by 10 a m. on Nov. 16, to County Hall, Spring-gardens, S.W.

Shift Engineer, Tunbridge Wells, £100 per annum.

Mains Superintendent, Bexhill Borough Council. Salary, £2; 21st inst. See advertisement.

Switchboard Attendant, Carlisle Electric Light Station. Salary, 25s. per week. Application by 18th inst.

Borough Electrical Engineer and Manager, Poplar Council. Salary, £400 per annum. See advertisement.

Brassfinishers accustomed to switches, arc lamps, the Manufacturing Electric Company, Limited, 11, Red Lion-street, Clerkenwell. See advertisement.

Assistant Works Manager for lamp factory, Ampere, care of J. W. Vickers, 5, Nicholas-lane, London, E.C. See advertisement.

FORTHCOMING EVENTS

FRIDAY, NOV. 13.

Physical Society.—At 8 p.m., ordinary meeting, Royal College of Science. Papers: "Means for Electrifying the Atmosphere on a Large Scale" and "An Arrangement for Driving Mercury Pumps," by Sir Oliver Lodge.

Electro-Harmonic Society.—At 8 p.m., "Ladies' Night" concert in King's Hall, Holborn Restaurant.

North-East Coast Institution.—At 7.30 p.m., general meeting at Newcastle. Paper: "Technical Education in Germany," by Mr. Max Wurl.

SATURDAY, NOV. 14

Glasgow Scientific Society.—At 7.30 p.m., ordinary meeting. Paper: "Motorcars," by Mr. Alex. Govan.

West Hartlepool Scientific Society.—At 7.30 p.m., ordinary meeting. Paper: "The Absurdities of the Present System of Measures," by Mr. Wm. C. Barrowman.

TUESDAY, NOV. 17.

Royal Statistical Society.—At 5.30 p.m., ordinary meeting. Address by Major P. G. Craigie, C.B., president.

Institution of Civil Engineers.—At 8 p.m., ordinary meeting. Paper to be further discussed: "Tensile Tests of Mild Steel, and the Relation of Elongation to the Size of the Test-Bar," by Prof. W. C. Unwin, F.R.S.

Institution of Electrical Engineers (Manchester Section).—At 7.30 p.m., ordinary meeting. Address by Mr. E. W. Cowan, chairman. followed by demonstration of the properties of radium by Dr. Schuster.

WEDNESDAY, NOV. 18.

Liverpool Engineering Society.—At 8 p.m., ordinary meeting. Paper: "Fuel Economy from the Chemical Point of View," by Mr. J. B. C. Kershaw, F.I.C.

Society of Arts.—At 8 p.m., opening meeting. Address by the Vice-President, Sir Wm. Abney, K.C.B., F.R.S.

Institution of Electrical Engineers (Students' Section).—At 7.30 p m., ordinary meeting.

Royal Meteorological Society.—At 7.30 p.m., at the Institution of Civil Engineers. Papers on "The Great Dustfall of Feb. 21 and 22 1903, and its Origin," by Messrs. H. R. Mill, D.Sc., and R. G. K. Lempfert, M.A.

THURSDAY, NOV. 19.

Institution of Electrical Engineers (Leeds Section).—At 7 30 p.m., ordinary meeting Paper: Destructor and Electricity Stations in Small Towns," by Mr. S. D. Schofield.

FRIDAY, NOV. 20

Junior Institution of Engineers.—Ordinary meeting. Paper: "Fires on Shipboard; their Chief Causes and the Method for Prevention and Extinction," by Mr. George Canning.

Institution of Mechanical Engineers.—At 8 p.m., ordinary meeting. Papers: "Roofing Existing Shops while work is proceeding," by Mr. R. H. Fowler; "Experiments on the Efficiency of Centrifugal Pumps," by Mr. Thomas E. Stanton, D.Sc.

SATURDAY, NOV. 21.

Junior Institution of Engineers.—At 2.30 p.m., visit to Orchard Dock, Blackwall, to witness a demonstration of fire extinguishing, etc., by invitation of the Clayton Company.

Symphony Concerts.—Those of our readers who happen to be of a musical turn of mind will be interested to know that the first of the Queen's Hall symphony concerts, under the direction of Mr. Henry J. Wood, takes place to-morrow (Saturday) afternoon at 3 o'clock. Herr Fritz Kreisler is the solo-violinist.

TO CORRESPONDENTS.

All Rights Reserved. Secretaries and Managers of Companies are invited to furnish Notices of Meetings, Issues of New Shares, Installations, Contracts, and any information connected with Electrical Engineering which may be interesting to our readers. Inventors are informed that any account of their inventions submitted to us will receive our best consideration

All communications intended for the Editor should be addressed C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, E.C. Anonymous communications will not be noticed.*

TO ADVERTISERS.

Advertisements should be addressed to the Publisher, 139-140, Salisbury Court, Fleet Street, E.C., and should reach him not later than noon of Thursday. **Special Terms** *for a series can be arranged on application.*

SITUATIONS WANTED will be charged at three words for One Penny (prepaid and net), with a minimum charge of Sixpence.

TO SUBSCRIBERS.

"THE ELECTRICAL ENGINEER" *can be had by Order from any Newsagent in Town or Country, and at the various Railway Stations; or it can, if preferred, be supplied direct from the Office on the following terms:*

	3 months.	6 months.	12 months.
United Kingdom	3s. 3d.	— 6s. 6d.	— 13s. 0d.
Other Places	5s. 6d.	— 10s. 6d.	— 21s. 0d.

(Post Free, Payable in Advance.)

Cheques, Post Office and Postal Orders for Subscription and Advertisements should be made payable to C. H. W. BIGGS, *139-140, Salisbury Court, Fleet Street, London, and be crossed "Union Bank."*

Bound Volumes of "THE ELECTRICAL ENGINEER," *containing half-year's copies, bound in Dark-Blue Cloth, Gold Lettered, price 8s. 6d. New Volume, January to July, 1903, now ready.*

TECHNICAL EDUCATION.

Mr. Max Wurl will to-day read a paper at Newcastle-on-Tyne before the North-Eastern Engineers upon the subject of "Technical Education in Germany." It is obviously impossible for us to comment upon a paper which is not yet read, but we welcome the opportunity of saying a few words upon the subject. In the first place, education as a whole has never obtained legislative consideration, and we incline to the opinion that no national system can be efficient which does not deal with the subject as a whole. Broadly speaking, the basis of national education depends upon the teaching in primary schools. The secondary schools take up the work where the primary schools leave off, and the teaching here must be of two kinds—one giving instruction suitable for those who enter the learned professions, the other dealing with those who enter into trade. The universities, again, must cater for these two great classes. Fundamentally, then, we must first have a kind of generalisation, then we must specialise. The capacity of a man for specialisation depends almost entirely upon his attainments in general knowledge. It would perhaps be a too sweeping condemnation to say that at present our whole system is a system of examination, not of education. The two things are entirely distinct, and many a one is well educated who is unable to pass certain examinations, while, on the other hand, a brilliant examinee may be emphatically uneducated. Education cannot give a man ability; that is inborn, not made. Every workshop proves this, for therein you will find the unlettered, because of his inborn ability, able to give points to the man of many examinations. Unfortunately, we cannot agree with those superficial observers who say that educationally, so far as business methods and manufacturing methods are concerned, we lag behind Germany and America We deny it; and again appeal to the workshops. The best equipped factories in this country are equal in all respects to those of any other nation. Those who make remarks only to the disparagement of their native land, are generally guided in such remarks by recollections of olden-day factories. They forget that a manufacturing nation has both old and new—the old will not compare favourably with the more recently equipped works at home or abroad—but that is a condition which must by the nature of things exist. Now we come back to the educational problem. Too much is attempted in ordinary schools. They seem to have no definite aim. They neither give the general education for the right training of workman, foreman, designer, or master. Their curriculum is a hotch-potch, leading nowhere definitely. In our primary schools there is too much smattering—a little parrot knowledge without a due comprehension or understanding of any one thing. Boys that do not know the meaning of half the words they read are taught science. Is it reasonable to expect any value from such teaching? Perhaps the greatest difficulty is to train a student to think. We now try to get him to remember. Change the *rôle* of the teacher, and let his aim be to arouse the dormant faculty of thought, and not so much to train the memory. In the first place, then, in our opinion, the teaching in primary schools should be greatly restricted, and the attempt made to so teach that at the close of primary school life the student should know something for himself—at any rate should know the meaning of words, and be well equipped for the future so far as reading, writing, arithmetic, geography, and history are concerned. Technical people and business men, however, look to secondary schools to obtain the training necessary for their future life. Here, we think, the system should be to deal almost entirely with principles You illustrate principles by practical examples, but the

Digitized by Google

application of principles to new combinations has nothing to do with school life. If, again, the thinking faculty is further developed, the student will see that the illustrative examples are examples only, and do not embrace the whole application. The great question arises here as to the further extension of schools or colleges wherein the whole training is one of specialisation. Except in one or two cases, specialisation is better left till the student has had some practical experience. We do not think the latter can be given in the ordinary school course, and strongly object to the idea that any student—not a born genius—can be properly trained to undertake responsible duties without having really practical experience.

Justice needs that both be heard."

REVIEW OF "PRACTICAL NOTES ON ELECTRIC MAINS."

SIR,—I am obliged for Mr. Lee's opinions upon the above review, and have waited for "others" to say where it is "absolutely wrong," without avail.

Mr. Lee mentions, in his letter, that in writing the book he had the "honest intention of helping those starting," but he admits that his "statements are apt to be misleading, because most readers will not have the same attendant convoy of thoughts" as he had; and he also states that "there are sure to be errors" in the book. These deficiencies are (as suggested in the review) easily explained by the fact that the book was written under difficulties; nevertheless, such misleading statements and errors require to be pointed out, if only for the benefit of the starters in question.

I trust Mr. Lee will excuse my anonymity and also the use of the title which the editor of this paper, perhaps too flatteringly, put at the head of the review. Mr. Lee's claim to the title, in view of his lengthy experience and the great responsibility of his work, is freely admitted.—Yours, etc., THE REVIEWER.

Nov. 8, 1903.

INDEPENDENT TELEPHONY.

SIR,—With regard to the "reply" of Messrs Gardner and Holme in your last issue to my letter which appeared in your columns of the 23rd ult., I shall be much obliged if you will kindly allow me to make a few further remarks.

My object obviously was to show that the increase in the multiple jacks was not the very inconsiderable thing that Messrs. Gardner and Holme tried to make it appear in their article under reference, and unless they do not anticipate that municipal exchanges will ever exceed 800 subscribers, I quite fail to understand what they mean in this connection by stating that their articles "are written from a practical point of view." I feel that it is I who have taken the practical view, and it is ridiculous to say I might as well have taken an exchange of eight million subscribers as 6,000. The latter figure was taken because there are already in this country several exchanges with about that number of lines, and the Glasgow Corporation claim to have considerably over 7,000 subscribers. Tunbridge Wells municipal exchange was reported to have had over 1,000 lines, and Brighton talk of getting 3,000. I think, therefore, your readers will see that there is far less reason, apart from any ulterior motive, for Messrs. Gardner and Holme stopping at 800 than for my going on to 6,000. Their remarks as to an exchange not increasing rapidly to 6,000 lines is entirely uncalled for, and beside the question. Whether the growth is rapid or not is quite immaterial to the argument, and, moreover, the point was not referred to by me. However, it may be well to remind them that the Glasgow Corporation glory in the fact, and advertise it widely, that they have in two years increased far more rapidly than Messrs. Gardner and Holme seem to think possible or probable, and did not "gallant little Tunbridge Wells" boast of its even more phenomenal growth, taking the size and character of the town into consideration.

As to the cost of the jacks, I gave this as 2s. merely because Messrs. Gardner and Holme put it at that figure. I do not know, of course, what they pay for them. If it includes the wiring, well and good; but they did not say so. It does not affect my argument in the least, which is that the number of jacks required *per line* will continue to increase more and more as the exchange grows.

When a critic is in the right it is quite the usual thing for his remarks to be characterised as "effusions," precious or otherwise, and for a strong point to be made of his anonymity. But facts are facts by whomsoever stated, and although I have no objection to my name being published in full, as no object would be served thereby, I prefer still to remain anonymous, but am prepared to satisfy you, Sir, that I am not employed by the National Telephone Company, nor in any way connected with that concern, as doubtless Messrs. Gardner and Holme think and wish to infer.—Yours, etc., R. M.
